for a quarter of an hour or thereabouts; by this boiling, the pitch, when cold, will become hard and brittle: or you may shorten this operation, by melting equal quantities of pitch and roſin, and then there is no occaſion to let it boil ſo long. Your pitch being thus prepared, you again melt it, and take it off the fire, and let it ſtand till the pitch becomes pretty cold, or of a thickiſh conſiſtence; and having warmed the poliſhing tool a little, to make the pitch ſtick to it, you pour out of the ladle upon the poliſhing tool as much pitch as you judge will cover the whole tool, when ſpread out, to about the thickneſs of one eighth of an inch; you then invert this tool with the pitch upon it, and preſs it upon the convex tool, which muſt be quite dry, clean, and cold, in order to give it the figure of the convex tool: in caſe it has not ſpread out ſo as to cover the whole ſurface of the poliſhing tool, you may warm the pitch by holding it before the fire, and preſſing it upon the convex tool, as before, till it has entirely covered the ſurface of the poliſhing tool; you then plunge it into cold water, till the braſs is quite cold.

N. B. In order to know if your pitch is hard enough, you preſs the edge of the nail of your thumb upon it, and if it receives an impreſſion, the pitch is not hard enough.

You then proceed to prepare this poliſhing tool, for the laſt poliſh of your glaſs, by grinding this poliſhing tool upon the convex tool with pretty coarſe emery, and a ſmall quantity of water, in the common way that tools are ground one upon another; but this muſt be done only for a ſmall ſpace of time, and the poliſhing tool muſt have no other preſſure than its own weight, for fear of ſome of the emery ſticking in the pitch, and you muſt never allow the emery to grow dry: when you have ground the pitch ſo as to be all over of the ſame colour, you then waſh the pitch from all the emery with a brush and clean water; after this you take a bottle of water, and holding the pitch tool in a ſloping poſition, you pour water out of the bottle ſo as to fall upon every part of its ſurface.

You then place the poliſhing tool in a horizontal poſition, and you put upon it ſome putty, waſhed from all its gritty particles, but it need not be the fineſt waſhed, and you put a good deal of water upon your poliſhing tool, mixing the putty and it together, and, you poliſh your glaſs upon this pitch-poliſher in the common manner of poliſhing glaſſes.

After you have poliſhed your glaſs about ten minutes, you again grind your poliſher upon the convex tool with emery, as before, for fear the pitch has, by working, loſt any of its proper figure; and the oftener you do this, the truer will be the figure of your glaſs; and in this manner you proceed till the glaſs is quite poliſhed.

You then take your glaſs off its handle, by holding it before the fire, till it is ſo warm that you can ſlide the handle off the glaſs; and whilſt the glaſs is warm, you take off as much of the pitch as you can with the ſharp edge of a knife; you then lay the glaſs down to cool, and, when quite cold, you drop ſome ſpirits of wine upon it; and this, with a cloth, will wipe off the reſt of the pitch.

You then examine the centre of the ſurfaces of your glaſs; and if it lies to one ſide of the centre of your glaſs, mark that place with a ſpot of ink, and then put on your handle as before, upon the ſide that is now poliſhed, with its centre over the ſpot of ink, and grind your glaſs as before, till the circular remaining part of the glaſs to be ground is as much diſtant from the centre of the glaſs on the other ſide from the ſpot as the ſpot was from the centre of your glaſs; you then by heat return your handle to the centre of the glaſs, and proceed to grind and poliſh this ſide of the glaſs as before.

N. B. The concave and convex tools ſhould be ground with fine emery, after you have done one ſide of your glaſs; for the oftener theſe are ground together, you will be the more ſure of having your figure true. Phil. Tranſ. vol. lviii. p. 507, &c.

Method of GRINDING, *&c. the ſpecula of reflecting telescopes.* The method generally followed by workmen is that propoſed by Meſſrs. Molyneux and Hadley, and publiſhed in Dr. Smith's Optics: this has been lately improved in a very conſiderable degree by Mr. Mudge, whoſe directions, founded on accurate experiments, and practiſed with ſucceſs in the conſtruction of teleſcopes, we ſhall adopt wherever they differ from thoſe that occur in the book juſt cited. For making the gages, take a long pole of fir, deal, or any wood, of a little more than double the length of the inſtrument intended, and ſtrike through each end of it two ſmall ſteel points, and by one of them hang it up perpendicularly againſt a wall; then take two pieces of thin plate-braſs well hammered, a little thicker than a ſixpence, which may be about an inch and a half broad, and let their length be in proportion to the diameter of the ſpeculum as three to two; ſo that if the ſpeculum be eight inches diameter, theſe may be about twelve. Fix each of theſe ſtrongly with rivets between two thin pieces of wainſcot, ſo that a little more than a quarter of an inch in the breadth may ſtand out from between the boards. Then fix up theſe pieces horizontally againſt the wall under your pole, and therewith, as with a beam-compaſs, ſtrike an arch upon each of them; then file each of them with a ſmooth file to the arch ſtruck, ſo as one may be a convex and the other a concave arch of the ſame circle. Theſe braſſes are the gages to keep the ſpeculum, and the tools on which it is ground, always to the ſame ſphere: and that they may be, therefore, perfectly true to each other, it is neceſſary to grind them with fine emery one againſt the other, laying them on a flat table for that purpoſe, and fixing one of them to the table. When the gages are perfectly true, let a piece of wood be turned about two tenths of an inch broader than the intended ſpeculum, which it is beſt to caſt in no leſs than two tenths of an inch thick; and for ſpecula of ſix, eight or ten inches broad, this ſhould be at leaſt three or four tenths thick when finiſhed. This board being turned, take ſome common pewter, and mix with it about one tenth of regulus of antimony, and with that wooden pattern, caſt one of this pewter, which will be conſiderably harder than common pewter. Let this pewter pattern be truly turned in a lathe, and examined by meanes of the gages before mentioned, as a pattern for caſting the ſpecula themſelves; and take care when it is turned, that it be at leaſt one twentieth of an inch thicker, and about one tenth of an inch broader than the ſpeculum intended to be caſt from it. The manner of making the moulds for caſting is now to be explained, and will ſerve for a direction as well for caſting this pewter pattern, as afterwards for caſting thereby the ſpeculum itſelf. The flaſks ſhould be of iron, and at leaſt two inches wider every way than the ſpeculum intended. In each flaſk there ſhould be the thickneſs at leaſt of one inch of ſand. The caſting ſand which the common founders uſe will anſwer the purpoſe as well as any; and any ſand will do which is naturally mixed with a ſmall proportion of clay, to make it ſtick. The ſand ſhould be as little wet as may be, and well beaten, but not too hard. The ingates ſhould be cut ſo as to let the metal flow in, in four or five ſtreams, over the whole upper part of the mould; otherwiſe, whatever pores happen in the metal will not be ſo equally diſperſed as they ſhould be over the whole face of the metal, theſe pores generally falling near the ingate ſtreams. Let the flaſks dry in the ſun for ſome hours, or near a very gentle fire, otherwiſe they will warp, and give the ſpeculum, when caſt, a wrong figure: for, beſides having the trouble in *grinding*, it is beſt, on many accounts, to have the ſpeculum caſt of a true figure; and for this reaſon it is beſt to caſt it from a hard pewter pattern, and not from a wooden one, as founders uſually caſt.

For the compoſition of the metal and manner of caſting it, ſee SPECULUM. When the metal is caſt, the next buſineſs is to grind and poliſh it, for which, ſays Mr. Mudge, four tools are all that are neceſſary, viz. 1. The rough-grinder, for working all the rough face of the metal: this is beſt made of lead, ſtiffened with about a fifth or ſixth part of tin; it ſhould be at leaſt a third more in diameter than the metal which is to be ground; and for one of any ſize, not leſs than an inch thick. It may be cemented on a block of wood, in order to raiſe it higher from the bench.

This leaden tool being caſt, muſt be fixed in the lathe, and turned as true as poſſible by the gage to the figure of the intended ſpeculum, making a hole in the middle, as a lodgement for the emery, of about an inch diameter for a metal of four inches: when this is done, deep grooves muſt be cut acroſs its ſurface with a graver, in the manner repreſented in *Tab. II. Optics, fig.* 25: theſe grooves will ſerve to lodge the emery, and by their means the tool will cut much faſter. Any kind of low handle, fixed on the back of the metal with roſin cement, will be ſufficient; but it ſhould cover two thirds of its back to prevent its bending.

2. The next tool is the convex braſs-grinder, on which the metal is to receive its ſpherical figure. In order to form this tool, procure a round ſtout piece of Hamburgh braſs, at moſt a ſixth part larger than the metal to be poliſhed, and let it be well hammered into a degree of convexity, by the aſſiſtance of the gage, ſuitable to the intended ſpeculum: then ſcrape and clean the concave ſide ſo thoroughly, that it may be well rinned all over; then caſt upon it, after it has been preſſed a proper depth into the ſand, the former compoſition of tin and lead in ſuch a quantity, that it may, for a ſpeculum of four

inches

inches diameter, be at leaſt an inch and a half thick, and with a baſe conſiderably broader than the top, in order that they may ſtand firmly upon the bench in the manner hereafter to be deſcribed. This being done, it muſt be fixed and turned in the lathe with great care, and of ſuch a convexity as exactly to ſuit the concave gage. This tool muſt have a hole, ſomewhat leſs than that in the metal to be worked upon it, in the middle, quite through to the bottom. When it is finiſhed off in the lathe, its diameter ſhould be one eighth wider than the metal.

The 3d tool is the bed of hones, the uſe of which is to perfect the ſpherical figure, and to give the metal a fine ſmooth face. *See Bed of* Hones.

The 4th and laſt tool is the bruiſer, with which both the braſs grinder and the hones are to be formed: this tool ſhould be made of thick ſtout braſs, perfectly ſound, about a quarter of an inch thick, and hammered as near to the gage as poſſible; it ſhould be then ſcraped, cleaned, and tinned on the convex ſide, as the ſecond tool was on the concave, and the ſame thickneſs of lead and tin caſt upon it. This ſhould be as broad at bottom as at top; and when it is fixed in the lathe, and turned off concave to the convex gage with accuracy, the diameter ought to be of a middle ſize between the hones and the poliſher or braſs grinder, which is uſed for this purpoſe. Having with the lathe roughly formed the convex braſs grinder, the bed of hones, and the concave bruiſer, the convex and concave braſs tools and the metal muſt be wrought alternately and reciprocally upon each other with fine emery and water, ſo as to keep them to the ſame figure as nearly as poſſible, in order to which ſome waſhed emery muſt be procured, by putting it into a bottle, half filling the bottle with water, and ſhaking the mixture; ſo that the coarſeſt of the emery will ſubſide to the bottom firſt, and the fineſt remain at the top: when freſh emery is laid on the tools, it is beſt done by gently ſhaking the bottle, and pouring out a ſmall quantity of the turbid mixture. The next operation is to grind the braſs convex tool with the bruiſer upon it, which is continued for about a quarter of an hour, and then the convex tool is wrought upon the bruiſer in the ſame manner. When theſe have been wrought on each other, occaſionally adding freſh emery, till the veſtiges of the turning tool are got out and both brought nearly to a figure, the ſame form muſt be given to the metal, by grinding it upon the braſs tool with the ſame kind of emery; taking care, however, by working the two former tools frequently together, to keep all three exactly in the ſame curve. The beſt kind of handle for the metal is made of lead, a little more than double its thickneſs, and ſomewhat leſs in diameter, of about three pounds weight, with a hole in the middle, a little larger than that in the metal: the handle ſhould be cemented on with pitch. The upper edge of this weight muſt be rounded off, that the fingers may not be hurt, and a groove, about the ſize of the little finger, be turned round juſt below it, for the more conveniently holding and taking the metal off the tools. When the bruiſer, braſs tool, and metal, are all brought to the ſame figure, and have a good ſurface, the next part of the proceſs is to give a correct ſpherical figure and a fine face to the metal, upon the hones: theſe, however, ſhould be covered with water for at leaſt an hour before they are uſed, otherwiſe they will be liable to alter their figure; and they muſt be never ſuffered to grow dry whilſt they are in uſe, for the ſame reaſon.

In order to give a proper figure to the hones, correſponding to that of the braſs tool, bruiſer, and metal, when they are fixed down to the block, ſome common flour emery, unwaſhed, with a good deal of water muſt be put upon them, and the bruiſer being placed upon the hones, and rubbed over them with a few ſtrokes and a light hand, the inequalities of the ſtone will be ſoon worn off, the mind that is generated being waſhed away, every quarter of a minute, with a great deal of water. As ſoon as the hones have received the general figure of the bruiſer, and all the turning ſtrokes are worn out from them, the emery muſt be carefully waſhed off, and cleared from the joints with a bruſh under a ſtream of water. The bruiſer and metal muſt be likewiſe cleared in the ſame manner. The hones being fixed down to the block, the bruiſer muſt be worked upon them with very cautious, regular, ſhort ſtrokes, forward and backward, to the right and left, turning the axis of the bruiſer in the hand while you move round the hones, by ſhifting your poſition, and walking round the block. The manner of conducting this operation is minutely deſcribed by Mr. Mudge. The metal may then be rubbed upon the hones in the ſame cautious manner, occaſionally rubbing the bruiſer upon the hones, in order to ſharpen them. When in this way the hone-pavement has given a fine face and true figure to the metal, you may proceed to try the metal and judge of its figure, by waſhing the hone-pavement quite clean; then putting the metal upon the centre of it, and giving two or three light ſtrokes round and round only, without carrying the edges of the metal much over the hones; this will take out the order of ſtraight ſtrokes: then having again waſhed the hones, and placed the ſpeculum upon their centre, with gentle preſſure, ſlide it towards you till its edge be brought a little over that of the hones; then carry it quite acroſs the diameter as far as the other ſide, and having given the metal a light ſtroke or two in this direction, take it off the tool. The metal being wiped quite dry, place it upon a table at a little diſtance from a window; ſtand as near the window, at ſome diſtance from the metal, and looking obliquely on its ſurface, turn it round its axis, and you will ſee at every half turn the grain given by the laſt croſs ſtrokes flaſh upon your eye at once over the whole face of the metal. This is a certain proof of a true ſpherical figure.

The laſt operation is that of poliſhing the ſpeculum, and this is the moſt difficult and eſſential part of the whole proceſs. Mr. Mudge, having made ſome ſtrictures on the method of Meſſrs. Hadley and Molyneux, generally followed, deſcribes at large that which he has diſcovered, after a number of trials, both of giving a correct parabolic figure and an exquiſite poliſh at the ſame time. Availing himſelf of the manner of poliſhing with pitch, practiſed by Sir Iſaac Newton, and mentioned in his Optics, he formed his poliſher by coating the braſs convex tool equally with pitch, which ſhould be neither very hard and reſinous nor too ſoft, about the thickneſs of a ſhilling, and by applying the bruiſer to it, gave the pitch upon the poliſher a fine ſurface and the true form of the bruiſer. He then divided the leaden weight upon the back of the metal into eight parts, by ſtrokes on the ſurface of the lead, which are marked with the numbers 1, 2, 3, 4, &c. in order to diſtinguiſh and regulate the turns of the metal. He alſo put half an ounce of putty into an ounce phial, and filled it two thirds with water; and having ſhaken the whole, let the putty ſubſide, and ſtopped the bottle with a cork: the other appendages of his apparatus are a ſmall-ſized camel's hair bruſh in a tea-cup with a little water, a piece of dry clean ſoap in a galley-pot, and a ſoft piece of ſponge. Theſe, as well as the metal, bruiſer, and poliſher, ſhould be conſtantly covered from duſt.

The poliſher being fixed down, is bruſhed over with the camel's hair bruſh, after it has been wetted and rubbed a little over the ſoap; then the bruiſer is worked lightly upon it, till it has acquired a good face and is fit for the metal. Then, having ſhaken up the putty in the phial, and touched the poliſher in five or ſix places with the cork wetted with that and the water, the bruiſer is placed upon the tool, and a few ſtrokes given to it upon the putty, in order to rub down any gritty particles after which, having removed it, the metal is worked lightly upon the poliſher round and round, carrying the edges of the ſpeculum, however, not quite half an inch over the edge of the tool, and now and then with a croſs ſtroke. The putty is repeatedly applied in the ſame manner, and wrought into the pitch in the courſe of the operation; and if the bruiſer be apt to ſtick, and does not ſlide ſmoothly upon the pitch, the ſurface of either tool may be occaſionally bruſhed over with the ſoap and water. After ſome continuance of this proceſs, the pitch is well defended by the coating of the putty, and the metal, preſſed only by its own weight and that of the handle, and occaſionally moiſtened, moves over it with a more uniform and regular friction. When the poliſh of the metal nearly reaches the edge, the round ſtrokes muſt be gradually altered for the ſhort and ſtrait ones. When this has been done for ſome time, in the manner minutely deſcribed by Mr. Mudge, the metal will begin to move ſtiffly as the friction increaſes, and the ſpeculum poliſhes very beautifully and ſpeedily, and the whole ſurface of the poliſhing tool will be equally covered over with a fine metallic bronze. As the metal wears much, its ſurface muſt be now and then cleaned; with a piece of ſhammy leather, and the poliſher likewiſe with a ſoft piece of wet ſponge. You will now be able to judge of the perfect ſpherical figure of the metal and tool, when there is a perfect correſpondence between the ſurfaces, by the fine equable feel there is in working, which is totally free from all jerks and inequalities. Having proceeded thus far, you may put the laſt finiſhing to this figure of the metal by bold croſs ſtrokes, only three or four in the direction of each of the eight diameters, turning the metal at the ſame time: this muſt be done quickly; for, if the tool be ſuffered to grow quite dry, you will never be able, with all your force, to ſeparate that and the metal, without deſtroying the poliſher by heat

heat. The metal will now have a beautiful polish and a true ſpherical figure, but will by no means make a ſharp diſtinct image in the teleſcope; for the ſpeculum will not be found to make parallel rays converge without great aberration; and, indeed, the deviation will be ſo great, as to be very ſenſibly perceived by a great indiſtinctneſs in the image.

Suppoſing then the metal to be now truly ſpherical, ſtop the hole in the poliſher, by ſoecing a cork into it underneath, about an inch, ſo that it do not reach quite to the ſurface; and having waſhed off any mud that may be on the ſurface of the tool with a wet ſoft piece of ſponge, whilſt the ſurface of it is a little moiſt, place the centre of the metal upon the middle of the poliſher; then having, with the wet bruſh, lodged as much water round the edge of the metal as the projecting edge will hold, fill the hole of the metal and its handle with water, to prevent the evaporation of the moiſture, and the conſequent adheſion between the ſpeculum and poliſher, and let the whole reſt in this ſtate for two or three hours: this will produce an intimate contact between the two, and by parting with any degree of warmth they may have acquired by the nearneſs of the operator, they will become perfectly cold together. By this time you may puſh out the cork from the poliſher to diſcharge the water, and give the metal the parabolic figure, in the following manner: move the metal gently and ſlowly at firſt, a very little round the centre of the poliſher, then increaſing by degrees the diameter of theſe ſtrokes, and turning the metal frequently round its axis, give it a larger circular motion, without any preſſure but its own weight: this manner of working may ſafely be continued about two minutes, moving yourſelf as uſual round the block, and carrying the round ſtrokes, in their increaſed and largeſt ſtate, not more than will move the edge of the metal half an inch or five eighths over the tool. The ſpeculum muſt not all this while be taken off from the poliſher, and conſequently no freſh putty can be added. It will not be ſafe to continue this motion longer than the time above mentioned; for if the parabolic tendency be carried in the leaſt too far, it will be impoſſible to recover a true figure of that kind, but by going through the whole proceſs for the ſpherical one in the manner before deſcribed, by the croſs ſtrokes upon the poliſher, which takes a great deal of time.

In order to try the true figure of the ſpeculum, place it in the teleſcope for which it is intended, and uſe the inſtrument as a kind of microſcope, moving the object to ſuch a diſtance that the rays may be nearly parallel. At about twenty yards a watch-paper, or ſome ſuch object, on which there are ſome very fine hair-ſtrokes of a graver, is fixed up. The lead muſt be taken off from the ſpeculum, the ſpeculum placed on the cell of the tube, and the inſtrument directed to the object; make an annular kind of diaphragm with card-paper, ſo as to cover a circular portion of the middle part of the metal between the hole and the circumference, equal in breadth to about an eighth part of the diameter of the ſpeculum: this paper ring ſhould be fixed in the mouth of the teleſcope, and remain ſo during the whole experiment, for the part of the metal covered by it is ſuppoſed to be perfect, and therefore unemployed.

There muſt likewiſe be two other circular pieces of card-paper cut out, of ſuch ſizes, that one may cover the centre of the metal by completely filling the hole in the laſt deſcribed annular piece; and the other, ſuch a round piece as ſhall exactly fit into the tube, and ſo broad as that the inner edge may juſt touch the outward circumference of the middle annular piece. It would be convenient to have theſe two laſt pieces ſo fixed to an axis, that they may be put in their places, or removed from thence ſo eaſily as not to diſplace or ſhake the inſtrument. All theſe pieces therefore together will completely ſhut up the mouth of the teleſcope.

Let the round piece which covers the centre of the metal, or that which has no hole in it, be removed; and, by a nice adjuſtment of the ſcrew, let the image (which is now formed by the centre of the mirror) be made as ſharp and diſtinct as poſſible. This being done, every thing elſe remaining at reſt, replace the central piece, and remove the outſide annular one, by which means the circumference only of the ſpeculum will be expoſed, and the image now formed will be from the rays reflected from the outſide of the metal. If there be no occaſion to move the ſcrew and little metal, and the two images formed by theſe two portions of the metal be perfectly ſharp and equally diſtinct, the ſpeculum is perfect, and of the true parabolic curve; or at leaſt the errors of the great and little ſpeculum, if there be any, are corrected by each other.

If, on the contrary, under the laſt circumſtance, the image from the outſide of the metal ſhould not be diſtinct, and it ſhould become neceſſary, in order to make it ſo, that the little ſpeculum be brought nearer, it is plain that the metal is not yet brought to the parabolic figure; but if, on the other hand, in order to procure diſtinctneſs, you be obliged to move the little ſpeculum farther off, then the figure of the great ſpeculum has been carried beyond the parabolic, and hath aſſumed an hyperbolic form. When the latter is the caſe, the circular figure of the metal muſt be recovered (after having fixed on the handle with ſoft pitch) by bold croſs ſtrokes upon the poliſher, finiſhing it again in the manner above deſcribed. If the ſpeculum be not yet brought to the parabolic form, it muſt cautiouſly have a few more round ſtrokes upon the poliſher; indeed a very few of them, in the manner before deſcribed, make in effect a greater difference in the ſpeculum than would be at firſt imagined. If a metal of a true ſpherical figure were to be tried in the above mentioned manner in the teleſcope (which Mr. Mudge has frequently done), the difference of the foci of the two ſegments of the metal would be ſo conſiderable, as to require two or three turns of the ſcrew to adjuſt them; ſo very great is the abberration of a ſpherical figure of the ſpeculum, and ſo improper to procure that ſharpneſs and preciſion ſo neceſſary to a good reflecting teleſcope.

Suppoſing that the two foci of the different parts of the metal perfectly coincide, and that, by the union of them when the apertures are removed, the teleſcope ſhews the objects very ſharp and diſtinct, you are not however then to conclude that the inſtrument is not capable of farther improvement; for you will perceive a ſenſible difference in the ſharpneſs of the image, under different poſitions of the great ſpeculum with reſpect to the little one, by turning round the great metal in its cell, and oppoſing different parts of it to different parts of the little metal, correcting by this means the error of one by the other. This attempt ſhould be perſevered in for ſome time, turning round the great ſpeculum about one ſixteenth at a time, and carefully obſerving the moſt diſtinct ſituation each time the eye-piece is ſcrewed on: when, by trying and turning the great metal all round, the diſtinct poſition is diſcovered, the upper part of the metal ſhould be marked with a black ſtroke, in order that it may always be lodged in the cell in the ſame poſition. This is the method Mr. Short always uſed; and the cautions is of ſo much conſequence, that he thought it neceſſary to mention it very particularly in his printed directions for the uſe of the inſtrument.

And farther, Mr. Short frequently corrected the errors of the great by the little metal in another way. If the great ſpeculum did not anſwer quite well in the teleſcope, he cured that defect ſometimes by trying the effect of ſeveral metals ſucceſſively, by this means correcting the errors of one by the other.

The apparatus above deſcribed for examining the parabolic figure of the ſpeculum, is repreſented in *Tab.* II. *Optics*, *fig.* 26. A A is the mouth of the teleſcope, or edge of the great tube: B B is a thin piece of wood faſtened into and ſluſh with the end of the tube, to which is permanently fixed the annular piece of paſteboard *cc*, intended to cover and to prevent the action of the correſponding part of the ſpeculum. D is another piece of paſteboard, fixed by a pin to the piece of wood B B, on which it turns as on a centre; ſo that the great annular opening H H may be ſhut up by the ring *F F*, or the aperture G G by the imperforate piece E, in ſuch manner that, in the firſt inſtance, the reflection may be from the centre, and in the latter, from the circumference of the great ſpeculum.

Mr. Mudge has remarked, that the operation of poliſhing will not proceed well in the heat of ſummer or the cold of winter; and that neither this, nor the other of *grinding* upon the bones, will go on ſo well, unleſs they be continued uninterruptedly from beginning to end. In the above account it has been ſuppoſed, that the metal to be wrought was about four inches diameter; if it be either larger or ſmaller, the ſizes of the bones, bruiſer, and poliſher, muſt be proportionably different.

The proceſs for poliſhing the little ſpeculum of a teleſcope, muſt be conducted in the manner already deſcribed for that of the large one; only obſerving, that as the little metal has an uninterrupted face, without a hole, ſo there is no occaſion for one in the poliſher: and likewiſe that, as the ſpherical figure is the only object in this caſe to be attempted, the difficulty of execution is much leſs than in the former. As it is always neceſſary to ſolder to the back of the little ſpeculum a piece of braſs, as a fixture for the ſcrew to adjuſt its axis, Mr. Mudge has communicated a neat and ſafe method of doing it, which he received from the late Mr. Jackſon, and which may be very uſeful to the optical or mathematical inſtrument-maker upon other occaſions. Having cleaned the

parts

parts to be foldered very well, cut out a piece of tin-foil the exact ſize of them; then dip a feather into a pretty ſtrong ſolution of ſal ammoniac in water, and rub it over the ſurfaces to be foldered; after which place the tin-foil between them as faſt as you can (for the air will quickly corrode their ſurfaces ſo as to prevent the ſolder taking), and give the whole a gradual and ſufficient heat to melt the tin. If the joints to be foldered have been made very flat, they will not be thicker than a hair: though the ſurfaces be ever ſo extenſive, the foldering may be conducted in the ſame manner, only that care muſt be taken, by general preſſure, to keep them cloſe together. In this manner, for inſtance, a ſilver graduated plate may be foldered on to the braſs limb of a quadrant, ſo as not to be diſcernible by any thing but the different colour of the metals.

We ſhall cloſe this article with obſerving, that a method of giving the parabolic figure to his great ſpeculum was a point of perfection which Gregory and Newton had wiſhed for, but deſpaired of attaining, and which Hadley does not appear to have attempted either in his Newtonian or Gregorian teleſcope. Mr. Short is ſaid to have poſſeſſed the ſecret; however it died with that ingenious artiſt. The method diſcovered by Mr. Mudge above recited, is, as he has ſtrong reaſons to believe, the ſame with that of Mr. Short. See farther on this ſubject Smith's Optics, book iii. chap. ii. and Mr. Mudge's excellent paper in the Phil. Tranſ. vol. lxvii. part i. art. 16. p. 256—348. See TELESCOPE.

GRINDING is alſo uſed for a coarſer and leſs accurate method of ſmoothing or poliſhing the ſurface of a body, particularly glaſs for looking-glaſſes, &c.

In the new method of working large plates of glaſs for looking-glaſſes, coach-glaſſes, &c. by moulding, and, as it were, caſting them, ſomewhat after the manner of metals, deſcribed under the article GLASS, the ſurface being left uneven, it remains to be ground and poliſhed. In order to this, the plate of glaſs is laid horizontally on a ſtone in manner of a table, and to ſecure it the better, plaiſtered down with mortar or ſtucco, that the effort of the workman, or of the machine uſed therein, may not ſhake or diſplace it: to ſuſtain it there is a ſtrong wooden frame that ſurrounds it an inch or two higher than the glaſs: the bottom or baſe of the *grinding* engine is another rough glaſs, about half the dimenſions of the former: on this is a wooden plank, cemented thereto; and upon this are proper weights applied, to promote the triture, the plank or table being faſtened to a wheel, which gives it motion. This wheel, which is at leaſt five or ſix inches diameter, is made of a very hard but light wood, and is wrought by two workmen placed againſt each other, who puſh and pull it alternately; and ſometimes, when the work requires it, they turn it round. By ſuch means, a conſtant mutual attrition is produced between the two glaſſes, which is favoured by water and ſands of ſeveral kinds beſtowed between; ſand ſtill finer and finer being applied, as the *grinding* is more advanced: at laſt emery is uſed. We need not add, that as the upper or incumbent glaſs poliſhes and grows ſmoother, it muſt be ſhifted from time to time, and others put in its place.

It is to be noted, that only the largeſt ſize glaſſes are thus ground with a mill; for the middling and ſmaller ſorts are wrought by the hand; to which end there are four wooden handles at the four corners of the upper ſtone or carriage, for the workmen to take hold of, and give it motion. What remains to the perfection of glaſs comes under the denomination of poliſhing.

GRINDERS, *molares dentes*. See MOLARES.

GRINETTA, in *Ornithology*, the name of a water fowl of the gallinula or moor-hen kind, having open feet, and no membranes annexed to them. This is the RALLUS *porzana* in the Linnæan ſyſtem. It is ſmaller than the moor-hen and the water-rail. Its legs are of a duſky greeniſh colour, and its toes very long; its beak very ſhort, compreſſed ſideways, and pointed at the end, and is covered at the origin with a deep yellow ſubſtance, looking like a plaiſter put on it. The head is brown, ſpotted with black; the neck a deep olive, ſpotted with white; from the bill, beyond the eyes, is a broad grey bar; the feathers of the back are black next their ſhafts, then olive-coloured and edged with white; the ſcapulars are olive, finely marked with two ſmall white ſpots on each web. It is common in Italy and Germany, but not ſo frequent in England, where it is ſaid to be migratory. It inhabits the ſides of ſmall ſtreams, concealing itſelf among the buſhes. Its uſual weight is about four ounces five drams.

GRIP, or GRIPE, in *Huſbandry*, is a ſmall ditch cut acroſs a meadow, or ploughed land, in order to drain it. It alſo ſignifies a handful; as, a *gripe* of corn.

GRIPE, in *Mechanics*. See CRANE.

GRIPE *of a ſhip*, is the compaſs or ſharpneſs of her ſtem under water, chiefly towards the bottom of her ſtem.

The deſign of ſhaping her ſo is, to make her *gripe* the more, or keep a good wind; for which purpoſe, ſometimes a falſe ſtem is put on upon the true one.

GRIPE is alſo a ſea-phraſe for a ſhip's being apt to run too much to windward of her courſe, particularly when ſhe fails with the wind on her beam or quarter: this effect is partly occaſioned by the ſhock of the waves that ſtrike the ſhip perpetually on the weather-quarter, and force the ſtern to leeward; but principally by the arrangement of the ſails, which diſpoſes the ſhip continually to edge to windward, while in this ſituation of falling: in ſuch caſe they ſay ſhe *gripes*.

GRIPES, *tormina ventris*, in *Medicine*, a ſort of colic, or painful diſorder of the lower belly, occaſioned by ſome ſharp pungent matters vellicating the parts, or by wind pent up in the inteſtines. See COLIC and DYSENTERY.

The *gripes* are a very common ſymptom in young children, and may be cauſed by the aliment they uſe, which is conſiderably different from what they had been accuſtomed to in the uterus.

The retention of a part of the meconium may alſo give occaſion hereto, as being ſomewhat acrimonious.

This diſorder ſometimes proves ſo violent, as to throw the child into univerſal convulſions, or to cauſe, what is vulgarly called *convulſions of the bowels*.

GRIPES, or COLIC, in *Farriery*, is an acute diſeaſe, to which horſes are very often ſubject. There are three different ſpecies of this diſorder, viz. the flatulent or windy, the bilious or inflammatory, and the dry *gripes*.

The firſt is known by the horſe's alternately and ſuddenly lying down and riſing; by his ſtriking his belly with his fore feet, ſtamping with his fore feet, and refuſing his meat; and when the *gripes* are violent, by convulſive twitches, turning up his eyes, ſtretching out his limbs, and alternate ſweats and cold damps; ſtriving to ſtale, turning his head frequently to his flanks, rolling about, and often turning on his back. The confined wind may be diſcharged by emptying the ſtrait gut with a ſmall hand dipped in oil, and thus the neck of the bladder is eaſed of its load, and the horſe ſtales. It is always proper to bleed young and plethoric horſes in the neck-vein. The following ball and clyſter ſeldom fail of giving relief: take Straſburgh or Venice turpentine, and pounded juniper berries, of each half an ounce; ſal prunella, or ſaltpetre, an ounce; oil of juniper one dram; ſalt of tartar two drams; make theſe ingredients into a ball with any ſyrup; and give it whole, waſhing it down with a decoction of juniper-berries, or a horn or two of ale. If this ball does not ſucceed, and make the horſe break wind and ſtale plentifully, in an hour or two give him another ball, and add to it a dram of ſalt of amber; and this may be repeated a third time, if neceſſary: during the fit, let the horſe have gentle exerciſe. Let the following clyſter be given between the balls, or alone, and repeated occaſionally: take chamomile flowers two handfuls; aniſe, coriander, and fennel ſeeds, of each an ounce; long pepper half an ounce; boil them in three quarts of water to two; and add Daffy's elixir, or gin, half a pint; oil of amber, half an ounce, and oil of chamomile eight ounces. The horſe ſhould be well rubbed, clothed, and littered with clean ſtraw up to his belly: and a pint of brandy, rum, or geneva, with as much ſweet oil, may be given for a drink; and if this ſhould not ſucceed, boil an ounce of pepper or ginger in a quart of milk, and add to it a handful of ſalt, and half a pint of oil, which, given warm, will purge in two or three hours.

The bilious inflammatory *gripes* are attended with a fever, beſides more of the preceding ſymptoms: the horſe alſo generally throws out a little looſe dung, with hot ſcalding water, the blackiſh or reddiſh colour and fœtid ſmell of which denote an approaching mortification. In this caſe three quarts of blood ſhould be immediately taken away, and the bleeding ſhould be repeated, unleſs the ſymptoms abate in a few hours. The emollient clyſter, with two ounces of nitre diſſolved in it, ſhould be thrown up twice a day, and gum Arabic water ſhould be plentifully drank, and a pint of the following mixture ſhould be given every two or three hours, till favourable looſe ſtools are procured, and then only night and morning, till the diſorder is removed. Take ſenna, three ounces, and ſalt of tartar half an ounce; infuſe them for an hour or two in a quart of boiling water, and add two ounces of lenitive electuary, and four of Glauber ſalts. If the diſorder increaſes, recourſe muſt be had to the jeſuit's bark, which ſhould be given in the decoction to the quantity of a pint every three hours, with a gill of red Port wine. In a caſe of leſs conſequence, take diaſcente, one ounce; diaſcordium, half an ounce; powder-

ed myrrh two drams; make these into a ball with two drams of oil of amber, and give it twice or thrice a day.

The dry *gripes* arise often from costiveness, and are discovered by the horse's frequent and fruitless motion to dung, the blackness and hardness of the dung, the frequent and quick motion of his tail, the high colour of his urine, and his great reflection. The first of these should, in this case, be searched by an oiled hand: then throw up the following emollient clyster twice a day: take marshmallows and chamomile flowers, of each a large handful; bruised bay-berries and fennel seeds, of each an ounce; boil them in a gallon of water to three quarts; and having poured the liquor into a pail, dissolve it in half a pound of treacle, and a pint of linseed, or of dry common oil. The purging drink prescribed for the inflammatory *gripes* should be also given, till the symptoms are removed. The diet for a horse with the *gripes* should be scalded bran, warm water-gruel, or water prepared by dissolving four ounces of gum Arabic in a quart of water and mixing it with other water. Farmer's Diction. art. *Gripes*.

GRIPES, in *Sea Language*, is the name of a machine formed by an assemblage of ropes, hooks, and dead-eyes, and used to secure the boats upon the deck of a ship at sea, and prevent them from being shaken by the labouring of the vessel. The hooks, which are fastened at their ends, are fixed in ring-bolts in the deck on each side of the boat; whence, passing over her middle and extremities, they are extended, by means of the dead-eyes, so as to render the boats firm and secure.

GRISLAGINE, in *Ichthyology*, the name of a fresh-water fish, of the *cyprinus* kind, with whitish fins, and eleven rays in the anal fin, common in the rivers of Germany. In something approaches to the common roach in shape. Its back is of a dusky blue, and its belly and sides, below the side-lines, are of a silvery whiteness. The side-lines are yellow and dotted, and over these there is an interrupted blackish line running into several oblong streaks from the gills to the tail.

GRISLEA, in *Botany*, a genus of the *octandria monogynia* class; the characters of which are these: the perianthium consists of one leaf, and is of a tubulated bell-fashioned shape; it stands erect, and is divided into four segments at the end: the flower consists of four oval petals, extremely small, scarce indeed exceeding in size the segments of the cup from which they arise; the stamina are eight subulated, erect, and extremely long filaments: the anthers are simple and erect; the germen of the pistil is oval; the style is capillary, and of the length of the stamina; the stigma is simple; the fruit is a globose, single-celled, polyspermous capsule. It is an American tree, extremely well distinguished from all others by the flower alone.

GRISLY *seed*, among *Herbalists*, denote thin, flat, skinny seeds.

GRISOLA, in *Ornithology*, the name of a bird of the lark kind, described by Aldrovandus, and supposed by Mr. Ray to be the same with the STIOLETTA, or *torditus*, of the Venetians.

GRIST, denotes CORN ground, or ready for grinding.

GRIZZLE, is sometimes used for GREY.

GRITHBRECHE, in our *Old Writers*, the same with breach of the peace. In this sense we find it mentioned in Leg. Hen. I. cap. 36. *In casu regis* grithbreche 100 *sol. emendabit*.

It comes from the Saxon, *grithbrice*, which signifies the same.

GRITHSTOLE, in our *Old Writers*, a place of sanctuary. Blount. See FRIDSTOLE.

GRITS, in *Natural History*. See SABURRÆ.

GRIT-*stone*, is a stone consisting of particles of sand agglutinated together. Of this kind of stone there are many varieties, differing in the size of the particles of sand that compose them, the different properties of these sands, and their different degrees of compactness and agglutination. Some of these stones are used for building, others for grinding, others for whetting sharp steel instruments, and others for filtrating water. See FILTRE.

GRINDSTONE, WHET-*stone*, and STONE.

GROANING, in *Hunting*, a term used for the cry or noise of a buck.

GROAT, an English money of account, equal to four pence.

Other nations, as the Dutch, Polanders, Saxons, Bohemians, French, &c. have likewise their *groots*, groots, grochen, gros, &c.

We had no silver MONEY in the Saxon times bigger than a penny; nor after the Conquest, till Edward III. who about the year 1351. coined groates, i. e. *groats*, or great pieces which went for 4*d.* a-piece, and half-*groats*; and so the matter stood till the reign of Henry VIII. who, in 1505, first coined shillings.

GROATS, a term used in many parts of the kingdom for oatmeal oats, or oats only half-ground.

GROCERS, by the stat. 37 Edward II. cap. 5. is used for those who engross merchandize. See ENGROSSING.

But *grocers* are now those who deal in *sugars*, spices, &c. and form one of the incorporated companies of London. See COMPANY.

GROGRAM, in the *Manufactory*, a sort of stuff, made of silk and mohair, being in reality no more than a taffety, coarser and thicker than ordinary.

GROIN, in *Anatomy*. See INGUEN.

GROMA, among the *Romans*, a way-wiser, or surveying instrument; whence those who used it were called *gromatici*, and the place in the camp where it was kept, *groma*. Ainsw.

GROMMELS, in a *Ship*, are small wreaths, formed of a strand of rope, and used to fasten the upper edge of a flag-sail to its respective stay, in different places. By means of the *grommets* the sail is accordingly hoisted or lowered. Instead of these HANKS have been lately introduced.

GROMPHENA, in *Botany*, a name used by some authors, particularly by Pliny, for the common garden MARYGOLD.

GROMWELL, or GROMIEL, in *Botany*, *lithospermum*, a genus of the *pentandria monogynia* class. Its characters are these: the flower hath a permanent empalement, cut into five parts; and one petal, with a cylindrical tube, divided into five obtuse points at the brim; the chaps are perforated; it has five short stamina, which are shut up in the chaps of the petal; and hath four germina, which turn to so many oval, hard, smooth, acute-pointed seeds, sitting in the spreading empalement. Miller reckons five species, and Linnæus seven. The seeds of the greater upright *gromwell* have been accounted powerfully diuretic, and cleansers of the reins and ureters, being boiled in wine or water; and of great service against the stone, gravel, or stoppage of urine, as also against the heat of it, and a gonorrhœa. Matthiolus commends two drams of the powder, to be given in womens milk, as a speedy help in hard labour. But they have long been discarded from practice. The root of the hairy *gromwell*, or *alkanet*, with scarlet flowers, are externally of a deep purplish red colour, and the cortical part communicates a fine deep red to oils, wax, and all unctuous substances, and to rectified spirit of wine. Its chief use is for colouring oils, plasters, lip-salves, &c. See ANCHUSA.

GRONDEUR, a name given by the French in America to a fish which is commonly eaten there; the jaws of which have been brought into Europe, and being examined by Mr. Jussieu, were found beset in a remarkable manner with teeth, which perfectly resembled the *buffonites*, called *crapondines*, and by some *serpentes-eyes*; and which, in their fossil state, had been for many ages accounted gems. The arrangement of these teeth is such, that the whole flat surfaces of the upper and lower jaw are in a manner paved with them. They are of different shape and size in the different parts; those placed towards the edges were of the small and flat kind, commonly found in Malta, and called *serpents-eyes*: and the larger *toad-stones*, as they are called, were placed more toward the middle; the largest of all being placed in two straight rows, or lines, along the center of each jaw. Each of these teeth is articulated by a gomphosis in the jaw, and when taken out, they all have that natural cavity which is found in the hinder part of the fossil ones. The sockets of these teeth have much the appearance of those from whence teeth have been frequently changed, and probably the fish theds them often in the course of its life. Mem. Acad. Par. 1723.

GRONNA, in our *Old Writers*, a deep pit, or bituminous place, where turfs are dug for burning.

GRONOVIA, in *Botany*, a genus of the *pentandria monogynia* class, the characters of which are: that the flower hath a single-leaved coloured empalement, cut into five parts; five small petals; and five hairy stamina, inserted alternately in the empalement; the germen becomes a roundish coloured fruit, with one cell, including one large roundish seed. There is only one species, first discovered by Dr. Houstoun at La Vera Cruz.

GROOM, denotes a servant in some inferior post. In which sense it amounts to the same with the old word, *garcio*, and the French *garçon*.

The word is formed from the Flemish, *geem*, *goer*, a boy.

GROOM is the denomination of several officers and servants of the king's houshold.

There are *grooms* of the almonry, *grooms* of the compting-house, *grooms* of the great-chamber, the privy-chamber, and the bed-chamber, *grooms* of the robes, of the wardrobe, &c.

GROOM *of the stole*. See STOLE.

GROOM *porter* is an officer of the houshold, whose busi-

ness

neſs is to ſee the king's lodging furniſhed with tables, chairs, ſtools, and ſtring: as alſo to provide cards, dice, &c. and to decide diſputes ariſing at cards, dice, bowling, &c.

GROOM is more particularly uſed for a ſervant, appointed to attend on horſes in the ſtables. See LAQUEY.

GROOVE, or GROVE, among *Joiners*, denotes the channel that is made by their plough in the edge of a moulding, ſtyle, or rail.

GROOVE alſo denotes a gardener's tool for tranſplanting flowers.

GROOVE, in *Mining*, is the ſhaft, or paſſage into the lead-mines, by which they draw up their ore. They are ſometimes ſunk in the vein, and ſometimes out.

GROOZDISHYS, in *Botany*, a name given by the Ruſſians to a ſpecies of muſhroom reſembling our pepper, or milky muſhroom, deſcribed by Lifter, Ray, &c. but larger. The *grooz-diſhys* is very broad and thick, and abounding with an acrid juice. The Ruſſians preſerve them in pickle, and eat them with their meats. When eaten freſh they inflame the mouth and throat, and endanger ſuffocation. Phil. Tranſ. N° 89.

GROS, a foreign money, in divers countries, anſwering to our *groat*.

A pound *gros*, livre de *gros*. See POUND and LIVRE.

GROSS, or GROSSUS, in our *Ancient Law Writers*, denotes a thing abſolute, and not depending on another. Thus *villain in groſs, villanus in groſſo*, was a ſervant, who did not belong to the land, but immediately to the perſon of the lord; or a ſervile perſon not appendant, or annexed, to the land or manor, and to go along with the tenures as appurtenant to it; but, like other perſonal goods and chattels of his lord, at his lord's pleaſure and diſpoſal.

GROSS, *advowſon in*. See ADVOWSON.

GROSS-BEAK, in *Zoology*, a name by which we commonly call the COCCOTHRAUSTES, called alſo at other times the *bow-finch*. This is the LOXIA *coccothraufies* in the Linnæan ſyſtem.

GROSS, *in common*. See COMMON.

GROSS *weight*, is the weight of merchandizes, and goods, with their duſt and droſs, as alſo of the bag, caſe, cheſt, &c. wherein they are contained; out of which *groſs* weight, allowance is to be made of tare and tret.

GROSS *average*. See AVERAGE.

GROSS is alſo uſed for the quantity of twelve dozen.

GROSSA, a groat. *Conceſſo eſt regi una* groſſa, *quæ continet quatuor denarios, de quolibet viro ad mulere*. Knighton, an. 1378.

GROSSE-*bois*, in our *Ancient Law Books*, ſignifies ſuch wood as has been, or is, either by the common-law, or cuſtom of the country, reputed timber.

GROSSULARIA, or RIBES. See GOOSEBERRY.

GROTESQUE, GROTESC, or GROTTESQUE, a wild whimſical figure, or deſign of a painter, or engraver; having in it ſomething ridiculous, extravagant, and even monſtrous. The name ariſes hence, that figures of this kind were anciently much uſed to adorn the grottos wherein the tombs of eminent perſons, or families, were incloſed. Such was that of Ovid, whoſe grotto was diſcovered near Rome about one hundred years ago.

Calot, a celebrated engraver of Lorrain, had a wonderful genius for deſigning *groteſques*: the like is ſaid of Leonardo da Vinci.

We alſo extend the word *groteſque* to any thing whimſical, or wildly pleaſant, in a perſon's dreſs, diſcourſe, &c. Maſquerade habits are the more valued, the more *groteſque* they are. Our theatres preſent us with entertainments in *groteſque* characters, i. e. perſons quaintly dreſſed; as harlequins, ſcaramouches, &c. Plautus has given us a very *groteſque* picture of Æſop. Ariollo and the Italian poets are full of *groteſque* deſcriptions.

GROTESQUE-*work*, GROTESK-*work*, or GROTTESCO, denotes a work, or compoſition, in painting and ſculpture, in the *groteſque* manner, or taſte; conſiſting either of things which are merely imaginary, and have no exiſtence in nature, or of things turned and diſtorted out of the way of nature, ſo as to raiſe ſurprize and ridicule. *Groteſque*-work is much the ſame with what we ſometimes alſo call *antique* and moreſco.

GROTESQUES, or GROTESKS, are particularly uſed for little fanciful ornaments, of animals, compounded with foliages, fruit, &c.

Such are thoſe painted by Raphael in the apartments of the Vatican, and thoſe carved by Michael Angelo in the ciellings of the Portico in the Capitol. Vitruvius calls compartments of this kind *hortpaginetulis*.

GROTTO, or GROTTA, in *Natural Hiſtory*, a large deep cavern, or den, in a mountain or rock.

The word is Italian, *grotta*, formed, according to Menage, &c. from the Latin *crypta*: Du-Cange obſerves, that *grotta* was uſed in the ſame ſenſe in the corrupt Latin.

The ancient anchorets retired into dens, and *grottos*, to apply themſelves the more attentively to meditation.

Okey-hole, Elden-hole, Poole's-hole, and the Devil's-A—ſe in the Peake, are famous among the natural caverns or *grottos* of our country.

The entrance of Okey-hole, on the ſouth ſide of Mendip-hills, is in the fall of thoſe hills, which is beſet all about with rocks, and has near it a precipitate deſcent of near twelve fathoms deep, at the bottom of which there continually iſſues from the rocks a conſiderable current of water. The naked rocks above the entrance ſhew themſelves about thirty fathoms high, and the whole aſcent of the hill above is about a mile, and is very ſteep. As you paſs into this vault, you go at firſt upon a level, but advancing farther, the way is found to be rocky and uneven, ſometimes aſcending and ſometimes deſcending. The roof of this cavern, in the higheſt part, is about eight fathoms from the ground, but in many particular places it is ſo low, that a man muſt ſtoop to get along. The breadth is not leſs various than the height, for in ſome it is five or ſix fathoms wide, and in others not more than one or two. It extends itſelf in length about two hundred yards. People talk much of certain ſtones in it, reſembling men and women, and other things, but there is little matter of curioſity in theſe, being only ſhapeleſs lumps of common ſpar. At the fartheſt part of the cavern there is a good ſtream of water, large enough to drive a mill, which paſſes all along one ſide of the cavern, and at length ſlides down about ſix or eight fathoms, among the rocks, and then preſſing through the clefts of them, diſcharges itſelf into the valley.

The river within the cavern is well ſtored with eels, and has ſome trouts in it; and theſe cannot have come from without, there being ſo great a fall near the entrance. In dry ſummers, a great number of frogs are ſeen all along this cavern, even to the fartheſt part of it; and on the roof of it, at certain places, hang vaſt numbers of bats, as they do in almoſt all caverns, the entrance of which is either level, or but ſlightly aſcending or deſcending; and even in the more perpendicular ones they are ſometimes found, provided they are not too narrow, and are ſufficiently high. The cattle that feed in the paſtures, through which this river runs, have been known to die ſuddenly ſometimes after a flood; this is probably owing to the waters having been impregnated, either naturally or accidentally, with lead-ore. Philoſoph. Obſerv. N° 2. p. 2.

In the Philoſophical Tranſactions, N° 480. p. 223, we have an account of a ſubterranean *grotto*, or cavern, near Weredale, about twenty miles ſouth-weſt of Newcaſtle.

Elden-hole is a huge profound perpendicular chaſm, three miles from Buxton, ranked among the natural wonders of the Peak. Its depth is unknown, and is pretended to be unfathomable. Cotſon tells us he ſounded 884 yards; yet the plummet ſtill drew. But he might eaſily be deceived, unleſs his plummet was very heavy; the weight of a rope of that length might well make the landing of the plummet ſcarce perceivable. Phil. Tranſ. N° 407. p. 24.

Peake's-hole, and Pool's-hole, called alſo the Devil's-A—ſe, are two remarkable horizontal ſprings under mountains; the one near Caſtleton, the other juſt by Buxton. They ſeem to have owed their origin to the ſprings which have their current through them; when the water had forced its way through the horizontal fiſſures of the ſtrata, and had carried the looſe earth away with it, the looſe ſtones muſt fall down of courſe: and where the ſtrata had few or no fiſſures, they remained entire; and ſo formed there very irregular arches, which are now ſo much wondered at. The water which paſſes through Pool's-hole is impregnated with particles of limeſtone, and has incruſted the whole cavern in ſuch a manner that it appears as one ſolid rock. Martyn, in Phil. Tranſ. N° 407. p. 27, & ſeq.

In *grottos* are frequently found cryſtals of the rock, ſtalactites, and other naturall congelaciations, and thoſe often of an amazing beauty.

M. Homberg conjectures, from ſeveral circumſtances, that the marble pillars of the *grotto* of Antiparos vegetate, or grow. That author looks on this *grotto* as a garden, whereof the pieces of marble are the plants; and endeavours to ſhew, that they could only be produced by ſome vegetative principle. Mem. Acad. anno 1702.

At Foligno in Italy, is another *grotto*, conſiſting of pillars and orders of architecture of marble, with their ornaments, &c. ſcarcely inferior to thoſe of art; but they all grow downwards: ſo that if this too be a garden, the plants are turned upſide down. Mem. de l'Acad anno 1711.

The Zirchnitzer ſea, or lake, in Carniola, famous for being full of water, fiſh, &c. the beſt part of the year,

and quite dry, and bearing grafs, corn, &c. the reft proceeds from fome fubterraneous *grotto*, or lake; as it is made highly probable by Mr. Vavafor, Phil. Tranf. N° 191.

We have feveral *grottos* famous in natural hiftory: as,

GROTTO *del Cani*, a little cavern near Pozzuoli, four leagues from Naples, the ſteams whereof are of a mephitical or noxious quality; whence alſo it is called *bocca tremenda*, the poiſonous mouth. See MEPHITIS.

Two miles from Naples, ſays Dr. Mead, juſt by the Lago de Agnano, is a celebrated *mofeta*, commonly called *la Grotta del Cani*, and equally deſtructive to all within the reach of its vapours.

It is a ſmall *grotto* about eight feet high, twelve long, and ſix broad; from the ground ariſes a thin, ſubtile, warm fume, viſible enough to a diſcerning eye, which does not ſpring up in little parcels here and there, but in one continued ſtream, covering the whole ſurface of the bottom of the cave; having this remarkable difference from common vapours, that it does not, like ſmoke, diſperſe itſelf into the air, but quickly after its riſe, falls back again, and returns to the earth; the colour of the ſides of the *grotto* being the meaſure of its aſcent: for ſo far it is of a darkiſh-green, but higher only common earth. And as I myſelf found no inconveniency by ſtanding *in* it, ſo no animal, if its head be above this mark, is the leaſt injured. But when, as the manner is, a dog, or any other creature, is forcibly kept below it; or, by reaſon of its ſmallneſs, cannot hold its head above it; it preſently loſes all motion, falls down as dead, or in a ſwoon; the limbs convulſed and trembling, till at laſt no more ſigns of life appear than a very weak and almoſt inſenſible beating of the heart and arteries; which, if the animal be left a little longer, quickly ceaſes too, and then the caſe is irrecoverable; but if it be ſnatched out, and laid in the open air, it ſoon comes to life again, and ſooner, if thrown into the adjacent lake.

The fumes of the *grotto*, the ſame author argues, are no real poiſon, but act chiefly by their gravity; elſe the creatures could not recover ſo ſoon; or, if they did, ſome ſymptoms, as faintneſs, &c. would be the conſequence of it. He adds, that in creatures killed therewith, when diſſected, no marks of infection appear; and that the attack proceeds from a want of air, by which the circulation tends to an entire ſtoppage; and this for much the more, as the animal inſpires a fluid of a quite different nature from the air, and ſo in no reſpect fit to ſupply its place.

Taking the animal out, while yet alive, and throwing it into the neighbouring lake, it recovers: this is owing to the coldneſs of the water, which promotes the contraction of the fibres, and ſo aſſiſts the retarded circulation: the ſmall portion of air which remains in the veſiculæ, after every expiration, may be ſufficient to drive out the noxious fluid. After the ſame manner, cold water acts in a deliquium animi: the lake of Agnano has no greater virtue in it than others.

The true explication of the noxious effects of this vapour may be ſeen under the articles AIR, and *Fixed* AIR, DAMP, &c.

GROTTA *del Sarpi* is a ſubterraneous cavern near the village of Saſſa, eight miles from the city of Braccano in Italy; deſcribed by Kircher thus:

The *Grotta del Sarpi* is big enough to hold two perſons: it is perforated with ſeveral fiſtular apertures, ſomewhat in manner of a ſieve; out of which, at the beginning of the ſpring-ſeaſon, iſſues a numerous brood of young ſnakes of divers colours, but all free of any particular poiſonous quality.

In this cave they expoſe their lepers, paralytics, arthritics, and elephantiac patients, quite naked; where the warmth of the ſubterraneous ſteams refolving them into ſweat, and the ſerpents clinging variouſly all around, licking and ſucking them, they become ſo throughly freed of all their vicious humours, that upon repeating the operation for ſome time, they become perfectly reſtored. This cave Kircher viſited himſelf, and found it warm, and every way agreeable to the deſcription given of it. He ſaw the holes, and heard a murmuring hiſſing noiſe in them. Though he miſſed ſeeing the ſerpents, it not being the ſeaſon of their creeping out; yet he ſaw a great number of their exuviæ, or ſloughs, and an elm, growing hard by, laden with them.

The diſcovery of this cave was by the cure of a leper going from Rome to ſome baths near this place; who loſing his way, and being benighted, happened upon this cave; and finding it very warm, pulled off his cloaths; and being weary and ſleepy, had the good fortune not to feel the ſerpents about him till they had wrought his cure. Muſeum Wormian.

The ſalutary effects of this cavern were probably of the ſame nature, and to be aſcribed to the ſame cauſe with thoſe of the PYRMONT and SPA waters, abounding with a great quantity of the GAS, or *fixed* AIR, which lies alſo to a certain height on the ſurface of the ground; and whether diſeaſed perſons reſort, and find relief in a variety of diſorders. The antiſeptic ſalutary quality of this air is now ſufficiently known.

Milky GROTTO, *Cryptæ Lactea*, a mile diſtant from the ancient village of Bethlehem, is ſaid to have been thus denominated on occaſion of the bleſſed Virgin, who let fall ſome drops of milk in giving ſuck to Jeſus in this *grotto*. And hence it has been commonly ſuppoſed, that the earth of this cavern has the virtue of reſtoring milk to women that are grown dry, and even of curing fevers.

Accordingly, they are always digging in it, and the earth is ſold at a good rate to ſuch as have faith enough to give credit to the fable. An altar has been built on the place, and a church juſt by it.

GROTTO is alſo uſed for a little artificial edifice made in a garden, in imitation of a natural *grotto*.

The outſides of theſe *grottos* are uſually adorned with ruſtic architecture, and their inſide with ſhell work, foſſils, &c. finiſhed likewiſe with jets d'eaus or fountains, &c.

A cement for artificial *grottos* may be made thus: take two parts of white roſin, melt it clear, and add to it four parts of bees wax; when melted together add two or three parts of the powder of the ſtone you deſign to cement, or ſo much as will give the cement the colour of the ſtone: to this add one part of flour of ſulphur: incorporate all together over a gentle fire, and afterwards knead them with your hands in warm water. With this cement the ſtones, ſhells, &c. after being well dried before the fire, may be cemented.

Artificial red coral branches, for the embelliſhment of *grottos*, may be made in the following manner: take clear roſin, diſſolve it in a braſs-pan; to every ounce of which add two drams of the fineſt vermilion: when you have ſtirred them well together, and have choſen your twigs and branches, peeled and dried, take a pencil and paint the branches all over whilſt the compoſition is warm; afterwards ſhape them in imitation of natural coral. This done, hold the branches over a gentle coal-fire, till all is ſmooth and even as if poliſhed.

In the ſame manner white coral may be prepared with white lead, and black coral with lamp-black.

A *grotto* may be built with little expence, of glaſs, cinders, pebbles, pieces of large flint, ſhells, moſs, ſtones, counterfeit coral, pieces of chalk, &c. all bound or cemented together with the above deſcribed cement.

The *grotto* at Verſailles is an excellent piece of building. Solomon de Caux has an expreſs treatiſe of *grottos* and fountains.

GROVE, in *Gardening*, &c. a ſmall thick wood, impervious to the rays of the ſun.

The ancient Romans had a ſort of *groves* near ſeveral of their temples, which were conſecrated to ſome god, and called *lucs*, by antiphraſis, *à non lucendo*, as being ſhady and dark.

Groves are not only great ornaments to gardens, but alſo afford relief againſt the violent heats of the ſun; furniſhing ſhade to walk under in the hotteſt parts of the day, when the other parts of the garden are intolerable: ſo that every garden muſt be defective which has not ſhade.

Groves are of two ſorts, either open or cloſe. Open *groves* are ſuch as have large ſhady trees, which ſtand at ſuch diſtances, as that their branches approach near enough to each other, to prevent the rays of the ſun from penetrating through them.

Moſt of the *groves* that have been planted, either in England or in the celebrated gardens of France, are only a few regular lines of trees, many of which are avenues to the habitation, or lead to ſome building or other object: but theſe do not appear ſo grand as others that have been made in woods, where the trees have grown at irregular diſtances, where they have large ſpreading heads, and are left ſo far aſunder as to permit the graſs to grow under them. For nothing is more noble than fine ſpreading trees, with large ſtems growing through the graſs: eſpecially if the graſs is well kept, and has a good verdure. Beſides, moſt planted *groves* have a gravel walk made in a ſtraight line between them, which is offenſive to true taſte: therefore whenever a gravel walk is to be carried through *groves*, it will be much better to twiſt it about, humouring the diſpoſition of the trees, than to attempt regularity. But under large trees, dry walks are not ſo uſeful as in open places; becauſe after rain the dropping of the trees will for ſome time render the walks uſeleſs.

In planting *groves*, the trees ſhould be diſpoſed irregularly, which will give them a more noble appearance, and alſo

also form a shade sooner than when they are planted in lines. When in planting a garden, full grown trees are found upon the spot, they should, if possible, remain inviolate; for it will be better to put up with many inconveniencies than to destroy what will require an age to supply.

Close *groves* have frequently large trees standing in them, but the ground under them filled with shrubs or underwood; so that the walks within them are private, and screened from winds, by which means they are rendered agreeable for walking, at such times when the air is either too hot or too cold for walking in the more exposed parts of the garden. They are often so contrived as to bound the open groves, and frequently to hide the walls or other inclosures of the gardens; and when they are properly laid out with dry walks winding through them, and sweet-smelling shrubs and flowers irregularly planted at the sides, they have a charming effect. If they are continued round the whole inclosure of the garden, there will be a much greater extent of walks; and these shrubs will appear the best boundary, where there are not fine prospects to be gained. Miller.

Groves have been in all ages held in great veneration. The PROSEUCHÆ, and high-places of the Jews, whither they resorted for the purposes of devotion, were probably situated in *groves*. See Joshua xxiv. 26. The proseuchæ in Alexandria, mentioned by Philo, had *groves* about them, because he complains that the Alexandrians, in a tumult against the Jews, cut down the trees of their proseuchæ: that at Rome, in Egeria's *grove*, was of the same sort. The veneration which the ancient DRUIDS had for *groves* is well known.

GROUND, in *Agriculture*, is a piece of land, or soil; or a portion of earth, whether fit, or unfit, to be tilled, and cultivated.

All sorts of *ground* may be reduced to boggy or marshy, chalky, gravelly, and stony. See MARSH, CHALK, SAND, GRAVEL, SOIL, &c.

GROUND-*angling*. See ANGLING.

GROUND, *battable*. See BATTABLE.

GROUND, among *Bowlers*. See BOWLING.

GROUND, *breaking*. See BREAKING.

GROUND, *commanding*. See COMMANDING.

GROUND, in *Etching*, denotes a varnish smeared over the surface of the metal to be etched, to prevent the aqua fortis from eating, or having effect, except in places where this *ground* is cut through, or pared off, with the points of needles. See ETCHING.

GROUND-*ivy*, *glechoma*, in *Botany*; called also *gill go by the ground*, *ale-hoof*, or *turn-hoof*, is a genus of the *didynamia gymnospermia* class; the antheræ of which unite in form of a cross, and the calyx is divided into five segments; this is a plant that grows naturally under hedges and on the sides of banks in most parts of England, and therefore it is rarely cultivated in gardens. The leaves which are roundish, or kidney-shaped, are set in pairs at the joints; on the bosoms of these come forth clusters of blue labiate flowers, whose upper lip is cloven and turned backwards: this plant flowers from April almost to the end of summer, and is generally found green all the winter.

Ground-ivy is an attenuant and dissolvent, and famous, both externally and internally, as a vulnerary. It is much used by way of tea in disorders of the breast and lungs, and is sometimes an ingredient in the pectoral decoction. It is esteemed a specific in erosions and ulcerations of the viscera, and particularly of the kidneys and lungs; with which intention its juice has been given to people in consumptions. Lindanus praises it in an *empyema* and *vomica pulmonum*, and recommends it to such as void blood and purulent matter by urine. It is also said to be good in bruises, and to cure the head-ach: but notwithstanding all this, it is left in great measure to the common people.

It gives the denomination to a sort of medicated ale, or drink, commonly called *gill*, or *gill-ale*, made by infusing the dried leaves of the plant therein.

The leaves of the common *ground-ivy* are found sometimes to produce on their under part certain galls, or round protuberances, of a fleshy texture, and green colour, of the size of nutmegs, or sometimes larger. These are in some years so common in France, that the poor people eat them either raw or roasted, and find them a wholesome food.

GROUND-*line*, in *Perspective*. See *Terrestrial* LINE.

GROUND, in the *Manage*. See TERRAIN.

GROUND, *manuring*. See MANURING.

GROUND-*nicks*. See NICKS.

GROUND-*nut*. See EARTH-*nut*.

GROUND, *oats*. See OATS.

GROUND-*pasture*. See PASTURE.

GROUND-*pine*, in *Botany* and *Medicine*, &c. See GERMANDER.

GROUND, *sticking-pins*. See CAMPHORATA.

GROUND-*plats*, in *Architecture*, are the outermost pieces of timber lying on, or near the *ground*, and framed into one another with mortises and tenons. In these also are mortises made to receive the tenons of joists, the summers, and girders; and sometimes the trimmers for the stair-case and chimney-way, and the binding joists.

GROUND *of a shield*, or *escutcheon*, in *Heraldry*, is properly called the FIELD.

GROUND, in *Painting*, is the surface upon which the figures, and other objects are raised or represented. See PAINTING.

Ground is properly understood of such parts of the piece as have nothing painted on them, but retain the original colour, upon which the other colours are applied to make the representations.

A drapery, piece of building, or the like, are said to serve as a *ground* to a figure, when the figure is painted on the drapery, or building.

In the like sense, we also say, the *ground* of a piece of tapestry, of an embroidery, of a medal, coin, &c.

GROUND *tackle*, a *Sea Term*, denoting a ship's anchor, cables, &c. with what is necessary to make her ride safe at anchor in a proper *ground*.

GROUND-*timbers*, in a *Ship*, are those whose timbers lie on her keel, and are fastened to it with bolts through the keelson. They are so called, because the ship lies at rest upon them when she is aground.

GROUND-*work*, in *Building*. See FOUNDATION.

GROUND *worm*. See WORM, and EARTH-*worm*.

GROUNDAGE, a custom, or tribute, paid for the standing of a ship in a port. Blount.

GROUNDING *of a ship*, is the bringing her on *ground*, to be trimmed, made clean, or to have some leak stopped in her.

The term is also applied to a ship's running aground accidentally, when under sail, or driving in a tempest.

GROUNDLING, an English name for that small species of the cobitis, more commonly called the LOACH, and by Artedi the smooth-spotted COBITIS with the body cylindric.

GROUNDSEL, *senecio*, in *Botany*, a genus of the *syngenesia polygamia superflua* class. Its characters are these: the flower is composed of many hermaphrodite florets, which form the disk, and female half-florets, which make the border, or rays, included in one common cylindrical empalement, which is rough, scaly and contracted above; the hermaphrodite florets are tubulous, funnel-shaped, cut into five parts at the brim, which are reflexed; they have five small hair-like stamina, terminated by cylindrical summits; and an oval germen, crowned with down, situated under the petal, supporting a slender style, crowned by two oblong revolving stigmas; the germen afterwards turns to an oval seed, crowned with down, inclosed in the empalement; the female half-florets, which form the rays, are stretched out like a tongue, and are indented in three parts at the top. There are many species of *groundsel*, which are common weeds; but Miller mentions some species of it which are cultivated as more valuable. Linnæus has annexed to this genus several species of Tournefort's RAGWORT.

The leaves of the common *groundsel*, taken in a strong infusion, are an emetic. Dr. Lewis conjectures that their emetic power may be merely owing to large doses of the infusion, by which the stomach was nauseated. It is prescribed in smaller doses in dropsies, jaundices, and hæmorrhages. Externally they are used in ointments against cutaneous foulnesses. Beat into a very coarse pulp, and applied cold to the pit of the stomach, they have had very good success in curing agues. They are to be used only on the days free from the fit. They vomit strongly some hours after application. See Medic. Ess. Edinb. vol. ii. art. 5. or Abridg. vol. i. p. 203.

GROUNDIEL, *African*. See *Foreign* COLTSFOOT.

GROUNDIEL, *German*. See STELLERA.

GROUP, or GROUPE, in *Painting* and *Sculpture*, an assemblage, or knot, of two or more figures of men, beasts, fruits, or the like, which have some apparent relation to each other.

The word is French, formed of the Italian *groppo*, a *knot*, or *cluster*.

In a good painting, it is necessary that all the figures be divided into two or three *groups*, or separate collections. Such and such a thing make a *group*, with such and such others of different nature and kind. The antique Laocoon is a fine *group* of three beautiful figures.

A *group* has somewhat in it of the nature of a symphony, or concert of voices: as, in the one, the voices must sustain each other, in order to fill the ear with an agreeable harmony from the whole; whence, if any part were to cease, something would necessarily be missed; so in the other, if the parts, or figures, be not well balanced, something will be found disagreeable.

There are two sorts of *groups*, or two manners of considering *groups*; with regard to the design, and to the clair-obscure. The first is common both to works of painting, and those of sculpture; the latter is peculiar to painting.

Groups, with regard to the design, are combinations of divers figures, which have relation to each other, either on account of the action, or of their proximity, or of the effect they have. These we conceive, in some measure, as representing so many different subjects, or at least so many distinct parts, or members of one greater subject.

Groups, with regard to the clair-obscure, are bodies of figures wherein the lights and shadows are diffused in such a manner, that they strike the eye together, and naturally lead it to consider them in one view.

In *Architecture* we sometimes say, a GROUP *of columns*, speaking of three or four columns joined together on the same pedestal. When there are but two together, we say, a *couple*, not a *group* of columns.

Two or more figures, that are in any way connected, are called a *group*: and they are said to be well or ill *grouped*, when they are or are not happily disposed. See *Tab. Archit. fig.* 46. II. Figures, though in the same situation, and joined to each other, if not connected in the design, are not said to be grouped, but are single FIGURES: such are those in the screen of columns, and round the Attic story, under the dome, in the wings of the building.

In *Music*, a GROUP is one of the kinds of diminutions of long notes, which in the writing forms a sort of *group*, or cluster.

The *group* usually consists of four crotchets, quavers, or semi-quavers, tied together, at the discretion of the composer.

GROUPADES is corruptly used in the *Manege*, for CROUPADES.

GROUPED *columns*. See COLUMN.

GROUSE, or GROUS, in *Ornithology*, is a general name comprehending several species of birds, which Linnæus has classed under the genus of TETRAO. Their general character is, that they have a short arched bill; that the outmost and inner toes are connected to the first joint of the middle toe by a small membrane; their legs are feathered to the feet; they have broad scarlet eye-brows. The *wood grous*, called also the *urogallus major*, and COCK of the mountain, or wood, is the *tetrao urogallus* of Linnæus. The male of this species sometimes weighs fourteen pounds: its bill is of a pale yellow colour; the nostrils are covered with dusky feathers; the head, neck, and back, are elegantly marked with slender lines of grey and black, running transversely. The feathers on the hind part of the head are long, and beneath the throat is a large tuft of long feathers. The upper part of the breast is of a rich glossy green; the rest of the breast and belly black, mixed with some white feathers; the sides are marked like the neck; the coverts of the wings are crossed with undulated lines of black and red-ish brown; the exterior webs of the greater quill-feathers are black, and at the setting on of the wings in both sexes is a white spot: the tail consists of eighteen black feathers marked on each side with a few white spots; the legs are covered with brown feathers, and the edges of the toes pectinated. See *Tab. III. Birds*, N° 25. The tail of the female is dusky; its throat red; its head, neck, and back marked with transverse bars of red and black; the breast has some white spots on it, and the lower parts of a plain orange colour; the belly is barred with pale orange and black; the tips of the feathers are white; the feathers of the back and scapulars are black, the edges being mottled with black and pale reddish brown; the scapulars are tipt with white; the tail is of a deep rud colour, barred with black, tipt with white, and consists of fifteen feathers. The female is considerably less than the male. See *Tab. III. Birds*, N° 26. These differences between the male and female led some writers to make the male and female of this species two different species; and Gesner has distinguished them in this manner, calling the female the *gregallus minor*, and the male the *gregallus major*. This species is found in no other part of Great Britain except the Highlands of Scotland, where it is known by the name of *cock-of-the-wood*, and in the old law books *capercalzie*, the *horse of the woods*. It inhabits woods and mountainous countries, and feeds on the tops of pines and birch-trees, and the berries of juniper. These birds are common in Scandinavia, Germany, France, and several parts of the Alps; and are generally reckoned well-tasted food. Another species of the *grouse* is the black game, heath cock, or black cock, being the *tetrao tetrix* of Linnæus; the male, which is called the *urogallus minor*, has a dusky bill; the plumage of the whole body is black, glossed over the neck and rump with a shining blue: the coverts of the wings are of a dusky brown, the inner coverts white; the thighs and legs are covered with dark brown feathers, and on the former are some white spots; the tail consists of sixteen black feathers, and is much forked; the feathers under the tail are of a pure white. The weight of an old black cock is about four pounds.

The female weighs about two pounds; the head and neck are marked with alternate bars of dull red and black; the breast with dusky black and white; the back, coverts of the wings and tail, are of the same colours with the neck; the inner coverts of the wings are white; and in both sexes form a white spot on the shoulder; the tail consists of eighteen feathers, variegated with red and black, and slightly forked. This species of birds frequent the same situations with the former: they feed on bilberries and other mountain fruits, and in winter on the tops of the heath: in summer they often descend from the hills to feed on corn. They never pair, but in spring the male gets on an eminence, crows, and claps his wings; on which signal all the females within hearing resort to him. The hen lays from six to eight eggs, which are hatched late in the summer. The young males, which quit their mother in the beginning of winter, keep together in flocks of seven or eight till spring; during which time they inhabit the woods. There is another variety of the black cock, which differs from the common sort in being spotted on the neck, breast, wings, and thighs, with red: such is also the *tetrao hybridus* of Linnæus. Pennant.

Another species of *grouse* is the red game, moor-cock, or GOR-COCK. A fourth species is the white game, *tetrao lagopus* of Linnæus, or PTARMIGON.

GROUT, or GROWT, in *Building*, is a very thin coarse morter; when it is mixed with bullock's hair, it is called *hair-grout*. See *Ensmithing of* TILES.

GROWAN, in *Natural History*, a word used by the miners in Cornwall to express a sort of coarse and gritty stone, which they are usually obliged to dig through before they come at the veins of ore. This is usually grey or whitish, but sometimes it is of various colours, often yellowish, and sometimes spotted with iron-colour, and an inky black; and often its texture is so loose and spungy, that there are holes in it of the size proper to receive a pea or a horse-bean: these are sometimes empty, but more usually they are filled up either with chalk or with spar. Beside the strata of this stone that lie over the ore, there is also a large quantity of it often placed by its side. They have this, and two other sorts of stone, lying in the way to the tin ore in Cornwall. The first of the others they call *moor-stone*, a very uncertain name, as it is also given by some to the common white granite of that county; but the miners only mean by it a loose sort of free-stone, somewhat softer than that usually employed in building. The other stone is called *killas*: this is a grey stone of the same kind, easily splitting into thin plates, and is very full of talcy flakes: this *killas* is, however, a very indeterminate name, as well as the other, for the same people sometimes use it also to signify a white earth common among them; this last, however, they sometimes distinguish by the epithet *white*. The word *growan* seems the only name they have kept to any determinate signification, for they never express by this word any other substance than the stone above described.

GROWING, in *Sea-language*, denotes the direction of the cable from the ship towards the anchor: thus, the cable grows on the starboard bow, when it stretches out forwards on the starboard or right side.

GROWME, in our *Old Writers*, an engine to stretch woollen cloth after it is woven: it is mentioned in the statute 43 Edw. III. cap. 10.

GROWTH *horsemen*, a rate so called, and paid in some places for the tithe of every fat ox or other unfruitful cattle.

GRUARII, in our *Old Writers*, the principal officers of the forest in general. The word comes from the old French *gruyer*, which signifies the same.

GRUB, the English name of the hexapode worms or maggots hatched from the eggs of beetles. See SCARABÆUS.

Grubs are an excellent bait for many kinds of fish. In angling for the grayling, the ash-*grub* is to be preferred to all others. This is plump, milk-white, but round from head to tail, and has a red head. There is also another *grub*, which is very common, and is longer and slenderer than the ash-*grub*: it is yellower and tougher, and is known by having a red head, and two rows of legs all along the belly. The trout and grayling usually frequent the same places, and it is not uncommon to take the trout, while fishing for the other. These *grubs* are to be kept in bran, in which they will grow tougher than they were at first; but the ash-*grub* is always so tender

tender, that it is difficult to make a good bait of it. The beſt method is to wrap it in a piece of ſtiff hair with the arming, leaving it ſtanding out about a ſtraw's breadth at the head of the hook, ſo as to keep the *grub* from totally ſlipping off when baited; the horſe-hair that the hook is faſtened to ſhould be as white as poſſible, that it may reſemble the colour of the bait, and not be ſuſpected.

GRUB *of the box*, or *box-pucerom*, in *Natural Hiſtory*, a name given to a ſort of inſect approaching to the nature of the *pucerom* of the elder and other trees, but differing from that animal in ſome eſſential characters, and being more properly of the ſame genus with the *fig*-inſect or falſe *pucerom*. Reaumur's Hiſt. Inſ. vol. vi. p. 100. See FIG-*inſect*.

Theſe inſects change their ſkin ſeveral times, in the manner of the *pucerom*, and they change their colour at the ſame time. They are at firſt reddiſh, but they are then extremely ſmall; after this they throw off a ſkin and become yellowiſh; after this they are of a deeper yellow, ſpotted with black; and finally, when at their full growth, they are greeniſh, and have black antennæ. The exuviæ which theſe creatures leave behind them, have often a grain of the excrement remaining fixed to them.

Mr. Reaumur, who took great pains to know the hiſtory of theſe minute animals, found that they finally became flies of a peculiar kind, reſembling thoſe of the fig-inſect; they hopped in the manner of graſshoppers, but only a little way at a time, and he was able to diſcover the parts peculiar to the male and female ſex, in the different individuals, but never could find any eggs or embryo-animals in the latter.

GRUS, *vine*, in the *Hiſtory of Inſects*. See VINE.

GRUB-*axe*, or GRUBBAGE, among *Gardeners*, a tool for grubbing up the roots of trees, weeds, &c.

GRUBBING, the term uſed by our farmers to expreſs the taking up the roots of trees out of the ground. Several occaſions offer for the doing this; as when trees are old and paſt growing to any uſe, the roots muſt be taken up, that young trees may be planted in their place. This is a chargeable operation in moſt places, but in ſome countries the farmers have deviſed a machine, which does a great part of the work in a much ſhorter time than in any other way can be done. It is a hook of iron, of about two feet and a half long, with a large iron ring faſtened to its ſtraight end or handle. The whole inſtrument may be made for about three or four ſhillings, and is to be uſed in this manner: the ground is firſt to be cleared away about the root, and any ſtraggling ſide-roots found running horizontally, are to be cut off: they then faſten the point of the hook to ſome part of the ſtump or root, and putting a long and ſtrong lever through the ring, two men at the end of it go round forcing it every way, till they tear the root out, ſwifling the tap-roots off at ſome diſtance under ground; the digging down to which, in the common way, is one great article of the expence. It is very effectual in ſtubbing up the roots of the underwood; but when large tree-roots are to be taken up by it, it is beſt to cleave them firſt with wedges into ſeveral pieces, then pull them out ſeparately.

GRUBBING *a cock*, a term uſed, by cock-fighters, for the cutting off the feathers under the wings. It is a thing not allowed by cockpit-law, nor to cut off his feathers in any handling place.

GRUBBS, in *Medicine*, a white unctuous kind of pimples, or little tumors, ariſing upon the face, chiefly the alæ of the noſe.

They are uſually owing to hard drinking, and an obſtructed perſpiration; though natural in ſome conſtitutions. They begin with a ſmall black point, which gradually ſpreads; and ſometimes the matter tends to ſuppuration, upon which the heads of the eruptions grow white or yellow. They are uſually reputed ſalutary; whence, to check their growth ſuddenly, has proved of ill conſequence. They are cured by evacuation, and acrimonious lotions.

GRUINA, the *crane-fly*, a name given by ſome authors to the TIPULA, or father-long-legs, from its legs being like thoſe of a crane. See CRANE-*fly*.

GRUME, GRUMUS, in *Medicine*, &c. a little maſs or lump of blood, milk, or other fluid, which is coagulated, thickened, hardened, &c.

Phiſiſical people frequently ſpit up *grumes*, i. e. clots of blood.

Grumes of milk are what we popularly call *curds*.

GRUMOSE *roots*, are thoſe which are compoſed of ſeveral ſmall knobs; ſuch are thoſe of the anemones, and of the little celandine.

GRUMOUS *blood* denotes that ſtate, or conſiſtence, of the blood, wherein it is too viſcid and thick, for a due, briſk circulation; the effects whereof are, that it ſtagnates in the capillary veſſels, and produces divers diſeaſes.

GRUNDEL, or GRUNDLING, in *Ichthyology*, a name uſed by ſome for the common loach, or loche, a ſmall freſh water fiſh, known among writers by the names of *cobitis* and *fonduluat*.

GRUNDLING, in *Ichthyology*, a name given alſo by the Germans to the *gobio fluviatilis*, or common gudgeon.

GRUNDULUS, in *Ichthyology*, a name given by Figulus, and others, to the fiſh called by us the *bull*, or *grundling*. It is a ſpecies of cobitis, called by authors in general *cobitis barbatula*, and *cobitis fluviatilis*. Artedi has diſtinguiſhed it by the name of the ſmooth ſpotted COBITIS, with the cylindric body.

GRUNNIENS *piſcis*, the *grunting fiſh*, the name of a fiſh caught in many parts of the Eaſt Indian ſeas, and called by the Dutch there *knorre-not*. It ſeems of the gurnet or gurnard kind, and nearly related to the guabo-coara of the Braſilians. When it is firſt taken out of the water, it makes a remarkable *grunting* noiſe. It has two fide lines on each ſide, running from the gills to the tail; the one of which is brown, and the other yellow; it is covered with very ſmall ſcales, and is a very fat and fleſhy fiſh; it grows to about ſix or ſeven inches long, and its head is large and ill ſhaped; it is a very well taſted fiſh.

GRUPPO, or *ſhake*, in *Muſic*, was introduced into England by a gentleman who learned it of the famous Schipione del Palla in Italy. It conſiſts in the alternate protation of two tones in juxta-poſition to each other, with a cloſe on the note immediately beneath the lower of them. This is the chief grace both in vocal and inſtrumental performances.

GRUS, in *Antiquity*, a dance performed yearly by the young Athenians, around the temple of Apollo, on the day of the Delia.

The motions and figures of this dance were very intricate, and variouſly interwoven; ſome of them being intended to expreſs the windings of the labyrinth wherein the Minotaur was killed by Theſeus.

GRUS, in *Aſtronomy*, a ſouthern conſtellation not viſible in our latitude. The number of ſtars in this conſtellation, according to Mr. Sharp's Catalogue, is 13; the ſituation longitude, latitude, and magnitude of which, are as follow:

Names and ſituations of the ſtars	Signs	Longit.	Latitude	Magnitudes
		° ′	° ′	
In the head	=	3 35	22 58	5
In the middle of the neck		12 5	26 55	5
In the inſertion of the neck		16 8	22 17	5
		16 11	22 17	5

GRUS. See CRANE, and *Tab.* II. *of Birds*, N° 17.

GRUS *balearica*. See CRANE, and *Tab. of Birds*, N° 7.

GRY, a meaſure containing one tenth of a LINE.

A line is one tenth of a digit, and a digit one tenth of a foot, and a philoſophical foot one third of a pendulum, whoſe diadromes, or vibrations, in the latitude of forty-five degrees, are each equal to one ſecond of time, or one ſixtieth of a minute.

GRYGALLUS, in *Ornithology*. See GROUSE.

GRYLLOTALPA. See *Mole* CRICKET.

GRYLLUS. See CRICKET.

GRYLLUS, in *Ichthyology*, a name given by ſome to the CONGER, or *ſea*-EEL. Ritterhuſius, who has given commentaries on Oppian's Halieutics, has given this word as the tranſlation of the congros of that author, which is the name of the ſame fiſh with the congrus of Ariſtotle, and the other ancient Greeks. Artedi has avoided the occaſion of any ſuch errors for the future, by not allowing it any generical name at all. He makes it a ſpecies of his genus of MURÆNA, and diſtinguiſhes it from all the others by the name of the *muræna* with the rim of the back-fin black.

GRYLLUS *vulgaris*, in *Ichthyology*, a name given by Geſner, Bellonius, and others, to the OPHIDION of the generality of authors; diſtinguiſhed by Artedi by the name of the *ophidion* with four cirri, or beards, at the lower jaw. Pliny has mentioned this under the name of the *piſciculus cornro ſimilis*.

GRYPHITES, in *Natural Hiſtory*, the name of a very common foſſil ſhell, the ſcreen, or living fiſh, to which it belongs, not being known.

The

The *gryphites*, according to Da Costa, is the fossil oyster-shell. Conchol. p. 250.

It is an oblong shell, very narrow at the head, or cardo, and gradually becoming wider to the extremity, where it ends in a circular limb. The head or beak is very excoiled, or much bent inward. It has been called by some the *conchites anomia rugosus*, by others they are called *concha rugosa*, and they are commonly known among us by the name of *cock-stones*. They are very frequent in many parts of the kingdom in our gravel-pits and clay-pits, and we seem to have three or four distinct species of them. Some are extremely rounded and convex on the back; others are less so, and the plates of which they are composed are in some smaller and thinner, in others much larger and thicker, in specimens of the same bigness. Hill's Hist. of Fossils, p. 650. See *Tab.* III. *Fossils*, *n.* 9.

GRYPHIUS *pes*, the *griffon's claw*, a name of a chirurgical instrument described by Ambrose Paré, and used for extending nuites from the uterus.

GRYPHUS, one of the many names used by chemists for the philosophers stone.

GRYPHUS, in *Surgery*, a sort of crooked pincers used by surgeons.

GRYPHUS is also a kind of SNIGMA, or an artful obscure description of a thing.

GRYPOSIS, of γρυπος, *crooked*, in *Medicine*, the name of a distemperature of the toe-nails, in which they bend inwards, and make their way deep into the flesh.

GUABANI, in *Botany*, the name of a delicious fruit in the West Indies, cooling, and of a sweet taste.

GUACAGUACA, in *Ornithology*, the Brasilian name of a bird of the larus, or gull kind, the eggs of which are much valued in America, but the flesh not at all. It is called by the Portuguese there the GAVIOTA.

GUACARI, in *Ichthyology*, the name of an American fish of a roundish, or in some sort a pyramidal figure, and of a foot or more than that in its common length. Its head is flat below, and roundish on the upper part; its mouth is small and round, and is placed in the under part of the head, and is furnished with a sort of beard, of slender, but stiff bodies, resembling short segments of hogs bristles; its back-fin is somewhat prickly, as in the pearch, and its tail is supported by strong nerves, and is very forked; its head is covered with a hard shelly cruft, which feels rough to the touch; and its body with triangular scales, which are larger toward the tail than near the head; and all of them are rough, as if they had been cut and rasped, and have a sort of tubercle in their middle; so that the whole fish seems covered with a coat of armour, and has a quadruple arrangement of tubercles on each side; it is all over of a pale saffron colour, but somewhat deeper on the belly than on any other part, and is all over variegated with brown spots, of the size of mustard-seeds.

There is also another kind of this fish, which differs in colour, being all over of a dusky brown, spotted with small specks of a fine deep black. They are both eaten; but the first kind has very little flesh; the latter has more, and it is also better tasted. Marcgrave's Hist. Brasil.

GUACUCUA, in *Zoology*, the Brasilian name of a kind of water-bat.

GUACUTA, the name of a very remarkable Brasilian fish, called also by some the *vespertilio aquaticus*, or water-bat, and by others the *monstrum piscis*. The anterior part of the body of this fish is like a plough; the head is eight fingers long, and five wide in the broadest part; the hinder part of its body is round, and pointed toward the tail; it is broad and flat, and the head scarce appears beyond the rim of the body; and has between the eyes a single horn, which is very hard, of a conic shape, and near two fingers long; it has a tolerably wide mouth, but no teeth; and it has on each side, in the middle of the body, an arm, red under these, on the belly, has two fins which seem to serve as feet; it has a tough skin, and, no scales; it is brown on the back, and is full of tubercles, and is red on the belly; it, most of all fish, approaches to the *rana piscatrix*. Marcgrave's Hist. Brasil. p. 39.

GUADUM, in *Natural History*, an herb, by the ancient Romans called *glastum* and *vitrum*; by the Greeks *isatis*; by the Britons *guadum*; and by us WOAD.

The ancient Britons, Cæsar informs us, painted their faces with this herb, to appear more terrible to their enemies; and Pliny relates, that the same was practised by the women in divers sacrifices.

GUAIACANA. *See Indian Date* PLUM.

GUAIACUM, *lignum vitæ*, or *pockwood*, in *Botany*, a genus of the *decandria monogynia* class. Its characters are these: the flower has a concave empalement: it hath five oblong, oval, concave petals, and ten erect stamina, which are inserted in the empalement; the germen, which is oval and pointed, afterward becomes a berry, which is roundish, with an oblique point, and deeply furrowed, including one oval hard seed. There are three species.

The common *lignum vitæ*, or *guaiacum*, which is used in medicine, grows naturally in most of the islands of the West Indies, where it becomes a very large tree, having a brownish, hard, brittle bark, not very thick; the wood is solid and ponderous, very resinous, of a blackish yellow in the middle, and of a hot aromatic taste; the smaller branches have an ash-coloured bark, and are garnished with leaves divided by pairs; each pair having two pair of small oval blunt pinnæ, of a stiff consistence, and a lucid green; the flowers are produced in clusters at the ends of the branches, composed of five oval concave petals, of a fine blue colour; in the centre of these is fixed a style with an oval germen, crowned by a slender stigma; and round this is planted a great number of stamina, which are as long as the style, terminated by sickle-shaped summits. Dr. Linnæus supposes the flowers to have but ten stamina, whereas they certainly have twenty, so it should be ranged in his twelfth class of plants; nor is it the empalement, but the germen which becomes the fruit. The bark and wood of this tree are much of the same nature, only the wood is accounted better: they are used in diet drinks, to purify and cleanse the blood, and to cause sweating; they are esteemed good for the gout and dropsy, the king's evil, and particularly for the French pox. The gum or resin, which exudes from incisions made in the trunk, is black, shining, and brittle, and when powdered, of a greenish white colour, of an aromatic smell, and poignant taste; is somewhat cathartic, and a good purge in rheumatic cases, to the quantity of two scruples mixed with the yolk of an egg, and given in a convenient vehicle.

The wood of this tree is so hard as to break the tools in felling them, so that it is seldom cut down for fire wood, being difficult to burn; but it is of great use to the sugar planters for making wheels and cogs for sugar mills. It is also frequently brought to Europe, and wrought into bowls and other utensils. Miller.

But its principal use is in medicine; being found to warm, dry, rarefy, attenuate, attract, and promote sweats and urine. Where the excretory glands are obstructed, the vessels lax and flaccid, and the habit replete with impure serous humours; in various cutaneous and catarrhous disorders, some female weaknesses, and chronical rheumatisms, it frequently has good effects; but in thin emaciated habits, and an acrimonious state of the fluids, it frequently does harm. The usual way of applying it is in decoction; and a decoction of half an ounce of the wood or bark may be taken in a day at proper intervals, the patient keeping warm, to promote a diaphoresis.

Decoctions of this wood taken internally, as also applied in fomentations externally, have been found of service in cancerous disorders. See Med. Ess. Edinb. vol. v. art. 9.

It is a very remarkable quality of *guaiac*, that the salt it yields has very little of the alkaline quality of other salts of that kind.

The best is that in large pieces, of a dusky colour, fresh, gummy, heavy, of an agreable smell, and a brisk pungent taste; the bark sticking close to the wood.

The bark of *guaiac* is held of nearly as much virtue as the wood itself; the rind is of no efficacy; so that, to make a sudorific decoction, or ptisan, of the wood, they first pare off all the white part, which, in reality, is the rind, and only chip or rasp off the hard, solid part, which is black, heavy, and resinous. The surgeons frequently substitute box-wood instead of *guaiac*, and, it is said, with equal success.

The resin drawn from *guaiac* is held much more effectual in venereal cases than either the wood, or bark. It is brought us in large pieces, not unlike common resin, but very different in respect of smell; the former, when cast on the coals, yielding a very agreeable balsamic fume.

The resin, which is the only active part, is obtained pure from the gummy substance, and from the woody and other indissoluble impurities, by digesting the compound, in rectified spirit, drawing off the spirit from the filtered solution, till the matter begins to grow thick, and then adding a quantity of water, which will precipitate the pure resin, and keep dissolved such of the gummy parts as the spirit may have taken up. A quantity of the gum will yield about three-fourths of its weight of resin. The resinous matter of the wood is totally extracted by digestion in rectified spirit, and partially by boiling in water. During the inspissation of the watery decoction, the resinous part is apt to separate and subside, unless a little spirit be added towards the end of the process, to keep it united with the gummy. This extract is kept in the shops in a soft and hard form; the first of a proper consistence for making into pills, the latter for being reduced into powder. The quantity of solid extract obtained by rectified spirit, amounts to about one fourth of

the weight of the wood; with water scarce one sixth is obtained. The extract is recommended by Hoffman as an excellent EMBRISE. The gum, or extracts made from the wood, are given from a few grains to a scruple, or half a dram; and sometimes two scruples, which last dose commonly proves in a considerable degree purgative. Solutions and tinctures of the gum *guaiacum* are made in the shops, both with rectified spirit of wine and sal volatile. The *guaiacum volatile* of the London pharmacopœia is made by adding to six ounces of the gum two pints and a quarter of sal volatile spirit; and for a more saturated solution, one pint and a half of rectified spirit of wine, with the solution of a dram and a half of balsam of Peru; and the *essentia guaiacina volatilis* or volatile tincture of the Edinburgh college, by diffolving four ounces of the *guaiacum*, with two drams of balsam of Peru, and half a dram of essential oil of *sassafras*, in a pound and a half of dulcified spirit of sal ammoniac; and the spirituous solution, by diffolving one pound of the gum and three drams of balsam of Peru in two pounds and a half of rectified spirit. These may be given from twenty drops to a tea-spoonful or more in any convenient vehicle. The gum, or refinous extracts, may also be diffolved by means of thick mucilages in watery liquors; and it is obferved, that the mucilaginous solution, which is at firft greyifh or brownifh, changes in a few hours to a fine blue or bluifh green colour. Lewis.

The *guaiac* wood is diftilled by putting thin fhavings of it into a ftone-ware retort, to which is to be fitted a large glafs receiver, with a fmall hole pierced in its fide; and the diftillation is to be promoted by a gradual fire. A liquor, like water, is obtained firft, and then an acid, reddifh, empyreumatic liquor, with a little reddifh oil. In this procefs a confiderable quantity of air is difcharged; which proves that this element is combined in certain bodies, and particularly in this. Dict. Chem. art. GOYAC.

GUAIAVA, *Pfidium, bay plum*, in *Botany*, a genus of the *icofandria monogynia* claſs. Its characters are theſe: the flower has a bell-fhaped empalement, divided into five oval points at the top; it hath five oval, concave, fpreading petals, inferted in the empalement, with a great number of ftamina, which are fhorter than the petals, and are inferted in the empalement, terminated by fmall fummits; it has a roundifh germen fituated under the flower, fupporting a long awl-fhaped ftyle, crowned by a fimple ftigma; the germen becomes a large oval fruit, crowned by the empalement, including a great number of fmall feeds. There are two fpecies, which grow naturally in the Eaſt and Weſt Indies. The common red *guaiava* hath a thick trunk, which rifes twenty feet high. After the flower is paſt, the germen becomes a large oval fruit, fhaped like a pomgranate, having one cell crowned by the empalement of the flower, and filled with fmall feeds; the fruit, when ripe, has an agreeable odour. They are much eaten in the Weſt Indies, both by men and beaſts; and the feed, which paſſes whole through the body, grows in great plenty every where. This fruit is very aſtringent, and nearly of the ſame quality with the pomgranate; ſo ſhould be avoided by thoſe perſons who are ſubject to be coſtive.

Theſe plants are propagated by feed, which when brought over in the fruit, gathered full ripe, will more certainly ſucceed: theſe ſhould be ſown in pots filled with kitchen-garden earth, and plunged into a hot-beſt of tanner's bark. In about ſix weeks, if the ſeed be good, the plants will appear, when they muſt have freſh air admitted to them, in proportion to the warmth of the ſeaſon. When the plants are ſtrong enough to remove, they ſhould be each planted in a ſmall pot, and plunged into a freſh hot-bed, ſhading them from the ſun, until they have taken new root. In the ſummer they will require plenty of water, and in hot weather a great ſhare of air. With this management the plants will produce flowers and fruit the third year, and may be continued a long time. Miller.

GUAIBI *coara*, in *Ichthyology*, the name of an American fiſh, called by the Portugueſe *burace de veiba*. It is flat-bodied, with a riſing back, and is uſually caught between fire and eight inches long, and of about a third part of its length in breadth. It is caught among the rocks and about the ſhores, and is eaten in conſiderable plenty in the Braſils, both by the natives and Portugueſe. Marcgrave's Hiſt. Braſil.

GUAMMINIBIQUE, in *Ornithology*, a name by which many authors have called the humming-bird, or GUAINUMBI.

GUAINUMBI, in *Ornithology*. See HUMMING-*bird*.

GUALACLING, in *Ornithology*, the name given by the people of the Philippine iſlands to a ſpecies of *bird* of the ſtarling kind. It is of the bigneſs of the turtle; it feeds on fruits, and is a very briſk and lively bird. It appears to be of a plain black colour, except when viewed in the ſun, and then is ſeen to be of a vaſt variety of bright colours.

GUAMAJACU *apa*, in *Ichthyology*, a name by which Marcgrave, and ſome others, have called the *piſcis* TRIANGULARIS.

GUAMAJACU *atinga*, in *Ichthyology*, the name of a fiſh of the orbis or globe-fiſh kind; which is thorny, and has the mouth of the ordinary frog-mouthed ſpecies. It is uſually about ſeven fingers breadth long, and in the place of teeth has a hard bone above and below in its mouth. The holes for its gills are large enough to admit one's finger, and near theſe there are two ſquare, broad, and ſhort fins; its head is covered with a hard bony ſhell, and all its body with prickles, except on the belly, where it is ſoft as the belly of a frog; the prickles are ſo many ſmall pointed bones. It can, at pleaſure, inflate its whole body into the reſemblance of a bladder; it is not eatable, but eſteemed poiſonous. Piſo, Hiſt. Nat. lib. v. cap. 16. See *Tab. Fiſh*, N° 2.

GUAMAJACU *guara*, in *Zoology*, a name by which ſome call that ſpecies of the *hyſtrix*, or ſea-porcupine, called by Marcgrave DIARE.

GUANA, in *Zoology*, a ſpecies of LIZARD.

GUANABANUS, a name by which Plumier, and other authors, have called ſeveral ſpecies of the annona. See ANNONA.

GUAPERVA, in *Ichthyology*, the name of an American fiſh, of the toad-fiſh, or rana-piſcatrix kind, but different from that in many things, and remarkably ſmall. It is ſeldom found of more than four fingers breadth long, and its more uſual ſize is but two fingers; it has no gills; its mouth is large, projected like that of a dog, and furniſhed with extremely ſmall teeth; it has a bone, ſupplying the place of a tongue; its eyes are extremely ſmall, and of a fine pale blue, like that of the turquoiſe; between its eyes, or in the middle of its upper lip, it has a little horn, ſtanding upright, but bending a little backward, and before that horn is a ſlender filament, half a finger long, turned backward, and with a little button at its end; it has one large fin upon its back, and two ſmaller on its belly or breaſt, and in the middle of its body, but rather nearer the head; it has on each ſide an arm, which toward the extremity degenerates into a fin, and is prickly at the end; it has no ſcales, but a tough ſkin, rough on the back, and ſmooth on the belly; it is of a reddiſh-brown colour, and ſpotted all over with large black ſpots. Marcgrave's Hiſtory of Braſil, p. 131.

GUARA, in *Ornithology*, the name of a Braſilian bird, called by Cluſius *vumming Indivus*, or the *Indian curlew*. It is a large bird, of the ſize of the plaice, or ſpoonbill, and lives about waters; its beak is long, and of a whitiſh grey, figured like a Poliſh ſword; the tail is ſhort, and is hid by the wings when they are cloſed; it is all over of a fine gay red, only that the long wing-feathers are tipped with black at their extremities, and there is ſomething very remarkable in its growth, for it is black when firſt hatched from the egg, from this it becomes greyiſh, and from this at length changes to its fine red.

GUARACAPEMA, in *Ichthyology*, a name uſed by ſome for the fiſh more uſually called the DORADO, or *auratus piſcis*.

GUARANTEE, or WARRANTEE, in *Law*, a term relative to *warrant*, or *warranter*; properly ſignifying him whom the warranter undertakes to indemnify or ſecure from damage.

GUARANTER is more frequently uſed for a warranter, or a perſon who undertakes and obliges himſelf to ſee a ſecond perſon perform what he has ſtipulated to the third. See WARRANTY.

GUARANTY, in *Politics*, an engagement of mediatorial or neutral ſtates, whereby they pledge their faith, that the articles of a particular treaty ſhall be inviolably obſerved on both ſides.

This engagement implies, that the guarantees are obliged to aſſiſt the party invaded contrary to the treaty, againſt the injurious aggreſſor; but not if the war is occaſioned by any other cauſes than the violation of the articles of peace. Puffendorf, Law of Nature and Nations, book viii. ch. 8. § 7.

The ancient lords were obliged to *guaranty* the lands of their vaſſals, i. e. to defend them againſt their enemies; otherwiſe they loſt their FEE, and their vaſſals were no longer bound to do them homage and ſervice. Kings alone did not forfeit their fiefs by not *guaranteeing* them; and yet we read, that Borel, count of Barcelona, threatened the king of France, Hugh Capet, to ſwear fealty to the Sarracens, in caſe he did not *guaranty* him; and under Lewis the Young, the count of Champagne did homage to the emperor, on the like account.

To *guaranty a fee*, had likewiſe another meaning; being uſed to denote that where a fee was divided between the eldeſt ſon and the younger, the eldeſt did homage to the lord, both for himſelf and all the reſt; and by that homage *guarantied* the whole.

GUARA-TEREBA, in *Ichthyology*, the name of an American fish of the *Scomber* kind, approaching to the nature of the trachurus, and which Mr. Ray thinks may properly be called the *trachurus Brasiliensis*, or the *Brasilian scad*. It is usually of about four or five inches in length; its head is obtuse, and its mouth furnished with very small teeth, the side-lines towards the tail are armed with prickly hooks, all pointed backwards; the tail is divided into two horns. It is eaten in Brasil, and other American countries.

GUARAUNA, in *Ornithology*, the name of a small Brasilian bird common in watery places, and of the size of our snipe. Its bill is straight, but a little hooked at the end, and is between four and five fingers breadth long; its body is about the same length, and its legs six fingers long; it is all over of a dusky brown, with an admixture of a cast of greenish: it is a well-tasted bird.

GUARD, or GARD, in its general sense, implies defence, custody, or conservation, of any thing; the act of observing what paths, to prevent surprise; or the care and precaution taken to hinder any thing's being done contrary to the intention and desire of another.

The word is formed of the French *garde*, and that of the corrupt Latin *warda*, and that of the German *wahren*, *to keep*, *to defend*.

GUARD is also used in a figurative sense, for the act or service of guarding, and the persons appointed for that purpose.

Thus we say, to be upon *guard*, to set the *guard*, mount the *guard*, to dismount the *guard*, to relieve the *guard*, to change the *guard*, the officer or serjeant of the *guard*; also, a strong *guard*, an attempt on the *guard*, &c.

So, again, those to whom the king commits the safety of his person, are called his *guards*, *life-guard*, *body-guard*.

And so those who have had the education and guardianship of infants, or idiots, are called their *guards* or *wards*.

GUARD, or GARD, is also applied to a writ relating to the office of WARD; wherein there are three kinds: one called *droit de garde*; the second, *ejectment de garde*; the third, *ravishment de garde*. See GUARDIAN.

GUARD, in the *Military Sense*, is properly the duty or service done by the soldiers, to secure the army, or place, from the attempts and surprizes of an enemy. In garrison the *guards* are relieved every day; so that every soldier mounts *guard* once every three or four days in times of peace, and much oftener in time of war. Of this there are divers kinds; as,

GUARD, *advanced*, a party of horse or foot, which marches before a corps, to give notice of approaching danger. See ADVANCE *guard*.

GUARD, *artillery*. See ARTILLERY *guard*.

GUARD, *artillery quarter*, is frequently a non-commissioned officer's *guard* from the royal regiment of artillery, whose *corps de garde* is always in the front of their encampment.

GUARD, *artillery rear*, consists of a corporal and six men, posted in the rear of the PARK.

GUARD, *baggage*, is always an officer's *guard*, who has the care of the baggage on a march.

GUARD-*boat*, in *Sea Language*, a boat appointed to row the rounds among the ships of war which are laid up in any harbour, &c. to observe that their officers keep a good look-out, calling to the *guard-boat* as the passes, and not suffering her crew to come aboard, without having previously communicated the watch-word of the night.

GUARDS, *camp*, are of two sorts; the one serves to maintain good order within the CAMP, and the other, which are stationed without the camp, serves to cover and secure it against the enemy. They are formed both of infantry and cavalry; and should consist, as the occasion requires, of the eighth part, or third part, or even of half the army, when an attack is apprehended. The cavalry *guards* are removed farther from the main army than the infantry; but not so far as to endanger their being cut off. These *guards* have generally a day post and a night post; the latter of which is seldom more than four or five hundred paces from the camp: the *guards* of infantry are generally fixed, except those that are to support and protect the cavalry *guards*, and to cover the forage grounds.

Corps de GARDE, or GUARD. See CORPS.

GUARD, *counter*, in *Fortification*. See COUNTER-*guard*.

GUARD, *forrage*. See FORRAGE.

GUARD, *grand*, consists of three or four squadrons of horse commanded by a field officer, and posted before the camp on the right and left wing towards the enemy, for the security of the camp.

GUARD *irons*, in a *Ship*, are certain curved or arched bars of iron placed over the ornamental figures on a ship's head or quarter, to defend them from the impression of some other ship, when they lie close to or rub against each other.

GUARD, *main*, is that from whence all the other *guards* are detached. Those who are to mount the main *guard*, meet at the respective captains quarters, and from thence they go to the parade; where, after the whole *guard* is drawn up, the small *guards* are detached for the posts and magazines; and then the subaltern officers draw lots for their *guards*, who are all commanded by the captain of the main *guard*.

GUARD, *picquet*, is a number of horse and foot, who keep themselves always in readiness in case of an alarm; the horses being generally saddled, and the riders booted. The foot draw up at the head of the battalion at the beating of the tattoo, but afterwards return to their tents, where they remain in readiness to march on any sudden alarm.

This *guard* is to make resistance, in case of an attack, till the army can get ready.

GUARD, *prowling*, is always an officer's *guard* that attends the provost in his rounds, to prevent desertion, marauding, rioting, &c.

GUARD, *quarter*, is a small *guard* commanded by a subaltern officer, posted in the front of each battalion, about two hundred and twenty-two feet before the front of the regiment.

GUARD, *rear*, is that part of the army which brings up the rear on a march: the rear *guard* of a party is frequently eight or ten horse, about five hundred paces behind the party. Hence the advance *guard* going out on a party, forms the rear *guard* in their retreat.

Rear Guard is also a corporal's *guard* placed in the rear of a regiment, to keep good order in that part of the camp. *Reserve Guards*. See RESERVE.

GUARD, *safe*. See SAFE-*guard*.

GUARD-*ship*. See *Guard*-SHIP.

GUARD, *standard*, is a small *guard* under a corporal, out of each regiment of horse, who mount on foot in the front of each regiment.

GUARD, *trench*, consists of three, four, or six battalions, according to the occasion, which mount in the time of a siege, in order to oppose the besieged when they sally out, protect the workmen, &c.

GUARD, *van*, is the same with the front of an army. See ADVANCE *guard*, and *advanced* GUARD, above.

GUARD is more particularly understood of a soldier, as a musqueteer, archer, or the like, detached from a company, or corps, to protect, detain, or secure, any person, or to survey his actions.

GUARDS is also understood of the troops, or companies, kept to guard the king; called also *royal guards*, *life guards*, *gardes du corps*, &c.

There are also usually bodies of *guards* to wait on the princes of the blood, in the same capacity.

The *guards* are distinguished into *horse*, *foot*, *grenadiers*, and *yeomen*.

GUARDS, *the English horse*, are divided into troops, called first, &c. troop of *horse-guards*. See HORSE.

GUARDS, *the foot*, are distinguished by regiments: of which there are three, called the first, &c. regiment of foot *guards*. They were raised in the year 1660: the first regiment is commanded by one colonel, one lieutenant-colonel, three majors, twenty-three captains, one captain-lieutenant, thirty-one lieutenants, and twenty-four ensigns; and contains three battalions. The second regiment has one colonel, one lieutenant-colonel, two majors, fourteen captains, one captain-lieutenant, eighteen lieutenants, and fifteen ensigns, and contains two battalions. The third regiment is the same as the second *Guards*, no doubt, are as ancient as monarchy: the remotest antiquity affords instances thereof.

The Roman emperors had for their *guard* the prætorian cohorts, established by Augustus, as Dion and Suetonius relate: those of the emperors of Constantinople were called *bucellarii*.

Captain, colonel, brigadier, exempt of the *guards*, &c. See CAPTAIN, COLONEL, BRIGADIER, YEOMAN, &c.

The French *guards* are divided into those *within*, and those *without* the palace: the first consists of the *gardes du corps*, or *body guards*, part whereof are *gardes de la manche*, q. d. *of the sleeve*, of the hundred Swisses, and the *guards* of the gate.

The *guards without* are the GENT *d'armes*, light horse, musqueteers, and two regiments of *guards*, the one French, the other Swiss.

The *gardes du corps*, or *life-guard*, consists of four companies of horse: the first was anciently Scotch, and still retains the name, though it now consists wholly of Frenchmen; and not only the name, but they also retain the ancient phrase, or formula, of answering, when called upon, *I am here*.

The *Scotch guard* was first established in France by Charles VII. who chose himself a *guard* out of such Scots as were sent by the early of Buchan, Douglas, and other Scotch lords, to drive out the English.

GUARD,

GUARDS, *prætorian*. See PRÆTORIAN.

GUARDS, *white*. See SCHOLARES.

GUARD, in *Fencing*, an action or posture, proper to defend or screen the body from the efforts or attacks of an enemy's sword.

There are four general *guards* of the sword; to conceive which, it will be necessary to imagine a circle drawn on an upright wall, and divided into four cardinal points; viz. top, bottom, right, and left.

Now when the point of the sword is directed to the bottom point of the circle, and, consequently, the head of the sword tilted up to the top point, with the body inclining forwards, this is called *prime*, or the *first guard*.

The *second guard*, which some improperly call the *third*, is when the point of the sword is directed to the *right* or second part of the same circle, a quadrant distant from the first, with the foot of the sword turned to the right, and the body raised proportionably. *Tierce*, or the *third guard*, is performed by directing the sword's point to the uppermost point of the same circle diametrically opposite to that of prime; in which case the body, arm, and sword, are in their natural disposition, being the mean between the extremes of their motion. *Quart*, or the *fourth guard*, is when the point of the sword is directed to the fourth point of the circle, descending to the right as far as one fourth of tierce, with the external side of the arm and the flat of the sword turned towards the ground; and the body out of the line to the right, and the foot of the sword towards the line to the left. There is also a *quint*, or a kind of *fifth guard*, being the return of the point of the sword on the right, after traverling the circle, to the point of the prime whence it had departed; and yet with a different disposition of the body, arm, and sword.

These *guards* are also called, by the masters, *figures* and *postures*; and the common centre of all their motions is to be in the shoulder.

In all these kinds of *guards*, there are high *advanced*, high *retired*, and high *intermediate guards*, when disposed before the upper part of the body, either with the arm quite extended, quite withdrawn, or in a mean state. *Mean advanced guard*, or, simply, *mean guard*, is when the sword is disposed before the middle part of the body. *Low advanced, retired, or intermediate guards*, are those where the arm and sword are advanced, withdrawn, or between the two extremes, before the lower part of the body.

Some will have prime the principal *guard*; others, quint; others, with better reason, tierce; because it consists of right lines, which are more easily defended than oblique ones, such as those of prime, second, quart, and quint.

GUARDS, in *Astronomy*, is a name sometimes applied to the two stars nearest the pole; being in the hind-part of the chariot, at the tail of the Little Bear.

Their longitude, latitude, &c. see among those of the other stars in the constellation URSA *minor*. One of them is the pole star.

GUARDANT, or GARDANT, in *Heraldry*, a term applied to a beast when born in a coat of arms full faced, or with his face turned towards the spectator, and thus appearing in a posture of guard or defence.

Heralds say, a lion is never so represented; but a leopard always.

GUARDIAN, or GARDIAN, is he to whom the charge, or custody, of any person, or thing, is committed.

The notion of *guardian* ANGELS is very ancient in the East.

In the convents of Franciscans, the officer is called *guardian*, who in the others is called *superior*.

In the order of the Garter, the officer, who in other military orders is called *grand-master*, is called the *sovereign guardian* of the order.

GUARDIAN, GARDEIN, in *Law*, is a person intrusted with the education, tuition, &c. of such as are not of sufficient discretion to guide themselves, and their own affairs; as children and idiots.

The word *guardian*, with us, includes the offices both of the tutor and curator of the civilians: the tutor, for instance, had the government of a youth till he arrived at fourteen years of age; and the curator had the disposition and ordering of his effects thenceforward till twenty-five years of age; or the charge of a lunatic, during his lunacy: all which purposes our *guardian* alone answers; though with regard to lunatics and idiots, these officers are commonly kept distinct.

There are several sorts of *guardians*. The first are *guardians* by nature, viz. the father, and, in some cases, the mother of the child: for if an estate be left to an infant, the father is, by common law, the *guardian*, and must account to his child for the profits; and, with regard to daughters, it seems by construction of 4 and 5 Ph. & Mar. cap. 8. that the father might by deed or will assign a *guardian* to any woman-child, under the age of fifteen; and if none be assigned, the mother shall in this case be *guardian*. The second sort are *guardians* for nurture, which are, of course, the father and mother, till the infant attains the age of fourteen years; and in default of father and mother, the ordinary usually assigns some discreet person to take care of the infant's personal estate, and to provide for his maintenance and education. There are also *guardians* in socage, who are also called *guardians* by the common law: these take place only when the minor is entitled to some estate in lands, and then, by the common law, the *guardianship* devolves upon the next of kin, to whom the inheritance cannot possibly descend. These *guardians* continue only till the minor is fourteen years of age.

But the ancient law relating to *guardians* is much altered by stat. 12 Car. II. cap. 24. which ordains, that "where "any person has a child under the age of twenty-one "years, and unmarried at the time of his death, it shall "be lawful for the father of the child, whether born at "the time of his decease, or yet in ventre sa mere, "either by deed, or will, to dispose of the custody and "tuition of such child while under age, or for any lesser "time, to any person, popish recusants excepted; which "disposition shall be good against all persons claiming "such child as *guardian* in socage, or otherwise." These are called *guardians* by statute, or testamentary *guardians*. "And in case the father appoint no *guardian*, the ordi- "nary may appoint one to look to his goods and chattels "till the age of fourteen; at which time the child may "choose a *guardian* himself; and for his lands, the next "of kin on that side by which the lands descend may "be *guardian*, as heretofore in case of a tenure in so- "cage."

The *guardian*, when his WARD comes of age, is bound to give him an account of all which he has transacted on his behalf, and must answer for all losses incurred by his wilful default or negligence. To prevent contests, the *guardians* of large estates apply to and act under the direction of the court of chancery, accounting annually before the officers of that court: for the lord chancellor, by right derived from the crown, is the general and supreme *guardian* of all infants, as well as idiots and lunatics. The court of chancery may, and sometimes does, remove a *guardian* who abuses his trust, and appoint another in his room.

GUARDIAN, in *Chivalry*, was an office which formerly belonged to the feodal lord, in virtue of his wardship of an heir-male, under the age of twenty-one, and of a female under fourteen. This wardship consisted in having the custody of the body and lands of such heir, without any account of the profits, till the age of twenty-one in males, and fifteen in females. These profits were claimed in lieu of knight-service, which the male was supposed capable of rendering at twenty-one, and the female by her husband at fourteen. However, if the female was under fourteen, when the lord's wardship commenced, he might keep her under ward till fifteen, by stat. West. 1. 3 Edw. I. cap. 22. This wardship was taken from the lord by the charter of Henry I. and transferred to the widow or next of kin. But this noble immunity did not continue long. When the male-heir arrived at the age of twenty-one, and the heir-female to that of fifteen, they might sue out their livery or *ousterlemain*, i. e. the delivery of their lands out of their *guardian's* hands; but for this they were obliged to pay a fine, viz. half a year's profits of the land.

These *guardians* had also another kind of power over their infant wards, which was that of disposing of them in matrimony; and if the infants refused a suitable match, they forfeited the value of the marriage to their *guardians*; but if they married without his consent, they forfeited double the value. This right of selling the ward in marriage was expressly delared by the statute of Merton, 20 Hen. III. cap. 6. Those grievances, and others of a similar nature, were first abolished by the lords and commons in parliament, in 1645; and this ordinance was confirmed by the Protector and his parliament in 1656; and they were finally abolished by the statute 12 Car. II. cap. 24. and by 20 Geo. II. cap. 43. and cap. 50. The same are also abolished in Scotland. See KNIGHT'S *service*.

GUARDIAN *in socage*. See GUARDIAN above, and SOCAGE.

GUARDIAN *of the spiritualities* is the person to whom the spiritual jurisdiction of a diocese is committed, during the time of the vacancy of the see.

This *guardian* may be either such in law, i. e. *jure magistratus*, as the archbishop is of any diocese within his province; or by delegation, as he whom the archbishop, or vicar-general, does for the time depute.

The dean and chapter of Canterbury are *guardians* both for

for the diocese, and the whole province, during a vacancy of the archbishoprick.

GUARDIAN *of the church*. See CHURCH-*wardens*.

GUARDIAN, *or warden*, of the Cinque-ports, is an officer who has the jurisdiction of the Cinque-ports, with all the power that the admiral of England has in other places. Camden relates, that the Romans, after they had settled themselves and their empire in our island, appointed a magistrate, or governor, over the east parts, where the Cinque-ports lie, with the title of *comes littoris Saxonici per Britannicum*; having another, who bore the like title, on the opposite side of the sea. Their business was to strengthen the sea-coast with munition, against the outrages and robberies of the Barbarians. And that antiquary takes our warden of the CINQUE-PORTS to have been erected in imitation thereof. Britannia, p. 228.

GUARDIAN *of the peace*. See CONSERVATOR *of the peace*.

GUARIBA, in *Zoology*, the name of a species of monkey found in the West Indies. It is of the size of a fox; its face is raised high, its eyes are black and shining, and its ears small and round; its tail is very long, naked toward the end, and extremely moveable; the creature frequently twisting it round things to fasten itself by it; it is covered all over with fine black shining hairs, except on the legs and part of the tail, where they are brown; the hairs are so nicely disposed all over the body, that the creature appears perfectly smooth; and they are much longer under the chin and throat, so that they form a sort of beard there. Ray's Syn. Quad. p. 152.

This species is found in prodigious numbers together in the woods, especially of Brasil and Guiana, and makes a very loud and delightful noise; and it is very common for one only to make a noise, and all the rest to form a most allembly round him. Marcgrave relates a very singular thing of this creature, in this respect, which he says he has frequently been an eye-witness to. They meet in great numbers before and after mid-day, when they form a large circle; and one placing himself above the rest, begins to make a loud noise; when he has sung thus by himself for some time, the rest all remaining in perfect silence, he lifts up his hand, and they instantly all join in a sort of chorus; this intolerable yell they keep up incessantly, till the same monkey, who gave the signal for their beginning, lift up his hand a second time, on which they all cease, and become silent again in a moment. He then exalts his pipe alone again, and so finishes the business of the assembly.

These creatures carry their young upon their backs, and skip very nimbly with them from tree to tree, the young ones clasping fast round their body with their arms. They are very fierce animals, and can never be tamed. There is a species of this kind also much larger than these, which have a very long, black, hairy beard. These, as Marcgrave allures, on his positive knowledge, will often attack the negro women as they go through the woods, and fight with them by force.

GUARUGUAKU, in *Ichthyology*, the name of a small American fresh-water fish, seldom exceeding an inch and half in length, and of a very slender body. It is eaten, though very small, being very well tasted. It is caught in abundance in lakes and ponds.

GUASSEM, a word used by Avicenna, and some other authors, to express certain black scorbutic spots and blotches appearing on the skin.

GUATUCUPA, in *Ichthyology*, the name of a sea-fish caught about the Brasilian shores. It grows to about two feet long; its back is a little elevated, its mouth small, and belet with sharp teeth; it has only one long fin upon the back, the rays of which are rigid and prickly. It is caught among the rocks, and is an extremely well tasted fish.

GUATUCUSA, in *Ichthyology*, the name of an American fish, approaching to the nature of the *corvinus* of the Mediterranean, and called by some *corvinus*. It is of an oblong shape; its back is a little prominent, but its belly perfectly flat and even; its usual length is from twelve to twenty inches. It is caught on the Brasilian shores, and is a very delicate fish.

GUAVA, in *Botany*. See GUAIAVA.

GUAZAMA, in *Botany*, the name of an American tree, described by Plumier as of the nature of the cacao. They are both species of the theobroma of Linnæus; but the guazama is peculiar in the structure of its fruit, which is of a somewhat globular figure, full of tubercles and protuberations on the surface, and yet divided into five loculaments for seeds within.

GUDGEON, in *Ichthyology*, the English name of the fish called by authors the *gobio*, and *gobius fluviatilis*. According to the new Artedian system, the word *gobius* is made the name of another genus of fishes, and the *gudgeon* is reduced to the genus of the CYPRINI. See FUNDULUS.

There are two species of the *gudgeon*. The first is our common river *gudgeon*, the *cyprinus gobio* of Linnæus, with eleven rays in the anal fin, and two cirrhi, known by its thick and rounded body, the smallness of its scales, its brown colour, with the variegations of its black spots, and its forked tail. The second is the lesser river *gudgeon*, differing from the former not only in size but in being of a more tapering figure, with very small toward the tail, and having [illegible] and less spotted. The first is common [illegible] (the *Gudgeon* FISHING); the [illegible] Germany, where it is commonly call[illegible]

GUDGEON, *jun.* S[illegible]

GUDGEONS, in a *ship*, [illegible] for the eyes driven into the stern-post, into which the pintles of the rudder go, to hang it on.

GUEBUCU, in *Ichthyology*, the name by which some have called the fish more usually known by the name of the BICUDA, a kind of sword-fish.

GUELPHS, or GUELFS, a celebrated faction in Italy, antagonists of the Gibelins.

The *Guelphs* and Gibelins filled Italy with blood and carnage for many years. The *Guelphs* stood for the pope, against the emperor. Their rise is referred, by some, to the time of Conrad III. in the twelfth century; by others, to that of Frederic I. and by others, to that of his successor, Frederic II. in the thirteenth century.

The name *Guelph* is commonly said to have been formed from *Welfe*, *Welfo*, on the following occasion: the emperor Conrad III. having taken the duchy of Bavaria from Welfe VI. brother to Henry duke of Bavaria; Welfe, assisted by the forces of Roger king of Sicily, made war on Conrad, and thus gave birth to the faction of the *Guelphs*.

Others derive the name *Guelphs* from the German *Welff*, on account of the grievous evils committed by that cruel faction. Others deduce the denomination from that of a German called *Goelfe*, who lived at Pistoye; adding, that his brother, named *Gebel*, gave his name to the GIBELINS; under which head the reader will find more ample account of the origin and history of those celebrated factions.

GUERITE, in *Fortification*, a centry-box; being a small tower of wood, or flame, placed usually on the point of a bastion, or on the angles of the shoulder, to hold a centinel, who is to take care of the ditch, and watch against a surprize.

GUERKIN, or GHERKIN, a kind of cucumbers for pickling.

GUERNSEY *fish*. See AMARELLUS.

GUESDA, in *History*, is properly the name of wood; but it is also used by some for the *luteum*, or *lutea herba* of the Romans, and *cynara* of the Greeks. This is an error in too many of the old authors, though so palpable that one would have thought no body could have run into it; the *luteum*, or *cynara*, having been always used to dye yellow, and the *glastum*, or *guesda*, to dye blue; and the characters of the *luteum*, or *cynara*, plainly shewing it to be our *genistella tinctoria*, or dyers-weed, but not at all agreeing with the *glastum*, or woad.

GUEST-*rope*, or *keep-hawser*, is that rope by which the boat is kept from *fleeting*, or going too much in and out, as the lies in the tow of a ship.

GUEST-TAKERS, or GIST-TAKERS. See AGISTOR.

GUET. See WATCH.

GUETTARDA, in *Botany*, a genus of the *monoecia heptandria* class, bearing male and female flowers in a cylindric cup; the corolla of each is divided into five segments, and that of the male funnel-shaped; the female has a single pistil, and the fruit is a dry drupe.

GUEULE, in *Architecture*. See GULA.

GUFFER, in *Ichthyology*. See EELPOUT.

GUIANA-*bark*, in the *Materia Medica*, the same with what is otherwise called SIMA-*ruuba*.

GUIDA, in the *Italian Music*, the guide, or leading voice, or instrument, in fugues. The parts that are to imitate and follow, are said to be *in conseguenza*. See FUGUE.

GUIDAGE, GUIDAGIUM, in ancient *Law-Writers*, money paid for safe-conduct through unknown ways, or a strange country.

GUIDIS, in *Military Language*, are usually the country people in the neighbourhood of an encampment; who give the army intelligence concerning the country, the roads by which they are to march, and the probable route of the enemy.

GUIDON, a sort of flag, or standard, borne by the king's life-guard; being broad at one extreme, and almost pointed at the other, and slit, or divided, into two.

The *guidon* is the enfign, or flag, of a troop of horse-guards. See GUARD.

GUIDON also denotes the officer who bears the *guidon*. The *guidon* is that in the horse-guards, which the enfign

is in the foot. The *guidon* of a troop of horſe takes place next below the cornet.

GUIDONS, GUIDONES, or *ſcholæ guidonum*, was a company of prieſts eſtabliſhed by Charlemagne, at Rome, to conduct and guide pilgrims to Jeruſalem, to viſit the holy places: they were alſo to aſſiſt them in caſe they fell ſick, and to perform the laſt offices to them in caſe they died.

GUIDONIA, in *Botany*, the name given by Plumier to the plant called afterwards by Linnæus SAMYDA, and ſuppoſed to be allied to the *malis*.

GUIDONIS *glandula*. See GLANDULA.

GUILANDINA, in *Botany*, the *bonduc*, or *nicker tree*, a genus of the *decandria monogynia* claſs. Its characters are theſe: the empalement of the flower is bell-ſhaped, cut at the rim into five equal parts; the flower has five concave ſpear-ſhaped petals, which are equal, inſerted into the empalement; in the centre is ſituated an oblong germen, which becomes a rhomboid pod, with a convex future on the upper ſide, having one cell, including oval hard ſeeds, ſeparated by partitions. There are five ſpecies, natives of different parts of the Eaſt and Weſt Indies.

The ſeeds, which are called Moloeca nuts, are eſteemed good in colics and hernias; and are ſaid to diſcuſs flatulencies, comfort a weak ſtomach, provoke the menſes, and expel the ſtone.

GUILD, GILD, or GELD. See GILD, and GELD.

GUILD-HALL, or GILD-HALL, the great court of judicature for the city of London.

In it are kept the *mayor's* COURT, the ſheriff's court, the COURT *of huſtings*, COURT *of equity*, court of common council, chamberlain's court, &c.

Here alſo the judges ſit upon *niſi prius*, &c.

GUILLEM, in *Ornithology*, the name given in many parts of England to the bird called by authors LOMMIA, and in ſome places the *bulcrow* and *ſea-hen*.

GUILLEMOT, *black*. See *Sea-turtle* DOVE.

GUILLEMITES, an order of monks in Flanders, whoſe habit reſembles that of the Ciſtercians: they follow the rule of St. Auguſtine, and are governed by a ſuperior, who does not take the title of provincial, and is elected every four years.

GUILT *tenſe*. See GILD.

GUINEA, a gold coin, ſtruck and current in England.

The value, or rate, of *guineas*, has varied: it was firſt ſtruck on the footing of twenty ſhillings; by the ſcarcity of gold was afterwards advanced to twenty-one ſhillings and ſix-pence; but it is now ſunk to twenty-one ſhillings. The pound weight troy of gold is cut into forty four parts and a half; each part makes a *guinea*. See GOLD, STANDARD, and MONEY.

This coin took its denomination, *guinea*, becauſe the gold, whereof the firſt was ſtruck, was brought from that part of Africa called *Guinea*; for which reaſon it likewiſe bore the impreſſion of an elephant.

GUINEA *company*. See COMPANY.

GUINEA *hen*, the *meleagris* of ſome authors and the *numida* of Linnæus, in *Ornithology*, is the name of a ſpecies of gallinaceous fowl, of the ſize of the common hen, but with a longer neck. Its body is ſhaped like that of a partridge, and its colour is all over a dark grey, very beautifully ſpotted with ſmall white ſpecks; there is a black ring round the neck; its head is reddiſh, and has on its top a hard horny protuberance of a brown colour; it is blue under the eyes, and has a red fleſhy appendage hanging down from thence. They naturally herd together in large numbers, and breed up their young in common; the females taking care of the broods of others, as well as of their own. They breed very well with us. Their fleſh is tender and ſweet; generally white, though ſometimes black.

They are not ſo tame and domeſtic as our own fowls, and particularly they will not lay in houſes, but get into the hedges and among buſhes, where they lay and hatch; but this is the occaſion of great loſs among them, the wild vermin deſtroying a great part of their young brood. The female alſo is leſs careful about the great buſineſs of hatching and taking care of them, than any other bird we are acquainted with: the beſt method, therefore, is to ſet other fowls upon the eggs of this kind. The young fowls of this kind are very beautiful; they look like ſo many partridges. Their beaks and legs are red, and their whole plumage is at that time of the colour of the partridge. See *Nat. of Birds*, N° 2.

The hen, if her neſt is found, and the eggs at times taken away, but ſo as always to have one there, will continue to lay till ſhe has depoſited a hundred, or ſometimes a hundred and fifty eggs, which are very well-taſted. This is a very active and ſprightly bird, and of an unquiet and troubleſome diſpoſition to the owner. It runs very ſwiftly in the manner of the quail and partridge; but its wings are ſhort, and it is not made for flying; yet at night it will not rooſt among other fowl, but gets upon a houſe or tree, or any other high and ſafe place. The cry of the bird is ſharp and diſagreeable to many ears, and it is almoſt continually making it. It is of a quarrelſome diſpoſition, and will be miſtreſs of the yard: its agility, and the ſharpneſs of its beak, generally obtain it the victory with whatever bird it fights. The *piſtade* is ſo common in America, that many have ſuppoſed it native there; but this is not the caſe: the origin of the bird is in Guinea, where they are found in flocks of two or three hundred, that perch on trees, and feed on worms and graſſhoppers; and the firſt that were ever brought into America, were brought in the year 1508, with the cargoes of negro ſlaves. The Spaniards, neither at that time, nor ever ſince, have attempted to tame them, or render them domeſtic, uſeful birds, but let them go looſe and wild in the Savannas, where they have increaſed to ſuch prodigious numbers that they may well appear native, and are ſeen in vaſt flocks together, and are called *morrion pintado* by the Spaniards and French. Obſerv. ſur les Cout. de l'Aſie, p. 196.

GUINEA *hemweed*. See *Guinea* HEMWEED.

GUINEA *pepper*. See PEPPER.

GUINEA-*pig*, or *mus perſicus* of Linnæus, the name given by our common people to a ſort of animal, diſtinguiſhed by authors by the name of *mus perſicus piſis et ovis, the rat with the hair and voice of a hog*.

It is a creature properly of the rat kind, and is not improperly called by Mr. Ray *mus americanus et Guineenſis perſicus piſis et ovis, the American or Guinea rat with the hair and voice of a pig*: though the ſame author ſeems to doubt whether it has not ſomething of the rabbit kind in it, by adding after the word *rats* that of *cuniculos*.

It is ſmaller than the rabbit, and has a ſhorter and thicker body; its ears are roundiſh, low, thin, pellucid, and very wide open, and are almoſt ſmooth; and are obſerved to be very nearly as large in the new-brought-forth creatures as in the full-grown.

Its noſe and beard are very much like thoſe of the hare, the long hairs which ſerve for whiſkers being diſpoſed in much the ſame manner; and the upper lip as the hare's or the rabbit's: two cutting teeth in each jaw are diſpoſed exactly as in the rat kind, and its hairs and grunting voice are wholly like thoſe of the pig.

It is ſometimes all over white, ſometimes all over of a reddiſh tawney; but moſt frequently it is mottled with large ſpots of both. Its fore-feet have four claws, its hinder ones only three, of which the middle one is much longer than the others. It ſits often upon its hattocks, in the manner of the rabbit, but it does not walk in the leaping manner of the rabbit kind, but as the hog, by ſetting one foot before the other; and in walking bears upon the heel, in the manner of the bear. It does not burrow in the earth; breeds at two months old; brings forth from four to twelve young ones at a time, which are not ſo blind at firſt as in the rabbit; and breeds every two months. It feeds on vegetables, and its fleſh is very well-taſted, and much reſembles that of the hog. This animal inhabits Braſil, but is domeſticated in Europe. Rats are ſaid to avoid their haunts. Ray's Syn. Quad. p. 223.

It is a very ſingular kind of animal, and there are three ſorts of it, all different from one another. 1. The *porcellus Indicus*, or common *Guinea-pig*. 2. The AGUTI. And, 3. The PACA of the Americans. See alſo APEREA and *Javan* HARE.

GUINEA *wheat*. See MAIZE.

GUINEA *worm*. See CHAETIA and DRACUNCULI.

GUINIAD, or GWINIAD, i. e. *whiting*, ſo called on account of the whiteneſs of its ſcales, the *ſalmo lavaretus* of Linnæus, in *Ichthyology*, is a name given by ſome to the fiſh known among authors by the name of *ferra*, a fiſh of the trutta-ſpecies kind, common in the lakes of Wales, particularly in that called Llyntegid, near Bala, in Merionethſhire, and ſome of the northern counties of England; and in the laſt of theſe places called the *ſchelley*. It is alſo found in the lakes of Switzerland, Italy, Norway, Sweden, Lapland, Scotland, and Ireland. The head is ſmall, ſmooth, and of a duſky hue; the eyes large, the noſe blunt at the end, the jaws of equal length, the mouth ſmall and without teeth; the branchioſtegous rays nine; the cover of the gills ſilvery, powdered with black; the back is a little arched, the colour gloſſed with a deep purple and blue, but near the lateral lines aſſumes a ſilvery caſt tinged with gold; the ſide line is ſtraight, and is formed of diſtinct ſpots of a duſky hue; the belly is a little prominent, and quite flat at the bottom; the firſt dorſal fin, near the middle, conſiſts of fourteen branched rays; the ſecond is near the tail, and is thin and tranſparent; the pectoral fins have eighteen rays, the venteral twelve, and the anal fifteen, which are all branched at their ends; the tail is much forked; the ſcales are large, and adhere to the body.

The *guiniad* has an inſipid taſte, and will not keep long.

Their spawning season in Llyntegid is in December, Camden observes, that this fish never wanders into the river Dee, and that the salmon never ventures into the lake: this is generally, but not universally the case. Pennant, and Phil. Transf. vol. lvii. for 1767, p. 211.

GUIRA-ACANGATARA, in *Ornithology*, the name of a Brasilian bird of the woodpecker kind, and of the size of our large spotted woodpecker. It is common in the woods in several parts of America, and, like our woodpeckers, makes a very loud yelling. Marcgrave.

GUIRACENOIA, in *Ornithology*, the name of a small Brasilian bird of the parus or titmouse kind. Its head, throat, breast, belly, and the lower half of its beak, are all of a fine blue; its neck, and the upper half of its back black; its wings are black, variegated with blue; its tail is black, and its legs brown. Marcgrave.

GUIRACOEREBA, in *Ornithology*, the name of a Brasilian bird of the size of a greenfinch. Its head is ornamented with a large spot of sea-green feathers; the rest of its head, its throat, its breast and belly, and the lower half of its back, are of a fine shining blue, with white variegations. There runs a fine blue line across the wings. The upper half of the back is of the deepest black imaginable, and is very glossy and shining; the tail is black, and the wings are large, and have a great deal of yellow in them, but that is not seen unless when the bird is flying. Marcgrave.

GUIRA-GUAINUMBI, in *Ornithology*, the name of a bird of the king-fisher or merops kind, of the size of a pigeon in appearance, being very thick covered with feathers, but its body is really not larger than that of a thrush; the bill is longish and black, a little crooked, and notched at the edges like the teeth of a saw; its legs are very short; its tail very long, and very narrow. It is a very beautiful coloured bird. Marcgrave.

GUIRANHEEMGATU, in *Ornithology*, the name of a Brasilian sparrow. Marcgrave.

GUIRAPANGA, in *Ornithology*, the name of a Brasilian bird of the thrush kind, remarkable for the loudness of its voice. It is the largest of all the thrush kind, approaching to the size of a small pigeon. Its only sounds are *cui cui cur cur cur*, which it repeats almost incessantly during the season when it cries, which is only for six or seven weeks, about midsummer. Marcgrave.

GUIRAPERA, in *Ornithology*, the name of a Brasilian bird. It is of the size of a lark, and has a short, thick, black beak; its head, neck, back, and belly, are of a pale yellow, like that of wax; and the lower part of the head, the throat, and the breast, are black; the wings and tail are brown and black, with a slight variegation of sea-green. Marcgrave.

GUIRAGUACUBERABA, in *Ornithology*, the name of a Brasilian bird of the size of a goldfinch. Its throat and the extremity of the belly are of a fine pale yellow, as is also the back; its head, the outside of its neck, and the anterior half of its back are of a pale green, as are also its wings and tail; but the wings have some brown feathers intermixed; it has a large black spot under its throat, reaching almost to its eyes; its beak is straight, slender and pointed; its feet are brown. Marcgrave.

GUIRAQUEREA, in *Ornithology*, the name of a Brasilian bird of the caprimulgus or goat-sucker kind, a sort of small owl, approaching to the figure of the cuckow. It is about the size of the lark, but its wings and tail are very long, which make it look much larger than it is; its legs are very short, and its toes are connected by a membrane, but not webbed like the ducks. It is not said whether this be a night-bird, or one that flies by day-light; but probably it is of the first kind, as its whole figure resembles the caprimulgus. Ray's Ornithology, p. 71.

GUIRARA-NHAENGETA, in *Ornithology*, the name of a Brasilian bird of the ornanthe or wheat-ear kind. Marcgrave.

GUIRATANGEIMA, in *Ornithology*, the name of a Brasilian bird of the woodpecker kind. It is of the size of a lark. There is a great deal of beauty in the contrivance of the nest of this bird; it is of a long cylindric figure, and is very nicely hung down from the firm twigs of trees. Marcgrave.

GUIRATINGA, in *Ornithology*, the name of a Brasilian bird of the heron kind, but smaller than the common heron. It walks very erect, its neck is long, and its feet and legs of a greenish yellow; it is all over of a pure snow-white, and its neck feathers are whiter and softer than those of the ostrich. It is always seen above water. Marcgrave.

GUIRATIRICA, in *Ornithology*, the name of a Brasilian bird of the bullfinch kind, called by Mr. Ray *rubicilla Americana*. It is of the size of a lark, and has a very strong beak. Marcgrave.

GUIRAUPIAGARA, in *Zoology*, the name of a species of serpent found in America, and so called from its love of eggs, the word expressing a devourer of eggs. It is a long slender snake, black on the back, and yellow on the belly; it is a great climber of trees, and rolls about among their upper branches, as swiftly as if swimming in water; it is a great enemy to birds, destroying vast quantities of their eggs. Ray's Syn. Animal. p. 329.

GUIRON. See GIRON.

GUITARRA, GUITAR, in the *Italian Musick*, the name of a musical instrument of the string kind, with five double rows of strings, which those that form the bass are in the middle, and by the use of the burden, an octave lower than the fourth.

This instrument was first used in Spain, and the Italians give it the portion of a combination of *Spagnolet*. It is found in Italy and other countries, but more frequently in Spain. The old English name of this instrument was CITTERN; and as the practice of it is very easy, it was formerly the recreation of lewd women and their visitors, and hence used as the symbol of a prostitute.

GUITGUIT, in *Ornithology*, the name under which Nieremberg has described a bird which he says is no larger than a wren, and of a beautiful green colour, and much esteemed for the table. This bird, he says, has great courage, though so very small, and often attacks whole flights of ravens, which it persecutes till they seek shelter among reeds and in thickets to hide themselves from it. Mr. Ray esteems the whole to be an entirely fabulous and false account, contrived as an imitation of the ancient tradition of the wren's fighting the eagle.

GULA, in *Anatomy*, the OESOPHAGUS or gullet; that conduit by which animals take down food into the stomach.

GULA *vaginalis*. See VAGINALIS.

GULA, GUEULE, or GOLA, in *Architecture*, a wave member, whose contour resembles the letter S; called by the Greeks CYMATIUM, q. d. a little wave, and by our workmen an OGEE. See *Arch. Civil.* pag. 25. N° 2.

This member is of two kinds; *recta* and *inversa*. The first and principal has its cavity above, and convexity below. This always makes the top of the coronæ of the cornice, jutting over the drip of the cornice like a wave ready to fall. It is called *gula recta*, and by the French *doucine*. Sometimes it is absolutely called the *entablature*, as being the first or uppermost member thereof.

The second is just the reverse of the former, its cavity being at the bottom; so that it appears inverted with regard to the former. This is used in the architrave, and sometimes in the cornice, along with the former, only separated by a reglet.

Some derive the word from the resemblance those members bear to the *gula* or throat of a man; others, from the heralds term *gules*, as supposing the moulding formed from the ancient manner of wearing their garments, which consisted of flips or swaths, alternately fur and stuff of various colours, the intervals between which were called *gules* or *gulets*.

GULASISI, in *Natural History*, a name given by the people of the Philippine islands to a very small and very beautiful species of PARROT.

GULBE, in *Architecture*, the same as GORGE.

GULE *of August*, the day of St. Peter *ad vincula*, which is celebrated on the first of August.

It is called the *gule of August*, from the Latin *gula*, *a throat*, for this reason, that one Quintius, a tribune, having a daughter that had a disease in her throat, went to pope Alexander, the sixth from St. Peter, and desired of him to see the chains that St. Peter was chained with under Nero, which request being granted, and the, kissing the chains, was cured of her disease: whereupon the pope instituted this feast in honour of St. Peter, and, as before, this day was termed only the calends of August; it was on this occasion called indifferently either the day of St. Peter *ad vincula*, from what wrought the miracle; or the *gule of August*, from that part of the virgin where on it was wrought.

GULES, in *Heraldry*, fignifies the colour of red.

The word is French *gueules*, which Fr. Menoel derives from the Hebrew *glal* or *galaal*, a reddish pellicle or skin appearing on a wound when it begins to heal; but F. Menestrier reproaches him, that there were no such words in the Hebrew tongue. This, however, is not ſtrictly true: all the eaſtern languages, the Hebrew, Chaldee, Syriac, and Arabic, ſay, ?ל?, *ghiil*, for *color*, *rubor*: whence the Arabic *ruhul*: and in the general, the word *gules* ſignifies *red*, among moſt of the oriental nations: the Arabs and Perſians give the name to the rose. Others, *with* Nicod, derive the name *gules* from *gula*, the throats of animals being generally red; or from the Latin *caſtulum*, which is the *κοκκος* of the Greeks, or ſcarlet grain.

The ſame colour, in the coats of noblemen, is by ſome called *ruby*, and in thoſe of ſovereign princes, *Mars*; but this is no ſtanding practice.

In engraving, *gules* is expreſſed by perpendicular ſtrokes

drawn from the top of the escutcheon to the bottom; it is also marked with the letter G. *Tab.* II. *Heraldry, fig.* 56.

This colour is reputed a symbol of charity, valour, hardiness, generosity; and represents blood-colour, cinnabar, and true scarlet. It is the first of all colours used in armoury; and is of that account, that anciently it was prohibited any person to wear *gules* in his coat armour, unless he were a prince, or had permission from the prince.

Spelman, in his Aspilogia, says, that this colour was particularly honoured by the Romans, as it had been before by the Trojans; and that they painted the bodies of their gods, and of their generals that triumphed, with vermilion. Under the consuls, the Roman soldiers wore red, whence they were denominated *rufati*. Joan. de Iudo Aureo adds, that the red dye, which the Greeks call *Phœnician*, and we *scarlet*, was first used by the Romans, to prevent seeing the blood issue from wounds in fight.

In effect, *gules* has always been esteemed an imperial colour: the emperors were clothed, shod, and had their apartments furnished with red; their edicts, dispatches, signatures, and seals, were of red ink and of red wax, whence the name *rubrics*.

GULL, in *Ornithology*, properly the common name of all the LARUS kind, but generally understood only as the name of the common black and white kind, or the *larus marinus* of Linnæus. This is the largest of all the *gull* kind; it usually weighs between four and five pounds. Its beak is yellow, flatted sideways, and three fingers breadth long, and a little hooked at the end, but the lower mandible is marked with a red spot, with a black one in the middle; its head is large and flatted at the top, and its back, breast, belly, and tail white, but with a little blackness just in the middle of the back, and in the long feathers of the wings; its legs and feet are white, and its hinder toe very short; its mouth opens to a great width; it feeds on fish, and, like the raven, greedily devours carrion and breeds in the highest cliffs, and is common on some of our coasts.

There are properly two subordinate genera of these birds; the first is of those which are large, and have an even, not forked tail, and have a tubercle in the lower chap of their bill; the other of the smaller ones, which have all forked tails, and have no tubercle in the lower chap. Of the first genus are the *great gull*, the HERRING-*gull*, the *sea*-MAI.L, the *sea*-MEW, the TARROCK, the PEWIT, the KITTIWAKE, the CATARACTA or SKUA, the MARTINAZZO; the CODDY MODDY, which Linnæus makes synonymous with the *tarrock*, but distinguished by others; it frequents, during winter, the moist meadows in the inland parts of England, far from the sea; the WINDER-*mere*, the CEPPHUS, the *brown* TERN, the *gavina*, and the *arctic* bird or STRUNTJAGGER. And of the second or smaller kind are the STERNA, the FISCHERLIN, the SCARECROW, and four species of the LARUS *fuliginosus*. Ray and Pennant.

GULLET. See OESOPHAGUS.

GULO. See GLUTTON.

GULOICK, in *Architecture*. See IMPOST.

GULPH, or GULF, in *Geography*, an arm or part of the ocean, running up with the land, and forming a capacious bay between two promontories.

The word comes from the French *golfe*, and that from the Italian *golfo*, which signify the same. Some deduce these farther from the Greek κόλπος; which Guichart again derives from the Hebrew גלף *gab*: Du Cange derives them from the barbarous Latin *gulfum* or *gulfus*, which signify the same thing.

Such is the *gulph* of Venice, called also the Adriatic Sea; the *gulph* of Constantinople, called the Black Sea; the *gulph* of Persia, called the Red Sea; the *gulph* of Lyons; the *gulph* of Sidra, near Barbary; the *gulfs* of Mexico, of St. Lawrence, of California; the *gulph* of Bengal, and those of Cochinchina and Kamtschatka.

A *gulph* is strictly distinguished from a SEA, because the latter is larger; from a *bay* or sinus it is again distinguished, by its being greater than the same.

Some will have it essential to a *gulph*, to run into the land through a straight or narrow passage.

The sea is always most dangerous near *gulphs*, because of the currents being penned up by the shores.

GULYAVAN, in *Natural History*, a name given by the people of the Philippine islands to a very beautiful bird, common in that part of the world; it is of the size of a turtle dove, and is very beautifully variegated with black and gold-coloured feathers. It feeds on fruits.

GUM, GUMMI, a mucilaginous juice, of no particular smell or taste exuding through the pores of certain plants or trees, and there hardening into a tenacious transparent mass, by the evaporation of the greatest part of their superabundant water.

Gum is properly one of the juices of the bark: it is drawn thence by the sun's warmth, in form of a glutinous humour; and by the same cause, is afterwards inspissated, concocted, and rendered tenacious.

The chemical character of *gums*, whereby they are distinguished from resins and other vegetable juices, is that they are dissoluble in water, forming with it a viscid transparent fluid; but not dissoluble in vinous spirits or oils; that they burn in the fire to a black coal, without melting or catching flame; and that they suffer no diffipation in the heat of boiling water. Of this kind of *gum* there are reckoned three kinds, *viz. gum Arabic, gum tragacanth*, and the *ordinary gums*, gathered from moist fruit-trees, as almond, apricot, plum, and cherry, &c. But this character, it is to be observed, excludes a great part of those commonly called *gums*.

In the general, *gums* are more viscid and less friable, and are generally dissoluble in any aqueous menstruum; whereas resins are more sulphureous, and require a spirituous or oily dissolvent. Boerhaave considers a *gum* as a sort of saponaceous fat, which, beside its oily principle in common with a resin, has some other ingredient that renders it miscible with water.

GUM *resins* are juices, partly mucilaginous and partly oily, which flow from many kinds of trees, and which become concrete by the evaporation of their finest fluid parts. The mucilaginous and oily parts, though intimately mixed, are not absolutely combined with each other; and, therefore *gum resins* are not perfectly soluble either by water, by oils, or by spirit of wine singly: a kind of solution is effected by the aid of trituration, e. gr. in water; but the resinous part remains suspended, and forms a kind of EMULSION, being divided but not dissolved, whilst the *gummy* part is entirely soluble in water, and forms a mucilage with it. For the complete solution of a *gum* resin, the resinous part must be separated from the *gummy* part, by applying alternately a spirituous and a watery menstruum. All *gum* resins are combined of substances not mutually soluble by each other; therefore the compound bodies resulting from their mixture must be opake: all those concrete juices that are not evidently transparent, may, from hence, be reasonably suspected to be of a *gummy* resinous nature; such are *myrrh, bdellium, sagapenum, opopanax, assa-fœtida*, &c. See RESINS. Chem. Dict. art *Gum*.

Grew, in his Anatomy of Plants, makes the following remarks concerning the import of the word *gum*, and the distinction thereof both from a RESIN and a MUCILAGE.

A resin, he observes, is originally a turpentine or aciduous liquor, having an exceeding small quantity of watery parts mixed therewith; and which, for that reason, will not be dissolved in water, but only in oil: of this kind are mastic, benzoin, tacamahaca, commonly called *gums*, though, strictly speaking, they are all true resins.

A *gum*, on the other hand, is originally a milky liquor, having a greater quantity of water, mixed with its oily parts; and which, for that reason, dissolves either in water or oil: of this kind are sagapenum, opopanax, ammoniac, &c.

A third sort of *gum* is that which is unoily, and which, therefore, dissolves only in water: as *gum* Arabic, the *gum* of the cherry-tree, &c.

These last substances, though commonly called *gums*, are only dried mucilages; being originally nothing else but the mucilaginous lymph issuing from the vessels of the tree, in the same manner as it does from comfrey, mallows, &c. and even from the cucumber; the vessels thereof, upon being cut across, yielding a lymph which is plainly mucilaginous, and which, being well dried, at length becomes a kind of *gum*, or rather a hardened mucilage.

In like manner, the *gums* of the plum-tree, cherry tree, and the like are nothing else but dried mucilages.

If we will take the word in its widest sense, all *gums* are originally either a terebinth, or a milk, or a mucilage.

Gums, in medicine, should always be strained before they are used, as being seldom free from dross and other admixtures, which hinder their operation.

Dr. Pringle, in his Observations on the Diseases of the Army, tells us, that *gums* are all powerful ANTISEPTICS.

Theophrastus speaks of a way of multiplying plants, performed *per lachrymas*, by means of the *gum* or resin; but Agricola takes this to be only practicable where there are seeds accidentally fallen into the *gum*.

GUM *aloes*. See ALOES.

GUM *ammoniac*. See AMMONIAC.

GUM *anime*. See ANIME.

GUM *apples*, in Languedoc, and some other parts of France. The juice of apples will sometimes exfudate through their rind, and congeal all about them in form of a clear white

gum, hard like ice, because of its being soon dried in the sun into a thin cake. The people call such an apple *gomme gete, or a gomeen apple.* It is very common to see apples covered in part with this *gum* in several specks; but it is more rare to meet with them wholly so. The *gum* is insipid to the taste.

We have one plant cultivated in some gardens, which yields in the heat of summer such another white, icy, and tasteless *gum*. This is the common rhubarb, of the stalks of the leaves of which tarts are made. The ribs of the larger leaves of this plant, in June and July, are covered with large transparent drops of this *gum*, and an ounce of it may be sometimes collected from a single plant. Philos. Trans. N° 224.

The common plums and sloes in our hedges also afford the same clear and tasteless white *gum*. If they are wounded on purpose for it, they usually throw more or less of it out at the wounds: but this is after some time, and is not in so large quantity as what they naturally throw out. The common laurel also affords a little transparent, white, and tasteless *gum* of no ill effect, though its leaves are poisonous. And it seems, upon the whole, that this clear juice is not peculiar to apples, or to two or three plants only; but that a great number, even most of them, do contain it, if we knew by what means to get it from them.

GUM *Arabic*, called also *Thebaic*, *Saracenic*, *Babylonic*, and *Acanthine*, from the places or the tree which produce it, is the juice of a little tree growing in Egypt, and also in divers parts of America, of the acacia kind, called in Latin *acacia vera*: it is very transparent, glutinous upon the tongue, almost insipid to the taste, often twisted, sometimes in the nature of a worm, and of a clear whitish or a pale yellow colour.

It is very common among us, but little is to be met with which is genuine; it is frequently adulterated with our common cherry and plum-tree *gum*, which are generally less white and less transparent. That is accounted best which is in smallest pieces, and almost of a white colour.

It dissolves easily in any aqueous liquor, and is used in making an aqueous vehicle for colours in painting, and for a variety of mechanical purposes: in medicine, it is good in all kinds of fluxes; particularly in catarrhs, as it thickens and softens the too acrimonious humours: it is esteemed good to incrassate, to stop the pores, blunt the points of too pungent medicines, and temper the acrimony of the trachea in coughs, &c.

It is chiefly given in the form of powder, from a scruple to a dram or two, and sometimes dissolved in water, in such proportion as not to make the liquor disagreeably slimy: an ounce renders a pint of water considerably glutinous, four ounces form the consistence of syrup. Though *gum*, in its dry state, is not affected by oily liquors, yet one part of *gum Arabic*, softened with an equal weight of water, is sufficient for rendering four parts or more of oil of balsam dissoluble. The solution may in like manner be reduced into emulsions, by grinding them thoroughly with powdered *gum*, and adding the water by degrees: by these means, all resinous and oily bodies may be dissolved in watery liquors. These emulsions, as well as the simple solutions of *gum* in water, mingle uniformly with acids and neutral salts; but on the mixture of any alkali, their parts are immediately separated. Lewis, Mat. Med. Lond. Med. Obs. &c. vol. i. art. 28.

GUM *asa-fœtida*. See ASA-*fœtida*.

GUM *bdellium*. See BDELLIUM.

GUM *copal*. See COPAL.

GUM *elemi*. See ELEMI.

GUM *euphorbium*. See EUPHORBIUM.

GUM *guaiacum*. See GUAIACUM.

GUM *gutta*, or *gutta gamba*, or *ghitta gamba*, popularly *gamboge*. See GAMBOGE.

GUM *lac*. See LACCA.

GUM *manna*. See MANNA.

GUM *mastic*. See MASTIC.

GUM *myrrh*. See MYRRH.

GUM *opium*. See OPIUM.

GUM *opoponax*. See OPOPANAX.

GUM *sagapenum*. See SAGAPENUM.

GUM *sandarach*. See SANDARACH.

GUM *sanguis draconis*. See DRAGON'S *blood*.

GUM *scammony*. See SCAMMONY.

GUM *senega*, or *senega*, is the gum ordinarily sold by the druggists for *gum Arabic*, which it resembles very nearly both as to form and virtue. It is either white, bordering on yellow, or of a deep amber colour, transparent, &c. It oozes out of a prickly shrub common enough in Africa, and of the same genus with that which affords the *gum* Arabic. The greater part of this *gum* is in larger and darker-coloured masses than the Arabic, and not smooth like it, but rough on the outside. This is supposed to be the strongest and most substantial, and the Arabic the purest and finest.

The *gum* Senegal is chiefly employed by the callico-printers, and in other businesses where *gums* are made use of. A proper vehicle for water-colours in painting may be formed by mixing a third or fourth part of the *gum* Senegal with *gum* Arabic, for the former dries more slowly than the latter, which is found to crack and separate from the cartoon or parchment on which the colour is laid with the least moisture of the atmosphere.

The *gum* is brought to us from Senegal, whence its name.

GUM *tacamahaca*. See TACAMAHACA.

GUM *tragacanth*. See TRAGACANTH.

GUM-*boils*, a morbid affection of the *gums*, called by the writers of surgery *parulides*. These are of different degrees, and usually arise from pains in the teeth. They are to be treated by discutients as other inflammatory tumors; but if these fail, or the disorder is neglected, it usually terminates in an abscess or fistula. Sage, camomile, and elder flowers, boiled in milk and water, make a good gargarism to be held in the mouth, and the remaining herbs may be fomented up in a bag to be kept hot to the cheek. A half roasted fig is a very good internal application, and when the softness of the tumor shews that the matter is suppurated, it ought immediately to be opened by the lancet, to prevent the matter's lodging there, and eroding the bone, and producing a fistula or caries. After it is opened, the matter should be gently pressed out with the fingers, and the mouth frequently washed with red wine, mixed with a decoction of vulnerary herbs, till it is well. When the ulcer has penetrated deep, it will be necessary to inject the same liquors with a syringe, and compress the part by a proper external bandage, to make the bottom part heal first: and when it is already become fistulous, and has callous edges, it may then often be cured, by injecting tincture of myrrh and elixir proprietatis, continuing this for some time. If all these prove ineffectual, the fistula must be laid open by incision, and the caries removed by medicines, caustics, or the actual cautery. If this proceeds, as sometimes it does, from a carious tooth, this is first to be drawn before any thing else can be done; and it is a good rule in these cases always to be rather too soon than too late in having them open. Heister.

GUM *fungus*, *cheiridia*, in *Botany*, a genus of the *fungoso-fungoidea aquosi* class. Its characters are these: the flower is composed of many hermaphrodite florets, which are uniform, and included in a cylindrical scaly empalement; these have one petal, which is stretched out on one side like a tongue, and they have each five short hairy flamina; the germen is situated under the floret, and becomes a single, oval, compressed seed, crowned with a single down, and inclosed in the empalement. We have one species, which grows naturally in Germany, Helvetia, and France. Miller.

GUM, *fossil*. See LIQUID AMBER.

GUM, among *Gardeners*, is a disease incident to fruit-trees of the stone kind; as peaches, plums, apricots, cherries, &c.

The *gum* is a kind of gangrene, arising from a corruption of the sap, which extravasates and hardens. It usually begins on some naked or broken part, and spreads itself to the rest. To avoid its spreading, M. Quintinie directs to cut off the morbid branch two or three inches below the part affected.

This *gum* is no more than a thick, dishempered, viscid juice, which, not being able to make its way through the fibres of the body of the tree, to feed and supply them, is obliged by the protrusion of other succeeding juice, to burst its vessels, which lie between the wood and bark, and to ooze out upon the bark.

When the distemper surrounds the branch, it admits of no remedy; and when it is only on one side of a bough, the *gum* must be taken off to the quick of it, and then some cow-dung clapped on the wound, and the part covered over with a linen cloth and tied down.

GUM-*water*. See WATER.

GUMMA, a sort of venereal excrescence on the periosteum of the bones.

GUMMI *vivum*, *vivre gum*, in the *Materia Medica* of the ancients. We meet with this name given to a drug they sometimes used in coughs and diseases of the lungs. This was the concreted juice or exudation of the olive-tree, called by the Greeks ἄκανθα ἔλαιος, and by the Latins *gummi olivæ*.

GUMS, in *Anatomy*. See GINGIVA and MOUTH.

GUN, a fire-arm, or weapon of offence, which forcibly discharges a ball, shot, or other offensive matter, through a cylindrical barrel, by means of gunpowder.

Gun is a general name, under which are included divers,

or even moſt ſpecies of fire-arms. They may be divided into *great* and *ſmall*.

GUNS, *great*, called by the general name *cannon*, make what we alſo call *ordnance* or *artillery*; under which come the ſeveral ſorts of cannon, as cannon-royal, demi-cannon, &c. culverins, demi-culverins, ſakers, minions, falcons, &c. See ORDNANCE; ſee alſo CANNON, CULVERIN, &c.

Inſtead of theſe names, which were formerly uſed, *great guns* are now denominated from the weight of the ball which they diſcharge: thus, a piece that diſcharges a ball of 24 pounds is called a 24 pounder; one that carries a ball of 12 pounds is called a 12 pounder, &c. and they are uſually diſtributed into *ſhip-guns*, which conſiſt of 42, 32, 24, 18, 12, 9, 6, and 3 pounders; CARRIAGE-*guns*, FIELD-*pieces*, and *battering guns*, compre hending 24, 18, and 12 pounders, whoſe ſeveral dimenſions are as follow:

Calibre	Length	Weight
	f. i.	c. qr. lb.
24	9 8	27 0 0
18	9 0	20 1 0
12	7 8	13 2 0

With reſpect to the metal of which they are made, they are divided into braſs *guns* and iron-*guns*. See CANNON and FOUNDERY.

The ſeveral parts of a *gun*, ſee *Tab. Gunnery, fig.* 1. have peculiar names, which are as follow: AB repreſents the whole length of the *gun*, which is always reckoned from the hind part of the baſe ring, or beginning of the caſeable, to the extremity of the muzzle; AE is the firſt reinforce, which is that part of the *gun* next to the breech, and made ſtronger than the other parts for reſiſting the force of the powder; EF the ſecond reinforce, which is made ſomewhat ſmaller than the firſt; FB is the chaſe; BB the muzzle; *A a* the caſeable, including the button *a*; *b* the caſeable aſtragal; *c* the neck of the caſeable; AC the breech; *A r* the breech mouldings; *r s* the baſe-ring and ogee; CD the vent-field; *t* the vent-aſtragal and fillets; *f* the firſt reinforce aſtragal; *p q* the firſt reinforce-ring and ogee; FI the chaſe-girdle; T, T, the trunnions, by which the *gun* is fixed upon its carriage; G the dolphins or handles; *w w* the ſecond reinforce-ring and ogee; *u* the charging cylinder, which is the whole ſpace from the chaſe-aſtragal to the muzzle-aſtragal; *x* the chaſe aſtragal and fillets; *z* the muzzle-aſtragal and fillets; *m* the ſwelling of the muzzle; *n* the muzzle mouldings; *o* the bore, or vacant cylinder, in which the powder and ball are lodged, the diameter of which is called the calibre, and the difference between the diameter of the ſhot and bore is called the windage of the *gun*; *a* the mouth; *d* the vent or touch-hole; and *c* the chamber. For a farther explication of theſe parts of a *gun*, ſee the ſeveral articles. The proportional dimenſions of theſe parts have been differently aſſigned by different authors. General Armſtrong, formerly ſurveyor-general of the ordnance, ſtates them in the following manner: if the length of the *gun*, whether it be braſs or iron, be divided into ſeven equal parts, then the length of the firſt reinforce, AE, will be two of theſe parts; the ſecond, EF, one, and a diameter of the bore; and the chaſe, FB, four of the ſame parts, wanting a diameter of the bore: the breech AC, or diſtance from the hinder part of the baſe-ring to the beginning of the bore, is always equal to the thickneſs of the metal at the vent. The trunnions T, T, are always a calibre in length, and as much in diameter, clear of the ſecond reinforce-ring, and ſo placed, that a line drawn through their centres touches the lower part of the bore: the length of the caſeable, *A b*, is always 2½ calibres. Farther, for braſs *guns*, if the calibre is divided into ſixteen equal parts, the thickneſs of metal at the baſe-ring from the bore is ſixteen of theſe parts; at the end of the firſt reinforce ring 14.5; at the ſame place, for the beginning of the ſecond reinforce, 13.5; at the end of the ſecond reinforce 12.5; at the ſame place, for the beginning of the chaſe, 11.5; at the end of the chaſe or muzzle, the mouldings excluded, eight parts: as to the mouldings, the breadth of the baſe-ring is 1.5 inches; breadth of the next ogee two inches; from the ogee the fore-part of the aſtragal, a calibre: the fillets of the aſtragal are each .28; and the aſtragal .56, ſo that their ſum is 1.12 inches; the fillets of the firſt and ſecond reinforce-rings are .25, and the breadth of theſe rings 1.25; the ogees next to them 1.5, and the fillets at the muzzle .25. In a 12 pounder and upwards, the muzzle ogee is 1.25 inches, but in a 9 pounder, and under, only one inch; the chaſe-girdle and aſtragal is one calibre; from the mouth of the *gun* to the muzzle aſtragal, the ſpace in an 18 pounder and upwards is equal to a diameter of the ſecond reinforce-ring, but in a 12 pounder, and under, equal to the diameter of the firſt reinforce-ring: the riſing of the mouldings at the firſt and ſecond reinforces is an eighth of an inch; and the riſing of the baſe-ring is determined by laying a ruler to the extremities of the firſt and ſecond reinforce mouldings. The ſwelling of the metal at the muzzle is always equal to the diameter of the ſecond reinforce-ring: as to the dimenſions of the caſeable, the diſtance from the hinder part of the baſe-ring to the fore part of the fillet next to the button is one third of a calibre; from hence to the centre of the button, one calibre; from the hinder part of the baſe-ring to the hinder part of the fillet, between the two ogees, one ſixth of a calibre; the diameter of the fillet next to the button 1.5 calibre; diameter of the neck ⅔ of a calibre, that of the button ſomewhat more than a calibre: the ſhell at the vent is three inches broad, and the vent is the fifth part of an inch.

For iron *guns* the calibre is divided into fourteen equal parts, and the thickneſs of metal at the vent from the bore is fixteen parts, at the end of the firſt reinforce 14.5, at the beginning of the ſecond 13.5, at the end of it 12.5; at the beginning of the chaſe 11.5, and at the end of the chaſe or muzzle eight parts. The mouldings, &c. are as before, excepting the vent, which is one fourth of an inch. General Armſtrong makes the lengths of the ſeveral *guns* as follow, viz.

	Pounders	Length		Pounders	Length
		feet			feet
Braſs *guns*.	32	10	Iron *guns*.	32	9.5
	24	9.5		24	9
	18	9.5		18	9
	12	9		12	8
	6	8		9	7
	3	7		6	6.5
	1.5	6		3	4.5

See Muller's Artillery, p. 70, &c.

The two following tables exhibit the dimenſions of all ſorts of braſs and iron *guns*, as eſtabliſhed by the Board of Ordnance in 1764.

TABLE I.

See CHARGE.

With regard to the length of guns, the modern practice is much improved; see CANNON; but experiments are still wanting, in order to determine the beſt length for any given charge. The ancients imagined, that the greater velocity the ſhot had, the greater would be the effect; and therefore they made their guns long and heavy, that they might charge them with as much powder as is equal in weight to the ſhot. The moderns found, by experience, that theſe guns were unwieldy, and that a leſs force would anſwer the purpoſe; and therefore they reduced the charge of powder as well as the weight of the metal. From ſome experiments made by M. Du Metz, mentioned by St. Remy in his Memoirs of Artillery, vol. i. p. 9. with pieces of different calibres, but all of the ſame length, viz. 10 feet, elevated to 45°, and equally charged with a quantity of powder weighing two thirds of their ſhot, it appears, that a 24 pound ſhot of this length carried its ſhot farther with that charge than any leſſer calibre of the ſame length; but theſe experiments do not prove, that, if the pieces had been longer or ſhorter, or if they had been loaded with more or leſs powder, the length of the 24 pounder was the beſt. To this purpoſe St. Remy farther informs us, that pieces of the ſame calibre, but ſomewhat ſhorter, with half the former charge, at the ſame angle of elevation, ranged nearly to the ſame diſtance as the others. From ſome other experiments with ſix 24 pounders nearly of the ſame weight, whoſe lengths were 10·5, 10, 9·5, 9, 8·5, and 8 feet, charged alike, and elevated to 7½, made by general Armſtrong at Woolwich, in 1739, it has been inferred, that 9·5 was the beſt length for a 24 pounder; but it does not appear what the charge was; and beſides, if the charge, ſuppoſed to be half the weight of the bullet, had been more or leſs, the lengths which carried the ſhot fartheſt would likewiſe have been more or leſs: ſo that allowing this length to be the beſt for that charge, it does not follow that it will remain ſo when the charge is either increaſed or diminiſhed, or when the weight of the metal is changed. But ſince theſe experiments were made, it has been found that eight pounds of powder are ſufficient for a 24 pounder, when it is to make a breach; and therefore it remains to be determined, what is the beſt length for that charge.

Mr. Robins obſerves, that practitioners in artillery have generally ſuppoſed, that there is one certain charge for every piece, which will communicate to the bullet a greater velocity than any other, either greater or leſs; and this charge has lately been aſſigned for heavy cannon about one third of the weight of the bullet, and in ſmaller pieces about one half. But from the principles which he has eſtabliſhed, relating to the force of fired gunpowder, he infers, that every augmentation of powder will increaſe the velocity of the bullet, unleſs the charge be ſo great as to fill up about three eighths of the cylinder; in which caſe, a caſe that never occurs in practice, an addition to the charge may diminiſh its velocity. It has alſo been generally ſuppoſed, that in each ſpecies of cannon there was a certain length, which communicated to the bullet fired from it a greater velocity than could be communicated by either a longer or ſhorter piece; but he has ſhewn that if two pieces of the ſame bore, but of different lengths, are fired with the ſame charge of powder, the longer will impel the bullet with a greater celerity than the ſhorter: thus, in an experiment with a ſmall piece, which was firſt ſixty diameters of the bore long, and afterwards cut to twenty diameters, and charged with half the weight of the bullet in powder, he found that an iron-ball, diſcharged from the former, penetrated into a block of wood above half as deep again as when it was diſcharged from the latter; ſo that, within the limits of practice, there is no piece ſo long, but if its length be augmented, an addition will be thereby made to the impetuoſity of its ſhot. He farther ſhews, that if two pieces of artillery, differing in length and in the metal of which they are formed, have their cylinders of equal bores and equal lengths, and be loaded with like charges of powder and like bullets, they will each of them diſcharge their ſhot with nearly the ſame degree of celerity. However, if two pieces of the ſame bore, and different lengths are ſucceſſively fired at the ſame elevation, with the ſame charge of powder, it will often happen that ſome of the ranges with the ſhorter piece will exceed ſome of thoſe with the longer piece; this is owing to the reſiſtance of the air, which acts upon projectiles, both by oppoſing their motion and diminiſhing their celerity, with different degrees of violence, as the projectile moves with a greater or leſs velocity, and alſo by diverting or deflecting them from the regular courſe, which they would otherwiſe follow. Beſides, if the longer piece be allowed a greater charge of powder than the ſhorter, the ſame effect will follow, provided that the charge of the ſhorter be not leſs than one fourth of the weight of the bullet, nor the charge of the longer more than the whole weight of the bullet. It appears hence, that the ranges of pieces at a given elevation are no juſt meaſures of the velocity of the ſhot; and, therefore a better method of determining the comparative velocities of bullets is to meaſure the depth of their penetration in any ſolid ſubſtance, placed at a ſmall diſtance from the muzzle of the piece. But though the velocity of a ball may be augmented by increaſing the charge or lengthening the piece, yet in many caſes that occur in practice, the advantages reſulting from hence are of little moment; in general, the leaſt charges, that are ſufficient to produce the deſired effect in cannonading, firing againſt ſhips, ruining of defences, or battering in breach, are always to be preferred; and the proper charge of any piece, whatever be its length, is not that quantity of powder which will communicate the greateſt velocity to the bullet, nor is it to be determined by any invariable proportion of its weight to the weight of the ball; but it is ſuch a quantity as will produce the leaſt velocity neceſſary for the purpoſe, and it ſhould be regulated by the uſe to which it is applied. Robins's Tracts, vol. i. p. 221, &c. p. 246. &c. See CHARGE, GUNNERY, PROJECTION, and RESISTANCE.

With a view to this ſubject, Mr. Muller has calculated the following table, in which the numbers at the top expreſs the lengths of the pieces in diameters of their bore; the firſt vertical column expreſſes the charges in reſpect to the weight of the ſhot; and the other numbers in the ſame horizontal lines, expreſs the diſtances in feet moved over by the velocities of the ſhot uniformly continued in a ſecond of time.

TABLE of Velocities.

	12	15	18	21	24	27	30	32
¼	1024	1056	1056	1064	1066	1068	1073	1074
½	1286	1206	1221	1217	1222	1224	1225	1234
¾	1426	1434	1452	1456	1475	1480	1486	1497
1	1578	1613	1641	1667	1677	1688	1696	711

N. B. The diameter of a nine pound ſhot, which is four inches, and expreſſes the height of the charge when it is a quarter of the weight of the ſhot, &c. was uſed in the calculation of this table. From this table it is inferred, 1. That if the charge is but a quarter of the ſhot's weight, the difference between the velocities, when the length is 12 and 15 diameters, is only nine feet in a ſecond: and the differences between the other velocities decreaſe, as the length increaſes: and, therefore, as the difference between the velocities, when the piece is 15 and 36 diameters, is only twenty-two feet in a ſecond, it follows, that when the pieces are charged with one quarter of the ſhot's weight, the length from 12 to 15 is the beſt in that caſe. 2. When the charge is one third of the ſhot's weight, it appears in the ſame manner, that the length from 15 to 18 diameters is the beſt. And, 3. When the charge is one half of the ſhot's weight, the length ought to be from 18 to 21 diameters; and when the charge is two thirds of the ſhot's weight, the length ſhould be from 21 to 24 diameters: and theſe lengths, ſays Mr. Muller, are conformable to practice; for the preſent light field-pieces are ſome 12, and others 15 diameters long, and their charge is one fourth of the ſhot's weight; and the heavy twenty-four pounders are commonly from 21 to 24 diameters long, and their proper charge is eſteemed to be two thirds of the ſhot's weight. On theſe principles Mr. Muller has given general inſtructions for braſs and iron guns, mortars and howitzes,

howitzes, as well as of their feveral carriages. Treat. of Artillery, p. 47, &c. 95, &c.

From a table of experiments, for finding the beſt length of *guns*, and their ſtreſt charges, deduced from actual trials in 1775, publiſhed in the Military Dictionary, 1779, it appears, that when the pieces were loaded with half the weight of the ſhot, the ranges were greater than when loaded with either more or leſs, except in the ſmaller calibres, where one third ſeemed to be the beſt charge; and the pieces of nine feet long carried farther than thoſe of ten feet ſix inches, and eleven feet, &c.

The advantage of large *guns*, or cannon, over thoſe of a ſmaller bore, is generally acknowledged. This advantage, ſays Mr. Robins, ariſes from ſeveral circumſtances, particularly in diſtant cannonading. The diſtance to which larger bullets fly with the ſame proportion of powder, exceeds the flight of the ſmaller ones, almoſt in proportion to their diameters; ſo that a thirty-two pounds ſhot, for inſtance, being ſomewhat more than ſix inches in diameter, and a nine pounds ſhot but four inches, the thirty-two pounds ſhot will fly near half as far again as that of nine pounds, if both pieces are to elevated as to range to the fartheſt diſtance poſſible. The reaſon of this is, the extreme great reſiſtance of the air, which is ſuch, that the diſtances to which bullets fly is more regulated by this reſiſtance than by the velocity they receive from the powder: and the larger bullets are leſs reſiſted, in proportion to their weight, than the ſmaller; ſo that their reſpective ranges are found to be nearly in the proportion of their diameters.

This advantage in the range of the heavier bullet, will not eaſily be counterbalanced by increaſing the charge of powder allotted for the ſmaller bullet. For though the ſwiftneſs of this laſt, as it is iſſuing from the piece, may be thereby greatly increaſed, yet the diſtance to which the bullet will fly is thereby but little influenced; as all this increaſe of velocity is ſoon taken away by the reſiſtance of the air, to which it conſtantly ſuffers. This affection might ſeem a paradox, but it is irrefragably eſtabliſhed by ſome experiments made by the French.

Another and more important advantage of heavy bullets is, that with the ſame velocity they break holes in all ſolid bodies, in a greater proportion than their weight. Thus, a twenty-four pounds ſhot will, with the ſame velocity, break out a hole in any wall, rampart, or ſolid beam, in which it lodges, above eight times larger than will be made by a three pounds ſhot: for the great ſhot will penetrate to above twice the depth that the ſmall one will, and leſs of the cavity it makes will be filled up again by the ſpring of the body pierced.

Large cannon alſo, by carrying the weight of their bullet, in grape or lead ſhot, may annoy the enemy more effectually than could be done by ten times the number of ſmall pieces.

The author here quoted, has propoſed to change the fabric of all the pieces employed in the Britiſh navy, from the twenty-four pounders downwards; ſo that they may have the ſame or leſs weight, but a larger bore. He thinks the thirty-two pounders, in preſent uſe, would be a proper model for this purpoſe. Theſe being of fifty-two or fifty-three hundred weight, have ſomewhat leſs than a hundred and two thirds for each pound of bullet. And that this proportion would anſwer in ſmaller pieces, in point of ſtrength, ſeems clear from theſe conſiderations: 1. That the ſtrength of iron or any other metal is in proportion to its ſubſtance. 2. That the leſſer quantity of powder, fired in a ſpace it fills, has proportionably leſs force than a larger quantity: ſo that if two pieces, a large and a ſmall one, be made in the ſame proportions to their reſpective bullets, and fired with a proportionable quantity of powder, the larger piece will be more ſtrained, will heat more, and recoil more than the ſmaller.

On this ſcheme our preſent twenty-four pounders will be eaſed of ſix or eight hundred weight of uſeleſs metal; and ſome pieces of a leſs calibre, as nine and ſix pounders, would be ſometimes eaſed by fourteen hundreds. Hence, much larger *guns* of the ſame weight might be borne. Thus, inſtead of ſix, nine, twelve, and eighteen pounders, our ſhips might carry twelve, eighteen and twenty-four pounders.

Guns would be kept cooler and quieter, and would be of more ſervice in many reſpects, if their uſual charge of powder were diminiſhed.

The author here quoted is of opinion, from his own trials, that a much greater reduction of the weight of ſhip guns might ſafely take place, and that one fourth, and even one fifth of the weight of the bullet in powder, if properly diſpoſed, would be ſufficient for naval purpoſes. See Mr. Robins's Propoſal for increaſing the Strength of the Britiſh Navy, in his Mathematical Tracts, vol. i. p. 283, &c. and his Letters, p. 295 and 356.

The author of the Military Dictionary, publiſhed in 1779, obſerves, with regard to the price of artillery, that the government pays 130*l.* per ton for braſs cannon, 12*s.* for each horſe, and a fixed price is allowed for carriages, wheels, iron-work, tumbrels, ammunition, and ball. For cannon-ball government allows 16*l.* per ton, and 8*s.* per quintal for gunpowder. Hence, he ſays, a twenty-four pounder, with all its appurtenances, ready to act againſt an enemy, ſtands the government in 324*l.* 19*s.* 8½*d.* a twelve pounder in 208*l.* 10*s.* 6*d.* and a ſix pounder in 119*l.* 4*s.* 6¼*d.* Art. *Cannon*.

For the hiſtory and invention of *guns*, ſee CANNON and GUN-*powder*.

For the uſe and application of *guns*, ſee GUNNERY and PROJECTILES.

GUN, *bed of*. See BED.

GUN, *boring of*. See *Boring of* CANNON and FOUNDRY.

GUN, *carriage of*. See CARRIAGE.

GUN, *charging of*. See CHARGE and GUN.

GUN, *chace*. See CHASE *gun*.

GUN, *evening*, is generally a twelve pounder, that is fired every night about ſun-ſet, and every morning at ſun-riſe, to give notice to the drums and trumpets of the army to beat and ſound the retreat and the reveille.

GUNS, *exerciſe of*, denotes the method of laying, loading, and firing the *guns*, at various diſtances from the but or mark: Mr. Robins recommends a more extenſive exerciſe than that of firing with a conſtant charge at two or three marks, placed at known and invariable diſtances, in which the ranges, penetrations, and deflections of pieces, fired with all neceſſary diverſity of charge, elevation, and diſtance, ſhould be examined, and the reſult compared with the new principles explained under the article GUNNERY, &c. See EXERCISE.

GUN, *pointing of*, ſo as to ſtrike diſtant objects, depends on two things, viz. 1. Tracing on the outſide of the piece a viſual line parallel to the axis, which is called *diſparity*, and is performed by taking half the difference of the diameters of the muzzle and baſe-ring, and fixing it perpendicularly on the muzzle-ring directly over the centre; for then a line, which paſſes from that point in the baſe-ring, which is directly over the centre of the piece, to the extremity of the diſtance thus placed on the muzzle-ring, will, when the piece is truly bored, be parallel to its axis: ſee DISPARITY and *Line of* DIRECTION. 2. The other operation is the determining the allowance to be made in diſtant ſhot for the incurvation of the flight of the bullet: this is greater or leſs *pro ratione parabolæ* according to the different charges of powder made uſe of. Mr Robins has determined, that ſuch a charge as produces a velocity between 1100 and 1200 feet in a ſecond, is in many caſes the moſt eligible: ſuppoſing, therefore, that the piece is loaded with ſuch a charge; in this caſe, if the ſhot were not retarded by the reſiſtance of the air, the range correſponding to one degree of this piece might be reckoned 450 *yards*, to two degrees 900, to three degrees 1350, &c ſince independently of the air's reſiſtance, the ranges at different elevations would be nearly in proportion to theſe angles; at leaſt as far as eight or ten degrees. But the reſiſtance of the air will occaſion a conſiderable alteration; becauſe, by diminiſhing the velocity of the bullet, it will render its track more incurvated than it would otherwiſe be, and diminiſh its range: and the ſmaller the ſhot, the greater would be the diminution. The following table will ſerve to ſhew the angles of elevation correſponding in different pieces to different diſtances, and will ſave the labour of computation.

Actual range in yards.	Angle of elevation.							
	24 lb	12 lb	9 lb	6 lb		4 lb		
1400	4	12	4	30	4	45	5	6
1200	3	26	3	40	3	50	4	0
1000	2	45	2	54	3	0	3	7
800	2	6	2	10	2	13	2	20
600	1	30	1	32	1	34	1	36
500	1	13	1	15	1	17	1	19
400		58		58½		59	1	01
300		43		43		43		44
200		27½		28½		23		28
100		14		14		14½		15

By this table, when the diſtance of the object is known, the angle, by which the axis of the piece ought to be elevated above the viſual line, will be readily determined; and when this angle is known, the piece may be directed or pointed, by meaſuring the length of it from the middle of the baſe-ring to the middle of the muzzle-ring, and computing the tangent of the given angle of elevation to that radius, which may be done either by a table of tangents, or by ſuppoſing that to a radius of one foot .21 of an inch is the tangent of a degree. Let CHRD

(*To*

(*Tab. Gunnery, fig.* 8.) be the given piece, AB its axis, DE half the difference between the diameter of the muzzle-ring and base-ring, and CE the line of DISPART; then make CG equal to the tangent of elevation last found, and the line GE will be the proper line for pointing of the piece. In practice it will be sufficient to erect only one perpendicular; e. gr. if GC exceed DE, their difference erected on the base-ring will, with the muzzle-ring at D, give the line of direction; but if DE exceed GC, the same difference erected on the muzzle-ring will, with the base-ring at C, give the direction of the piece. In diſtances leſs than 500 yards, it will be ſufficient to allow one fourth of a degree for the inclination corresponding to every hundred yards, without having recourſe to the table. Mr. Robins obſerves, that the charge of powder producing the velocity above ſtated is the moſt eligible, is from one ſixth to one fourth of the weight of the bullet in powder; the different goodneſs of powder, and the difference in the length of pieces producing that diverſity. Robins's Tracts, vol. i. p. 318, &c.

The common mechanical method of directing cannon to a given object, is to find the centre-line, or two points, one at the breech and the other at the muzzle, by a ſmall inſtrument called the perpendicular, and then applying the two fore-fingers to the base-centre to look behind them, till the muzzle-centre be made to cut the centre of the object; then the piece is properly directed: and having found the neceſſary elevation, place the centre of the quadrant in the bore, and raiſe or depreſs the piece till the plummet cuts the required elevation.

GUN, *proving of a*. See PROVING.

GUN, *riſe*. See RISE.

GUNS, *ſmall*, include fire-locks, muſkets, muſketoons, carabines, blunderbuſſes, fowling-pieces, *&c.*

Piſtols and mortars are almoſt the only kinds of regular weapons, charged with gunpowder, that are excepted from the denomination of *guns*.

No one may ſhoot with, or keep in his houſe, any hand-*gun*, &c. who hath not lands to the value of 100*l.* a year, on pain of 10*l.* nor ſhall any perſon ſhoot with ſuch a *gun*, under the length of one yard, under the like penalty. If any one do ſo, any perſon who hath 100*l.* per annum land, may ſeize the gun unlawfully kept and uſed; but then he muſt break it within twenty days, or forfeit 40*s.* In foreſts, parks, and chaſes thoſe who have power to take away *guns* may retain the ſame. Stat. 33 Hen. VIII. cap. 6. which act continues now in force. See GAME.

Great GUN at Dover caſtle is a large braſs *gun* twenty-four feet long without, and twenty-two feet in the bore beautifully adorned with flowers and emblematical figures in relievo, and ſeveral inſcriptions. This curious *gun*, vulgarly called queen Elizabeth's pocket-piſtol, was a preſent from the emperor Charles V. to Henry VIII. while they were engaged together in a war with France. The charge of this *gun* is fifteen pounds of powder, and it is ſaid to carry a ball ſeven or eight miles.

GUN is alſo a name given by the miners to an inſtrument uſed in cleaving rocks with gunpowder. It is an iron cylinder of an inch and quarter thick, and about ſix inches long, and having a flat ſide to receive the ſide of a wedge, and a hole drilled through it to communicate with the inſide of the hole in the rock. The hole is made of about eight inches deep, and in the bottom of it is put about two or three ounces of gunpowder; then this *gun* is driven forcibly in, ſo as to fill up the hole, and the wedge is driven in on its flat ſide to ſecure it. The priming at the hole is then fired by a train, and the orifice being ſo well ſtopped by this *gun*, the force of the powder is determined to the circumjacent parts of the rock which it ſplits. See MINE.

GUN-*room*, in a *ſhip*, is the apartment on the after end of the lower or *gun*-deck, where the maſter-gunner and his crew rendezvous, get ready their cartridges, &c. and do all things belonging to their buſineſs. In ſmall ſhips of war, it is uſed by the lieutenants as a dining-room, &c.

GUNDELIA, in *Botany*, a genus of the *ſyngeneſia polygamia ſuperflua* claſs. Its characters are theſe; it has an uniform tubulous flower, compoſed of many hermaphrodite flowers, which have but one petal, ſlightly cut into five parts; and they have five ſhort hairy ſtamina: an oval *germen* is ſituated at the bottom of the flower, which becomes a roundiſh ſingle ſeed, incloſed in the common receptacle which is conical; and the ſeeds are ſeparated by a chaffy down. There are two varieties of this plant, which were diſcovered by (and named from) Dr. Gundelſcheimer, in company with Mr. Tournefort, near Balbout, in Armenia. Miller.

GUNNEL *of a ſhip*. See GUN-*wale*.

GUNNELLUS, in *Ichthyology*. See BUTTER-*fiſh*.

GUNNERA, in *Botany*, a genus of the *gynandria diandria* claſs, without calyx or corolla, and having two ſtyles; the germen is double, dented, and contains a ſingle ſeed.

GUNNERS, officers of the Tower and other garriſons, whoſe buſineſs it is to manage and look after the ordnance mounted on the lines and batteries, which are all fixed and ready with cartouches and ball, for ſervice, on the ſhorteſt warning.

They carry a field-ſtaff, and a large powder-horn in a ſtring over the left ſhoulder; in which equipage they march by the guns.

GUNNER, in the *Artillery*, is the ſecond rank of private men in the royal regiment of artillery.

GUNNER *of a ſhip of war*, an officer appointed to take charge of the artillery and ammunition aboard; to obſerve that the former are kept in order, and fitted with tackle and other furniture, and to teach the failors the exerciſe of the cannon: he is aſſiſted by a mate, &c.

Maſter GUNNER *of England*, is an officer appointed to teach and inſtruct all ſuch as deſire to learn the art of gunnery, and to adminiſter to every ſcholar an oath; which, beſide the duty of allegiance, obliges him not to ſerve any foreign prince or ſtate without leave; nor to teach the art of gunnery to any but ſuch as have taken the ſaid oath; and to certify to the maſter of the ordnance, the ſufficiency of any perſon recommended to be one of his majeſty's *gunners*.

The *gunner*, Sir J. Moore obſerves, ſhould know his pieces and their names, which are taken from the height of the bore, the names of the ſeveral parts of a piece of ordnance, how to tertiate his gun, and how to diſpart it, *&c.*

GUNNER'S *level*. See LEVEL.

GUNNERY, the art of ſhooting with guns and mortars, i. e. of charging, directing, and exploding thoſe fire-arms to the beſt advantage. See *Tab. Gunnery, fig.* 9.

Gunnery is ſometimes conſidered as a part of the military art, and ſometimes as a part of pyrotechny.

To the art of *gunnery* belongs the knowledge of the force and effect of gunpowder, the dimenſions of pieces, and the proportions of the powder and ball they carry, with the methods of managing, charging, pointing, ſponging, &c.

Some parts of *gunnery* are brought under mathematical conſideration, which, among mathematicians, are called abſolutely by the name *gunnery*: viz. the method of elevating or raiſing the piece to any given angle, and of computing its range prior to raiſing or directing it ſo, as it may hit a mark or object propoſed.

The inſtruments chiefly uſed in this part of *gunnery* are the CALIPERS or gunners COMPASSES, QUADRANT, and LEVEL: the methods of applying which, ſee under thoſe articles; and for the particular principles and laws of *gunnery*, ſee PROJECTILE.

With regard to the hiſtory of this part of mixed mathematical ſcience we may obſerve, that long before the invention of *gunnery*, properly ſo called, the art of artillery was in actual practice; for one of the kings of Judah, eight hundred years before the Chriſtian æra, erected, on the towers and bulwarks of Jeruſalem, engines of war, for ſhooting arrows and great ſtones for the defence of that city. 2 Chron. xxvi. 15.

Such machines were afterwards known to the Greeks and Romans under the names BALLISTA, CATAPULTA, &c. which produced effects, by means of the action of a ſpring of a ſtrongly twiſted cordage, formed of tough and elaſtic animal ſubſtances, no leſs terrible than the cannon and mortars of the moderns. Theſe warlike inſtruments continued in uſe, not only during the time of the Roman empire, but to the twelfth and thirteenth centuries; nor is it probable that they were totally laid aſide, till gunpowder and the modern ordnance ſuperſeded their uſe.

The firſt application of GUNPOWDER to military affairs ſeems to have been ſoon after the year 1300, for which the propoſal of friar Bacon, about the year 1280, for applying its enormous expanſion to the deſtruction of armies, might give the firſt hint; and Schwartz, to whom the invention of gunpowder has been erroneouſly aſcribed, might have been the firſt who actually applied it in this way: for, it is ſaid, that having pounded the materials of this mixture in a mortar, which he afterwards covered with a ſtone, a ſpark of fire accidentally flew into the mortar, and the explo ſion blowed the ſtone to a conſiderable diſtance.

We ſhall here only mention the prohibition of fire-arms in the Code of Gentoo Laws, printed by the Eaſt India Company in 1776, which ſeems to confirm the ſuſpicion ſuggeſted by a paſſage in Quintus Curtius, that Alexander the Great found ſome weapons of that kind in India. Cannon in the SCHANSCRIT idiom, is called ſhet-aghnee, or the weapon that kills a hundred men at once.

However, the firſt pieces of artillery, charged with gunpowder

powder and ſtone bullets of a prodigious weight, were of very clumſy and inconvenient ſize and ſtructure. See CANNON. Thus, when Mahomet the Second beſieged Conſtantinople in 1453, he battered the walls with ſtones of this kind, and with pieces, ſome of which were of the calibre of 1200 pounds, and which could not be fired more than four times a day. The matter and fabric of theſe unwieldy pieces were changed for others that were lighter and more manageable, and particularly for braſs cannon, about the cloſe of the fourteenth century. The formation of artillery, if we except the ingenious method of boring cannon, not long ſince invented, hath been little improved within the laſt two hundred years; the proportions of the beſt pieces being now much the ſame with thoſe that were made in the time of the emperor Charles V. but their uſe and application have undergone conſiderable changes, the ſame ends being now generally purſued by ſmaller pieces than thoſe which were formerly thought neceſſary: the manner of forming a breach, by firſt cutting off the whole wall as low as poſſible, before its upper part is attempted to be beat down, ſeems alſo to be a conſiderable improvement in the practical part of artillery; as is alſo that diſpoſition of artillery called the BATTERY à ricochet, firſt uſed in 1692. But the theory of *gunnery* has made ſlower advances than the mechanical part. The firſt people who directed their attention to this ſubject were the Italians, about the beginning of the ſixteenth century. N. Tartaglia, the famous mathematician of Breſcia, who invented the method of ſolving cubic equations, generally aſcribed to Cardan, profeſſedly diſcuſſed the theory of projectiles, in his Nova Scientia, printed at Venice in 1537; and in his Queſiti & Inventioni diverſi, in 1546; and in another work, tranſlated into Engliſh, under the title of Colloquies concerning the Art of Shooting in great and ſmall Pieces of Artillery, and publiſhed at London in 1588: he is ſuppoſed to be the firſt who aſſerted, that the greateſt range of projectiles was at an elevation of 45°; and he alſo determined, contrary to the opinion of his contemporaries, that no part of the track deſcribed by a cannon-ball is a right line, though the curvature is in ſome caſes ſo ſmall as not to need attention. To him is likewiſe aſcribed the invention of the *gunner's* QUADRANT.

However, nothing deciſive was delivered as to the nature of the curve deſcribed by ſuch bodies till the time of Galileo, who diſcovered the law of ACCELERATION in falling bodies, and publiſhed his celebrated Dialogues on Motion in 1638. He deſcribed the action and effects of gravity on falling bodies, and on theſe principles determined, that the flight of any projectile would be in the curve of a parabola, unleſs ſo far as it were diverted from that track by the reſiſtance of the air: accordingly he has ſhewn, that a body, ſhot horizontally, would, in its flight, deſcribe half a parabola, and when the piece had an elevation above the horizon, a whole parabola, provided that it fell on the plane of the battery: he alſo proved, that, whatever the ranges of the projected body or the elevation of the piece were, the ball would ſtill trace that curve line, of a greater or leſs amplitude, by the time it deſcended to the level of the place from which it was projected. His diſciple, Torricelli, extended this theory, by ſhewing that, whether the ball fell above or below the plane of its projection, it deſcribed a parabola of a larger or a ſmaller amplitude, according to the angle of elevation of the piece and the ſtrength of the powder. Galileo was not unapprized of the effects of the air's reſiſtance, and he has propoſed the means of examining the inequalities which they would occaſion in the motion of a ball at ſome given diſtance from the piece; yet he expreſsly ſays, that "among theſe projectiles which we "make uſe of, if they are of a heavy matter and round "form, nay, if they are of a lighter matter, and have a "cylindrical form, ſuch as arrows ſhot from bows, their "track or path will not ſenſibly decline from the curve "of a parabola." See his fourth Dialogue on Motion. In this theory his ſucceſſors for a conſiderable time acquieſced, without trying how far the real motions of projectiles deviated from a parabolic track, or deciding, whether the reſiſtance of the air was, or was not, neceſſary to be attended to in the determinations of *gunnery*. Admitting that no great variation could ariſe from the reſiſtance of the air, in the flight of balls, chiefly on account of the extreme rarity of the air compared with the denſe and ponderous compoſition of thoſe projected bodies, they eſtabliſhed it as a kind of general axiom, that the flight of theſe bodies is nearly in the curve of a parabola. Accordingly, in 1674, our countryman, Mr. Anderſon, publiſhed his treatiſe of the Genuine Uſe and Effects of the Gun, in which he maintains the Galilean theory, and to anſwer all objections that could be urged againſt it: and though he was obliged to infer from ſubſequent experiments, that the whole track of projected bodies was not parabolical, as appears by his treatiſe, entitled To hit a Mark, publiſhed in 1690, yet, inſtead of aſcribing the deviation of their flight from the parabolic curve to the reſiſtance of the air, he framed an hypotheſis for reconciling his experiments with his doctrine: he ſuppoſed, that the bullet, at its firſt diſcharge, flew for a certain diſtance in a right line, from the end of which line it began to bend into a parabola: this right line, which he calls *the line of the impulſe of fire*, he ſuppoſes to be the ſame in all elevations; and, by aſſigning a proper magnitude to this line of impulſe, he was able to reconcile any two ſhot made at different angles, however oppoſite they might prove to the common principles. But this new modelled theory was not confirmed by his following experiments.

In the year 1682, Monſ. Blondel publiſhed, at Paris, a treatiſe, entitled L'Art de jetter des Bombes, in which he labours to ſhew, that the retardation ariſing from the reſiſtance of the air is ſo very inconſiderable, as to be of no account in practice. This opinion was ſo generally received both in France and England, that there ſeem to have been none who ſuſpected its fallacy.

Dr. Halley, in a paper communicated to the Royal Society in 1686, expreſsly aſſerts, that "in large ſhot of "metal, whoſe weight many times ſurpaſſes that of the "air, and whoſe force is very great in proportion to the "ſurface wherewith they preſs thereon, this oppoſition "(occaſioned by the reſiſtance of the air to the motion "of cannon-balls) is ſcarce diſcernible:" and from actual experiments he infers, that "although in ſmall "and light ſhot the oppoſition of the air ought and muſt "be accounted for, yet in ſhooting of great and weighty "bombs, there need be very little or no allowance." made." Phil. Tranſ. N° 179. p. 19. or Abr. vol. i. p. 484. The practitioners in *gunnery*, though an erroneous theory had obtained the ſanction of ſo great a name as that of Dr. Halley, might have been led to ſuſpect its truth by the authority of a ſtill greater name, viz. that of Sir Iſaac Newton, who, in 1687, publiſhed his Principia Mathematica Phil. Nat. in which he has demonſtrated, (ſee lib. ii. § 7.) that the curve deſcribed by a projectile, in a ſtrongly reſiſting medium, differed much from a parabola, and that the reſiſtance of the air was great enough to make the difference between the curve of projection of heavy bodies and a parabola far from being inſenſible, and, therefore, too conſiderable to be neglected. The truth of theſe concluſions was farther eſtabliſhed by M. Huygens, in his Diſcours de la Cauſe de la Peſanteur, Leide, 1690, in which he affirms, from experiments and mathematical inveſtigation, that the track of all projectiles was very different from the line of a parabola. However, the teſtimony of theſe writers produced little change in the general opinion; indeed M. Reſſons, a French officer of artillery, in a memoir preſented to the Royal Academy, in 1716, declares that theory was of very little ſervice in the uſe of mortars; that practice had convinced him there was no theory in the effects of gunpowder; for, having endeavoured, with the greateſt preciſion, to point a mortar agreeably to the calculations of M. Blondel, he had never been able to eſtabliſh any ſolid foundation upon them. One other inſtance occurs, in which D. Bernouilli applies the doctrine of Sir Iſaac Newton to the motions of Projectiles. Com. Acad. Petrop. tom. ii. p. 338. &c.

In this ſtate of error and unaccountable contradiction between theory and practice did the ſcience of *gunnery* remain, till the ingenious Mr. Robins, in the year 1742, publiſhed a ſmall treatiſe, entitled New Principles of *Gunnery*, containing many curious diſcoveries relating to the force of gunpowder, the velocity of bullets impelled by its explоſion, the difference in the reſiſting power of the air to ſwift and ſlow motions, the deviation of the flight of projected bodies from the parabolic curve in a degree never diſcovered or ſuſpected by any, and the deflection of bullets and other projectiles from the vertical plane in which the ſhot is made, reſulting from a rotatory motion which they accidentally acquire about an axis. Theſe diſcoveries have been confirmed and improved by himſelf in ſubſequent publications, and by others, particularly M. Euler, of Berlin, who publiſhed it with a large Commentary, in 1745; and by M. Le Roy, of Paris, in the Mem. Acad. Sc. for 1751; and by Dr. Hutton, of the Military Academy at Woolwich. The reader will find a more particular account of theſe diſcoveries in the ſequel of this article, and under the articles GUN, GUNPOWDER, PROJECTILE, RANGE, RESISTANCE, and RIFLE-*gun*.

Mr. Robins, from the experiments related in his New Principles of *Gunnery*, having concluded, that the force of fired GUNPOWDER, at the inſtant of its explоſion, is the ſame as that of an elaſtic fluid of a thouſand times

the denſity of the common air, and that the elaſticity of this fluid, like that of air, is proportionable to its denſity, propoſes the following problem.

The dimenſions of any piece of artillery, the denſity of its ball, and the quantity of its charge being given, to determine the velocity which the ball will acquire from the exploſion, ſuppoſing the elaſticity or force of the powder at the firſt inſtant of its firing to be given.

In the ſolution of this problem he aſſumes the two following principles: 1. That the action of the powder on the bullet ceaſes as ſoon as the bullet is got out of the piece. 2. That all the powder of the charge is fired, and converted into an elaſtic fluid, before the bullet is ſenſibly moved from its place.

Theſe aſſumptions, and the concluſions before mentioned, make the action of fired gunpowder to be entirely ſimilar to that of air condenſed a thouſand times; and from thence it will not be difficult to determine the velocity of the ball ariſing from the exploſion: for the force of the fired powder diminiſhing in proportion to its expanſion, and ceaſing when the ball is out of the piece, the total action of the powder may be repreſented by the area of the curve, the baſe of which repreſents the ſpace through which the ball is accelerated; and the ordinates to which, repreſent the force of the powder at every point of that ſpace: and theſe ordinates being in reciprocal proportion to their diſtance from the breech of the gun, becauſe when the ſpaces occupied by the fired powder are as 1, 2, 3, 4, &c. the force of the powder, or the ordinates repreſenting it, will be as 1, $\frac{1}{2}$, $\frac{1}{3}$, $\frac{1}{4}$, &c. it appears that the curve will be a common hyperbola, and that the area intercepted between it, its aſymptote, and the two ordinates repreſenting the force of the powder at the firſt exploſion and at the muzzle of the piece, will repreſent the total action of the powder on the ball: but if the ball were urged through the ſame ſpace, by an uniform force equal to its gravity, the total action of this force would be repreſented by a rectangle, the baſe of which would be the baſe of the curve or intercepted portion of the aſymptote before mentioned, and the height of which would repreſent the uniform force of gravity. Hence the ſquare of the velocity of the ball, reſulting from the action of the gunpowder, will be to the ſquare of the velocity, reſulting from the action of gravity, as the area of the hyperbolic ſpace is to the area of the rectangle: but the velocity of the ball reſulting from gravity is given, being the velocity it would acquire from a height equal to the ſpace through which the powder accelerates it; and the proportion between the hyperbolic ſpace and the rectangle is alſo given from the analogy of hyperbolic ſpaces and logarithms; therefore the velocity of the ball ariſing from the action of the fired gunpowder will be given. This reaſoning may be illuſtrated by a view of *fig.* 10. *Tab. Gunnery*, to which let AB repreſent the axis of any piece of artillery, A the breech, and B the muzzle; DC the diameter of its bore, and DEGC a part of its cavity filled with powder. Suppoſe the ball, that is to be impelled, to lie with its hinder ſurface at the line GE, then the preſſure exerted at the exploſion, on the circle of which GE is the diameter, or, which is the ſame thing, the preſſure exerted in the direction FB, on the ſurface of the ball, is eaſily known from the known dimenſions of that circle: draw any line FH perpendiculas to FB, and AI parallel to FH, and through the point H, to the aſymptotes IA and AB, deſcribe the hyperbola KHNQ; then if FH repreſents the force impelling the ball at the point F, the force impelling the ball in any other place as M will be repreſented by the line MN, the ordinate to the hyperbola at that point; for when the fluid impelling the body along, has dilated itſelf to M, its denſity will be then to its original denſity in the ſpace DEGC reciprocally as the ſpaces through which it is reſpectively extended; that is, as FA to MA, or as MN to FH, but it appears, that the elaſticity or impelling force of this fluid is directly as its denſity; therefore, if FH repreſents that force at the point F, MN will repreſent the like force at the point M.

Since the abſolute quantity of the force impelling the ball at the point F is known, and the weight of the ball is likewiſe known; the proportion between the force the ball is impelled with, and its own gravity, is known. In this proportion take FH to FL, and draw LP parallel to FB: then MN, the ordinate to the hyperbola in any point, will be to its part MR, cut off by the line LP, as the impelling force of the powder in that point M, to the gravity of the ball; and conſequently, the line LP will determine a line proportional to the uniform force of gravity in every point; whilſt the hyperbola HNQ determines in like manner ſuch ordinates, as are proportional to the impelling force of the powder in every point; whence, by the 35th propoſition of lib. ii. of Sir Iſaac Newton's Phil. Nat. Prin. Math. the areas FLPB and FHQB are in the duplicate proportion of the velocities, which the ball would acquire, when acted on by its own gravity through the ſpace FB, and when impelled thro' it by the ſame ſpace by the force of the powder. But ſince the ratio of AF to AB, and the ratio of FH to FL, are known, the ratio of the area FLPB to the area FHQB is known; and hence its ſubduplicate. And ſince the line FB is given in magnitude, the velocity, which a heavy body would acquire in being impelled through this line by its own gravity, is known, being no other than the velocity it would acquire by falling through a ſpace equal to that line; find then another velocity, to which this laſt mentioned velocity bears the given ratio of the ſubduplicate of the area FLPB to the area FHQB, and this velocity, thus found, is the velocity the ball will acquire when impelled through the ſpace FB by the action of the inflamed powder.

To give an example of this, let us ſuppoſe the length of the barrel of a gun, or AB, to be 45 inches, its diameter DC, or rather the diameter of the ball to be $\frac{1}{2}$ of an inch, and the ſpace occupied by the powder, AF, to be 28 inches; to determine the velocity which will be communicated to a leaden bullet by the exploſion, ſuppoſing the bullet laid at firſt with its ſurface contiguous to the powder.

By the theory here laid down it appears, that at the firſt inſtant of the exploſion the flame will exert, on the ball lying cloſe to it, a force one thouſand times greater than the preſſure of the atmoſphere. But the mean preſſure of the atmoſphere is eſteemed equal to that of a column of water 32 feet high, whoſe lead being to water as 11·345 to 1, this preſſure will be equal to that of a column of lead 384 inches in height, whoſe multiplying this by 1000, a column of lead 384000 inches high would produce a preſſure equal to what is exerted on the ball by the powder in the firſt inſtant of the exploſion; and the leaden ball being $\frac{1}{2}$ of an inch in diameter, and conſequently equal to a cylinder of lead on the ſame baſe 1 an inch in height, the preſſure at firſt acting on it will be equal to 384000 × 1, or eighty times its weight; whence the force of gravity, FL, is to that of the powder at its firſt exploſion, FP, as 1 to 69300: and FB to FA as as 45—28 (or 42 ½ to 28; that is, as 339 to 224, whence the rectangle FLPB is to the rectangle AFHS, as 339 to 224 × 69800 that is, as 1 to 452·4—. And from the known application of the logarithms to the meaſuration of the hyperbolic ſpaces it follows that the rectangle AFHS is to the area FHQB as 452429, &c. is to the tabular logarithm of $\frac{AB}{AF}$; that is, of $\frac{45}{28}$, which is 1·2330570; whence the ratio of the rectangle FLPB to the hyperbolic area FHQB is compounded of the ratio of 1 to 452·4—, and of 452429, &c. to 1·2330570; which together make up the ratio of 1 to 122673, the ſubduplicate of which is the ratio of 1 to 350·7; and in this ratio is the velocity, which the bullet would acquire by gravity, in falling through a ſpace equal to FB, to the velocity the bullet will acquire from the action of the powder, impelling it through FB; but the ſpace FB being 42½ inches, the velocity a heavy body will acquire in falling through ſuch a ſpace is known to be, what would carry it nearly at the rate of 14·07 feet in 1″ of time; whence the velocity, to which this has the ratio of 1 to 350·7, is a velocity, which would carry the ball at the rate of 14·07 × 1107 feet in 1″ of time; that is, at the rate of 1678 feet in 1″ of time. And this is the velocity, which, according to the theory, the bullet in the preſent circumſtances would acquire from the action of the powder, during the time of its dilatation. And this being once computed for one caſe, is eaſily applied to any other; for if the cavity DEGC left behind the bullet be only in part filled with powder, then the line FF, and conſequently the area FHQB will be diminiſhed in the proportion of the whole cavity to the part filled; if the diameter of the bore be varied, the lengths AB and AF remaining the ſame, then the quantity of powder and the ſurface of the bullet which it acts on, will be varied in the duplicate proportion of the diameter; but the weight of the bullet will vary in the triplicate proportion of the diameter; whereupon the line FH, which is directly as the abſolute impelling force of the powder, and reciprocally as the gravity of the bullet, will change in the reciprocal proportion of the diameter of the bullet. If AF, the height of the cavity left behind the bullet, be increaſed or diminiſhed, the rectangle of the hyperbola, and conſequently the area correſponding to ordinates in any given ratio, will be increaſed or diminiſhed in the ſame proportion. From all which it follows, that the area FHQB, which is in the duplicate

duplicate proportion of the velocity of the impelled body, will be directly as the logarithm $\frac{AB}{AF}$, (where AB repreſents the length of the barrel, and AF the length of the cavity left behind the bullet,) alſo directly as the powder that cavity filled with powder, and inverſely as the diameter of the bore, or rather of the bullet, likewiſe directly as AF the height of the cavity left behind the bullet. Conſequently the velocity being computed above, for a bullet of a determined diameter, placed in a piece of a given length, and impelled by a given quantity of powder, occupying a given cavity behind that bullet: it follows, that by means of theſe ratios the velocity of any other bullet may be thence deduced, the neceſſary circumſtances of its poſition, quantity of powder, &c. being given. Where note, that in the inſtance of this propoſition we have ſuppoſed the diameter of the ball to be ½ of an inch: whence the diameter of the bore will be ſomething more, and the quantity of powder contained in the ſpace DBGC will amount to exactly 12 drs. a ſmall wad of tow included.

As to the firſt of the principles here aſſumed, the author has obſerved (ſee alſo his Mathematical Tracts, vol. i. p. 164, &c.) that it would be found erroneous, if examined with a geometrical rigour; ſince it cannot be queſtioned but the flame acts in ſome degree on the bullet after it is out of the piece: but, in experiments, no ſuch accuracy is attainable; minute irregularities are the neceſſary concomitants of all complicated experiments: in the colliſion of bodies, in the running or ſpouting of water, even in ſmall velocities, irregularities happen not reconcileable to theory, or to each other; what may not then be ſuppoſed to happen from the action of ſo furious a power as gunpowder? From experiments it appears, that velocities of bullets fired from the ſame piece, charged with the ſame powder, and all other circumſtances, as nearly as poſſible the ſame, do yet differ from each other by ſometimes more than $\frac{1}{20}$ part of the whole; but this is a ſmall degree of inaccuracy in a caſe of this nature, and if the action of the flame on the bullet, after it is out of the piece, is ſo ſmall as to produce no greater effect than what may be deſtroyed by the inevitable variations of the experiments, the neglecting it entirely is both convenient and a reaſonable proceedure. Now, what gives ground to think that this poſition, though not rigorouſly true, may be ſafely aſſumed, is the conſideration of the ſpreading of the flame by its own elaſticity, as ſoon as it eſcapes from the mouth of the piece; for by this it may be conceived that the part of it which impinges on the bullet may be neglected, although the impulſe of the flame be a very remarkable force.

With regard to the ſecond aſſumed principle, that all the powder is fired before the bullet is ſenſibly moved from its place, it is to be obſerved, that this very poſition, having been examined by a committee of the Royal Society, was, after ſeveral experiments, determined in the negative, from whence many may be ready to conclude, that the whole theory muſt be overturned. But this requires a farther diſcuſſion; and it will appear, that though this principle be not rigorouſly true, no more than the former, yet it ſeems alſo that it may be ſafely admitted in inveſtigating the effects of powder, ſince, even in ſhort barrels, where the ſpace the bullet was impelled through was not five inches, and where of courſe the efficacy of velocity was greateſt, it cannot amount to one thirtieth of the whole. This will appear from the experiments made by the committee; for when the barrel was ſo ſhortened, that the bullet being placed cloſe to the wad, lay with its outer ſurface nearly level with the mouth of the piece, yet, even in this ſhort tranſit of the bullet, but $\frac{1}{30}$ of the whole charge, as a medium, was collected unfired, which, properly reduced, amounts to but $\frac{1}{60}$ of the charge. This collection is founded on theſe conſiderations, that the powder uſed by the committee being unequally grained, when the ſmaller grains, colected by ſifting, were uſed, the quantity remaining unfired was leſs as a medium, in the ratio of 5 to 3, than when it was uſed without ſifting. Alſo, by extracting the ſalt-petre from the powder collected unfired, there was leſs ſalt-petre contained in it than in real powder, nearly in the ratio of 9 to 7. Now theſe two proportions compounded, make the proportion of 15 to 7, in which proportion muſt the quantities of powder unfired be reduced, in order to determine the quantity of fine good powder that might be ſuppoſed to remain unfired in the experiments brought to confirm the aforeſaid theory.

Now, it appears, by experiments, that the velocities of bullets placed in the ſame ſituation, are in the ſubduplicate proportion of the charges; conſequently the deficiency of velocity ariſing from the loſs of $\frac{1}{30}$ of the charge will be about $\frac{1}{60}$ of the velocity only. And in the experiments made with a barrel 53 inches in length, where the ball had not three inches to move, the quantity of real powder collected unfired from a charge of 12 drs. would have been no more than 16 grains, or a medium, or ½ of the whole charge, which would produce a deficiency of $\frac{1}{60}$ of the velocity only: a difference leſs than what frequently occurs in the exacteſt repetition of the ſame experiments.

This, it is thought, is fully ſufficient to juſtify the principle in queſtion; eſpecially, as in all caſes of real uſe, the length of the barrel, in proportion to the quantity of the charge, will be much greater than in the inſtances here mentioned. See Phil. Tranſ. N° 469. p. 450, 452, &c. or Martyn's Abr. vol. viii. p. 208. or Robins's Math. Tracts, vol. i. p. 164, &c. and ſee the Experiments of the Committee, in the Tranſactions, N° 465. p. 172, 173, &c. or Martyn's Abr. vol. viii. p. 253, &c.

The greateſt number of thoſe who have written on the manner in which powder takes fire, have ſuppoſed it to be done by regular degrees: the firſt grains firing thoſe contiguous, and they the next ſucceſſively; and it has been generally thought, that a conſiderable time was employed in theſe various communications: for Mr. Daniel Bernoulli, in his Hydrodynamics, has concluded, from ſome experiments made at Peterſburgh, that the greateſt part of the charge eſcapes out of the piece unfired, and that the ſmall part which is fired, does not take fire till it is near the mouth. Many theories too have been compoſed on the time of the progreſs of the fire among the grains, and the different modifications which the force of powder did thence receive; and it has been generally conceived, that the proper lengths of pieces were determinable from this principle; ſo, that they ſhould be long enough to give time for all the powder to fire.

But no ſuch regular and progreſſive ſteps from obſervable in the exploſion. For conſidering that by adding with a greater weight of bullet, and thereby almoſt doubling the time of the continuance of the powder in the barrel, its force receives but an inconſiderable augmentation; and that doubling and trebling the uſual charge, the powder thus added always produces a correſpondent effect in the velocity of the bullet; likewiſe, that in a piece near four feet in length, charged with an uſual charge of powder, the velocity communicated to the bullet, during the firſt three inches of its motion, is full half the velocity acquired in its whole paſſage through the barrel; and conſidering alſo that the elaſticity or force of the powder, in the three firſt inches of its expanſion, is at a medium near eight times greater than in the two laſt feet of the barrel: it may be concluded from all theſe circumſtances, that the time employed by the powder in taking fire was not neceſſary to be attended to in theſe computations; but that the whole maſs might be ſuppoſed to be kindled, before the bullet was ſenſibly moved from its place.

And the experiments reported by the committee of the Royal Society, before mentioned, are ſtrong proofs that the powder is not fired in the progreſſive manner uſually ſuppoſed; for when the ſhort barrel was charged with twelve penny-weight and ſix penny-weight reſpectively, the quantity of powder which was collected unfired from twelve penny-weight, did not exceed by three grains, at a medium, what was collected from ſix penny-weight, although the bullet was a leſs time in paſſing through the barrel with twelve penny-weight than with ſix, it having a leſs way to move; conſequently the quantity remaining unfired of the ſix penny-weight, did not continue unfired for want of time, ſince when the piece was charged with twelve penny-weight, the additional ſix penny-weight was contained in a ſhorter time. See Phil. Tranſ. N° 469. p. 450. or Robins, &c. ubi ſupra.

Mr. Robins has alſo given us an ingenious way of determining, by experiments, the velocity which any ball moves with, at any diſtance from the piece it is diſcharged from.

This may be effected by means of a pendulum made of iron, having a broad part at bottom, covered with a thick piece of wood, which is faſtened to the iron by ſcrews. Then having three poles joined together by their tops, and ſpreading at bottom, ſuch as are vulgarly uſed in weighing and lifting heavy bodies, and called by workmen triangles; on two of theſe poles, towards their tops, are ſcrewed on ſockets, on which the pendulum is hung by means of a croſs-piece, which becomes its axis of ſuſpenſion, and on which it ought to vibrate with great freedom. Something lower than the bottom of the pendulum there ſhould be a brace, joining the two poles to which the pendulum is ſuſpended; and to this brace there is faſtened a contrivance made with two edges of ſteel, reſembling in the manner of a drawing pen; the ſtrength with which theſe edges preſs on each other being diminiſhed or increaſed at pleaſure, by means of a ſcrew. To

the

the bottom of the pendulum ſhould be faſtened a narrow ribbon, which paſſing between the ſteel edges, may hang looſely down by means of an opening cut in the lower piece of ſteel.

The inſtrument being thus fitted, if the weight of the pendulum, the reſpective diſtances of its centre of gravity, and of its centre of oſcillation from its axis of ſuſpenſion, be known, it may from thence be found what motion will be communicated to this pendulum by the percuſſion of a body of a known weight moving with a known degree of velocity, and ſtriking it in a given point; that is, if the pendulum be ſuppoſed at reſt before the percuſſion, it will be known what vibration it ought to make in conſequence of ſuch a blow; and if the pendulum being at reſt, is ſtruck by a body of a known weight, and the vibration which the pendulum makes after the blow is known, the velocity of the ſtriking body may from thence be determined.

Now the extent of the vibration, made by the pendulum, may be meaſured by the ribbon. For if the preſſure of the ſteel edges on the ribbon be regulated by the ſcrew, ſo as to be free and eaſy, though with ſome minute reſiſtance to hinder its ſlipping of itſelf, then ſetting the pendulum at reſt, let the part of the ribbon between the pendulum and ſteel edges be drawn ſtraight, but not ſtrained; and fixing a pin in the part of the ribbon contiguous to the edges, the pendulum ſwinging back by the impulſe of the ball, will draw out the ribbon to the juſt extent of its vibration, which will be determined by the interval on the ribbon between the edges and the place of the pin.

The computation by which the velocity of the ball is determined, from the vibration of the pendulum after the ſtroke, is founded on this principle of mechanics: that if a body in motion ſtrikes on another at reſt, and they are not ſeparated after the ſtroke, but move on with one common motion, then that common motion is equal to the motion with which the firſt body moved before the ſtroke; whence, if that common motion and the maſſes of the two bodies are known, the motion of the firſt body before the ſtroke is thence determined. On this principle it follows, that the velocity of a bullet may be diminiſhed in any given ratio, by its being made to impinge on a body of a weight properly proportioned to it; and hereby the moſt violent motions, which would otherwiſe eſcape our examination, are eaſily determined by the retarded motions which have a given relation to them. See New Princip. of Gunnery, p. 28, 29, &c. See alſo the Phil. Tranſ. N° 469. p. 444, where a ſmall correction, relating to a number in Mr. Robins's 8th propoſition, is mentioned: or Math. Tracts, vol i. p. 83, &c. and p. 163, &c.

It is to be obſerved, that the length to which the ribbon is drawn, is always nearly the chord of the arch deſcribed by the aſcent; it being ſo placed, as to differ inſenſibly from thoſe chords which moſt frequently occur; and theſe chords are known to be in the proportion of the velocities of the pendulum acquired from the ſtroke. Hence it follows, that the proportion between the lengths of ribbon drawn out at different times, will be the ſame with that of the velocities of the impinging bullets.

Now from the computations delivered by Mr. Robins, it appears, that the velocity of a bullet, whoſe weight was $\frac{1}{12}$ of a pound, was 1641 feet in one ſecond of time, when the chord of the arch deſcribed by the aſcent of the pendulum, in conſequence of the blow, was 171 inches. Therefore, by the proportion of any other lengths of ribbon drawn out, by any percuſſion, to 171, the proportion of the velocity with which the bullets impinge, to the known velocity of 1641 feet in 1″, will be determined.

As experiments of this kind are often attended with danger and difficulty, thoſe who may be diſpoſed to make any, will find ſeveral uſeful practical cautions, in p. 31, 32. and 33, of the ſaid treatiſe.

By the experiments recited at large, in propoſition IX. of the ſame treatiſe, it appears, that the computations from Mr. Robins's theory, compared with thoſe experiments which were made with barrels of various lengths, from ſeven inches to forty-five, and with different quantities of powder, from ſix penny-weight to thirty-ſix, have a remarkable coincidence, and ſuch as occurs but in a few philoſophical ſubjects of ſo complicated a nature.

Suppoſing, for inſtance, the length of a barrel to be 45 inches, the quantity of powder 12 penny-weight, the cavity containing it 2$\frac{1}{2}$ inches, and the ball $\frac{3}{4}$ inch diameter, weighing 1$\frac{1}{2}$ ounce, or $\frac{1}{16}$ of a pound avoirdupoiſe, and the windage or exceſs of the diameter of the barrel above that of the bullet about $\frac{1}{10}$ of an inch; the velocity of the bullet will, by theory, be about 1670 feet in one ſecond, and this velocity is found in theſe experiments, to be the mean velocity which the ball really receives in thoſe circumſtances. Hence we may determine the velocities with which muſket and cannon-ſhot are diſcharged from their reſpective pieces, by their uſual allotment of powder.

For as a leaden ball of $\frac{3}{4}$ inch diameter, and weighing nearly 1$\frac{1}{2}$ ounce avoirdupoiſe, being fired from a barrel of 45 inches in length, with half its weight of powder, will have a velocity at its iſſuing from the piece, which, if uniformly continued, would carry it near 1670 feet in 1″; ſo if inſtead of a leaden ball an iron one of the ſame diameter was placed in the ſame ſituation in the ſame piece, and was impelled by the ſame quantity of powder, the velocity of ſuch an iron bullet would be greater than that of the leaden one, in the ſubduplicate ratio of the ſpecific gravities of lead and iron; and ſuppoſing that ratio to be as 3 to 2, and computing on the foregoing principles, it will appear, that an iron bullet of 24 lb weight, fired from a piece of ten feet in length, with 16 lb of powder, will acquire from the exploſion a velocity which, if uniformly continued, would carry it nearly 1650 feet in 1″. But if inſtead of this full charge, weighing two thirds of the ball, we ſuppoſe the charge to be only half that weight, then its velocity would be no more than at the rate of 1450 feet in 1″; and the ſame would be the velocities of every leſſer bullet, fired with the ſame proportions of powder, if the lengths of all pieces were conſtantly in the ſame ratio with the diameters of their bore; and though this proportion does not always hold, yet the difference is not conſiderable enough to occaſion a very great variation from the velocities here aſſigned. But in theſe determinations, the windage is ſuppoſed to be no more than is juſt neceſſary for the eaſy putting down the bullet; whereas, in real ſervice, either through negligence or unſkilfulneſs, it often happens, that the diameter of the bore ſo much exceeds the diameter of the bullet, that great part of the inflamed fluid eſcapes by its ſide; whence the velocity of the ſhot may, in this caſe, be conſiderably leſs than what is here aſſigned: however part of this may poſſibly be compenſated by the greater heat which in all probability attends the firing theſe large quantities of powder.

The theory here eſtabliſhed ſuppoſes what is ſaid under the head GUNPOWDER, that the powder when fired is equally hot with iron at the beginning of its white heat; but in very ſmall quantities of powder the heat is probably leſs, and conſequently the elaſticity leſs than what ariſes from this ſuppoſition. Now this decreaſe of elaſticity in ſmall quantities of powder has been found in many trials actually to take place. For inſtance, according to the theory before laid down, the velocity given the ball by the action of the powder, is in round numbers 1670 feet in 1″; and this, as has been ſaid, is confirmed by the experiments taken at a medium. If now the barrel and poſition of the ball remaining the ſame, there be placed in the ſpace that contained twelve penny-weight of powder there mentioned, only one penny-weight; it follows, that if the elaſticity of the ſmaller charge be the ſame in proportion to its quantity with that of the larger, then the velocity of the bullet, when impelled by the explöſion of the ſmaller charge, will be to the velocity of a bullet impelled by a greater charge in the ſubduplicate ratio of the quantities of the reſpective charges, that is, in the ſubduplicate ratio of 1 to 12. Conſequently the velocity communicated by twelve penny-weight, being known to be that of 1670 feet in 1″, the velocity communicated by one penny-weight would be that of 482 feet in 1″ nearly: but by repeated trials, differing little from each other, it has been found, that the real velocity acquired by the ball in this caſe, from the explöſion of one penny-weight, was rather leſs than that of 400 feet in 1″. Whence it is evident, that the elaſticity of one penny-weight of powder, when fired, is leſs in proportion to its quantity than that of twelve penny-weight, as it ought to be by the theory.

So if three penny-weight of powder be placed in the ſame manner with the one penny-weight laſt mentioned, the real velocity the ball will acquire from the explöſion will be from 740 to 750 feet in 1″. Whereas, ſuppoſing the elaſticity of three penny-weight, when fired, to be in ſimilar circumſtances the ſame with that of twelve penny-weight, the velocity acquired by the ball ſhould be 825 feet in 1″.

It is farther to be obſerved, that the theory, eſtabliſhed under the head GUN-POWDER, ſuppoſes that in the firing of gun-powder about $\frac{1}{3}$ of its ſubſtance is converted by the ſudden inflammation into a permanent elaſtic fluid, the elaſticity of which, in proportion to its heat and denſity, is the ſame with that of the common air in the like circumſtances: it further ſuppoſes, that all the force exerted by gun-powder in its moſt violent operations, is no more than the action of the elaſticity of the fluid thus generated; and theſe principles enable us to determine the velocities of bullets impelled from fire-arms of all kinds.

From this theory appears the inconclusiveneſs of what ſome authors have advanced relating to the advantages of particular forms for the CHAMBERS *of mortars and cannon*; for all their laboured ſpeculations on this head are evidently founded on very erroneous opinions about the actions of fired powder. Lib. cit. p. 99.

But it muſt not be diſſembled, that however probable this theory may be from the experiments and reaſons on which it is founded, there ſtill remains a difficulty which ſeems not yet fully accounted for. The doubt ariſes from ſome experiments made before a committee of the Royal Society, who thereupon gave it as their opinion, that the change of the form in the chamber will produce a change of the diſtance to which the bullet is thrown. The experiments upon which this opinion was founded, were as follow:

Three braſs chambers were made, whoſe depths were reſpectively three inches, 1¼ inch and ½ inch; ſo turned as to fit the chamber of a braſs mortar exactly; each of theſe chambers contained, when full, one ounce troy of powder. The ball was of braſs, weighing nearly 356 ounces troy; the ball touched the powder of the charge in all theſe experiments. With the firſt chamber of three inches deep, the elevation of the mortar being 45°, the range taken at a medium of three ſhot was 741 feet; and the mean diſtance to which the ball was thrown with the chamber of ½ inch deep, was but 464 feet. As to the chamber of 1¼ inch, it not fitting the chamber of the mortar exactly, the ranges were very irregular; but the leaſt range, though fired late in the dampeſt of the evening, exceeded the firſt leaſt range of the ½ inch chamber, and the firſt leaſt range extended to 686 feet; ſo that the committee ſeem well warranted in their opinion. The difficulty is to reconcile this with the foregoing theory. Its ingenious author has in general obſerved, in the account of his book given in the Phil. Tranſ. N° 469. p. 455. or Tracts, &c. vol. i. p. 173. that when the charge is much ſmaller than the uſual allotment of powder, there are ſome irregularities, as thoſe ariſing from the different heat of ſmall and large quantities of powder, to which head too perhaps muſt be referred the experiments made by the committee on the effect of different ſmall chambers; but in cuſtomary charges, the velocities of bullets reſulting from all the experiments hitherto made, are really ſuch as the theory requires. And it appears, that theſe velocities are much greater than what they have been hitherto accounted; and there are reaſons from the theory to believe, that in cannon-ſhot the velocities may ſtill exceed the foregoing computation. See Phil. Tranſ. N° 465. or Martyn's Abr. vol. viii. p. 253, &c.

If a bullet be laid at a conſiderable diſtance from the charge, the principles before laid down cannot then be applied to determine the velocity of the ball; they being only applicable in caſes where the bullet is contiguous to the charge, or nearly ſo. For by what is ſhewn under the article GUNPOWDER, when the ſurface of fired powder is not confined by a heavy body, which it is obliged to impel before it, the flame dilates itſelf with a velocity much beyond what it can at any time communicate to a bullet by its continued preſſure; becauſe the powder having acquired a conſiderable degree of velocity of expanſion, the firſt motion of the ball will not be produced by the continual preſſure of the powder, but by the percuſſion of the flame. From whence it follows, that the velocity of a bullet, laid at a conſiderable diſtance before the charge, ought to be greater than what would be communicated to it by the preſſure of the powder acting as before mentioned in this article. And this deduction from theory is confirmed from experience, by which it was found that a ball laid in a barrel, at the diſtance of 11½ inches from the breech, and impelled by twelve penny weight of powder, acquired in its diſcharge a velocity of about 1400 feet in 1″; whereas if it had been acted on by the preſſure of the flame only, it would not have acquired a velocity of 1200 feet in 1″. The ſame was found to hold true in all other greater diſtances (and alſo in leſſer, though not in the ſame degree) and in all quantities of powder. And from hence ariſes a conſideration of conſequence in practice, which is, that no bullet ſhould at any time be placed at any conſiderable diſtance before the charge, unleſs the piece be extremely well fortified; for a moderate charge of powder, when it has expanded itſelf through the vacant ſpace, and reaches the ball, will, by the velocity each part has acquired, accumulate itſelf behind the ball, and be thereby prodigiouſly condenſed; whence if the barrel be not extraordinarily ſtrong, it muſt burſt. This is confirmed by the experience of an exceeding good Tower muſket of very tough iron, which being charged with twelve penny-weight of powder, and the ball being placed ſixteen inches from the breech, upon firing the piece, part of the barrel, juſt behind the bullet, was ſwelled out to double its diameter, and two large pieces burſt out of it. If the powder be not placed together at the breech, but ſcattered uniformly through the whole cavity left behind the bullet, the progreſſive motion of the flame may hence be ſuppoſed to be prevented by the expanſion of the neighbouring parts. And it was found that the ball being laid as before, 11½ inches from the breech, its velocity, in this caſe, inſtead of 1400 feet in 1″, was only 1190 feet. See New Principles of Gunnery, part i. prop. 12. or Tracts, &c. p. 113. &c.

It appears from experience, that bullets of the ſame diameter and denſity impinging on the ſame ſolid ſubſtance with different velocities, will penetrate that ſubſtance to different depths, which will be in the duplicate ratio of thoſe velocities nearly. Thus a leaden bullet of ¾ of an inch in diameter, being fired againſt a ſolid block of elm with different velocities, as of 1700 feet, 730, and 420 feet in 1″, the cavities were found to be as 55, 10, and 3, reſpectively; which are nearly in the duplicate proportion of thoſe velocities: perfect regularity in caſes of this nature cannot be expected, when the unequal texture of the ſame piece of wood, and the change of the form of the bullet by the ſtroke, are conſidered.

From the penetration being in the duplicate proportion of the velocity of the impinging body, it follows, that the reſiſtance of the wood, like that of gravity, is uniform. See New Princip. of Gunnery, p. 94, 95. or Tracts, &c. p. 152. See GUN.

It appears from the account already given of Mr. Robins's admirable experiments, that the balls he made uſe of, in aſcertaining their initial velocity, were very ſmall, being only muſket balls of about one ounce in weight; but other occupations, and his immature death, prevented his proſecuting his experiments with others of a larger ſize. This defect is now, in a very conſiderable degree, ſupplied by the experiments of Dr. Charles Hutton, in which he has made uſe of ſmall cannon balls, from one pound to near three pounds weight, and formed a variety of concluſions, which may be applied to cannon-ſhot of the largeſt ſize. The machinery uſed by Dr. Hutton is much of the ſame kind with that of Mr. Robins; and the intention of his experiments is to diſcover the initial velocity of military projectiles, or the velocity with which a ball iſſues from a piece.

The gun, with which the experiments were made, was of braſs; the diameter of the bore at the muzzle was 2.16 inches, and at the breech 2.08 inches; and the greateſt ball iron ball, which it would admit, was 10¾ ounces avoirdupoiſe; but leaden balls weighing 12 pound, and long cylindrical ſhot weighing near three pounds, were ſometimes uſed; the length of the bore was 42.6 inches, ſo that it was nearly 20½ calibres long. The powder was that commonly made for government, and the charge was 2, 4, or 8 ounces, put into a light flannel bag, and rammed without uſing any wad before it. The diſtance of the gun from the pendulum was 29 or 30 feet; and the depth of the penetration ſeemed to be near three inches in ſolid wood, when two ounces of powder were uſed. The firſt courſe of experiments was performed in May 1775; the day being clear and dry; and it appears from the reſult, that the mean velocity of five ſhot, with two ounces of powder, was 626 feet in 1″, and of two ſhot, with four ounces of powder, 915 feet in 1″, which velocities are in the ratio of 1 to 1.46. But the mean weight of the balls in the former caſe was 17½ ounces, and in the latter 17½ ounces, and the ratio of the quantities of powder was that of 1 to 2. In this inſtance it is evident, the velocities are very nearly as the ſquare roots of the quantities of powder directly, and the ſquare roots of the weights of the balls inverſely. The ſecond courſe of experiments was performed in June, in a clear and dry, but windy day. The mean velocity of the ſecond and third ſhot, in theſe experiments, was 973 feet in 1″, and of the fourth and fifth, 749 feet in 1″, which numbers are in the ratio of 1 3 to 1, the charges were two ounces, and the balls were 10½ ounces and 46½ ounces reſpectively. In this inſtance, the velocity of the heavier ſhot is a little leſs than what would ariſe from the inverſe ratio of the ſquare roots of the weight of the ſhot. Some of theſe experiments were rendered doubtful by the effect of the wind; but as the mean velocity is 973, and only 626 in the former courſe, with the ſame charge of powder, though the balls were heavier with the greater velocity, in the proportion of 19 to 17 nearly, Dr. Hutton aſcribes this remarkable difference chiefly to the windage in the firſt courſe, and takes occaſion from hence to recommend the uſe of balls approaching in proportion nearer to the diameter of the bore of the gun than what is preſcribed in the preſent eſtabliſhment. The next courſe of experiments was performed on a clear, dry, and calm day, in the ſame month. In ſix ſhot on this occaſion, the common mean weight of the ball was 18¾ ounces; the mean velocity with two ounces of powder was 738 feet in 1″, and that with four

ounces 1043 feet in 1″: the ratio of which velocities is that of 1 to 1.414: or accurately the ratio of the square roots of the quantities of powder. The fourth course was performed with another machine on a fine clear day in July. The machinery for this and the following course, says Dr. Hutton, was so perfect, and every circumstance attending the experiments so carefully observed, that the conclusions resulting from them may be relied on with great safety. Those of the first day were made with leaden balls, and those of the other with iron ones, which differed greatly in weight; and as every other circumstance was the same, they afford very good means for discovering the law of the different weights of shot, while the variations of the powder from 1 to 4 and 8 ounces, furnish us with the rule for the different quantities of it. The mean velocities with 2, 4, and 8 ounces of powder, were 823, 873, and 1162 feet in 1″, which are in the ratio of 1, 1.424 and 1.93; and these numbers are nearly in the ratio of the square roots of the quantities of powder, viz. 1, 1.414 and 2. The mean weight of the balls used with 8 ounces of powder was 28¼ ounces, and that with the 2 and 4 ounces 28⅝; the reciprocal subduplicate ratio of these is that of 1 to 1.006, in which proportion increasing 1.9, the number for the greater velocity, and it becomes 1.931, which falls short of 2 by .069, or about the 58d part too small for the subduplicate ratio of the powder. This defect is ascribed to three causes, viz. the less length of cylinder through which the ball was impelled; the greater quantity of elastic fluid which escaped in this case than in the others by the windage, on account of the great velocity; and the greater quantity of powder blown out unfired in this case than in that of the less velocities. Hence we may infer, how small the quantity of powder which is blown out unfired in any of these cases, and the amazing quickness with which it fires in all cases; for although the time in which the ball passed through the barrel, when impelled by the eight ounces of powder, was not much different from the half only of the time in which it was impelled by the two ounces, it is evident that in half the time there was nearly four times the quantity of powder fired. In the last course of experiments, consisting of fifteen shot, the mean velocities with 2, 4, and 8 ounces of powder, were 701, 993, and 1397 feet in 1″, which are as the numbers 1, 1.416 and 1.993, or nearly in the subduplicate ratio of the weights of powder, viz 1, 1.414 and 2. The mean weight of the balls, which were iron, with the 2 and 4 ounces of powder, was 18¾ ounces, and with the eight ounces of powder 18⅞ ounces; and, therefore, if the number 1.993 be diminished in the reciprocal subduplicate ratio of 18¾ to 18⅞, it will become 1.985, which falls short of the number 2 by .015, or the 133d part of itself; and this defect is to be ascribed to the causes mentioned in the recital of the former course.

By comparing the correspondiug velocities in these two last courses, viz. 673 and 701, &c. it will be found that the ratio of the first or of the velocities with two ounces of powder, is that of 1 to 1.1636 of the next two, viz 873 and 993, that of 1 to 1.13751 and the ratio of the last, viz. 1162 and 1397, that of 1 to 1.2022. But the mean weight of the shot for the 2 and 4 ounces of powder, was 18¾ ounces, and 18⅝ ounces; and for 8 ounces of powder, 28¼ ounces, and 18⅞ ounces; the reciprocal subduplicate ratio of the former will be that of 1 to 1.214, and of the latter that of 1 to 1.241; which are little different from the real ratios above found. The conclusions that may be deduced from these experiments are the following, viz. that powder fires almost instantaneously, as Mr. Robins had before observed; that the velocities communicated to balls of the same weight, with different charges, are nearly in the subduplicate ratio of their charges; and to balls of different weights, with the same charge, nearly in the reciprocal subduplicate ratio of their weights; and, therefore, when the weights of balls and charges differ, the velocities are directly as the square roots of the charges, and reciprocally as the square roots of the weights, nearly; so that it would be a great improvement to make use of a shot of a long form, or of heavier matter; as it would also be to diminish the windage; for thus one third or more of the quantity of powder might be saved; and by combining these two last improvements, half the quantity of powder might be saved; and a small gun might be made to produce the effect and execution of one two or three times its size, by discharging a shot of two or three times the weight of its natural ball or round shot. In this way a small ship might discharge shot as heavy as those of the greatest now made use of. Experiments of this kind performed with guns of various lengths, would likewise serve to determine the just length of caunon for shooting farthest with the same charge of powder. By means of such experiments, properly conducted and varied, we may be able to solve every question relating to military projectiles, except such as depend on the RESISTANCE of the air to bodies moving swiftly in it. See a farther account of the machinery used by Dr Hutton, and of his experiments, in the Phil. Trans. vol. lxxiii. for 1778. part i. art. 3. p. 50.

GUNPOWDER, a composition of salt petre, sulphur, and charcoal, mixed together, and usually granulated, which easily takes fire, and, when fired, rarefies, or expands, with great vehemence, by means of its elastic force.

It is to this power we owe all the action and effect of guns, ordnance, &c. so that the modern military art, fortification, &c. depend wholly thereon.

The invention of *gunpowder* is ascribed, by Polydore Virgil, to a chemist; who, having accidentally put some of this composition in a mortar, and covered it with a stone, it happened to take fire, and blew up the stone.

Thevet says, the person here spoken of, was a monk of Freibourg, named Constantine Anclizen; but Belleforet, and other authors, with more probability, hold it to be Bartholdus Schwartz, or the Black, who discovered it, as some say, about the year 1320; and the first use of it is ascribed to the Venetians, in the year 1380, during the war with the Genoese; and it is said to have been first employed in a place anciently called Fossa Clodia, now Chioggia, against Laurence de Medicis; and that all Italy made complaints against it, as a manifest contravention of fair warfare.

But what contradicts this account, and shews *gunpowder* to be of an older æra, is, that Peter Mexia, in his Various Readings, mentions that the Moors being besieged in 1342, by Alphonsus XI. king of Castile, discharged a sort of iron mortars upon them, which made a noise like thunder; which is seconded by what Don Pedro, bishop of Leon, relates in his chronicle of king Alphonsus, who reduced Toledo, viz. that in a sea-combat between the king of Tunis, and the Moorish king of Seville, above four hundred and fifty years ago, those of Tunis had certain iron tubes or barrels, wherewith they threw thunder-bolts of fire.

Du-Cange adds, that there is mention made of *gunpowder* in the registers of the chambers of accounts in France as early as the year 1338.

Farther, it appears that our Roger Bacon knew of *gunpowder* near a hundred years before Schwartz was born. That excellent friar tells us, in his treatise De Secretis Operibus Artis & Naturæ, & de Nullitate Magiæ, cap. 6. which is by some supposed to have been published at Oxford in 1216, and which was undoubtedly written before his Opus Majus, in 1267, "that from salt-petre, "and other ingredients, we are able to make a fire that "shall burn at what distance we please." Dr. Plott, in his History of Oxfordshire, p. 236, &c. assures us, that these "other ingredients were explained, in a MS. copy of "the same treatise, in the hands of Dr. G. Langbain, "seen by Dr. Wallis, to be sulphur and wood coal." The writer of the life of Friar Bacon, in the Biographia Britannica, vol. i. says, that Bacon himself has divulged the secret of this composition in a cypher, by transposing the letters of the two words in chap. xi. of the above cited treatise; where it is thus expressed: *sed tamen salis petræ* LURA MOPE CAN UBRE (i. e. *Carbonum pulveri*) *et sulphuris, et sic facies tonitrum & coruscationem, si scias artificium*: and from hence Bacon's biographer apprehends the words *carbonum pulveri* were transferred to the sixth chapter of Dr. Langbain's MS. In this same chapter Bacon expressly says, that sounds like thunder, and corruscations, may be formed in the air, much more horrible than those that happen naturally. He adds, that there are many ways of doing this, by which a city or an army might be destroyed; and he supposes that, by an artifice of this kind, Gideon defeated the Midianites with only three hundred men. Judges, chap. vii. There is also another passage to the same purpose, in the treatise De Scientia Experimentali. See Dr. Jebb's edition of the Opus Majus. p. 474.

Mr. Robins apprehends (see the preface to his Tracts), that Bacon describes *gunpowder* not as a new composition, first proposed by himself, but as the application of an old one to military purposes, and that it was known long before his time. Marcus Græcus, an ancient author, who probably lived about the time of the Arabian physician Mesue, in the beginning of the ninth century, and mentioned by him, in a treatise intitled Liber Ignium, of which Dr. Mead had a MS. copy, and cited by Dr. Jebb in the preface to Bacon's Opus Majus, describes two kinds of fire-works: one for flying, inclosed in a case or cartouche, made long and slender, and filled with the composition closely rammed like our modern rocket: and the other thick and short, strongly tied at both ends, and half filled, resembling our cracker; and the composition which he prescribes for both is two pounds of charcoal, one pound of sulphur, and six pounds of salt-petre, well powdered and mixed together in a stone mortar.

Mr.

Mr. Dutens carries the antiquity of *gunpowder* much higher; and he refers to the accounts given by Virgil, Æn. lib. vi. ver. 585; Hyginus, Fabul. 61 & 650; Eustatius, ad Odyss. x. 234. p. 1682. l. 1. Valerius Flaccus, lib. i. 662, and others, of Salmoneus' attempt to imitate thunder, presuming from hence that he used a composition of the nature of *gunpowder*. He adds, that Dion Cassius, in his Hist. Rom. in Caligul. p. 662, and Johannes Antiochenus, in Chronica, apud Peiresciana Vaticii, Paris. 1634. p. 804, report the same thing of Caligula. The Brachmans did the same, according to Themistius Orat. xxvii. p. 347. and also the Indians, whose practice is recorded by Philostratus, Vita Apoll. lib. ii. cap 33. See likewise lib. iii. cap. 13. Dutens's Inquiry into the Origin of the Discoveries attributed to the Moderns, p. 262, &c. Eng. ed. 1769.

See the preface to the Code of Gentoo Laws, 1776; where it is asserted, that *gunpowder* was known to the inhabitants of Hindostan far beyond all periods of investigation.

GUNPOWDER, *preparation of.* There are divers compositions of *gunpowder*, with respect to the proportions of the three ingredients, to be met with in pyrotechnical treatises; but the process of making it up, is much the same in all.

For some time after the invention of artillery, *gunpowder* was of a much weaker composition than that now used by us, or that described by Marcus Græcus; which was chiefly owing to the weakness of their first pieces. See GUNS and CANNON.

Of twenty-three different compositions, used at different times, and mentioned by Tartaglia in his *Quest. & Inv.* lib. iii. quest. 5. the first, which was the most ancient, contained equal parts of nitre, sulphur, and charcoal. When guns of modern structure were introduced, *gunpowder* of the same composition with the present came also into use. The cannon powder, in the time of Tartaglia, was made of four parts of salt petre, one of sulphur, and one of charcoal; and the musket powder of forty-eight parts of salt-petre, seven parts of sulphur, and eight parts of charcoal; or of eighteen parts of saltpetre, two parts of sulphur, and three parts of charcoal. The cannon powder was in meal, and the musket powder grained; and it is certain, that the invention of graining powder, which is a very considerable advantage, is a modern improvement. See the preface to Robins's Math. Tracts. p. 32, &c.

When the several ingredients of *gunpowder* are properly prepared, mixed, and grained, in the manner recited below; if the least spark be struck thereon from a steel and flint, the whole will be immediately inflamed, and burst out with extreme violence.

The effect is not hard to account for: the charcoal part of the grain whereon the sparks falls, catching fire like tinder, the sulphur and nitre are readily melted, and the former also breaks into flame; and at the same time the contiguous grains undergo the same fate. Now it is known, that salt-petre, when ignited, rarefies to a prodigious degree.

Sir Isaac Newton reasons thus on the point: the charcoal and sulphur in *gunpowder* easily take fire, and kindle the nitre; and the spirit of the nitre, being thereby rarefied into vapour, rushes out with an explosion much after the manner that the vapour of water rushes out of an æolipile; the sulphur also, being volatile, is converted into vapour, and augments the explosion: add, that the acid vapour of the sulphur, namely that which distils under a bell into oil of sulphur, entering violently into the fixt body of the nitre, lets loose the spirit of the nitre, and excites a greater fermentation, whereby the heat is farther augmented, and the fixt body of the nitre, is also rarefied into fume; and the explosion is thereby made more vehement and quick.

For if salt of tartar be mixed with *gunpowder*, and that mixture be warmed till it takes fire, the explosion will be greatly more violent and quick than that of *gunpowder* alone, which cannot proceed from any other cause than the action of the vapour of the *gunpowder* upon the salt of tartar, whereby that salt is rarefied. See *Salts* VOLATILIZED.

The explosion of *gunpowder* arises, therefore, from the violent action whereby all the mixture being quickly and vehemently heated, is rarefied and converted into fume and vapour; which vapour, by the violence of that action, becoming so hot as to flame, appears in the form of a flame. See DETONATION *of nitre.*

M. de la Hire, in the History of the French Academy for 1702, ascribes all the force and effects of *gunpowder* to the spring or elasticity of the air inclosed in the several grains thereof, and in the intervals or spaces between the grains; the powder being kindled, sets the springs of so many little parcels of air a-playing, and dilates them all at once, whence the effect; the powder itself only serving to light a fire which may put the air in action; after which the whole is done by the air alone.

But it will appear from the experiments and observations of Mr. Robins, recited in the sequel of this article, that if this air be in its natural state at the time when the powder is fired, the greatest addition its elasticity could acquire from the flame of the explosion would not amount to five times its usual quantity, and, therefore, could not suffice for the two hundredth part of the effort, which is exerted by fired powder.

In order to understand the force of *gunpowder*, it must be considered, that whether it be fired in a vacuum or in air, it produces by its explosion a permanent elastic fluid. For if a red-hot iron be included in a receiver, and the receiver be exhausted, and the *gunpowder* be then let fall on the iron, the powder will take fire, and the mercurial gage will suddenly descend upon the explosion; and though it immediately ascends again, yet it will never rise to the height it first stood at, but will continue depressed by a space proportioned to the quantity of *gunpowder* which was let fall on the iron. By this means (firing small quantities at a time) the mercurial gage may be reduced from 29½ inches to 12½. Now this experiment, which has been often repeated, proves the proposition with respect to the production of a permanent elastic fluid in a vacuum; for the descent of the gage could only be effected by the pressure of some new generated fluid in the receiver, balancing in part the pressure of the external air. That this fluid, or some part of it at least was permanent, appears from hence, that though in these experiments the quicksilver ascended after the operation, yet next day it had ascended no higher than 27½, at which place it seemed to continue fixed. And that this fluid is elastic, is proved from the descent of the mercurial gage; since the quantity of matter contained in this fluid could not by its gravity alone have sunk the quicksilver by the least sensible quantity; also from its extending itself through any space, however great, the experiment succeeding in either a large or small receiver, only the larger the receiver the less will be the descent of the mercurial gage to the same quantity of powder; the pressure of the generated fluid diminishing as its density diminishes. See Phil. Trans. N° 295.

The same production likewise takes place, when *gunpowder* is fired in the air; for if a small quantity of *powder* be placed in the upper part of a glass tube, and the lower part of the tube be immerged in water, and the water be made to rise so near the top, that only a small portion of air is left in that part where the *gunpowder* is placed; if in this situation the communication of the upper part of the tube with the external air be closed, and the *gunpowder* be fired (which may easily be done by a burning-glass) the water will, in this experiment, descend on the explosion, as the quicksilver did in the last, and will always continue depressed below the place at which it stood before the explosion; and the quantity of this depression will be greater, if the quantity of *powder* be increased, or the diameter of the tube be diminished. From whence it is proved, that as well in air as in a vacuum, the explosion of fired *powder* produces a permanent elastic fluid. Hauksbee, Phyl. Mechan. Exp. p. 81. This release of real and elastic air from various substances, in certain circumstances, is now a well known and incontestible fact. See AIR.

It also appears from experiment, that the elasticity or pressure of the fluid produced by the firing of *gunpowder*, *in, ceteris paribus*, directly as its density. This follows from hence, that, if in the same receiver a double quantity of *powder* be let fall, the mercury will subside twice as much as in the firing of a single quantity. For the vapour produced from the double quantity, being contained in the same receiver, will be of double the density of that produced from the single quantity; whence the elasticity or pressure, estimated by the descent of the mercury, being likewise double, the pressure is directly as its density. Also the descents of the mercury, when equal quantities of *powder* are fired in different receivers, are reciprocally as the capacities of those receivers; and consequently as the density of the produced fluid in each.

To determine the elasticity and quantity of this elastic fluid, produced from the explosion of a given quantity of *gunpowder*, Mr. Robins premises, that the elasticity of this fluid increases by heat, and diminishes by cold, in the same manner as that of the air; and that the density of this fluid, and consequently its weight, is the same with the weight of an equal bulk of air, having the same elasticity and the same temperature. From these principles, and from the experiments by which they are established, for a detail of which we must refer to the book itself, so often cited in these articles, he concludes, that the fluid produced by the firing of *gunpowder* will be nearly ⅓ of the weight of the generating *gunpowder*; and

and the ratio of the reſpective bulks of the *powder*, and the fluid produced from it, will be, in round numbers, 1 to 244.

Count Saluce, in his Miſcell. Phil. Mathem. Soc. priv. Taurin. p. 125. makes the proportion as 1 to 222, which, he ſays, agrees with the computation of Meſſ. Haukſbee, Amontons, and Belidor.

Hence we are certain, that any quantity of *powder* fired in any confined ſpace, which it adequately fills, exerts at the inſtant of its exploſion againſt the ſides of the veſſel containing it, and the bodies it impels before it, a force at leaſt 244 times greater than the elaſticity of common air, or, which is the ſame thing, than the preſſure of the atmoſphere; and this without conſidering the great addition which this force will receive from the violent degree of heat with which it is endued at that time; the quantity of which augmentation is the next head of Mr. Robins's enquiry. He determines that the elaſticity of the air is augmented, when heated to the extremeſt heat of red-hot iron, in the proportion of 746 to 1041 nearly; and ſuppoſing that the flame of fired *gunpowder* is not leſs hot than red-hot iron, and the elaſticity of the air, and conſequently of the fluid generated by the exploſion, being augmented by the extremity of this heat in the ratio of 1041 to 746, it follows, that if 244 be augmented in this ratio, the reſulting number, which is 999⅝, will determine how many times the elaſticity of the flame of fired *powder* exceeds the elaſticity of common air, ſuppoſing it to be confined in the ſame ſpace which the *powder* filled before it was fired.

Hence then the abſolute quantity of the preſſure exerted by *gunpowder* at the moment of its exploſion, may be aſſigned; for ſince the fluid then generated has an elaſticity 999⅝, or in round numbers, 1000 times greater than common air; and ſince common air, by its elaſticity, exerts a preſſure on any given ſurface equal to the weight of the incumbent atmoſphere, with which it is in equilibrio, the preſſure exerted by fired *powder*, before it has dilated itſelf, is 1000 times greater than the preſſure of the atmoſphere, and conſequently the quantity of this force on a ſurface of an inch ſquare, amounts to above ſix ton weight; which force, however, diminiſhes, as the fluid dilates itſelf.

Dr. Ingenhouſz accounts for the effect of *gunpowder* by eſtabliſhing, that nitre yields by heat a ſurpriſing quantity of pure dephlogiſticated air, and charcoal a conſiderable quantity of inflammable air; the fire employed to inflame the powder exerts both the two airs, and ſets fire to them at the inſtant of their extrication. See his theory largely explained in Phil. Tranſ. vol. lxix. part ii. art. 26.

Though it has here been ſuppoſed, that the heat of *gunpowder*, when fired in any conſiderable quantity, is the ſame with iron heated to the extremity of a red heat, or to the beginning of a white heat, yet it cannot be doubted but that the fire produced in the exploſion is ſomewhat varied (like all other fires) by a greater or leſs quantity of fuel; and it may be preſumed, that according to the quantity of *powder* fired together, the flame may have all the different degrees from that of a ſanguine red heat to the heat ſufficient for the vitrification of metals; but as the quantity of *powder* requiſite for the production of this laſt mentioned heat is certainly greater than what is ever fired together for any military purpoſe, we ſhall not be for from our ſcope, if we ſuppoſe the heat of ſuch quantities as come more frequently in uſe to be, when fired, nearly the ſame with the ſtrongeſt heat of red-hot iron; allowing a gradual augmentation to this heat in larger quantities, and diminiſhing it when the quantities are very ſmall. Prin. of Gunnery, in Robins's Math. Tracts, vol. i. p. 59, &c.

We may obſerve, that the variations of the denſity of the atmoſphere do not any way alter the action of *powder*. By comparing ſeveral trials made at noon in the hotteſt ſummer ſun, with thoſe made in the freſhneſs of the morning and the evening, no certain difference could be perceived; and it was the ſame with thoſe made in the night and in winter. Indeed, conſidering that the ſame quantity of that elaſtic fluid in which the force of *powder* conſiſts, is generated in a vacuum and in common air, it is difficult to conceive how this force can be affected by the greater or leſs denſity of the atmoſphere.

But the moiſture of the air has a very great influence on the force of *powder*; for that quantity which in a dry ſeaſon would communicate to a bullet a velocity of 1500 feet in one ſecond, will not in damp weather communicate a velocity of more than 12 or 1300 feet in a ſecond, or even leſs, if the *powder* be bad and negligently kept. Robins's Math. Tracts, vol. i. p. 101, &c.

This agrees with an experiment made before a committee of the Royal Society, where *powder* having been dried by being put into a phial placed in boiling water, threw a ball out of a mortar twice as far as the ſame quantity of *powder* taken out of the ſame barrel before it was dried. Now the ranges under the ſame circumſtances of charge, elevation, &c. being as the ſquares of the velocities of the ball, theſe velocities, in this experiment, will be to each other nearly as 17 to 12, which give ranges as 289 to 144. Phil. Tran. N° 465. p. 282, 283.

If *powder* be damp, ſhot made with equal quantities of it out of the ſame parcel, will differ conſiderably from each other, perhaps ten times more than if the *powder* was in good order. A ſmall charge ſeems to loſe a greater part of its force than a larger, each being equally damp. Another circumſtance attending damp *powder* is, a remarkable fouling in the piece, after firing, much beyond what ariſes from an equal quantity of dry *powder*.

That *powder* will imbibe moiſture from the air, and thereby increaſe in weight, is certain. A parcel of very good *powder* being placed on a white paper, pierced with a great number of fine holes, and held over the ſteam of hot water, the *powder* in half a minute was increaſed about ½ in weight. Another parcel continuing longer in the ſteam was increaſed by ⅓ part. That the moiſture of the atmoſphere has a like effect, appears from this, that an ounce of *powder* kept for ſome time in a room having a fire in it every day, being dried before the fire, loſt above ⅛ part of its weight; one third of which it regained in leſs than two hours, by being removed to a part of the room diſtant from the fire. And as the air is often much moiſter than when this experiment was tried, and the open air is more moiſt than a room with a fire, it cannot be doubted but that the twentieth or thirtieth part of the ſubſtance of the beſt *powder* is water. Now as a certain quantity of water mixed with *powder* will prevent its firing at all, it cannot be doubted but every degree of moiſture muſt abate the violence of the exploſion; and hence the effects of *damp* powder are not hard to account for.

It is to be obſerved, that the moiſture imbibed by *powder* does not render it leſs active when dried again. Indeed, if *powder* be expoſed to the greateſt damps without any caution, or if common ſalt abounds in it, as often happens through negligence in refining the nitre, the moiſture it imbibes may, in ſuch caſes, be perhaps ſufficient to diſſolve ſome part of the nitre, which is a laſting damage that no drying can retrieve. But when tolerable care is taken in preſerving *powder*, and the nitre it is compoſed of has been well purged from common ſalt, it will retain its force much longer than is uſually ſuppoſed; and it is ſaid that *powder* has been known to have been preſerved for fifty years, without any apparent damage from its age.

Some care is neceſſary in the drying of damp *gunpowder*; for there is a degree of heat, which though not ſufficient to fire the *powder*, will yet melt the brimſtone, and deſtroy the texture of the grains. Nay more, there is a heat with which the brimſtone will flame and burn away gradually, and yet the *powder* will not explode; of this any one may ſatisfy himſelf by heating a piece of iron red-hot, and then throwing a few grains of *powder* on it at different intervals, during the time of its cooling; for by this means he will find, that at a certain time the ſeparate grains that fall on the iron will not explode, but will burn with a ſmall blue flame for ſome ſpace of time, the grain ſtill remaining unconſumed. Indeed, when it has begun to burn in this manner, it ſometimes ends with exploding; but this more commonly happens when a number of grains lie near together; for then, though each ſeparate flame is not ſufficient to explode its reſpective grain, yet the whole fire made by them altogether, grows ſtrong enough at laſt to end in a general explotion; however, by attending to the proper temperature of the iron, and ſpreading the grain, two or three inches ſquare may be covered with a blue lambent flame, which will laſt a conſiderable time without any explotion, and the grains afterwards will not apparently have loſt either their colour or their ſhape. Now ſince theſe grains, when the brimſtone is thus burnt or even melted out of them, will no longer act as *powder*, it is evident that *powder* may be ſpoiled by being dried with too violent a heat. Robins, ubi ſupra, p. 104, &c.

The velocity of expanſion of the flame of *gunpowder*, when fired in a piece of artillery, without either bullet or other body before it, is prodigious. By the experiments of the author ſo often quoted, it ſeems this velocity cannot be much leſs than 7000 feet in a ſecond. This however muſt be underſtood of the moſt active part of the flame. For, as was obſerved before, the elaſtic fluid, in which the activity of *gunpowder* conſiſts, is only ⅞ of the ſubſtance of the *powder*, the remaining ⅛ will in the explotion be mixed with the elaſtic part, and will by its weight retard the activity of the explotion; and yet they will be ſo completely united as to move with one common motion; but the unelaſtic part will be leſs accelerated than the reſt, and ſome of it will not be carried out of the barrel, as appears by the conſiderable quantity

of unctuous matter, which adheres to the inside of all fire-arms after they have been used. These inequalities in the expansive motion of the flame, render it impracticable to determine its velocity otherwise than from experiments. The foundation of which determination is, that a barrel being fixed in a proper situation on a pendulum, such as is described under the head GUNNERY, and being charged with twelve penny-weight of *powder*, without either ball or wad, the *powder* being only put together by the rammer; on the discharge the pendulum ascended through an arch whose chord was 10 or 10¼ inches.

Now if the piece be again loaded with the same quantity of powder, rammed down by a wad of tow weighing one penny-weight, it may be supposed that this wad, being very light, will presently acquire that velocity, with which the elastic part of the fluid will expand itself when uncompressed; and it was accordingly found, that the chord of the ascending arch was by this means augmented to twelve inches; so that by the additional weight of one penny-weight of matter moving with the velocity of the swiftest part of the vapour, the pendulum ascended through an arch whose chord was two inches longer than before. And by calculating upon these facts, and the principles laid down in his book, Mr. Robins determines that the velocity with which this one penny-weight of matter moved, must be about 7000 feet in one second.

It is this prodigious celerity of expansion of the flame of fired *gunpowder*, which is its peculiar excellence, and the circumstance in which it so eminently surpasses all other inventions, either ancient or modern, for the purpose of military projections: for as to the quantity of motion of these projectiles only, many of the warlike machines of the ancients produced this in a degree far surpassing that of our heaviest cannon-shot or shells; but the great celerity given to these bodies cannot be in the least approached by any other means than by the flame of *powder*. The reason of this difference is, that the ancients could by weights, or the elasticity of springs and stretched chords, augment their powers to any degree desired; but then each addition of power brought with it a proportional addition of matter to be moved; so that as the power increased, those parts of the machine which were to communicate motion to the projectile, and were consequently to move with it, were likewise increased; and thence it necessarily happened, that the action of the power was not solely employed in giving motion to the impelled body, but much the greatest part of it was spent in accelerating those parts of the machine in which the power resided, to enable them to pursue the body to be projected with perpetual impulse, during its whole passage through the extent of their activity. Hence then it came to pass, that, though these ancient machines could throw enormous weights, they could project them but with small degrees of celerity, compared with what we can communicate to our cannon and musket-shot; whence, in all operations where these great velocities are useful, our machines are infinitely superior to those of antiquity; although, in more confined and shorter projections, these last have some advantage which may yet render them worthy of the attention of those military geniuses, who have capacity enough to consider each part of a profession according to its true and genuine value, independent of the partial estimation of the times they live in. Ibid. p. 112.

Gunpowder is a commodity of such consequence, both in respect of speculation, of war, and of commerce (the consumption thereof being incredible), that it will deserve a more particular detail. To make *gunpowder* duly, then, regard is to be had, that the salt-petre be pure, and in fine large crystals or shootings; otherwise, it is to be purified, by taking away its fat or common salt, and earthy part, thus: dissolve ten pounds of nitre in a sufficient quantity of fair water; settle, filtrate, and evaporate it in a glazed vessel, to the diminution of half, or till a pellicle appear on it; the vessel may then be taken off from the fire, and set in a cellar: in twenty-four hours the crystals will shoot, which separate from the liquor; and after the like manner may the liquor be crystallized several times, till all the salt be drawn forth: this done, put it into a kettle, and that on a furnace with a moderate fire, which gradually increase till it begins to smoke, evaporate, lose its humidity, and grow very white: it must be kept continually stirring with a ladle, for fear it should return to its former figure, whereby its greasiness will be taken away; after that, so much water is to be poured into the kettle as will cover the nitre; and when it is dissolved, and reduced to the consistency of a thick liquor, it must be stirred with a ladle, without intermission, till all the moisture is again evaporated, and it be reduced to a dry and white meal. See SALT-PETRE, and NITRUM *purificatum*.

The like regard is to be had to the sulphur, choosing that which is in large lumps, clear and perfectly yellow; not very hard, nor compact, but porous; nor yet too much shining; and if, when set on fire, it freely burns away all, leaving little or no resident matter, it is a sign of its goodness; so likewise, if it be pressed between two iron plates that are hot enough to make it run, and in the running appears yellow, and that which remains of a reddish colour, it may be concluded to be fit for the purpose. But in case the flame be foul and impure, it may be purified in this manner: melt the sulphur in a large iron ladle, or pot, over a very gentle coal fire, well kindled, but not flaming; then scum off all that rises on the top, and forms upon the sulphur; take it presently after from the fire, and strain it through a double linen cloth, letting it pass at leisure; so will it be pure, the gross filthy matter remaining behind in the cloth. See SULPHUR.

Some persons, misled by an experiment of Dr. Hales, which shews that burning sulphur does not generate elastic air, but diminishes the quantity of common air, have imagined that the sulphur was an unnecessary and even injurious ingredient of *gunpowder*. But Mr. Beaume has found by experiments, that the force of *gunpowder* was nearly doubled by addition of the sulphur. The use of sulphur, says the translator of the Chemical Dictionary, seems to be not to increase the explosion immediately by its own combustion, but to accelerate the combustion of the other ingredients, in consequence of its being more easily inflammable than the charcoal.

For the charcoal, the third ingredient, such should be chosen as is large, clear, and free from knots, well burnt and clensing. See CHARCOAL.

The charcoal of light woods has been generally employed; but Mr. Beaume affirms from experience, that the charcoals of heavy and hard woods, if they have been well made, are as fit for the purpose. The charcoal not only concurs with the sulphur in supplying the inflammable matter, which causes the DETONATION *of the mixture*, but also considerably adds to the explosive power of the detonating nitre, by the quantity of elastic vapour expelled during its combustion.

Powder being a mixture of sulphur and charcoal, which are very inflammable substances, with salt-petre, which in itself is not, if the salt-petre be too much in quantity, when compared with the other two, their burning may not be sufficient to consume the whole of the salt-petre; whence the fire may be less violent, and consequently the *powder* less vigorous, than if some of the salt-petre was taken away, and a like quantity of the other materials were added in its stead. On the other hand, if the salt-petre in the composition be less than what the burning of the other two substances can easily consume, the fire will be less active than it ought to be, because it is not augmented so much as it would be if a larger quantity of salt-petre had been added to the composition.

Hence it appears that the goodness of *powder* is not to be estimated only from the quantity of salt-petre contained in it, although that substance seems to be the basis of the elastic fluid, in which its force consists: for since the converting of the salt-petre into that fluid, and the elasticity of the fluid, afterwards, depend in some measure on the violence of the fire produced in the explosion, it is plain that there is a certain proportion in the mixture of the materials, which will best contribute to this purpose, and consequently to the perfection of the *powder*.

What this proportion is, has been ascertained by experience; and it seems now to be generally agreed, that in any quantity of *powder* three-fourths of it should be salt-petre, the remaining one-fourth consisting of equal quantities of sulphur and charcoal. This is the proportion followed by the French, and by most nations in Europe: we, indeed, pretend to a greater degree of nicety in our proportions; though, it is said, they do not greatly differ from what is here mentioned; nor is it certain that they are preferable: this, however, may be depended on, that no methods of proving *powder*, hitherto generally practised in England, could at all ascertain the difference; and other *powders* made with the usual proportions, are nothing inferior to our's.

But it is not the due proportion of the materials only, which is necessary to the making of good *powder*; another circumstance, not less essential, is the mixing them well together; if this be not effectually done, some parts of the composition will have too much salt-petre in them, and others too little; and in either case there will be a loss of strength in the *powder*. Robins, ubi supra, p. 119, &c.

There have been commonly enumerated three kinds of *powder*, viz. *cannon-powder*, *musket-powder*, and *pistol-powder*; of each of these again there are two sorts, a *stronger*, and a *weaker*; all which differences arise only from the various proportions.

The proportions are thus: in the stronger *cannon-powder*,

to every hundred pounds of salt-petre, twenty-five pounds of sulphur are generally allowed, with the same quantity of charcoal; and in the weaker *common-powder*, to every hundred pounds of salt-petre, twenty pounds of sulphur, and twenty-four pounds of charcoal. As for the stronger *musket-powder*, a hundred pounds of salt-petre require eighteen pounds of sulphur, and twenty of charcoal; and in the weaker there go to a hundred pounds of salt-petre, fifteen of sulphur, and eighteen of charcoal. In the stronger *pistol-powder*, a hundred pounds of salt-petre require twelve of sulphur, and fifteen of charcoal; whereas the weaker has 18 a hundred pounds of salt-petre, only ten of sulphur, but eighteen of charcoal. Other authors prescribe different proportions: Semienowitz, for mortars, directs a hundred pounds of salt-petre, twenty-five of sulphur, and as much of charcoal; for great guns, a hundred pounds of salt-petre, fifteen of sulphur, and eighteen of charcoal; for muskets and pistols, a hundred pounds of salt-petre, eight of sulphur, and ten of charcoal. The author of the Dictionary of Chemistry, recommends seventy-five parts of purified nitre, fifteen and a half parts of charcoal, and nine and a half parts of sulphur.

Marchius extols the proportion of one pound of salt-petre to three ounces of charcoal; or two, or two and a quarter, of sulphur: than which, he affirms, no *gunpowder* can possibly be stronger.

He adds, that the usual practice of making the *gunpowder* weaker for mortars than guns, as in the example above, is without any foundation, and renders the expence needlessly much greater: for whereas to load a large mortar twenty-four pounds of common is required, and consequently to load it ten times, two hundred and forty pounds; he shews by calculation, that the same effect would be had by one hundred and eighty pounds of the strong powder.

GUNPOWDER, *as to the process of making the*; all the ingredients are first to be finely powdered, then moistened with fair water, or vinegar, or spirit of wine, or water and spirit of wine mixed together, or urine; afterwards all must be well beat for the space of twenty-four hours at least, and then granulated after the following manner: a sieve is to be prepared with a bottom of thick parchment made full of round holes, and the former beaten mass moistened before-hand with twenty ounces of spirit of wine, twelve of spirit of wine-vinegar, thirteen of spirit of nitre, two of spirit of sal ammoniac, and one ounce of camphor dissolved in spirit of wine; and let all these be mingled together; otherwise, take forty ounces of brandy, and one of camphor, and let them be mixed and dissolved for the same purpose: when the whole compound is made up into balls as big as eggs, put them into the sieve, and with them a wooden ball; which move up and down about the sieve, so that it may break the balls of powder, and make it pass through the little holes in corns.

For greater quantities, MILLS are usually provided, by means of which, more work may be performed in one day, than a man can do in a hundred.

Chinese powder may also be made of several colours; but the *black* is the most serviceable of any.

To make white powder proceed thus:—Take ten pounds of salt-petre, one of sulphur, and two of the saw-dust of elder, or the like wood, powdered very fine; mix them together, and use the former method. Or thus: with ten pounds of nitre, and a pound and a half of sulphur dried, and finely powdered, mix two pounds of saw-dust, &c. or, instead of that, rotten wood dried and powdered, with two pounds and three ounces of salt of tartar; whereof make powder to be kept close from the air.

It is also to be observed, that in making *pistol-powder*, if you would have it stronger, it should be stirred up several times while in the mortar, and moistened with water distilled from orange or lemon peels, or some other oily vegetable substance in an alembic, and then beaten for twenty hours, as aforesaid.

Cherry-powder is of so much greater force than white in dust or meal, that it is generally concluded the larger grains are stronger than the smaller: for which reason, *cannon-powder* is granulated larger than other powders; and therefore *powder* in loading should not be beat home into the piece, so as to bruise the grains. Powder is smoothed for small arms by the following operation: a hollow cylinder or cask is mounted on an axis, turned by a wheel; this cask is half filled with powder, and turned for six hours, and thus by the mutual friction of the grains of powder it is smoothed. The fine mealy part thus separated or worn off from the rest is again granulated. There are several ways to prove the goodness of *gunpowder*: 1. By sight; for if it be too black, it is too moist, or has too much charcoal in it; so also if rubbed upon white paper, it blackens it more than good *powder* does: but if it be of a kind of azure colour, somewhat inclining to red, it is a sign of good *powder*. 2. By touching; for if in crushing it with your fingers ends, the grains break easily, and turn into dust, without feeling hard, it has too much coal in it; or if in pressing under your fingers upon a smooth hard board, some grains feel harder than the rest, or, as it were, dent your fingers ends, the sulphur is not well mixed with the nitre, and the *powder* is naught. 3. By burning, wherein little heaps of powder are laid on *white* paper three inches or more asunder, and one of them fired; which, if it only fires all away, and that suddenly, and almost imperceptibly, without firing the rest, and makes a small thundering noise, and a white smoke arises in the air almost like a circle, the *powder* is good; if it leaves black marks, it has too much coal, or is not well burnt: if it leaves a greatness, the sulphur or nitre are not well cleansed or ordered. Again, if two or three corns be laid on paper an inch distant, and fire be put to one of them, and they all fire at once, leaving no sign behind, but a white smoky colour in the place, and the paper not touched, the *powder* is good. So also if fired in a man's hand, and it burns not, but if black knots appear, which burn downwards in the place where proof was made, after firing, it is not strong enough, but wants nitre. The method most commonly followed for this purpose, here with us, says Mr. Robins, is to fire a small heap of it on a clean board, and to attend nicely to the flame and smoke it produces, as likewise to the marks it leaves behind on the table; from all which instructive particulars the merit of the *powder* is ascertained with great accuracy, as is pretended: but besides this uncertain method, which how much soever it may be practised, none will undertake seriously to defend, there are, on particular occasions, other contrivances made use of, all which bear some analogy to the common powder-triers, sold at the shops: only they are more artfully fabricated, and instead of a spring they move a weight, which is a more certain and equal power.

The method of *proving gunpowder*, as practised by our board of ordnance, is to take out of several barrels a measure, of about the size of a thimble, which is spread upon a sheet of fine writing-paper, and then fired; if the inflammation is very rapid, the smoke rises perpendicularly, and the paper is neither burnt nor spotted. the *powder* is judged to be good: then two drams of the same *powder*, being exactly weighed, are put into a machine, called *eprouvette* or *gunpowder* prover, which if it raises a weight of 24lb. to the height of 3½ inches, it is received into the king's magazines: and is hence called *ordnance* or *government-powder*.

But these machines, says Mr. Robins, though more perfect than the common powder-triers, are yet liable to great irregularities; for as they are all moved by the instantaneous stroke of the flame, and not by its continued pressure, they do not determine the force of the fired powder with that certainty and uniformity which were to be desired in these kinds of trials: and therefore, the method followed by the French, in the receiving of powders from the makers, seems to be much better. Their practice is thus:

They have, in each magazine, a small mortar cast with its bed, according to a determined pattern, which is the same throughout the kingdom: this mortar is always pointed at 45°, and it contains just three ounces of powder; and it is a standing maxim, that no powder can be received into their store, unless three ounces of it, placed in the chamber of this mortar, throw a solid ball of 3¼ inches diameter to the distance of at least 35 French fathom. But if each barrel of powder was to be proved in this manner, the trouble of changing the mortar, &c. would be intolerable, and the delay so great, that no business of this kind could ever be finished. The method by firing against a pendulum, in the manner mentioned under the head GUNNERY, seems a readier way; but still it requires some nicety and time, which if were to be wished could be obviated. Robins's Mathemat. Tracts, vol. i. p. 121.

To recover damaged *powder*, the method of the *powder* merchants is this; they put part of the *powder* on a sail-cloth, to which they add an equal weight of what is really good; and with a shovel mingle it well together, dry it in the sun, and barrel it up, keeping it in a dry and proper place.

Others again, if it be very bad, restore it by moistening it with vinegar, water, urine, or brandy; then they beat it fine, scarce it, and to every pound of *powder* add an ounce, an ounce and an half, or two ounces (according as it is decayed), of melted salt-petre; and afterwards these ingredients are to be moistened and mixed well, so that nothing may be discerned in the composition; which may be known by cutting the mass, and then they granulate it as aforesaid.

In case the *powder* be in a manner quite spoiled, the only

way

way is to extract the salt-petre with water, according to the usual manner, by boiling, filtrating, evaporating, and cryſtallizing; and then, with freſh ſulphur and charcoal, to make it up anew again.

Perſons keeping more than 200 lb. weight of *gunpowder* at one time, within the cities of London and Weſtminſter, or their ſuburbs, &c. are liable to forfeitures if it be not removed; and juſtices of the peace may iſſue warrants to ſearch for, ſeize, and remove the ſame, 5 and 11 Geo. I. and 5 Geo. II. cap. 20. All the acts relating to the making, keeping, and carrying of *gunpowder* are reduced into one, by 12 Geo. III. cap. 61.

GUN-SHOT *wounds*. See WOUND.

GUNTER's LINE, called alſo *line of lines*, and *line of numbers*, is a graduated line uſually placed on ſcales, rules, ſectors, &c.

This line conſiſts of the logarithms transferred upon a ruler, from the tables, by means of a ſcale of equal parts, ſo as to anſwer much the ſame purpoſes, inſtrumentally, as the logarithms themſelves do arithmetically. What the logarithms do by addition and ſubtraction, is done in this line by turning a pair of compaſſes this way and that.

This line has been contrived various ways, for the advantage of having it as long as poſſible. As, firſt, on the two-feet ruler, contrived by Edmund Gunter, and called *Gunter's ſcale*; whence alſo the line itſelf took its popular denomination *Gunter's line*.

After this, Wingate doubled the line, or laid it together, ſo as one might either work right on, or across. Then it was projected in a circle, by Oughtred, and made to ſlide by the ſame author: and laſtly, it was projected in a kind of ſpiral, by Brown.

The method of uſing or applying, is much the ſame in all; except that in Gunter's and Wingate's way, common compaſſes are uſed: in Oughtred's and Brown's flat compaſſes, or an opening index and in ſliding rules, no compaſſes at all.

Deſcription of GUNTER's *line*. The whole length of this line is divided into two equal intervals, uſually called radiuſes; the firſt begins at the left-hand with the number 1; the middle point between the two radiuſes, where the firſt ends and the ſecond begins, is alſo marked with number 1; and the end of the ſecond radius, which terminates the line at the right-hand end, is marked with the number 10, againſt which are inſcribed the letters *mm*. Each of theſe equal radiuſes or intervals is divided into 9 equal ſpaces, marked 2, 3, 4, 5, 6, 7, 8, 9: but the ſpaces in one radius are exactly of the ſame lengths with the ſpaces alike marked in the other radius; each of theſe 9 unequal ſpaces are ſubdivided, firſt into ten unequal, and then each of theſe into two or more parts, ſuch as thoſe ſpaces can conveniently contain. If the left-hand 1 ſtands for the number one, the middle 1 repreſents the number 10, and the 10 at the right-hand end ſtands for the number 100, then the figures 2, 3, 4, &c. in the firſt radius ſtand for the numbers 2, 3, 4, 5, 6, 7, 8, 9; and the like figures in the ſecond radius ſtand for the numbers 20, 30, 40, 50, 60, 70, 80, and 90; and the ten firſt ſubdiviſions in the ſpaces of the ſecond radius ſtand for the reſpective units between the marked ſpaces. If the left-hand 1 be called 10, the middle 1 ſtands for 100, and the 10 at the right-hand ſtands for 1000; the ſeveral ſpaces and ſubdiviſions in the firſt interval are then to be eſtimated as thoſe were eſtimated in the ſecond radius, when the right-hand end ſtood for 100; but now, in the ſecond interval, the firſt ſubdiviſions in the ſpaces ſtand for hundreds, and the leſſer diviſions of theſe ſtand for ſuch parts of 100, as there are parts introduced; thus, where only 2 of the laſt ſubdiviſions can be introduced, each ſtands for 50; where 4 can be contained, each ſtands for 25; if 5 are put in, each ſtands for 20; and where 10 are introduced, each ſtands for 10; again, if the firſt 1 be called 100, the ſecond 1 ſtands for 1000, and the 10 at the end ſtands for 10000, &c. if the firſt 1 ſtands for $\frac{1}{10}$, the ſecond 1 ſtands for 1, and the 10 at the end ſtands for 10; and in this caſe, the numbered diviſions in the ſecond radius ſtand for the units between 1 and 10; the firſt ſubdiviſions ſtand for tenth-parts of unity, and the ſecond ſubdiviſions ſtand for the parts of tenths, according to the number of theſe ſecond ſubdiviſions, &c. ſo that whatever values are put upon any diviſion or ſubdiviſion in the ſecond radius, the value of the correſponding diviſion in the firſt radius will be only a tenth part, and *vice verſâ*: thus, if the diviſion marked 5 in the ſecond radius ſtands for 5000, or 500, or 50, or $\frac{5}{10}$, &c. then the 5 in the firſt radius will ſtand for 500, or 50, or 5, or $\frac{5}{10}$ or $\frac{5}{100}$ &c.

Conſtruction of GUNTER's *line*. From a ſcale of equal parts, accurately divided, and of ſuch a length, that 20 of the primary diviſions ſhall make the whole length of the intended ſcale of numbers, take the firſt 10 of theſe diviſions, and lay this diſtance down twice on the logarithmic ſcale, making 2 equal intervals; marking the firſt point 1, the ſecond 1 (or rather 10), and the third 10 (or rather 100). From the ſame ſcale take the diſtances expreſſed by the 3 firſt figures of the logarithms of the numbers 2, 3, 4, 5, 6, 7, 8, 9 reſpectively, rejecting the indices, viz. 301, 477, 602, 699, 778, 845, 903, 954; lay theſe diſtances on each interval of the logarithmic ſcale, between the marks 1 and 10, 10 and 100, reckoning each diſtance from the beginning of its interval, viz. from 1 and from 10, and mark theſe diſtances with the figures 2, 3, 4, 5, 6, 7, 8, 9, in order. The diſtances expreſſing the logarithms of the numbers between 10 and 20, 20 and 30, 30 and 40, 40 and 50, 50 and 60, 60 and 70, 70 and 80, 80 and 90, 90 and 100, rejecting the indices, are alſo to be taken from the ſcale of equal parts, and laid on the logarithmic ſcale, in each of the primary intervals between the marks 1 and 2, 2 and 3, 3 and 4, 4 and 5, 5 and 6, 6 and 7, 7 and 8, 8 and 9, 9 and 10, reſpectively, reckoning each diſtance from the beginning of its reſpective primary interval. The laſt ſubdiviſions of the ſecond primary interval are to be divided into others, as many as the ſcale will admit of, by laying down the logarithms of ſuch intermediate diviſions.

The accuracy of the diviſion of this line may be determined by taking with a pair of compaſſes the diſtance between the diviſions marked with the numbers 1 and 2, which will reach from 2 to 4, from 4 to 8, from 8 to 16, &c. and from 1½ to 3, from 3 to 6, from 6 to 12, &c. alſo from 1¼ to 2½, from 2½ to 5, from 5 to 10, &c. or the ſame diſtance applied to any one of the diviſions between 1 and 2, will reach from thence to diviſions found always by doubling the laſt number. The ſame work may be done without compaſſes, by moving the ſlider till the left-hand 1 on the line of numbers ſtands againſt the diviſion expreſſing any number counted on the fixed line of numbers, then will the diviſions 2, 4, 8, 16, 32, &c. on the ſlider ſtand againſt the reſpective diviſions on the fixed line, which will repreſent twice, 4 times, 8 times, 16 times, &c. the diviſion againſt which the 1 on the ſlider was ſet. Theſe diviſions on the fixed line which correſpond to the diviſions 2, 4, 8, 16, &c. on the ſlider will be cut by the edge of the braſs index by moving it along to the diviſions on the ſlider.

To find a diviſion or point in the line of numbers anſwering to any given number. Let the number be 654: ſeek in the ſecond radius between the figures 6 and 7 for the fifth of the firſt ſubdiviſions, between this fifth and ſixth are 4 ſecond ſubdiviſions, each of which anſwers to 2½ units; then will a point taken a little nearer to the ſecond than the firſt of theſe ſmaller ſubdiviſions anſwer to the number 654 very nearly; the correſponding point in the firſt radius anſwers to the number 654, and if this point in the firſt radius anſwered to 654, the like point in the ſecond would anſwer to 6540. Let the number be 168: in the ſecond radius between 1 and 2, ſeek the ſixth of the larger ſubdiviſions, and the point will fall between this ſixth and the ſeventh of the ſubdiviſions, and the true point will be on the eighth of the ſmaller ones, which will repreſent the number 168; the like diviſion in the firſt radius repreſents 16.8. but if this ſtood for 168, then the like diviſion in the ſecond radius ſtands for 1680.

To find a fraction, conſider that the line properly only expreſſes decimal fractions, as thus, $\frac{1}{10}$, or $\frac{2}{10}$, or $\frac{3}{10}$, and nearer the rule cannot well come than one inch, one tenth, one hundredth, or one thouſandth part of an inch: ſo that for other fractions, as quarters, half quarters, &c. you muſt either eſtimate them as near as you can reaſonably, or elſe reduce them into decimals.

Uſe of GUNTER's LINE. 1. *Two numbers being given, to find a third, geometrically proportional to them; and to three a fourth number, to a fourth, a fifth, &c.* Extend the compaſſes on the line from one number to another; then if that extent be applied upwards and downwards, as you would either increaſe or diminiſh the number from either of the numbers, the moveable point will fall on the third proportional number required. Again, the ſame extent, applied the ſame way from the third, will give a fourth; and from the fourth, a fifth, &c.

For example: let the two numbers 2 and 4 be propoſed to find a third proportional, &c. to them; extend the compaſſes on the firſt part on the line of numbers, from 2 to 4; which done, and the ſame extent being applied upwards from 4, the moveable point will fall on 8, the third proportional required; and from 8 it will reach to 16, the fourth proportional; and from 16 to 32, the fifth, &c. Contrariwiſe, if you would diminiſh, as from 4 to 2, the moveable point will fall on 1, and from 1 to $\frac{1}{2}$, or .5 and from .5 to .25, &c.

But generally in this, and in moſt other works, make uſe of the ſmall diviſions in the middle of the line; that you may the better eſtimate the fractions of the numbers you make uſe of; for how much you miſs in ſetting the compaſſes to the firſt and ſecond term, ſo much the

more

more you will err in the fourth; therefore the middle part will be most useful. For example, as 8 to 11, so is 12 to 16.5, if you imagine one integer to be divided into ten parts, as they are on the line on a two-foot rule. See SLIDING-*rule*.

2. *One number being given to be multiplied by another, to find the product.* Extend the compasses from 1 to the multiplicator; and the same extent, applied the same way from the multiplicand, will make the moveable point fall on the product: thus, if 6 be given to be multiplied by 5, extending the compasses from 1 to 5, the same extent will reach from 6 to 30, the product sought.

3. *One number being given to be divided by another, to find the quotient.* Extend the compasses from the divisor, e. g. 25, to 1, and the same extent will reach from the dividend, e. g. 750, to the quotient 30; or extend the compasses from the divisor to the dividend, the same extent will reach the same way from 1 to the quotient.

4. *To reduce a vulgar fraction into a decimal.* In this case, the denominator of the given fraction is to the numerator as 1 is to the decimal required: let the fraction be $\frac{7}{8}$, extend the compasses from 8 to 7, and this extent laid the same way from 1 will reach to .875 the required decimal.

5. *Three numbers being given, to find a fourth in direct proportion.* Extend the compasses from the first number, suppose 7, to the second, v. g. 22: that done, the same extent, applied the same way from the third, 28, will reach to the fourth proportional sought, viz. 44, which is the circumference of a circle, whose diameter is 28, by Archimedes's proportion.

6. *Three numbers being given, to find a fourth in inverse proportion.* Extend the compasses from the first of the given numbers, suppose 60, to the second of the same denomination, viz. 30, if that distance be applied from the third number backwards, 5, it will reach to the fourth number sought, 2.5.

7. *Three numbers being given, to find a fourth in duplicate proportion.* If the denominations of the first and second terms be lines, extend the compasses from the first term to the second, of the same denomination: this done, that extent being applied twice the same way from the third term, the moveable point will fall on the fourth term required. E. g. the area of a circle, whose diameter is 1, being 0.78539, what will the content of a circle be, whose diameter is 28? Apply the extent from 1 to 28, the same way from .785 twice, the moveable point will fall on 616, the fourth proportional or area sought.

8. *Having three numbers given, to find a fourth in triplicate proportion.* In this case the first and second terms must be always in the same denomination: e. g. If an iron bullet of 4 inches diameter, weighs 9 pounds, what is the weight of another of the same metal, whole diameter is 6 inches: the extent from 4 to 6, laid on three times from 9 will reach to 30, 3 pounds.

9. *To find a mean proportional between two given numbers.* Bisect the distance between the given numbers, the point of bisection will fall on the mean proportional sought. Thus the quotient of the two extremes divided by one another, extremes being 8 and 32, the middle point between them will be found 16.

10. *To find two mean proportionals between two given lines.* Trisect the space between the two given extremes; the two points of trisection will give the two means required; thus, if 8 and 27 be the two given extremes, the two means will be found 12 and 18.

11. *To find the square root of any number under* 1000000. The square root of a number is always a mean proportional between 1, and the number whole root is required; yet with this general caution, that if the figures of the number be even, that is 2, 4, 6, 8, 10, &c. then you must look for the unit at the beginning of the line, and the number in the second part or radius, and the root in the first part; or rather, reckon 10 at the end to be unity; and then both root and square will fall backwards towards the middle in the second length or part of the line. If they be odd, the middle 1 will be most convenient to be counted unity, and both root and square will be found from thence forward towards 10. On this principle the square root of 9 will be found to be 3; the square root of 64, to be 8, &c.

12. *To find the cube root of any number under* 1000000000. The cube root is always the first of two mean proportionals between 1 and the given number, and therefore to be found by trisecting the space between them. Thus the cube root of 1728 will be found 12; the root of 17280, nearly 26; the root of 172800 almost 56.

Though the point on the line representing all the square numbers is in one place, yet, by altering the unit, it produces various points and numbers for their respective roots. The rule to find this is, to put dots, or to suppose them put, over the first figure to the left hand, the fourth figure, the seventh, and the tenth: if then the last dot on the left-hand falls on the last figure, as it does in 1728, the unit must be placed at 1 in the middle of the line, and the root, the square, and the cube, will all fall forward to the end of the line.

If it fall on the last but 1, as in 17280, the unit must be placed at 1 in the beginning of the line, and the cube in the second length; or the unit may be placed at 10 at the end of the line, and then the root, the square, and cube, will all fall backwards, and be found in the second part between the middle and end of the line. Thus will the cube root of 8 be found 2; and that of 27, 3; that of 64, 4; that of 125, 5; that of 216, 6, &c.

We may observe in general, with regard to these two last problems, that the line of numbers is only a line of logarithms, and any logarithm divided by 2, quotes the logarithm of the square root of its natural number; if divided by 3, it gives the logarithm of the cube root, and if by 6, it gives the logarithm of the sixth power, &c. Hence the roots of all powers may easily be found on the line of numbers, by dividing the distance or extent on the scale, between unity and the number given to be extracted, into as many equal parts as are directed by the index of that power, i. e. the square into 2 equal parts; the cube into 3; the biquadrate into 4, &c. which half, third, fourth, &c. part, taken in the compasses and laid off from unity (observing well the notation, or value of the figures) will give the respective root required.

For the particular use of *Gunter's line* in the measuring of timber, gauging of vessels, &c. See SLIDING-RULE.

For other uses in geometry, trigonometry, &c. See SECTOR, and GUNTER'S *scale*.

GUNTER'S *quadrant* is a quadrant made of wood, brass, or some other substance; being a kind of stereographic projection on the plane of the equinoctial, the eye supposed in one of the poles: so that the tropic, ecliptic, and horizon, form the arches of circles, but the hour-circles all curves, drawn by means of several altitudes of the sun, for some particular latitude every day in the year.

The use of this instrument is to find the hour of the day, the sun's azimuth, &c. and other common problems of the globe; as also to take the altitude of an object in degrees.

See its description and use more at large under the article *Gunter's* QUADRANT.

GUNTER'S *scale*, also called by navigators absolutely, *The Gunter*, is a large plain scale, with divers lines thereon, of great use in working questions in navigation, &c. See SCALE and SAILING.

This instrument derives its name from its inventor, Mr. Edmund Gunter, who was professor of astronomy in Gresham college, and first published the scales of logarithms, numbers, lines, and tangents, in his description of the cross-staff, in 1624. The errors which had crept into *Gunter's scale*, by length of time and negligence in the fabrication of it, have been corrected by the late Mr. John Robertson, librarian to the Royal Society, and the instrument has been reconstructed, under his inspection and with his improvements, by Messrs. Nairne and Blunt, mathematical instrument makers in London. See a description of this instrument in its improved state by W. Mountaine, F. R. S. published in 1778.

On one side of the scale, represented *Tab. Trigonom. fig.* 1. are the lines of numbers, marked *numbers*; the line of artificial lines, marked *lines*; the line of artificial tangents, marked *tangents*; the line of artificial versed sines, marked *V. S.* the artificial lines of the rhumbs, marked *S. R.* the artificial tangents of the rhumbs, marked *T. R.* meridian line in Mercator's chart, marked *Merid.* and equal parts, marked *E. P.*

To which on the shorter scales of a foot long, are usually added lines of latitudes, hours, and inclinations of meridians. On the back side of the scale are the lines usually found on a plain scale.

The lines of artificial lines, tangents, and numbers, are so fitted on this scale, that by means of a pair of compasses, any problem, whether in right-lined or spherical trigonometry, may be solved very expeditiously, and with tolerable exactness; whence the instrument becomes extremely useful in all parts of mathematics where TRIGONOMETRY is concerned, as navigation, dialling, astronomy, &c.

The same lines are also occasionally laid down on rulers to slide by each other; hence called *sliding Gunters*; so as to be used without compasses; but he that understands how, to use them with, may, by what we have said of Everard's and Coggeshall's sliding rules, use them without. See SLIDING-*rule*.

The *Gunter's scale*, as it has been lately improved, is made 30 inches long, 2 inches broad, and about half

half an inch thick. One face contains the natural fcales; half the length of this face is filled with fcales of equal parts, which are denominated by the divifions of an inch, viz. fcales of 10, 12½, 15, 20, 25, 30, 35, 40, 45, 50, and the left-hand primary divifion of each fcale is divided into 10 equal parts, and alfo into 12 equal parts: on the other half of this face are put the feveral lines which conftitute the *plain* SCALE, fuch as the fcales of rhumbs, chords, fines, fecants, tangents and half-tangents, fitted to a radius of 2 inches; alfo the dialling fcales, viz. inclination of *meridians*, latitudes, chords, and hours, to a radius of 2 inches; and a fcale of chords and miles or longitude to a radius of 3 inches, and other fcales of chords and rhumbs to a radius of 1 inch. The breadth of the other face, which contains the logarithmic fcales, is divided into 12 parts, or fcales running nearly the whole length; nine of thefe fcales may be called fixed, and the other three moveable, being on a fliding piece of about 30¼ inches long, ¾ an inch broad, and of the thickneſs of the fcale. The order of thefe fcales, or lines is,

Fixed
1. A line of fine rhumbs, marked S. R.
2. A line of tangent rhumbs, marked T. R.
3. A line of verſed fines, marked V. S.
4. A line of fines, marked Sin.

Sliding
5. A line of fines, marked Sin.
6. A line of numbers, marked Num.
7. A line of tangents, marked Tan.

Fixed
8. A line of tangents, marked Tan.
9. A line of numbers, marked Num.
10. A line of meridian degrees to 50, marked Mer.
11. A line of meridian degrees from 50 to about 74, marked Mer.
12. A line of degrees of longitude, marked Lon.

Along this face an index or thin piece of braſs, about an inch broad, is contrived to ſlide, which going acroſs the edge of the fcales at right angles to it, will ſhew on the ſeveral lines the diviſions which are oppoſite to one another, although the lines are not contiguous. The apparatus at the right hand conſiſts of a braſs box and two ſcrews; the ſlider paſſes freely through the box, when the perpendicular ſcrew is eaſed and may be readily ſet by hand to the terms given; but for greater accuracy, and in order to keep the ſlider in its true poſition, move the perpendicular ſcrew, which by a ſub-ſpring will fix the ſlider in the box, and then by the motion of the horizontal ſcrew, the greateſt degree of accuracy poſſible may be obtained. Compaſſes may be uſed with this ſcale, as well as with the common *Gunter*, by firſt bringing the radius on the ſlider exactly in a line with the others on the right hand and fixing it there. In a convenient part of this inſtrament are marked 10 ſea-feet, each of which contains 13.8258 Engliſh inches, and each foot is divided into 12 equal parts, called ſea-inches. The method of forming and graduating the ſeveral lines on *Gunter's* ſcale is as follows: the conſtruction of the line of numbers has been already explained: for the line of logarithmic fines, it is to be obſerved, that this line terminates at 90 degrees, juſt againſt the 10 at the end of the line of numbers; and from this termination the degrees are laid backwards, or from thence towards the left; in order to obtain diviſions anſwering to theſe, ſeek in a table of logarithmic fines the numbers expreſſing the ARITHMETICAL *complements* of the ſeveral degrees, without the index, take theſe numbers from the ſcales of equal parts by which the line of numbers was formed, and apply them to the ſcale of lines from 90°. Then the arithmetical complements of the logarithmic fines (or the cofecants) abating the index of 10°, 20°, 30°, 40°, &c. are the numbers 76033, 46595, 30103, 19193, &c. and the equal parts anſwering to theſe numbers will give the diviſions for 10°, 20°, 30°, 40°, &c. and proceed in the ſame manner for the intermediate degrees. The arithmetical complement of the fine of 50° 44′ 21″ will be equal to 10 of the primary diviſions of the ſcale of equal parts, or to one interval in the logarithmic ſcale: ſo that a decreaſe of the index by unity anſwers to one interval; then a decreaſe of the index by 2 anſwers to 2 intervals, or the whole length of the logarithmic ſcale, which happens at the fine of 0° 34′ 23″; and the diviſions anſwering to the fine of a little above 3′, viz. 3′ 27″, will be equal to 3 intervals, and the fine of 21″ will be 4 intervals; and therefore all the fines between 90° and 0° 34′ are thoſe only, which can be put on this ſcale, the leſſer fines extending beyond this length. It has been uſual to inſert the diviſions to every 5′, as far as 10°; from 10° to 30°, the ſmall diviſions are made 15′ each; from 30° to 50°, every half degree is marked; from 50° to 70° only the whole degrees. On the improved ſcale the ſpace between 90° and 80° is too ſmall to admit of more than five diviſions; that neareſt to the 90° being the mark for 85°; between 80° and 60°, the diviſions are ſingle degrees; from 60° to 30° every degree and half degree are introduced; from 30° to 20° are degrees and third-parts, or every 20′; from 30° to 20° are degrees and quarters, or every 15′; and from 20° downwards are put in the degrees and ſixth parts of degrees. This line of fines is put the uppermoſt of the 3 on the ſlider, and alſo the loweſt on the upper part of the fixed ſcales, whereby the 2 ſcales of fines are contiguous.

For the line of tangents, it is evident, ſince the tangent of 45° is equal to the radius, or fine of 90°, that 45° on this ſcale will terminate directly oppoſite to 90° on the fines; and the ſeveral diviſions of this ſcale of logarithmic tangents are conſtructed in the ſame manner as thoſe of the fines, by applying their arithmetical complements backwards from 45° or towards the left hand. The degrees above 45° are to be counted backwards on the ſcale; thus, the diviſion at 40, repreſents both 40° and 50°, &c. In the new ſcale this line deſcends as low as 0° 34′ on the fines: the ſpace between 10° and 45°, and back again from 45° to 80° are large enough to admit of 4 ſpaces in each; and therefore, the ſubdiviſions between 10° and 80° extend to every 15 minutes; but the degrees under 10 and above 80 are each ſubdivided into 6 parts, of 10 minutes each. This line of tangents is, like that of fines, laid down twice on the new *Gunter*, once on the ſlider and once on the loweſt fixed part. The conſtruction of theſe lines of fines and tangents, above explained, depends on the following theorems in trigonometry: 1. The coſine is to the radius as the radius is to the ſecant. 2. The fine is to the radius as the radius is to the coſecant. 3. The tangent is to the radius as the radius is to the cotangent. From theſe theorems it appears, that, if the radius of the tables be ſuppoſed equal to 1, in either of the above caſes, one of the quantities will be equal to the quotient of unit divided by the other; but diviſion is performed by ſubtraction with logarithms, and the ſubtraction of a logarithm is the ſame as the addition of its arithmetical complement; conſequently, the logarithmic coſine and ſecant of the ſame degrees are the arithmetical complements of one another; and, as the arithmetical complement of any number is what that number wants of unity in the next ſuperior place, every natural fine and its arithmetical complement are together equal to radius. Therefore, ſince the fines begin at one end of the radius and terminate in 90° at the other end, in a ſcale of fines, the arithmetical complement of any fine or its cofecant, laid backwards from 90°, gives the diviſion for that fine: and the caſe will be the ſame in a ſcale of logarithmic fines. And as the logarithmic tangents and cotangents are the arithmetical complements of one another, the diviſions to the degrees both under and above 45, in a ſcale of logarithmic tangents, are equally diſtant from the diviſion of 45°; conſequently, the diviſions ſerving for the degrees under 45 will ſerve, by reckoning backwards, for thoſe above 45.

For the verſed fines: from the ſcale of equal parts take the arithmetical complements of the logarithmic coſines, or the ſecums of the complements, of 5, 10, 15, 20, 25, 30, &c. degrees, rejecting the indices; and the double of theſe diſtances will give the diviſions, on the propoſed ſcale of verſed fines, expreſſing 10, 20, 30, 40, 50, 60, &c. degrees, continued and divided according to the length of the ſcale: otherwiſe, having a table of logarithmic verſed fines to 180°, ſubtract each logarithmic verſed fine from that of 180 degrees, and lay the remainders ſucceſſively taken from the ſcale of equal parts on the ruler backwards from the common termination. This line of verſed fines begins at 0°, and runs thence towards the left hand to about 168°; one extremity of this line has the ſame termination with the lines of numbers, fines and tangents, where the mark for 180° ſhould be placed; but as the ſcale begins at this place, and the diviſions may be ſuppoſed to go backwards, therefore 0 is put for the beginning, and the numbers thence proceeding through 10, 20, &c. towards the left are only the ſupplements of the verſed fines themſelves.

On the new ſcale, the diviſions under 10° fall too cloſe to one another to be diſtinguiſhed; from 10° to 60° every ſingle degree is introduced; from 60° to 100°, every degree and half degree; from 100° to 130°, every degree and third of a degree; from 130° to 150° every degree and quarter of a degree; and above 150° every degree and ſixth part of a degree.

The conſtruction of the lines of fine rhumbs and tangent rhumbs is eaſily underſtood; as theſe are formed by taking the fines and tangents of the degrees and minutes anſwering to the rhumbs and parts of rhumbs from the lines of fines and tangents reſpectively, and laying them down on their proper ſcales.

The ſcale of longitude is alſo a line of equal parts repre-

forming the lengths of degrees of longitude, or of the degrees taken on the equator, in which the reckoning of a ship's longitude at sea is kept; each degree, in the new scale, being about half an inch, and subdivided into ten parts of six minutes each.

The scale of meridional degrees is formed from the preceding, and shews the length of the degrees of latitude, relative to the correspondent degrees of longitude; the degrees being gradually increased in the same proportion as the degrees of longitude on the globe diminish from the equator towards either pole: and each of them is subdivided into ten parts of six minutes each.

This scale comprehends, in the improved *Gunter*, two lengths of the ruler; the first length extends from the beginning at 0° on the right, and proceeds thence towards the left as far as 50°; and begins again on the right-hand at 50°, and goes on to the left as far as 75°, which is as far as most navigators extend, except those of the Greenland fisheries.

GUNTER's *scale, use of.* 1. *The base of a right-lined, right-angled triangle being given, 30 miles, and the oppose angle thereto 20 degrees, to find the length of the hypothenuse.* The trigonometrical canon or proportion is thus: as the sine of the angle, 20 degrees, is to the base, 30 miles, so is the radius to the length of the hypothenuse. Set one foot of the compasses, therefore, on the 20th degree of the line of the sines, and extend the other to 30 on the line of numbers; and the compasses remaining thus opened, set one foot on 90 degrees, or the end of the line of sines, and extend the other on the line of numbers: this will give 68 miles and a half for the length of the hypothenuse sought.

2. *The base of a right-angled triangle being given, 25 miles, and the perpendicular 15, to find the angle opposite to the perpendicular.* As the base, 25 miles, is to the perpendicular, 15 miles, so is the radius to the tangent of the angle sought. Extend the compasses, then, on the line of numbers, from 15, the perpendicular given, to 25, the base given; and the same extent will reach the contrary way, on the line of tangents, from 45 degrees to 31 degrees, the angle sought.

3. *The base of a right-angled triangle being given, suppose 20 miles, and the angle oppose to the perpendicular 50 degrees, to find the perpendicular.* As radius is to the tangent of the given angle, 50 degrees, so is the base, 20 miles, to the perpendicular sought. Extend the compasses then on the line of tangents, from the tangent of 45 degrees to the tangent of 50 degrees; and the same extent will reach on the line of numbers the contrary way, from the given base, 20 miles, to the required perpendicular, 23¾ miles.

Note, the extent on the line of numbers is here taken from 20 to 23¾ forwards: that the tangent of 50 degrees may be as far beyond the tangent of 45 degrees, as its complement 40 degrees wants of 45 degrees.

4. *The base of a right-angled triangle being given, suppose 35 miles, and the perpendicular 48 miles, to find the angle opposite to the perpendicular.* As the base, 35 miles, is to the perpendicular, 48 miles, so is radius to the tangent of the angle sought. Extend the compasses from 35 on the line of numbers to 48, the same extent will reach the contrary way on the line of tangents, from the tangent of 45 deg. to the tangent of 36 deg. 5 min. or 53 deg. 55 min. To know which of those angles the angle sought is equal to, consider that the perpendicular of the triangle being greater than the base, and both the angles opposite to the perpendicular and the base making 90 deg. the angle opposite the perpendicular will be greater than the angle opposite to the base; and consequently the angle, 53 deg. 55 min. will be the angle sought.

5. *The hypothenuse of a right-angled spherical triangle being given, suppose 60 degrees, and one of the sides 20 degrees, to find the angle opposite to that side.* As the sine of the hypothenuse 60 deg. is to radius, so is the sine of the given side 20 deg. to the sine of the angle sought. Extend the compasses on the line of sines from 60 deg. to the radius, or 90 deg. and the same extent will reach on the line of sines the same way, from 20 deg. the given side, to 23 deg. 30 min. the quantity of the angle sought.

6. *The course and distance of a ship being given, to find the difference of latitude and departure.* Suppose a ship sails from the latitude of 50 deg. 10 min. north, S. S. W. 48.5 miles; as radius is to the distance sailed 48.5 miles, so is the sine of the course, which is two points, or the second rhumb from the meridian, to the departure. Extend the compasses from 8 or 90 deg. on the artificial line rhumb-line to 48.5 on the line of numbers, the same extent will reach the same way from the second rhumb, on the line of artificial lines of the rhumbs, to the departure swelling 18.6 miles.

Again, as radius is to the distance sailed 48.5 miles, so is the course of the course 67 deg. 30 min. to the difference of latitude. Extend your compasses from the radius, on the line of lines, to 48.5 miles on the line of numbers; the same extent will reach the same way, from 67 deg. 30 min. on the line of lines, to 44.8 on the line of numbers; which converted into degrees by allowing 60 miles to a degree, and subtracted from the given north latitude 50 deg. 10 min. leaves the remainder 49 deg. 25 min. the present latitude.

This problem may be easily solved with the slider, by setting 48.5 on the slider against 90 on the line of sines, or 8 on the line of sine-rhumbs; then against two points, or 22 deg. 30 min. on the line of sines, is 18.6, the departure; and against two points on the line of sine-rhumbs, or 22 deg. 30 min. on the line of sines, is 44.8 on the slider, for the difference of latitude.

7. *The difference of latitude and departure from the meridian being given, to find the course and distance.* A ship from the latitude 50 deg. north, sails north-eastward till she has altered her latitude 1 deg. 10 min. or 70 miles, and is departed from the meridian 57.5 miles, to find the course and distance. As the difference of latitude, 70 miles, is to radius, so is the departure, 57.5 miles, to the tangent of the course, 39 deg. 20 min. or three points and a half from the meridian. Extend the compasses from the fourth rhumb, on the line of artificial tangents of the rhumbs, to 70 miles on the line of numbers, the same extent will reach from 57.5, on the line of numbers, to the third rhumb and a half on the line of artificial tangents of the rhumbs.

Again, as the sine of the course, 39 deg. 20 min. is to the departure 57.5 miles, so is the radius to the distance 90.6 miles. Extend the compasses from the third rhumb and a half, on the artificial lines of rhumbs, to 57.5 miles on the line of numbers; that extent will reach to the sine of the eighth rhumb, on the lines of the rhumbs, to 90.6 miles on the line of numbers.

8. *Three sides of an oblique spherical triangle being given, to find the angle opposite to the greatest.* Suppose the side A B, *Tab. Trig. fig.* 2. be 40 deg. the side B C 60 deg. and the side A C 96 deg. to find the angle ABC. Add the three sides together, and from half the sum subtract the greater side A C, and note the remainder: thus, e. gr. the sum will be 196 deg. half of which is 98 deg. from which subtracting 96 deg. the remainder is 2 deg.

Then extend the compasses from the sine of 90 deg. to that of the side AB 40 deg. and applying this extent to the sine of the other side B C 60 deg. you will find it reach to a fourth line 34 degrees.

Again, from this fourth line extend the compasses to the sine of the half sum, i. e. the sine of 72 deg. the supplement of 98 deg. to 180; this second extent will reach from the sine of the difference 2 deg. to the sine of 3 deg. 24 min. against which, on the versed lines, stand 151 deg. 50 min. the quantity of the angle sought.

GÜNWALE, or GUNNEL *of a ship*, is that piece of timber which reaches on either side of the ship, from the half-deck to the fore-castle, being the uppermost bend, which finishes the upper works of the hull in that part, and wherein they put the stanchions which support the waste-trees. This is called the *gunwale*, whether there be guns in the ship or not. The lower part of any port, where any ordnance are, is also termed the *gunwale*.

GUR, or GUHR, in *Mineralogy*, a word used to express a fluid matter looking like milk, but reduced sometimes, by evaporation, to the consistence of honey, and appearing in form of a white sediment. It is common in the mines of Sweden, and in some other places; it is sometimes calcareous or chalky, and sometimes metallic, and by dropping forms stalactitical concretions. Bromell. de Lapid.

GURGEATIO, a name by which some authors have called that peculiar disease so fatal in England at one time, and commonly called *sudor Anglicus*, from the violent profusions of sweat which appeared immediately on being seized with it.

GURGIPTING, in *Falconry*, a term used when a hawk is stiff and choaked up. Dict. Rust.

GURGULIO, in *Natural History*, a name given by the ancients to a peculiar class of *scarabei* or beetles; the characters of which are, that they have not a short head like the other beetles, but a long one, forming a trunk in the manner of the common flies; in this the horns or antennæ of the creature are lodged. These are divided by Lister into two kinds; the one having only one joint in this promuscis or snout, and that placed in or near the middle; the other having several placed near the end. Of the first kind we have only two species. Of the other kind, in which the promuscis has several joints at the end, we have five species; and in all these, as well as in the former, the antennæ are inserted in the promuscis.

GURNARD, a sea fish, of which there are several species.

The

The characters are, that they have a ſloping noſe, a head covered with ſtrong bony plates, ſeven branchioſtegous rays, and three ſlender appendages at the baſe of the pectoral fins: and it is added that they can make a ſort of noiſe; hence the Latins called them *aculi*, from their imitating, in ſome ſort, the voice of the cuckow.

The Engliſh *gurnard*, which is their common name, ſeems alſo taken from their grunting; and one ſpecies of them is called the *piper*, LYRA, or the *muſician*, from its reſembling with its voice a ſmall pipe.

GURNARD, *the grey*, or TRIGLA *gurnardus* of Linnæus, is the moſt common kind; it is frequent in the Britiſh ſeas and elſewhere, and eſteemed a very well-taſted fiſh. This is of a long ſlender ſhape; its back is of a duſky green marked with black ſpots, and with yellow and white ones; the ſide-lines are dotted and rough; under theſe the ſides are of a pale colour, and variegated with numerous white ſpots; the belly is white; the head is large, and is covered with a ſort of bony plates, the upper one of which runs out behind into two ſharp prickles; the ſnout has alſo two horns, each having three little knots or teeth, and there are alſo two others before each eye; the mouth is large, and the teeth very ſmall; its gill-fins are not ſo large as in many others of this kind; and its back has a cavity between two rows of pointed bones: the tail is bifurcated. This fiſh, which bites eagerly at a red rag, is uſually taken with the hook in deep water; but it is found ſometimes ſporting near the ſurface. They are often caught of the length of two feet and a half.

GURNARD, *the red*, is an Engliſh name given to the TRIGLA *cuculus* of Linnæus, called by authors in general the *cuculus*, and by ſome *oscyra*, *lyra*, and *aspo*. It is properly a ſpecies of trigla, according to the new Artedian ſyſtem, and is diſtinguiſhed from all the other ſpecies, by the name of the wholly red trigla with the ſnout lightly divided into two horns, and the operculs of the gills ſtriated. This is an inſtance of the value of the Artedian names; this conveying ſo good an idea of the fiſh, that it cannot be miſtaken, and the others conveying none at all. See *Tab. of Fiſhes*, N° 9. This red ſpecies is what we ſometimes ſimply call the *gurnard*, and ſometimes the *rotchet*.

GURNARD, *ſapphirine*, *trigla hirundo* of Linnæus, or *tub-fiſh*, is diſtinguiſhed from the other ſpecies of *gurnard* by the breadth and colours of the pectoral fins, which are very broad and long, of a pale green, moſt beautifully edged and ſpotted with rich deep blue. The dorſal fins are lodged between two rows of ſpines, of a ſerrated form; the back is of a greeniſh caſt: the ſide-line is rough; the ſides are tinged with red, and the belly white; the pupil of the eye is green, and on the inner corner of each are two ſmall ſpines. Theſe fiſh are found on the coaſt of Cornwall.

GURNARD, *yellow*. See DRACUNCULUS.

GUROUNDI, in *Ornithology*, the name of a ſmall Braſilian bird, frequently kept in cages for its ſinging, and more commonly called TEITEI.

GUSSET, in *Heraldry*, denotes one of the ABATEMENTS of honour, appropriated to laſcivious, effeminate, or wanton perſons. It is formed of a line drawn from the dexter or ſiniſter angle of the chief, and deſcending diagonally to the chief point; from whence another line falls perpendicularly upon the baſe: as repreſented *Tab.* II. *Herald. fig.* 67.

GUST. See TASTE.

GUST is uſed by Bracton, and other ancient writers, for ſtranger or gueſt, who lodges with a perſon the ſecond night. See UNCUTH.

In the laws of St. Edward, publiſhed by Lambard, the word is written *geſt*.

GUST denotes a ſudden and violent ſquall of wind, burſting from the hills upon the ſea, ſo as *to* endanger the ſhipping near the ſhore. Theſe are peculiar to ſome coaſts, as thoſe of South Barbary and Guinea.

GUSTATION. See TASTING.

GUSTO *grand*. See GRAND.

GUTS. It is obſerved, in the diſſections of many of the beaſts of prey, that the *guts* are very remarkably ſhort in compariſon of thoſe of other animals. The lion and the lynx are of this number; the *guts* being in theſe only of three times the length of the body. This argues ſpeedy digeſtion, and a great voracity of the creature. See INTESTINES.

GUTTA, a Latin term for what in Engliſh we call DROP.

GUTTÆ *Anglicanæ*, *Engliſh drops*, *volatile Engliſh drops*, or *Goddard's drops*, a name of a medicinal liquor prepared from divers ingredients, formerly ſuppoſed to be of ſovereign efficacy againſt coagulations of the blood, malignant fevers, and particularly the ſmall-pox, obſtructions, epilepſies, drowſy diſeaſes, vapours, &c.

The inventor of theſe celebrated drops was Dr. Goddard, a phyſician of London. The ſecret of their compoſition was purchaſed by King Charles II. at the price of 50,000*l.* ſterl. whence they were denominated *guttæ Anglicanæ*.

This coſtly receipt we ſhall here gratify the reader with *à meliorem methi*: "Take five pounds of human "cranium, of a perſon hanged, or dead of ſome violent "death, two pounds of dried vipers, two pounds of "hart's-horn, and two of ivory; mince the whole ſmall, "put it in two or three retorts, and diſtil it in a reverb "beratory furnace, with the ſame precautions as are "ordinarily uſed in diſtilling hart's-horn and vipers, to "extract their volatile ſalt. When the veſſels or re"ceivers are cold, unlute them, and ſhake them well, "in order to looſen the volatile ſalts from the ſides of "the veſſels. Pour the whole in a large glaſs cucurbit, "and filtrate it through a brown paper, in order to ſe"parate the oil which is here uſeleſs: put the filtrated "liquor in a glaſs retort, and place it in a ſand heat, "and fit another glaſs retort thereto, as a recipient; take "care all things be well luted, and make a cohobation "of the ſaid matters at three times. But, by the way, "add all the ſalt before ſeparated from the receivers: "and after the ſaid three cohobations, unlute the re"torts, and pour the whole into a matraſs with a long "neck, to which fix a ſuitable capital, and a receiver; "lute all the joinings on each ſide with a wet bladder "and ſet the veſſel in a ſand-heat: by this means, the "volatile ſalt will be ſublimed, and ſtick to the capital "and upper part of the matraſs. Continue the fire till "ſpirit enough hath riſen to uſe and diſſolve the ſalt "which aroſe firſt: then take all the fire out of the fur"nace, that the diſtillation may proceed no farther, "which is a circumſtance of the laſt importance, with"out which the medicine would be weakened by too "much phlegm." Boyle, in Mem. de Trev. 1713.

As to the doſe of this remedy, they begin with ſeven or eight drops, increaſing by degrees to forty or fifty, on preſſing occaſions, as in apoplexies, lethargies, weakneſſes, &c.

The real compoſition of the *guttæ*, however, is ſomewhat controverted. Dr. Liſter aſſures us, that he had the ſecret communicated to him by king Charles II. that it is no other than the volatile ſpirit of raw SILK, rectified with oil of cinnamon, or ſome other eſſential oil.

The ſame author aſſures us, he had found by experience, that the *guttæ Anglicanæ* were not in any reſpect preferable to the common volatile ſpirits of hartſhorn and ſal ammoniac, except that the ſmell is more ſupportable. Mem. de l'Acad. des Scien. ann. 1700.

GUTTÆ, in *Architecture*, are ornaments of form in little cones, in the plafond of the Doric cornice, on the architrave, underneath the triglyphs, repreſenting a ſort of drops or bells; they are uſually ſix in number. See *Tab. Archit. fig.* 25. N° 12.

They are ſometimes alſo called *lacrymæ*, *tears*; and *campanæ* or *campanulæ*, *bells*. Leon Baptiſta Alberti calls them *nails*.

GUTTA *roſacea*, in *Medicine*, denotes a red or pimpled face; a diſtemper, which, though not always owing its original to hard drinking, is nevertheleſs moſt incident to tipſers of ſtrong beer, wines, ſpirits, &c.

As to the cure, beſides making a revulſion by bleeding, bliſtering, cupping, iſſues, &c. the diet ought to be moiſtening and cooling, as lettuce, purſlain, ſorrel, and ſpinach: the drink may be an emulſion of the cold ſeeds milk and water, clarified whey, &c.

In the uſe, however, of this cooling regimen, great caution is neceſſary; for if a perſon be taken off at once from his ſtrong liquors, and allowed nothing but whey, or milk and water, it may coſt him his life, by haſtening a ſudden decay of heat, palling his appetite, and bringing on a leucophlegmatia or dropſy.

As for what concerns topics, much caution is likewiſe to be uſed. If there be only redneſs without pimples, and the diſeaſe recent, refrigerants and repellents take place; but if puſtules appear, diſcutients muſt be mixed; and if theſe puſtules ſeem hard, and the diſeaſe be of long ſtanding, there may be reaſon for emollients to ripen and digeſt the tough and viſcid matter, which is afterwards to be let out.

If the diſeaſe be ſtubborn, and the tubercles grow hard, we are to begin with emollients, both ſotus and ointment: ſuch are the decoction of mallows, vervein, Solomon's ſeal, and linſeed; alſo a cerate of ſpermaceti, or Bate's white cerate. James.

GUTTA SERENA, ſo called from the tranſparency of the ſeveral humours of their membraues, is a diſeaſe of the eyes, being an entire privation of ſight, without any apparent fault, or diſorder of the part, excepting that the pupil looks ſomewhat larger and blacker than before.

This diſorder is moſt commonly, but not univerſally, attended with a dilatation of the pupil; ſo that every di-

lated

lated pupil is not a certain ſign of this diſeaſe. Scrophulous ſubjects have often very dilated pupils, with little or no defect of ſight; but in them the pupils preſerve their motion; the loſs of which motion, ſays Mr. Worſier, is a more certain ſign of a *gutta ſerena* than dilatation of the pupils. The Greeks call it *amaurosis*. This diſorder is either *tranſient* or *permanent*.

The *tranſient gutta ſerena* is that found in appoplexies and ſipothymias, from immoderate bleeding, and the like, which vaniſhes as the fit or paroxyſm goes off. To this kind alſo belong thoſe ſometimes produced by the ſuppreſſion of the hæmorrhoids, menſes, or other habitual evacuations, the healing up of iſſues, or the like.

The *permanent* is that whoſe cauſe is fixed in the retina, or in the optic nerves; chiefly in the want of the clear intercourſe and influx between the brain and thoſe parts. To this kind alſo belong thoſe occaſioned by hydrocephali, by ſtones found near the root of the optic nerves, or by ſtrictures compreſſing thoſe nerves, or by debilities and extenuations, by contortions and compreſſions of the ſame at their iſſue out of the cranium.

The proximate cauſe is, according to Hoffman and other eminent phyſicians, a palſy of the optic nerves.

The mediate cauſes of this diſorder may, as in other nervous caſes, be referred to two kinds, repletion and inanition.

To the firſt belong all ſuch cauſes as increaſe the blood too much, or force it with too much violence into the head. Thus, too great motion, immoderate hot bathing, violent fits of anger, deficiency of the menſes, and ſpaſms in the lower parts, forcing the humours upwards, as it ſometimes happens to women in labour, and by vomits. All theſe cauſes, as alſo the repulſion of humours appearing on the ſkin, and drying up of ulcers, the tranſlation of morbid matter in malignant fevers, ſmall-pox, or phreniſy, and the improper uſe of mercurials, have been known to bring on a *gutta ſerena*; ſometimes, indeed, only tranſitory, and ſometimes curable by evacuations, as bleeding, &c.

To the ſecond kind belong all immoderate effuſions of the vital juices. Thus, great hæmorrhages, bloody vomits, profuſe bleeding, and, above all, early and immoderate venery, have been obſerved to produce BLINDNESS, extremely difficult, if not impoſſible, to cure. See Hoffm. Oper. tome iii. p. 228. ſeq.

The *gutta ſerena*, is one of the moſt dangerous and untractable of all diſeaſes of the eyes. The ſymptoms of this diſeaſe, in its incipient ſtate, and of a cataract, much reſemble one another; they are alike indicated by a head ach, fixed not near the forehead; by a dimneſs of ſight, as if duſt were thrown before the eyes; by the idea of moths flying before the eyes; and by the multiplication of objects.

The *gutta ſerena* admits of no operation on the eye itſelf; but when the caſe is recent and partial, evacuations of blood from the temporal arteries, by leeches or the lancet, from one of the external jugular veins, or from a vein of the arm, joined with brisk purgatives, are adviſeable. Biſters on the head are likewiſe to be recommended; or an iſſue made by cauſtics on the coronal ſuture, where it joins with the ſagittal, if biſters do not ſucceed to our wiſhes. Strong decoctions in water of equal parts of Peruvian bark and valerian root in powder, joined with volatile ſalts, adminiſtered in pretty large doſes at proper intervals, are often very beneficial. The oleum animale and muſk have often been of great ſervice in enervated and paralytic habits. Warner on the Eye, p. 34, &c.

The cure, according to Pitcairn, is to be attempted with mercurials, particularly calomel, and ſometimes even with ſalivation, and with decoctions of guaiacum.

Hoffman recommends the ſulphur of antimony. See ANAUDOSIS and *Medical* ELECTRICITY.

The late Mr. Fergaſon contrived an inſtrument for applying the power of electricity to diſorders in the eyes: this inſtrument conſiſts of a pointed braſs wire, faſtened by means of a cork at the ſmaller end of a conical glaſs, open at both ends, and paſſing through the axis of this glaſs, ſo that its point comes within about half an inch of the larger aperture of the glaſs: the inſtrument is to be ſo fixed, that the larger aperture of the glaſs may ſurround the eye, and keep its lid open, and the point of the wire is directed to the pupil, and at the diſtance of about half an inch or an inch from it. In the uſe of this inſtrument a ſpark often proceeds from the point of the wire, which occaſions very acute pain; and, therefore, Mr. Partington fixed a wooden point upon the pointed wire: but the directors of this laſt gentleman are better adapted to the purpoſe.

GUTTE. See GUTTY.

GUTTERS, in *Building*, a kind of canals in the ROOFS of buildings ſerving to drain, receive, and carry off the rain-waters.

Gutters are either parallel to the horizon, or vertical. The former ſhould be made with a proper deſcent, that there may be a good current, as the workmen term it; for if laid too level, the water will be apt to ſtand in plaſhes.

As to the vertical *gutters*, or thoſe formed by two roofs meeting at right angles to each other, or by the end of one roof joining to the ſide of another, they are either made of lead or tiles, which are either plain or concave: theſe laſt are called *gutter*-tiles, and may be eaſily laid. But in laying on the plain tiles, the workman begins at one ſide of the *gutter*, and ſo works across, as if it were plain work, and then brings the near row of tiles back again; ſo that he works forth and back, to and fro, from right to left. By this means, the *gutters* laid after this manner are not angular, but of a kind of diſtorted curvilineas form, which prevents the mortar from being waſhed away with the rain.

GUTTER-*lath* is the name of a croſs-bar, laid along the middle of a hatch-way in ſome ſhips, for ſupporting the covers, and any weighty body that may be laid or moved upon them.

GUTTER-*tyle*. See TYLE.

GUTTETÆ *palmi* is the name of an epileptic powder in the Paris Pharmacopœia, compoſed of miſſetoe of the oak, roots of white dittany, the root and ſeed of peony, of each half an ounce; the ſeeds of gooſe-foot, two drams; human ſkull, three drams; red coral prepared, two drams; the horns of elk's foot, half an ounce; and a ſcruple of gold-leaf: all which ingredients are to be reduced to a fine powder. This powder has been deemed a very powerful antiſpaſmodic, and is ſaid to have been adminiſtered in the quantity of a ſcruple for a doſe, for a conſiderable time, with great ſucceſs in the epilepſy.

GUTTURAL *letters*, are thoſe pronounced or formed, as it were in the throat.

Dr. Wallis diſtinguiſhes the VOWELS in our language into labial, palatine, and *guttural*; according to the ſeveral degrees of opening the mouth to pronounce them, larger, middle, and leſs. On this footing he makes three *guttural* vowels, and three labial, and as many palatines.

The four *guttural* letters in Hebrew are א, ה, ח, and ע, formed into the technical word אהחע.

GUTTUROSUS *piſcis*, a ſmall fiſh common in the Mediterranean, and brought to market at Rome, Venice, and elſewhere; and called in different parts, *goteroſalo*, GOTTORUGINE, and *gotte di more*.

GUTTUS, a term among antiquaries for a ſort of vaſe uſed in the Roman ſacrifices, to take the wine and ſprinkle it *guttatim*, drop by drop, upon the victim.

Vigenere on T. Livy gives the figure of the *guttus*, as repreſented on divers medals, and other ancient monuments.

GUTTY, or GUTTE, in *Heraldry*, is when a thing is repreſented as charged or ſprinkled with drops.

In blazon, the colour of the drops is to be named: thus, *gutty* of ſable, of gules, &c.

Some authors will have red drops called *gutty de ſang*, or *drops of blood*; black ones, *gutty de poix*, or *pitch*; white, *gutty d'eau*, or *water*, &c.

GUY, in a *Ship*, is any rope uſed to keep off weighty bodies from bearing or falling againſt the ſhip's ſide, when they are to be hoiſted or lowered. Thus, if any thing is to be haled in over the gunwale, it is gently caſed in by a *guy*-rope, faſtened uſually to the ſtanchions of the waſte-trees.

GUY is likewiſe a large ſtuck rope, extending from the head of the main-maſt to the head of the fore-maſt, and having two or three large blocks faſtened to the middle of it. This is chiefly employed to ſuſtain the tackle uſed for hoiſting in and out the cargo of a merchant-ſhip, and is removed from the maſt-heads as ſoon as the veſſel is laden or diſcharged. See GARNET.

GUY's *hoſpital*. See HOSPITAL.

GUZES, in *Heraldry*, roundles of a ſanguine or murry colour.

GWABR-MERCHED, in *our old Writers*, a Britiſh word ſignifying a payment or fine, made to the lords of ſome manors, upon the marriage of their tenants-daughters; or otherwiſe, on their committing incontinency. See MARCHET.

GWAIF, or WAIF. See WAIF.

GYBING, in *Sea language*, denotes the act of ſhifting any boom-ſail from one ſide of the maſt to the other.

GYLPUT, in *our old Writers*, the name of a court-held every three weeks in the liberty or hundred of Pathlow, in the county of Warwick. *Inquiſit. ad quod damn.* 13 Edw. III. Blount.

GYLTWITE, in *our old Writers*, a compenſation of amends for treſpaſſes, &c. *Mulcta pro tranſgreſſione*. LL. Edg. regis, anno 964. Terms of Law.

GYMNARTHRIDIA, in the *Hiſtory of Inſects*, a ſeries

or clafs of infects, which have foft and naked bodies furnifhed with limbs.

Thefe have been generally called *zoophytes*, a term expreffing creatures partly of an animal, and partly of a vegetable nature; but as it is now well known that there are none fuch, it is proper that the term *zoophyte* fhould no longer be retained.

Under this clafs are comprehended the LIMAX or the naked fnail, the LERNEA, MEDUSA, APHRODITA, AMPHITRITE, &c.

GYMNASIARCH, GYMNASIARCHA, compounded of *γυμνασιον*, and *αρχη*, *government*, in *Antiquity*, the maffter or director of a gymnafium.

The Greeks did not rank the *gymnaftarcha* among the number of magiftrates; though his office was of great confideration, as having the care of all the youth, who were trufted to him to be formed to exercifes of the body.

He had two principal officers under him, who were to affift him in the government of the gymnafium; the firft named XYSTARCHA, and the fecond *gymnafta*. The former was maffter of the ATHLETÆ, and preffided over the wreftling. The latter had the direction of all the other exercifes, taking care they were performed in due time and manner, that they were not too fevere, that the youth attempted nothing beyond their ftrength, and that nothing were done that might be injurious to their health.

Thefe had feveral fubaltern officers or fervants under them, for the fervice and inftruction of the youth committed to them.

GYMNASIUM, a place fitted for the performing exercifes of the body.

This word is *γυμνασιον*, formed of *γυμνος*, *naked*; becaufe they anciently put off their cloaths, to practife with the more freedom.

Among the ancients, *gymnafium* was a public edifice deftined for exercife, and where people were taught, and regularly difciplined, under proper maffers.

If we may credit Solon in Lucian's Anacharfis and Cicero De Orat. lib. ii. the Greeks were the firft who had *gymnafia*; and among the Greeks, the Lacedæmonians: after them the Athenians, from whom the Romans borrowed them.

There were three principal *gymnafia* at Athens; the Academy, where Plato taught; the Lyceum, noted for Ariftotle's lectures; and the Cynofarges, allotted for the populace.

Vitruvius defcribes the ftructure and form of the ancient *gymnafia*, lib. v. cap. 11. They were called *gymnafia*, becaufe the champions performed *naked*; and *palæftræ*, from *wreftling*, which was one of the moft ufual exercifes there: the Romans fometimes alfo called them *thermæ*, becaufe the baths and bagnios made a principal part of the building.

It appears, that they did not perform their exercifes quite naked, fo early as the time of Homer, but always in drawers; which they did not lay afide before the thirty-fecond Olympiad. One Orfippus is faid to have been the firft who introduced the practice: for having been worfted, by means of his drawers undoing and entangling him, he threw them quite afide, and the reft afterwards imitated him.

The *gymnafia* conffted of feven members or apartments. M. Burette, after Vitruvius, recites no lefs than twelve, viz. 1. The exterior *porticus*, where the philofophers, rhetoricians, mathematicians, phyficians, and other virtuofi, read public lectures, and where they alfo difputed and acheartfed their performances. 2. The *ephebeum*, where the youth affembled very early, to learn their exercifes in private, without any fpectators. 3. The *cary cium*, *apodyterium*, or *gymnafterium*, a kind of wardrobe, where they ftripped, either to bathe or exercife. 4. The *elæothefium*, *alipterion*, or *unctuarium*, appointed for the unctions, which either preceded or followed the ufe of the bath, wreftling, pancratia, &c. 5. The *conifterium* or *coniftra*, in which they covered themfelves with fand or duft, to dry up the oil or fweat. 6. The *palæftra*, properly fo called, where they practifed wreftling, the pugillate, pancratia, and divers other exercifes. 7. The *fphæriftcrium* or tennis-court, reforved for exercifes wherein they ufed balls. 8. Large unpaved alleys, which comprehended the fpace between the porticos and the walls wherewith the edifice was furrounded. 9. The *xyfti*, which were porticos for the wreftlers in winter or bad weather. 10. Other *xyfti* or open alleys, allotted for fummer and fine weather, fome of which were quite open, and others planted with trees. 11. The BATHS, conffting of feveral different apartments. 12. The STADIUM, a large fpace of a femicircular form, covered with fand, and furrounded with feats for the fpectators.

For the adminiftration of the *gymnafia*, there were divers officers: the principal were, 1. The *gymnafiarcha*, who was the director and fuperintendent of the whole. 2. The *xyftarcha*, who preffided in the xyftus or ftadium. 3. The *gymnafta*, or maffter of the exercifes, who underftood their different effects, and could accommodate them to the different complexions of the athletæ. 4. The *pædotriba*, whofe bufinefs was mechanically to teach the exercifes, without underftanding their theory or ufe: Under thefe four officers were a number of fubalterns, whofe names diftinguifhed their different functions.

For the kinds of exercifes practifed in the *gymnafia*, they may be reduced to two general claffes, as they depend either on the action of the body alone, or as they require external agents or inftruments. The former are chiefly of two kinds, *orchaftice* and *palæftrice*.

The *orchaftice* comprehended, 1. *Dancing*. 2. *Cubiftice*, or the art of tumbling. 3. *Sphæriftice* or tennis, including all the exercifes with pilæ or balls.

The *palæftrice* compriled all exercifes under the denomination *palæftra*; as *wreftling*, *boxing*, *pancratia*, *haplomachia*, *running*, *leaping*, *throwing the difcus*, the *exercife of the javelin*, and that of the *hoop*, denominated by the Greeks τροχος, which conffted in rolling an iron hoop five or fix feet in diameter, befet with iron rings, the noife of which appalling the people to give way, afforded them alfo an amufement. Both ftrength and ffill were requifite in directing this hoop, which was to be driven with an iron rod.

To thefe muft alfo be added, the exercifes belonging to the medicinal gymnaftics; as, 1. *Walking*. 2. *Vociferation*, or fhouting. 3. *Holding one's breath*.

The bodily exercifes, which depend on external agents, may be reduced to *mounting* the horfe, *riding* in a chaife, or other wheeled vehicle; *rocking* in beds or cradles, and fometimes *fwinging*; to which may be added, the art of *fwimming*. Hoffman enumerates no lefs than fifty-five forts of *gymnaftic* exercifes.

GYMNASTES, Γυμναστης, among the *Ancients*, an officer in the ancient *gymnafium*, next in authority to the *gymnafiarch and xyftarch*.

GYMNASTERIUM, Γυμναστηριον. See GYMNASIUM.

GYMNASTICKS, GYMNASTICE, or the GYMNASTIC *art*, denotes the art of performing exercifes of the body, whether for defence, health, or diverfion.

The *gymnaftic* art is divided into three fpecies or branches; *military*, *medicinal*, and *athletic* or *fportive*.

Several modern writers have treated of this art; as Mercurialis, De Arte *Gymnaftica*; Faber, in Agonifitic. Joubert, De *Gymnaftic*; Cagnatus, De Simil. Tuend. Voffius, De Quatuor Artib. Popular. Meurfius, De Orcheftra; Fuller, in Medicina *Gymnaftica*; and M. Burette, in feveral Differtations on the ancient Dancing, Spheriftics, Athletics, Wreftling, Pugillate, Difcus, &c.

M. Burette has given the hiftory of *gymnaftics* in the Memoirs of the Royal Academy of Inferiptions. According to him, this art is coeval with the world. In reality, we can hardly fuppofe mankind to have ever been without fome fort of exercifes of the body, which the defence of their perfons, the preffervation of health, and even recreation and mirth, would neceffarily lead them to. See EXERCISE.

On the firft eftablifhment of fociety, men, being apprifed of the neceffity of military exercifes, for repelling the infults of their neighbours, inftituted GAMES, and propofed prizes, to animate their youth to combats of divers kinds. And as running, leaping, ftrength and dexterity of arm in throwing the javelin, driving a ball, or toffing a quoit, together with wreftling, &c. were exercifes fuited to the manner of fighting in thofe days, fo the youth vied to excel in them, in the prefence of the aged, who fat as their judges, and difpenfed prizes to the conquerors; till what was originally only amufement, became, at length, a matter of fuch importance, as to intereft famous cities, and entire nations, in its practice.

Hence arofe an emulation and eagernefs to excel, in hopes, one day, of being proclaimed and crowned conquerors in the public games, which was the higheft honour a mortal could arrive at: nay, they went fo far as to imagine, that even gods and demi-gods were not infenfible of what men were fo captivated with; and, in confequence hereof, to introduce the greateft part of thefe exercifes into their religious ceremonies, the worfhip of their gods, and the funeral honours done to the manes of the dead.

Though it be hard to determine the precife epocha of the *gymnaftic* art, yet it appears from feveral paffages in Homer, and particularly the twenty-third book of the Iliad, where he defcribes the games celebrated at the funeral of Patroclus, that it was not unknown at the time of the Trojan war. From that defcription, which is the earlieft monument now extant of the Grecian *gymnaftics*,

it appears, that they had chariot-races, boxing, wrestling, foot-races, gladiators, throwing the discus, drawing the bow, and hurling the javelin; and it should seem, from the particular account Homer gives of these exercises, that even then the *gymnastic* art wanted little of perfection: so that when Galen says there was no *gymnastic* art in Homer's days, and that it began to appear no earlier than Plato, he is to be understood of the medicinal *gymnastics* only. This last, indeed, had its rise later; because, while men continued sober and laborious, they had no occasion for it; but when luxury and idleness had reduced them to the sad necessity of applying to physicians, these, who had found that nothing contributed so much to the preservation and re-establishment of health as exercises, proportioned to the different complexions, ages, and sexes, did not fail to refer them to the practice of *gymnastics*.

According to Plato, one Herodicus, prior a little time to Hippocrates, was the first who introduced this art into physic; and his successors, convinced by experience of its usefulness, applied themselves in earnest to improve it.

Hippocrates, in his book of Regimen, has given instances of it, where he treats of exercise in general, and of the particular effects of walking, with regard to health; also of the different sorts of races, either on foot or horseback; leaping, wrestling, the exercise of the suspended ball, called *corycus*, chironomy, unctions, frictions, rolling in the sand, &c.

But as physicians did not adopt all the exercises of the *gymnastic* art in their practice, it came divided between them and the masters of martial and athletic exercises, who kept schools, the number of which was greatly increased in Greece.

At length the Romans also caught the same taste: and, adopting the military and athletic exercises of the Greeks, they improved and advanced them to the utmost pitch of magnificence, not to say extravagance. But the decension of the empire involved the arts in its ruin, and, among others, *gymnastics* and medicine; which last unhappily then relinquished the title it had to the former, and has neglected to resume it ever since.

GYMNIA, in *Zoology*, a new established class of animalcules, containing such as have neither tail, nor any visible limbs. See ANIMALCULE.

GYMNIC, GYMNICUS, something belonging to the exercises of the body.

Gymnic games, *ludi gymnici*, are those wherein the body is exercised: such are wrestling, running, dancing, the use of the lance, quoit-playing, &c.

These made the chief diversions of the OLYMPIC, NEMEAN, PYTHIAN, and ISTHMIAN solemnities; being called by the Greeks Πενταθλον, and the Latins *Quinquertium*. See PENTATHLON.

GYMNOCRITHON, in *Botany*, a name given by some authors to the *zeopyrum*, or *hordeum nudum*, the naked barley.

GYMNOPÆDIA, a kind of dance, established by Lycurgus, and in use among the ancient Lacedæmonians; performed, during their sacrifices, by young persons who danced naked, singing at the same time a hymn in honour to Apollo.

The word is also written *gymnopædice*; it is compounded of γυμνος, *naked*, and παις, *child*.

One Terpander is recorded as the inventor of the *gymnopædia*. Athenæus describes it as a Bacchic dance, performed by youths stripped quite naked, with certain interrupted though agreeable motions and gestures of the body; the arms and legs being flourished and directed after a peculiar manner, representing a sort of real wrestling.

GYMNOPODIA, among the *Ancients*, a kind of shoes which discover the naked feet. They were worn by the Grecian women, who were very fond of them.

GYMNOPYRIS, in *Natural History*, the name of a genus of fossils, the characters of which are these: they are of the class of the *pyrites*, and are compound, inflammable, metallic bodies, found in detached masses, of no determinately angular figure; of a simple internal structure, not striated; and are naked, or not covered with any investient coat or crust, in which they differ from the pyritaces. See *Tab. of Fossils, class* 5.

Of this genus there are only two known species.

GYMNOSOPHISTS, a set of Indian philosophers, famous in antiquity; so denominated from their going barefoot.

The word is formed of the Greek γυμνοσοφιστης, q. d. a sophist or philosopher who goes naked.

This name was given to the Indian philosophers, whom the excessive heat of the country obliged to go naked; as that of *Peripatetics* was given to those who philosophied walking.

Laertius, Vives, &c. will not have *Gymnosophists* to have been the name of any particular sect, but a common name of all the philosophers in the Indies; and hence they divide them into Brachmans and Germani.

Among the Germani, called also by Porphyry *Samanæi*, and by Clemens Alexand. *Semnonæ*, some were called *Hylobii*, by Clemens Alexand. *Allobii*, as inhabiting the woods: which last seem to come nearest to the notion of *Gymnosophists*. Clemens relates, that these Allobii neither inhabit cities nor towns, are clothed mostly with the leaves of trees, eat acorns and berries, and drink water out of their hands, abstaining from marriage and procreation.

The *Gymnosophists* believed the immortality and transmigration of the soul: they placed the chief happiness of man in a contempt of the goods of fortune and the pleasures of sense, and gloried in having given faithful and disinterested counsels to princes and magistrates. It is said, that when they became old and infirm, they threw themselves into a pile of burning wood, in order to prevent the miseries of an advanced age. One of them, named Calanus, thus burnt himself in the presence of Alexander the Great.

Apuleius, Florid. lib. i. describes the *Gymnosophists* thus: "They are all devoted to the study of wisdom, both "the elder masters and the younger pupils; and what "to me appears the most amiable thing in their character is, that they have an aversion to idleness and "indolence: accordingly, as soon as the table is spread, "before a bit of victuals be brought, the youths are all "called together from their several places and offices, "and the masters examine them what good they have "done since the sun-rise: here one relates something "he has discovered by meditation; another has learned "something by demonstration; and as for those who "have nothing to allege why they should dine, they are "turned out to work fasting."

The great leader of the *Gymnosophists*, according to Jerome, was one Buddas, called by Clemens Butta, who is ranked by Suidas among the Brachmans. That last author makes Buddas, the preceptor of Manes the Persian, the founder of the *Gymnosophists*.

There were likewise African *Gymnosophists*, who dwelt upon a mountain in Ethiopia, near the Nile, without the accommodation either of house or cell. These did not form themselves into societies, like those of India; but each had his private retirement, where he studied and performed his devotions by himself. If any person had killed another by chance, he applied to these sages for absolution, and submitted to whatever penances they enjoined. They pretended to an extraordinary frugality, and lived only upon the fruits of the earth. Lucian ascribes to these philosophers several new discoveries in astronomy.

GYMNOSPERMIA, in *Botany*, the name given by Linnæus to a certain series of plants of the DIDYNAMIA class. *Tab.* II. *Botany*, N° 11. and *Tab.* V. *class* 14.

GYMNOTUS, in *Ichthyology*, the name of a genus of fishes, the characters of which are these: it is of the malacopterygious kind in the Artedian system, but in the Linnæan it belongs to the order of apodes; the branchiostege membrane contains five bones, and it has no fin upon the back; the head is furnished with lateral covers; the upper lip with two tentacula; the eyes are covered with a skin; the body is flatted and carinated under the lower fin. Linnæus enumerates five species of this genus, one of which is an American fish, described by Maregrave under the name of *carapo*.

Another species is distinguished, on account of its electrical powers, by the name of the *gymnotus electricus*, or *electrical eel*, and by the French *anguille tremblante*. This is a fresh-water fish found in the river of Surinam, in South America: the common size is from three to four feet in length, and from ten to fourteen inches in circumference about the thickest part of the body; however, it is said, that some have been seen in the river of Surinam which are upwards of twenty feet long, and whose stroke or shock proved instant death to those who received it. *Tab.* II. *Fishes*, N° 12.

This fish has been lately much the object of examination. It is described, in general, by Mr. Bancroft, in his Essay on the Natural History of Guiana, and more minutely by Dr. Garden, in the Phil. Trans. The head is large and flat, and perforated with holes; the upper and lower jaws are of an equal length, and form a wide mouth without teeth; there are two nostrils on each side of the head, one pair being large and raised above the surface, the other small and level with the skin; the eyes are small, flat, and of a bluish colour; the body is thick and roundish near the head and to some distance from it, but gradually diminishes in size and increases in depth to the point of the tail, which is rather blunt; the back and sides are covered with many light-coloured spots; the

the whole body, from about four inches below the head, seems to be divided into four different longitudinal parts, viz. the upper part or back, which is roundish, and separated from the other parts by the lateral lines; these take their rise just above the pectoral fins, and gradually converge, as they run down along the sides towards the tail; the second part is the body of the fish, or its strong muscular part, separated from the former by the lateral lines; this is of a lighter blue colour than the back, and swell out a little on each side. but, toward the lower part, it is again contracted or sharpened into the *carina*, or keel, which is the third division; this part is thin and lax, and covered with a reticulated skin of a greyish colour; the *carina* begins about six or seven inches below the base of the head, and reaches down to the tail; it seems to be of a strong muscular nature, and terminates in a thin edge, on which is situated the fourth part or division, which is a long, deep, soft, wavy fin, continued from about three or four inches below the head to the end of the tail. The anus of this fish is placed underneath, and about an inch more forward than the pectoral fins; these are small, and orbicular in shape, and are placed, one on each side, just behind the head, over the *foramina spiratoria*, which are small, and generally covered with a lax skin, situated in the axillæ of these fins: the chief use of these fins seems to be to raise the head of the fish when he wants to breathe, which he does every four or five minutes, by raising his mouth out of the water: this circumstance shews that he is amphibious and has lungs; and Dr. Garden concludes, from his *foramina spiratoria*, that he has *branchiæ* likewise. The skin of the body is formed into a number of *ruga* or annular bands, which reach across the body to the base of the carina on each side; thus it has a worm-like appearance, and, like the worm tribe, it has also a power of lengthening or shortening its body, and of swimming backwards or forwards. But the most astonishing property of this fish is its power, exerted at its own pleasure, of giving an electrical shock to any person, or number of persons joining hands, provided the first touched the fish, and the last put his hand into the water in which it swam. The shock is conveyed either by the immediate touch of the fish with the hand, or through the same metallic or other conductors which convey the electric fluid; and it is intercepted by the common non-conductors of that fluid. This shock has been sometimes strong enough to pass through a brass chain, if the links were not too numerous, and the chain tense. But in all experiments of this kind, it seems to have been necessary to form a proper communication between the different parts of the fish; though some persons have affirmed, that they were shocked by touching him only with one hand: in this case, however, some unobserved communication may have produced the effect. The surprising power which this fish possesses seems to have been designed for its defence and subsistence; the exercise of it in the latter view is observable, whenever small fishes, which are a part of its food (as well as worms and animal food in general) are thrown into the water: for these are first struck, till they are dead or stupefied, and afterwards swallowed. If one of these small fishes be taken out of the vessel where the *gymnotus* is, after it has been apparently killed, and put into fresh water, it will soon revive again. In some cases, the death, or apparent death of its prey, is not effected without several repeated shocks, which have been observed to increase in strength according to the occasion. These electrical qualities depend on particular organs, which have been dissected and accurately described by Mr. J. Hunter: of these organs there are two pair, a larger and a smaller, placed on each side the fish, and separated from one another; and they constitute, perhaps, more than one third of the whole animal. The structure of the organs consists of flat partitions or septa, and cross divisions between them, by means of thin plates or membranes; of which transverse plates there are, in an inch of length, about 240, which multiply the surface in the whole to a vast extent. The nerves in this fish, which are appropriated for the exercise of its electrical powers, and which arise particularly from the medulla spinalis, whence they issue in pairs between all the vertebræ of the spine, and supply the organs, are much larger than those that are bestowed on any other part for the purposes of sensation and action. Mr. Hunter's anatomical description is illustriated by three plates. For a farther account of the electrical property of this fish, see TORPEDO. Phil. Trans. vol. lxv. part i. art. 10. p. 94. art. 11. p. 102, vol. lxv. part ii. art. 39. p. 395.

GYNÆCEUM, among the *Ancients*, the apartment of the women; or a separate place, in the inner part of the house, where the women keep themselves retired, employed in their spinning, out of the sight of the men.

The word is compounded of the Greek γυνη, *a woman*, and οικος, *a house*.

Under the Roman emperors there was a particular establishment of *gynæcea*, being a kind of manufactories managed chiefly by women, for the making of cloaths, furniture, &c. for the emperor's houshold. Mention is made of these *gynæcea*, in the Theodosian and Justinian code, and by divers other authors.

In imitation hereof, divers of the modern manufactories, particularly those of silk, where a number of women and maids are associated and formed into a body, are called *gynæcea*.

GYNÆCIARIUS, a workman employed in the gynæceum. In the ancient gynæcea there were men to weave and shape; the rest, as spinning, &c. being performed by women.

Criminals were sometimes condemned to serve in the gynæcea, much as now in the galleys; frequently, also, this was a kind of service which princes enacted of their subjects or vassals, both men and women, whom they made to work for them in their gynæcea.

GYNÆCOCOSMI, Γυναικοκοσμοι, in *Antiquity*, Athenian magistrates, whose business it was to regulate the women's apparel, according to the rules of modesty and decency. See GYNÆCONOMUS.

GYNÆCOCRATUMENI, an ancient people of Sarmatia Europæa, inhabiting the eastern banks of the river Tanais, near its opening into the Palus Mæotis; thus called, as authors relate, because they had no women among them; or, rather, because they were under the dominion of women.

The word is formed of γυνη, *woman*, and κρατουμενοι, *vanquished*, of κρατεω, *I overcome*, q. d. overcome by women.

Fa. Hardouin, in his notes on Pliny, says, they were thus called, because, after a battle which they lost against the Amazons on the banks of the Thermodoon, they were obliged to have a venereal commerce with them, in order to get them children: *Et quod victoribus obsequuntur ad procreandam eis sobolem.*

Hardouin call them the husbands of the AMAZONS, *Amazonum connubia*; for, as the author observes, the word *unde* must be retrenched from Pliny, having been foisted into the text by people who were not masters of the author's meaning, *unde Amazonum connubia.*

They who take the Amazons for a fabulous people, will conclude the fame of the *Gynæcocratumeniani.*

GYNÆCOCRACY, GYNÆCOCRATIA, a petticoat-government, or a state where women have, or may have, the supreme command.

The word is formed of γυνη, γυναικος, *woman*, and κρατος, *authority, power, government.*

In this sense, England and Spain are *gynæcocracies*: the French value themselves, and think they are greatly happy, that their monarchy is not *gynæcocratic.*

GYNÆCOMASTOS, of γυνη, *woman*, and μαστος, *I bear*, a term used by the ancients, to express a man whose breasts are large and turgid like those of women, and afford milk.

It was an observation among the ancients, that such men were naturally impotent. Paulus Ægineta observes, that the breasts of men as well as women swell at the time of puberty, but that those of women continue swelled, and those of men subside again, except in the case of the *gynæcomastoi*, where they remain turgid, and become in time more and more so, as the fat increases under them. As this swelling of the breasts gave a suspicion of impotency, those who laboured under that deformity, usually had recourse to a very painful operation in surgery to get rid of it. An incision was made in the form of a crescent in the lower part of the breast, then the skin being drawn back, the fat was taken out, and the lips of the wound healed by means of suture. When the breasts were very large and hung down, they made two incisions, one within the other, meeting at the extremities, and then separating all the skin between them, they took out the fat; and finally, if the disease returned, or they had performed the operation imperfectly, leaving some behind, they repeated the whole a second time.

GYNÆCONOMUS, the name of a magistrate of Athens, who had the censure and inspection of the women.

The word is compounded of the Greek γυνη, γυναικος, *woman*, and νομος, *law*.

There were ten *gynæconomi*; their business was to inform themselves of the lives and manners of the ladies of that city, and to punish such as misbehaved themselves, or transgressed the common bounds of modesty and decency.

They had a list hanging out, of the names of all those whom they had censured, or condemned to any mulct, forfeiture, penance, or other penalty.

GYNÆSIA, a word used by the writers in medicine, some-

times for the MENSTRUA, and sometimes for the LOCHIA.

GYNANDRIA, in *Botany*, the twentieth class of plants in the Linnæan system, in which the male and female parts of the flower are joined at their origin, the stamina or male parts of which grow to the pistil or female part, and not to the receptacle of the seed. See FRUCTIFICATION, and *Tab. of Botany, class* 20.

The word is formed of the Greek γυνὴ, *female*, and ἀνὴρ, *male*.

The general character of this class of plants is very obvious: they are distinguished at first sight from all others, by the stamina being placed upon the style; or, in other words, the receptacle is elongated into the form of a style, and bears on it both the pistil and stamina. This class contains eight orders. *Tab.* VI. *Botany, class* 20.

The order of the *decandria*, the first of this class, is a very natural distinction among plants, and its genera differ from one another in no other grand particular but the nectaria. Botanists, in general, have judged the roots of this order of plants, which are either reticulated or palmated, to be a very certain mark of distinction; but this observation of the difference of the nectaria, which is owing to Linnæus, is much to be preferred, as being both more certain and more obvious. The structure of the fructification in this order of plants is very singular: the germen of the pistil is always contorted, and the petals are five in number; the two external ones often form themselves into a galea, the lower lip of which forms the nectarium, which supplies the place of a fifth petal and a pistil: the style is affixed to the interior margin of the nectarium, so that it and its stigma are scarce to be distinguished in the flower: the stamina are always two filaments, very short, and supporting two antheræ, which are of a narrow shape below, and are naked and divided into several lobes, in the manner of the pulp of an orange; these are covered each with a small cell, which is open downwards, and growing on the inner margin of the nectarium: the fruit or seed-vessels is a capsule, containing only one cell, and formed of three valves; the seeds are very numerous, and as small as grains of dust, and are affixed to a slender receptacle, which is placed within each valve. This order comprehends nine genera; the *orchis*, *satyrium*, &c. the other orders are, the *triandria*, including four genera; *tetrandria*, containing one genus; *pentandria*, containing three genera; *hexandria*, containing two; *decandria*, containing two; *dodecandria*, including one genus; and *polyandria*, containing three genera.

The flowers of all the plants of this class have a strange, and, as it may be called, monstrous appearance, very different from that of all other plants in their country, but this is only owing to the singular disposition of the parts of fructification in these flowers, as described above. Linnæi. Gen. Plant. p. 451.

GYPSINE *stone*, a name given by some writers to the GYPSUM, or fossil substance, of which the powder called *plaister of Paris* is made by calcination. There are in many parts of Arabia vast rocks of this stone; it resembles alabaster, but is softer, and of a more lax texture. It is found to be a very easy stone to form by tools, and therefore the Arabs build with it in some of the places in the neighbourhood of the quarries, but they are forced to make the walls very thick, as the stone is so soft and crumbly. The building called Arsoffa, or Arsoffa Emir, which seems the remains of a monastery, is built wholly of this stone; and when the sun shines upon it, the walls give such a lustre, that they dazzle the eyes; but the softness of the stone, and the redness of the mortar, have conspired to make it a very ruinous pile at present, though of no great antiquity, the stones having split and moulded away in the walls, and the foundations failed in many places. Phil. Trans. N° 218. p. 150.

GYPSINUM *metallum*, in the *Natural History of the Ancients*, a name used for the common *lapis specularis*, of which they often made windows, as we do of glass. It was by some called *Cyprium metallum*, because frequently found in Cyprus.

GYPSOCHI, artists who work in plaister. See PARADIGRAMMATICE.

GYPSOPHYLA, in *Botany*, a genus of the *decandria digynia* class. Its characters are these: the flower hath a permanent bell-shaped empalement, cut into five parts at the top; it hath five oval blunt petals, and ten awl-shaped filaments; in the centre is situated a globular germen, which becomes a globular capsule with one cell, opening with five valves, filled with small roundish seeds. There are several species, which are plants of no great beauty.

GYPSOPHYTON, in *Botany*, a name given by some authors to the *saxifraga antiquorum*, or saxifrage of the ancients.

GYPSUM, in *Natural History*, the name of a class of fossils, the characters of which are these: they are composed of small flat particles, irregularly arranged, and giving the whole masses something of the appearance of the softer marbles; they are bright, glossy, and in a small degree transparent; not flexible nor elastic, not giving fire with steel, nor fermenting with or dissoluble in acid menstruums, and calcine very easily in the fire.

Gypsum is found in very large quantities in many parts of the globe, forming extensive chains of mountains and hills, as in the neighbourhood of Paris. It is always crystallized or regularly disposed; but in its crystallization assumes a variety of forms. In some cases, it is composed of large, transparent, thin lamine, which are so applied to each other as to constitute masses as transparent as crystal: in this form it is called *lapis specularis*. In other cases, it is crystallized in *fibræ*, like threads applied longitudinally to each other: this is called *fibrated gypsum*. And sometimes a large quantity of *gypsum* is found in small irregular crystals, joined together and forming considerable masses of semi-transparent granulated stones, commonly called *gypseous* ALABASTER. We also meet with a rhomboidal gypseous stone, called also SELENITES; and other *gypsums* are found, consisting of differently formed crystals, as hexagonal parallelepipedons and pyramids.

Gypsum is distinguished from calcareous earths by not dissolving and effervescing with acids; but M. Baumé observes, that it may in some measure be dissolved by acids; however, in this state, it is separated by crystallization, without retaining any part of the acid: besides, quicklime does not harden, as *gypsum* does, without the addition of sand or cement. It has been observed by Mr. Pott, in his Lithogeognesia, that *gypsum* cannot be fused without addition by the most violent fire of furnaces; but Mr. D'Arcet has found that all gypseous stones and earths are fusible in this way by a violent and long-continued heat.

The author of the Chemical Dictionary infers, from the various properties of *gypsum*, that it is nothing else than calcareous earth saturated with vitriolic acid; or that it is a true SELENITES. Its want of hardness, its transparency, its crystallization, and its solubility in water, proceed from its saline character. It cannot be combined with any acid, because it is naturally saturated with the vitriolic acid. It requires much water to dissolve it, on account of its selenitic quality, or on account of the great quantity of earth which it contains, and the intimacy with which this earth is united with the vitriolic acid. Its calcination is nothing else than the subtraction of the water of its crystallization. The properties of quick-lime, which it acquires by calcination, are owing either to the superabundant calcareous earth which it may contain, or rather to the subtraction of a part of the vitriolic acid, which is engaged during calcination, by touching some inflammable matter with which the acid unites and forms sulphur. And, finally, the hardening of plaister, when calcined and mixed with water, may proceed from a mixture of those parts, which, by calcination, have become quick-lime, with other parts which have not acquired that quality, and which serve as a cement to the former; or it proceeds from the *gypsum* resuming the water of its crystallization, and again crystallizing precipitately and confusedly. Art. *Gypsum*.

All the species burn with a very slight degree of fire, to that which is commonly called *plaister of Paris*; but the softer require the smaller degrees of fire, and, in general, the harder and more marbly make the better plaister. The common way of burning this stone into plaister, is too slight to give it all the hardness it is capable of. It is reported by many, that a greater degree of heat renders it much superior in hardness; and, it is said, that the artificial marble, with which the whole palace of Munich is adorned, and which the elector of Bavaria esteems more than marble, for which it is mistaken by all that see it, is made of the common *gypsum*, first burnt in the ordinary way, and afterwards put over the fire again in a copper vessel, and suffered to boil, as it will like water, for a long time: when this boiling ceases of itself, the matter is taken out, and common colours, such as are used in painting, are mixed with it in various proportions; which, on the wetting it with water, and working it in the common manner of plaister of Paris, diffuse themselves, and imitate the veins of natural marble. Phil. Trans. N° 91.

GYPSUM is used in the Canaries by way of remedy for their wine; and about Malaga a large quantity is turned up with the juice of their grapes.

GYPSUM *striatum*, *striated plaister-stone*, in *Natural History*, the name commonly used for the whitish less glossy TESTACEA, with short thick filamenta.

It is of a rude, irregular, and unequal surface, and lax, friable

friable texture, found in maſſes of various ſizes, from one to twelve or eighteen inches over, but always broad and flat, its thickneſs being uſually but an inch and a half, and in the broadeſt pieces ſeldom much more than two inches: it is compoſed of conſiderably large and coarſe longitudinal filaments, running uſually very evenly through the maſs: it is eaſily fiſſile in a perpendicular direction, that is parallel to the arrangement of theſe filaments: it is of a dull whitiſh colour, and its filaments, when examined ſingly, have a ſlight ſhare of tranſparency. It will not at all give fire with ſteel, or ferment with aqua fortis, but very readily calcines to a perfectly white ſubſtance. It is found in clay and marle-pits, among the ſtrata of gravel, and in the fiſſures of ſtone, and is common in Yorkſhire and other parts of the kingdom.

The Germans uſe it in fluxing the ſulphureous ores of metals; and our druggiſts ſell it under the name of Engliſh talc, for cleanſing of ſilver lace.

GYPSUM *cymbaicum* is a name given by the ancients to the white chalk, which was eſteemed by them for the cleanſing of cloths, and which makes an excellent plaiſter or cement without previous burning. See CALX *nativa*.

GYPSY, a name given to a ſet of vagrants. See EGYPTIANS.

GYRFALCON, in *Ornithology*, the name of a large and fierce ſpecies of FALCON, called in Engliſh the *jerfalcon*. Its name is a compound of the German *gyr*, which ſignifies a *vultur*, and *falco*, the *falcon*. It is the largeſt of all the falcon kind; its head is flatted, and of a greyiſh colour; the throat is of a pure white; its beak very thick and ſtrong, but ſhort, and of a bluiſh colour; the breaſt and belly are marked with narrow lines, thinly ſcattered, and pointing down; the wings with large heart-ſhaped ſpots; the middle feathers of the tail with a few bars; the legs are thick and ſtrong, and feathered a little below the knees, and both they and the feet are of a pale blue.

It is a very bold and daring bird, attacking all other fowl without reſerve, and particularly the heron and ſtork kind: the other falcons are all afraid of this. It is ſometimes quite white, and was formerly in high eſteem when falconry was in vogue.

GYRINUS, in *Zoology*, a name uſed for a ſpecies of MORDELLA.

GYRLE, among *Sportſmen*. See GIRLE.

GYROMANCY, GYROMANTIA, a kind of DIVINATION, performed by walking round, or in a circle.

The word is compounded of the Greek γυρος, *circle*, and μαντια, *divination*.

GYROVAGI, in *Eccleſiaſtical Writers*, monks, who leaving their monaſteries, under pretence of piety, wandered about from one religious houſe to another.

The ſame appellation was alſo given to prieſts who left their pariſhes.

H.

H, Is the eighth letter of our alphabet, and the fixth conſonant.

Varro, De Re Ruſtica, lib. iii. cap. 1. calls the *h*, *aſſatim*; and Martianus Capella ſays, it is pronounced by only a gentle contraction of the trachea. Hence it has been diſputed, whether or no the *h* be a real letter.

Some will only have it to be an aſpiration, or ſpirit, becauſe its ſound is ſo weak. And accordingly the Greeks, of later ages at leaſt, do not place it in the line with the other letters, but put it over the head of the letter which follows it; though it ſhould ſeem they anciently wrote it in the ſame line with the reſt.

The Latin grammarians, as they were religious imitators of the Greeks, have, on their authority, generally diſallowed the *h* as a letter; and the moderns have herein followed the Latins, urging, that it is founded only by a ſtrong emiſſion of the breath, without any conformation of the organs of ſpeech, and therefore that it is no letter. However, others maintain that the *h*, like all other aſpirates, from the time it is aſpirated, and for this very reaſon that it is aſpirated, is not only a letter, but a real conſonant; it being a motion, or effort of the larynx, to modify the ſound of the vowel that follows; as is evident in the words *heaven*, *health*, *here*, &c. where the vowel *e* is differently modified from what it is in the words *endive*, *eating*, *eleſt*, &c. and ſuch modification is all that is eſſential to a conſonant. They add, that the *h* is either a letter, or *ſ* and *s* are none; thoſe being no more than liſſing aſpirations; and that they who exclude the *h* from among the letters, as conceiving it only a mark of aſpiration, might as well exclude the labial conſonants *b* and *p*, and ſay they are only marks of certain motions of the lips, &c. Hence they conclude that the *h* is a letter, and a conſonant of the guttural kind, i. e. a conſonant, to the pronunciation whereof the throat concurs, in a particular manner, more than in any other of the organs of voice.

It is true, in many words beginning with *h*, the aſpiration is very weak, and almoſt inſenſible; the *h* in thoſe caſes not doing its office: but it does not ceaſe to be a conſonant on that ſcore, more than the various other conſonants, which we write but do not pronounce; as the *h* in *quick*, &c. and ſeveral other letters, particularly in the Hebrew, French, &c. Nor does it ceaſe to be a conſonant, becauſe it does not hinder the eliſion of the foregoing vowel, when another vowel follows in the ſubſequent word; for then *m* would undergo the ſame diſqualification.

M. Menage diſtinguiſhes two kinds of *h*; the one an aſpirate, which he allows a conſonant, the other a mute, which he conſiders as a vowel. Now, it is certain, the aſpirated *h* is a conſonant; but the mute *h* is no vowel, as having no peculiar or proper ſound diſtinct from that of the vowel, or diphthong, immediately following it.

When the *h* is preceded by a *c*, the two letters together have frequently the ſound of the Hebrew ש, with a point over the right horn: as in *church*, &c.

In moſt words derived from the Greek, and beginning in that language with the letter χ, the *ch*, which begins them in Engliſh, has generally the ſound of a *k*, as in *echo*, *chorus*. &c. though it is ſometimes ſoftened a little, as in *Cherſoneſus*, &c.

After a *p*, the *h* is always pronounced together with the *p*, like an *f*: as in *phraſes*, *Philiſtines*, *phlegm*, *phlebotomy*, *philoſophy*, *Phaeacians*, &c. Moſt words of this claſs are either proper names, or terms of art, borrowed from the Greek, or the Oriental languages; and written in Greek with a φ, and with a ה in the others.

The *h* in Engliſh is ſcarcely ever mute at the beginning of a word, or where it immediately precedes a vowel, as *houſe*, *behaviour*, &c. Where it is followed by a conſonant, it has no ſound, according to the preſent pronunciation.

In ancient authors we frequently meet with *h* put inſtead of *f*, as *haba*, for *faba*; but this is principally obſervable in the Spaniſh tongue, where moſt of the words borrowed from the Latin beginning with an *f*, take the *h* in lieu of it: as *hablar*, for *fabulari*; *habe*, for *fabus*; *hado*, for *fatum*. For the relation which *h* has to the Æolic digamma, ſee the letter F.

The aſpirate or ſharp accent of the Greeks, which is the ſame with our *h*, is alſo frequently changed in the Latin for an *s*; as, *ſal*; ἑπτα, *ſeptem*; ἑξ, *ſex*; ἑρπω, *ſerpo*; ἡμιυς, *ſemis*; ἑς, *ſus*, &c. The *h* is alſo uſed for ſome other letters, enumerated at large by Paſſerat, De Literarum inter ſe Cognatione & Permutatione.

Anciently the *h* was put for *ch*; thus *Chlodovæus* was formed *Hludovicus*, as it is read on all the coins of the ninth and tenth centuries; and it was on this account, that they wrote *Hludovicus* with an *h*. In courſe of time, the ſound of the *h* being much weakened, or entirely ſuppreſſed, the *h* was dropt, and the word was written *Ludovicus*. In like manner we read *Hlotaire*, *Hlovis*, &c. F. Lobineau will have this difference to have riſen from the differences in the pronunciation. Such, ſays he, as could not pronounce the guttural, wherewith theſe two words begin, ſubſtituted a *c* for it; and they who pronounced it ſo, wrote it after the ſame manner: but ſuch as were accuſtomed to pronounce the guttural, wrote it likewiſe. He might have added, that ſuch as could not pronounce it, at length abſolutely rejected it, and both wrote and ſpoke *Louis*, *Lotaire*, &c. Some learned men have conjectured that the *h* ſhould have been detached from the name; and that it ſignified lord, from the Latin *herus*, or the German *herr*. Much as the D, which the Spaniards prefix to their proper names, as *D. Pietro*, for Don Philip. But as it is likewiſe found before the names of ſeveral cities, it is more probable the letter was there uſed to denote the rough, harſh pronunciation of the ancient Franks.

In reality, the moſt ancient way of writing the names of theſe French kings, was not by *h*, but by *ch*; where the *c* ſeems to have ſtood for *koning*, *king*, and the *h* was inſerted to give the *c* a guttural ſound.

The *h* is ſometimes alſo found preſixed to the *e*; as *Haranx*, *halandæ*, &c. for *Carolus*, *colendæ*, &c.

H, among the *Ancients*, was alſo a numeral letter, ſignifying 200, according to the verſe:

H *coque ducentos per ſe deſignat habendos.*

When a daſh is drawn at the top of the H, it ſignified two hundred thouſand. See what has been obſerved on this ſubject under the letter A.

HABAKKUK, one of the twelve leſſer prophets, whoſe prophecies are taken into the canon of the Old Teſtament.

The name is written in Hebrew with חבקוק *habeth*; and ſignifies a *wreſtler*, or *grappler*. The Greek tranſlators call him *Ambakoum*.

The preciſe time is not known when *Habakkuk* prophecied; but from his predicting the ruin of the Jews by the Chaldeans, it may be concluded that he was contemporary with Jeremiah, and prophecied in the reign of Joſiah. His prophecy only conſiſts of three chapters.

HABDALA, or HADDALAH, a Jewiſh ceremony, practiſed among that people every ſabbath day evening.

The word is Hebrew, and literally ſignifies *ſeparation*: it is formed of הבדל, *habdel*, *to ſeparate*; the ceremony being looked upon as the diviſion or parting of the ſabbath from the reſt of the week. It was eſtabliſhed to prevent their being too haſty in ending the ſabbath.

Towards the close of the sabbath, when the stars begin to appear, every master of a family lights a torch or flambeau, or at least a lamp with two wicks. A little box of spices is then prepared, and a glass of wine taken; then singing or rehearsing a prayer, and blessing the wine and the spices, they all smell at them; and, after a few ceremonies performed about the torch, or lamp, they cast a little of the consecrated wine into the flame; every body tastes; and thus they break up, wishing each other, not a good night, but a good week.

HABEAS *corpora juratorum*, is a writ that lies for bringing in a JURY, or so many of them as refuse to come upon the *venire facias*, for the trial of a cause brought to issue. This is of the same nature in the common pleas, as the DISTRINGAS *juratores* in the court of king's bench.

HABEAS *corpus*, in *Law*, a writ, which a man indicted and imprisoned for any crime, or trespass, before the justices of peace, or in a court of franchise; having offered sufficient bail, which is refused, though the case be bailable; may have out of the king's bench, thereby to remove himself thither, at his own costs, to answer the cause at the bar thereof.

The order, in this case, is first to procure a *certiorari* out of the chancery, directed to the said justices, for removing the indictment into the king's bench; and upon that to procure this writ to the sheriff, for causing his body to be brought at a certain day.

This writ is also used to bring the body of a person into court, who is committed to any gaol, either in criminal or civil causes; and a *habeas corpus* will remove a person and cause from one court and prison to another. Of this there are various kinds: such is the *habeas corpus ad respondendum*, when a man hath a cause of action against one who is confined by the process of some inferior court; in order to remove the prisoner, and charge him with this new action in the courts above: such is that *ad satisfaciendum*, when a prisoner hath had judgment against him in an action, and the plaintiff is desirous to bring him up to some superior court to charge him with process of execution. Such also are those *ad prosequendum*, *testificandum*, *deliberandum*, &c. which issue when it is necessary to remove a prisoner, in order to prosecute or bear testimony in any court, or to be tried in the proper jurisdiction wherein the fact was committed. Such is, likewise, the common writ *ad faciendum et recipiendum*, which issues out of any of the courts of Westminster-hall, when a person is sued in some inferior jurisdiction, and is desirous to remove the action into the superior court; commanding the inferior judges to produce the body of the defendant, together with the day and cause of his caption and detainer, whence the writ is frequently denominated an *habeas corpus cum causâ*, *to do and receive* whatsoever the king's court shall consider in that behalf. This is a writ grantable of common right, without any motion in court; and it instantly supersedes all proceedings in the court below. But the great and efficacious writ in all manner of illegal confinement is that of *habeas corpus ad subjiciendum*, directed to the person detaining another, and commanding him to produce the body of the prisoner, with the day and cause of his caption and detention, to do, submit to, or receive the award of the judge or court. This is a high prerogative writ, issuing by the common law out of the court of king's bench, not only in term-time, but also during the vacation, by a *fiat* from the chief justice, or any other of the judges, and running into all parts of the king's dominions. In this court it is necessary to apply for this writ by motion to the court, as of certiorari, prohibition, mandamus, &c. shewing some probable cause, why the extraordinary power of the crown is called in to the party's assistance; and when a probable ground is shewn, that the party is imprisoned without just cause, the writ of *habeas corpus* is then a writ of right, which may not be denied, but ought to be granted to every man that is committed to prison, or detained there, or otherwise restrained, though it be by the command of the king, the privy-council, or any other.

The writ of *habeas corpus* was originally ordained by the common law of the land, as a remedy for such as were unjustly imprisoned, to procure their liberty; but many abuses having been introduced into the mode of granting it, it became necessary to prevent them by modern statutes. Accordingly, by the petition of right, 3 Car. I. it is enacted, that no freeman shall be imprisoned or detained, without cause shewn, to which he may make answer according to law. And by 16 Car. I. cap. 10. if any person be restrained of his liberty by order or decree of any illegal court, or by command of the king's majesty in person, or by warrant of the council board, or of any of the privy-council, he shall, upon demand of his counsel, have a writ of *habeas corpus*, to bring his body before the court of king's bench or common pleas; who shall determine whether the cause of his commitment be just, and thereupon do as to justice shall appertain. The methods of obtaining this are further pointed out and enforced by 31 Car. II. cap. 2. See the next article.

HABEAS *corpus act* is the famous statute 31 Car. II. cap. 2. which some have called the second *Magna Charta*, and bulwark of English liberty. The substance of this important statute is comprised in the following particulars; viz. 1. That the writ of *habeas corpus* shall be returned, and the prisoners brought up within a limited time according to the distance, not exceeding to any case twenty days. 2. That such writs shall be endorsed as granted in pursuance of this act, and signed by the person awarding them. 3. That on complaint and request in writing by or on behalf of any person committed and charged with any crime (unless committed for treason or felony, expressed in the warrant, or for suspicion of the same, or as accessary thereto before the fact, or convicted or charged in execution by legal process) the lord chancellor, or any of the twelve judges, in vacation, upon viewing a copy of the warrant or affidavit, that a copy is denied, shall (unless the party has neglected for two terms to apply to any court for his enlargement) award a *habeas corpus* for such prisoner, returnable immediately before himself, or any other of the judges; and upon the return made shall discharge the party, if bailable, upon giving security to appear and answer to the accusation in the proper court of judicature. 4. That officers and keepers neglecting to make due returns, or not delivering to the prisoner or his agent within six hours after demand a copy of the warrant of commitment, or shifting the custody of a prisoner from one to another, without sufficient reason or authority (specified in the act) shall for the first offence forfeit 100*l.* and for the second offence 200*l.* to the party grieved, and be disabled to hold his office. 5. That no person, once delivered by *habeas corpus*, shall be recommitted for the same offence, on penalty of 500*l.* 6. That every person committed for treason or felony shall, if he requires it, the first week of the next term, or the first day of the next session of over and terminer, be indicted in that term or session, or else admitted to bail; unless the king's witnesses cannot be produced at that time; and if acquitted, or if not indicted and tried in the second term or session, he shall be discharged from his imprisonment for such imputed offence; but that no person, after the assizes shall be opened for the county, in which he is detained, shall be removed by *habeas corpus*, till after the assizes are ended; but shall be left to the justice of the judges of assize. 7. That any such prisoner may move for and obtain his *habeas corpus*, as well out of the chancery or exchequer, as out of the king's bench or common pleas; and the lord chancellor or judges denying the same, on sight of the warrant or oath that the same is refused, forfeit severally to the party grieved the sum of 500*l.* 8. That this writ of *habeas corpus* shall run into the counties palatine, cinque ports, and other privileged places, and the islands of Jersey and Guernsey. 9. That no inhabitant of England (except persons contracting, or convicts praying to be transported, or having committed some capital offence in the place to which they are sent) shall be sent prisoner to Scotland, Ireland, Jersey, Guernsey, or any places beyond the sea, within or without the king's dominions; on pain that the party committing, his advisers, aiders, and assistants, shall forfeit to the party grieved a sum not less than 500*l.* to be recovered with treble costs; shall be disabled to bear any office of trust or profit; shall incur the penalties of *præmunire*, and shall be incapable of the king's pardon. And, lest this act should be evaded, by demanding unreasonable bail, or sureties, for the prisoner's appearance, it is declared by 1 W. & M. stat. 2. cap. 2. that excessive bail ought not to be required.

In consequence of this act, it is now expected by the court, that, upon writs of *habeas corpus* at the common law, the writ should be immediately obeyed, without waiting for any *alias* or *pluries*; otherwise an attachment will issue. Blackst. Comm. vol. iii. p. 136, &c.

HABENA, in *Surgery*, the name of a BANDAGE contrived to keep the lips of a wound together, and save the painful operation of a SUTURE.

HABENDUM, in *Law*, a word of course in a conveyance. In every conveyance are two principal parts, the *premises*, and the *habendum*: the office of the first is to express the name of the grantor, the grantee, and the thing granted.

The *habendum* is to limit the estate, so that the general implication, which, by construction of law, passed in the premises, is by the *habendum* controuled and qualified.

Thus in a lease of two persons, the *habendum* to one for life,

life, alters the general implication of the joint tenancy in freehold, which should pass by the premises, if the *habendum* were not.

HABENTIA, in *Law*, signifies riches. In some ancient charters, *habentes homines* is taken for rich men; and we read, *nec res suam quisquam requirat, vel* habentes homines, *quos ea dirimas* stealing men.

HABERDASHER, in *Commerce*, a seller of hats, and other small wares.

The master and wardens of the COMPANY of *haberdashers* in London, calling to their assistance one of the company of cappers, and another of the hat-makers, and mayors, &c. of towns, may search the wares of all haters who work hats with foreign wool, and who have not been apprentices to the trade, or who dye them with any thing but copperas and galls, or woad and madder; in which cases they are liable to penalties by stat. 8 Eliz. cap. 7. and 5 Geo. II. cap. 22.

For the etymology of this denomination, see BERDASH.

HABERDASHERS *hospital*. See HOSPITAL.

HABERE *facias possessionem* is a writ that lies where one has recovered a term for years in an action of ejectment, in order to put him into possession again.

HABERE *facias seisinam*, a judicial writ, which lies where a man has recovered lands in the king's court; directed to the sheriff, commanding him to give him the seisin thereof.

This writ sometimes also issues out of the records of a fine, directed to the sheriff of the county where the lands lie; commanding him to give to the cognizee, or to his heirs, seisin of the land whereof the fine is levied.

In the execution of these writs, the sheriff may take with him the *posse comitatus*, and may justify breaking open doors, if the possession be not quietly surrendered. But if it be peaceably yielded, the delivery of a twig, a turf, or the ring of the door, in the name of seisin, is sufficient execution of the writ.

There is also a writ called HABERE *facias seisinam, ubi res habuit unum, dies, & vastum*; which lies for the delivery of lands to the lord of the fee, after the king had taken his due of a person's lands, who was convict of felony.

HABERE *facias visum* is a writ that lies in divers cases, as in dower, formedon, &c. where a view is to be taken of the land or tenement in question.

HABERGION, or HAUBERGEON, HABERGETUM, a coat of mail; an ancient piece of defensive armour, in form of a coat, descending from the neck to the middle; and formed of little iron rings, or mailes, linked into each other.

The word is also written *haburge*, *hauberge*, *haubera*, *haubert*, *hauther*, *hauberk*, and *hauberk*. Spelman takes it to have been formed from the ancient French *hault*, *high*, and *berg*, *armour*, *covering*; as serving to defend the upper part of the body. Du-Cange and Skinner choose to derive it from the Belgic *hals*, or Teutonic *hairs*, *neck*, and *bergen*, *to cover*; as if it were a peculiar defence for the neck. Others will have it formed of *al*, *alla*, q. d. *all*, and *bergen*, *to cover*; as importing it a cover for the whole body.

HABHAZZIL, in *Botany*, a name given by Leo Africanus, and some other of the writers of geography, to a plant growing in many parts of Africa, which they say produces its fruit under the earth in form of small round globules, which are much esteemed as food, and have the taste of an almond. The fruit, as it is called, is no other than the distinct tubers of the root, which are connected by fibres or strings, and are in the propagation of the plant very useful to its spreading over a large spot of ground in a little time; all the fibres which shoot out horizontally from the root being terminated by these tubers, and each of these sending out on the opposite side several other fibres, which at due distances produce other tubers. The Africans dig up the ground at random near to the place where they see any of these plants, and never fail of picking up a great number of them. The plant which produces them is the TARSI, and they are eaten in many other places besides Africa. The Spaniards are very fond of them, and call them AVELLANDA, from their likeness to hazel-nuts in shape.

HABILIMENTS *of war*, in our *Ancient Statutes*, signify armour, harness, utensils, or other provisions for war; without which there is supposed no ability to maintain war.

HABIT, in *Philosophy*, an aptitude, or disposition, either of mind or body, acquired by a frequent repetition of the same act.

Some of the schoolmen call this a *qualitative habit*, and define it a quality adventitious to a thing, fitting and disposing it either to act or suffer.

Others define *habit* an affection of mind or body, perfisting by long use and continuance. In which sense the, a constant *habit*, is distinguished from *habens*, a present disposition, liable soon to alter.

HABITS may be distinguished into those of the mind, and of the body. This virtue is called a *habit* of the mind; strength, a *habit* of the body.

All natural *habits*, whether of body or mind, are no other than the body and mind themselves, considered as either acting or suffering; or they are modes of the body or mind, wherein either perseveres, till altered by some contrary mode. Aristotle enumerates five *habits* of the mind; viz. understanding, knowledge, wisdom, prudence, and art; which division the later writers set aside, and only admit of three intellectual *habits*; viz. science, prudence, and art; agreeable to the three kinds of objects, about which the mind has occasion to be facilitated; which are either theoretical, practical, or effective.

Virtues and vices are considered by philosophers under the notion of good and bad *habits*.

The archbishop of Cambray denies *habits*, in general, to be certain impressions left in the mind; by means whereof, we find a greater ease, readiness, and inclination, to do any thing formerly done, by having the idea ready at hand to direct us how it was done before. Thus, e. gr. we form a *habit* of sobriety, by having always before us the inconveniences of excess; the reflections whereof, being often repeated, render the exercise of that virtue continually more and more easy.

F. Malebranche gives a more mechanical theory of the *habits*. His principle is, that they consist in a facility which the spirits have acquired, of passing easily from one part of the body to another. He argues thus: if the mind act on, and move the body, it is in all probability, by means of a flock of animal spirits lodged in the brain, ready to be sent at the motion of the will, by means of the nerves which open or terminate in the brain, into the muscles of the body.

Now, an influx of spirits into a muscle, occasions a swelling, and, of course, a shortening of the muscle; and, consequently, a motion of the part to which that muscle is fastened.

Farther, the spirits do not always find all the roads open and free, which they are to pass through; whence that difficulty we perceive of moving the fingers with that quickness necessary to play on a musical instrument, or of moving the muscles necessary to pronounce the words of a foreign language. But, by degrees, the spirits, by their continual flux, smoothen the ways; so that at length they meet with no resistance at all. In this facility the spirits find of passing, when directed into the members of the body, *habits* consist.

On this hypothesis, it is easy to account for an infinity of phenomena relating to the *habits*. Why, for instance, children acquire new *habits* with more ease than grown persons? Why it is difficult to get rid of inveterate *habits*? Whence that incredible quickness in the pronunciation of words, even without thinking of them; as is particularly observable in those long accustomed to formulas, &c.

On this footing, the faculty of memory appears to have very much the nature of a *habit*; insomuch that in one sense it may pass for a *habit*.

Custom, says Mr. Locke, settles *habits* of thinking in the understanding, as well as of determining in the will, and of motions in the body; all which term to be but trains of motion in the animal spirits, which, once set agoing, continue in the same steps they have been used to, which by often treading are worn into a smooth path, and the motion in it becomes easy, and as it were natural. Essay on the Human Understanding, book ii. ch. 33. See ASSOCIATION *of ideas*.

HABIT, in *Medicine*, is what we otherwise call the temperament or constitution of the body; whether obtained by birth, or occasioned by the manner of living.

An ill, distempered *habit*, without any particular apparent disease, the physicians usually call a *cachexia*, or *cachymia*.

A thing is said to *enter the habit*, when it becomes instantly diffused throughout the body, and is conveyed to the remotest stages of circulation.

HABIT is also used for a dress, or garb; or the composition of garments where with a person is covered.

In this sense we say, the *habit* of an ecclesiastic; of a religious, &c. the nunnery *habit*, &c.

The ecclesiastical *habit* only commenced about the time of Gregory the Great, i. e. it only began at that time to be distinguished from the lay *habit*; viz. in the 6th century. The establishment of the barbarous nations was the occasion thereof; for the laymen took the *habit* of the nations they had subjugated to, but the priests kept to the Roman dress.

The abbot Boileau has an express treatise on the ecclesiastical *habit*; wherein he maintains, contrary to the common

common opinion and cuſtom, that the eccleſiaſtical *habit* ſhould be a ſhort one, and that a ſhort *habit* is more decent than a long one.

The different *habits* and cloaths which the generality of the world wear, are through inadvertency and inattention very frequently the cauſe of very unhappy maladies. Mr. Winſlow, in the Memoirs of the Royal Academy of Sciences at Paris, has obſerved, that the greateſt attention and care are neceſſary on ſeveral occaſions in regard to this, as it is ſuppoſed, trifling article; and given many inſtances of the ill effects of it. The ancients have obſerved the inconveniences of many parts of dreſs, and daily obſervation confirms to us the many miſchiefs the ladies ſuffer from the ſtiff whale-bone ſtays they wear, and the diſorders of the viſcera of the lower belly, to which thoſe are ſubject who lace themſelves too tightly; and this is not only of dangerous conſequence to themſelves, but frequently is the death of children in breeding women.

The tight binding of the neck by the men's neckcloths, ſtocks, or the too tight collars of their ſhirts, &c. has been very frequently the only occaſion of ſeveral very terrible diſorders of the head, the eyes, and the breaſt; deafneſs, vertigoes, faintings, and bleedings at the noſe, are the frequent conſequences of this practice; and the phyſicians conſulted for relief in theſe caſes, have found all means ineffectual, merely from their not attending to the cauſe of the malady; when a cure might have been, and often has been, made without the help of medicines, only by leaving off thoſe unnatural bandages which had been the occaſion of them, from the not ſuffering the free return of the blood by the jugular veins, which had preſſed up into the head, without moleſtation, by the carotid arteries.

Mr. Cruger added to theſe relations, that a certain officer in the army of the king of Denmark, always ordered his ſoldiers to tie their cravats very tight, and garter their ſtockings below the knee, tying them alſo very hard; by which means they always looked red and florid in the face, and thick legged, ſo that his men always appeared ſtout, robuſt, well fed, and in good caſe. But the conſequence of this was, that after ſome time his men were all ſeized in a very particular manner with diſorders, for which the common methods of treatment gave no relief, and great numbers of them died, after all the internal as well as external methods which could be tried, were found ineffectual. Their diſeaſe ſeemed a putrid ſcorbutic infection; and this not only appeared externally, but was found to affect even the internal parts of ſuch of them as were opened after their death. It is unqueſtionable, that this wholly proceeded from the ligatures they continually wore about their necks and legs by order of their officer, and might have been cured merely by leaving them off; and it has even been proved on animals, as calves, ſheep, &c. that extremely tight ligatures on their legs, &c. will have ſo great an effect, as to alter the whole maſs of blood, render the animal morbid, and even make the fleſh unwholeſome and unfit for food. Memoirs Acad. Scien. Par. 1740.

Mr. Winſlow has obſerved, that the different motions of the bones of the foot, which are very free in their natural ſtate as is very plainly ſeen in young children, are uſually wholly loſt to us as we grow up, by means of the improper preſſure of our ſhoes. The high-heeled ſhoes the women wear, entirely change the natural conformation of the bones of the whole foot. They render the foot elevated and arched, and incapable of being flatted, on account of the unnatural union and aneyloſis they bring on between the bones, which is not unlike that which happens to the vertebræ of people who are humpbacked: for theſe high ſhoes make the extremity of the os calcis, to which the tendo Achillis is affixed, to be always unnaturally elevated, and the anterior part of the foot on the contrary is much more depreſſed than it naturally would be. The conſequence of this is, that the muſcles which cover the hinder part of the leg, which ſerve by the attachment of the tendon to ſtretch out the foot, are continually in an unnatural ſtate of contraction; while the muſcles of the anterior part of the leg, whoſe office is to bend the foot forward, are on the contrary kept in a like unnatural ſtate of elongation and diſtention. To this cauſe it is owing, that we very frequently ſee women unable to go down a hill, or any declivity, without great pain; whereas, on the contrary, in walking up a hill, their high-heeled ſhoes make them walk as it were, on even ground; the end of the foot being only ſo far elevated as to bring it on a level with the unnatural poſition of the heel. The women who wear this ſort of ſhoes find it alſo very troubleſome to walk for a long time, though it be on the moſt even ground, and eſpecially if they are obliged to walk quick. They can by no means leap ſo freely and eaſily as thoſe who wear lower heeled ſhoes. The reaſon of which is, that in the human ſpecies, as well as in birds and beaſts, the action of leaping is executed by a ſudden lifting up the hinder part of the os calcis, by means of the action of thoſe muſcles to which the great tendon is faſtened.

Low-heeled ſhoes by no means ſubject the wearer to any of theſe inconveniences, but, on the contrary, they greatly facilitate all the natural motions of the feet, as we have daily innumerable inſtances in the labourers, chairmen, porters, and others of the lower claſs of mankind; and the wooden ſhoes worn by the lower claſs of people in France, notwithſtanding their weight and inflexibility, do not ſo much prevent the proper motions of the muſcles, whoſe office it is to move the feet. For beſide the lowneſs of their heel, they are rounded at the end downwards, which in ſome degree compenſates for their inflexibility, ſerving in the place of the alternate inflection of the foot on its toes on the one part, while the other is lifted up in walking.

But to return to the miſchiefs done by high-heeled ſhoes, there is yet a further inconvenience from them than what has been mentioned, ſince not only the muſcles of the tendo Achillis, which ſerve to move the foot in the extenſion, but the anterior muſcles alſo, which ſerve to the extenſion of the toes, are by the height of theſe ſhoes always in an unnatural ſtate; and not only the anterior muſcles, which ſerve to the bending of the foot, but the poſterior muſcles alſo, which ſerve to the bending the toes, are, at the ſame time, by means of this height, kept forcibly in an elongated and extended ſtate. This continual unnatural ſhortening of ſome of the muſcles, and as unnatural lengthening of others, cannot but cauſe, ſooner or later, a greater or leſſer diſtemperature of their veſſels, as well the veins and arteries as the lymphatics and nerves; nor may this be confined merely to the parts affected, but by the communication of theſe veſſels with thoſe of other more diſtant parts, may, even with thoſe of the abdomen and its viſcera, may bring on diſorders which will be attributed to very different cauſes, and therefore will be treated with medicines which will not only prove uſeleſs, but in many caſes hurtful. It is certain that long cuſtom makes theſe unnatural extenſions and contractions of the muſcles as it were natural to women; inſomuch that thoſe who are accuſtomed to theſe ſhoes would find it painful and diſagreeable to walk in others. But this is no proof that the unnatural ſtate in which the muſcles are continually kept, may not often be the occaſion of all the remote diſorders before hinted at, and which, many of them at leaſt, may appear to have no relation to their original cauſe. Memoirs de Acad. Scien. Par. 1740.

HABIT is particularly uſed for the uniform garments of the religious, conformable to the rule and order whereof they make profeſſion: as the *habit* of St. Benedict, of St. Auguſtine, &c.

In this ſenſe we ſay abſolutely, ſuch a perſon has taken the *habit*; meaning, he has entered upon a NOVICIATE in a certain order. So he is ſaid to quit the *habit*, when he renounces the order. See VOW.

The *habits* of the ſeveral religious are not ſuppoſed to have been calculated for ſingularity or novelty: the founders of the orders, who were at firſt chiefly inhabitants of deſerts and ſolitudes, gave their monks the *habit* uſual among the country people. Accordingly, the primitive *habits* of St. Anthony, St. Hilarion, St. Benedict, &c. are deſcribed by the ancient writers, as conſiſting chiefly of ſheep-ſkins, the common dreſs of the peaſants, ſhepherds, and mountaineers, of that time; and the ſame they gave to their diſciples.

The orders eſtabliſhed in and about cities and inhabited places, took the *habit* worn by other eccleſiaſtics at the time of their inſtitution. Thus, St. Dominic gave his diſciples the *habit* of regular canons, which he himſelf had always worn to that time. And the like may be ſaid of the Jeſuits, Barnabites, Theatins, Oratorians, &c. who took the common *habit* of the eccleſiaſtics at the time of their foundation. And what makes them differ ſo much from each other as well as from the eccleſiaſtical *habit* of the preſent times, is, that they have always kept invariably to the ſame form; whereas the eccleſiaſtics and laics have been changing their mode on every occaſion.

HABITATION, a dwelling-place, or HOUSE.

HABITATION is ſometimes alſo uſed for COHABITATION.

HABITUAL, ſome thing that is become a habit, or habitude.

Thus we ſay, an *habitual* or inveterate diſeaſe; *habitual* ſin, &c.

HABITUAL *grace*. See GRACE.

The Romiſh divines hold *habitual grace* only neceſſary in order to be ſaved; and actual *grace* to the doing any thing meritorious.

HABITUDE, *Habitudo*, in the *Schools*, ſignifies, the reſpect or RELATION which one thing bears to another. In this ſenſe *habitude* is one of Ariſtotle's categories. Some of the more preciſe and accurate Schoolmen conſider *habitude* as a genus, and ſubdivide it into two ſpecies. Where it is conſidered as quieſcent, they call it *reſpect*; where as moved, *relation*; to which ſome add a third ſpecies, conſidered in reſpect of figure, which they call *mode*.

HABITUDE is alſo uſed, in *Philoſophy*, for what we popularly call habit; *viz.* a certain diſpoſition, or aptitude, for the performing or ſuffering of certain things, contracted by reiterated acts of the ſame kind.

HACHES, and HACHING. See HATCHING.

HACK, a tool uſed by miners, in ſhape like a mattock.

HACKNEY. See HAQUENY.

HACKNEY *coach*. See *Hackney* COACH.

HADBOTE, in our *Old Writers*, a recompence or amends for violence offered to perſons in holy orders.

HADDOCK, the *gadus æglefinus* of Linnæus, *in Ichthyology*, a name given by us to a ſpecies of fiſh of the ASELLUS kind, according to the generality of writers; and of the genus of the GADI, according to the new Artedian ſyſtem. It is called by Salvian the *aſellus major*, or *praxter aſellus*, and by Turner and Willoughby, the *aras* or *aſmus* of the ancients. Charleton tells us, that it was the *callaris*, *galeri*, or *galerii*, of the old Romans, mentioned by Pliny; but Artedi has ſome doubt about that. It is called by Artedi by a name much more expreſſive than any of the old ones. This is the *gadus* with a bearded mouth, with three fins on the back, with a whitiſh body, with the upper jaw longeſt, and with the tail a little forked.

Large *haddocks* begin to be in roe in the middle of November, and continue ſo till the end of January; from that time till May they are very thin tailed, and much out of ſeaſon. The ſmall ones are extremely good from May to February; and thoſe which are not old enough to breed in February, March, and April. The fiſhermen aſſert, that in rough weather *haddocks* ſink down into the ſand and ooze, in the bottom of the *ſea*, where they ſhelter themſelves till the ſtorm is over, becauſe they take none in ſtormy weather. In ſummer they live on young herrings, and other ſmall fiſh; and in winter on a ſpecies of *ſerpula*, called the ſtone-coated worm, and by fiſhermen *haddock-meat*. The grand ſhoal of *haddocks* comes periodically on the coaſts of Yorkſhire; the large ones quit the coaſt as ſoon as they get out of ſeaſon, leaving behind abundance of ſmall ones, and are ſaid to viſit the coaſts of Hamburgh and Jutland in the ſummer. On each ſide of the *haddock* there is a large black ſpot, aſcribed by ſuperſtition to the impreſſion made by St. Peter's finger and thumb, when he took the tribute money out of the mouth of a ſpecies of this fiſh. Pennant.

HADE, in *Mining*, ſignifies any ſhafe or turn which deſcends like the ſide of a houſe, or like the deſcent of a ſteep hill. It is then ſaid to *hade*.

HADES. See ADES.

HADRIANEA, or HADRIANALIA, in *Antiquity*, games inſtituted by Antonine, at Puzzooli, in honour of the emperor Hadrian, or Adrian.

There are two ſorts of *Hadrianalia*, the one held every year, and the other every five years.

HADRIANISTS, *Hadrianiſtæ*, in *Church Hiſtory*. See ADRIANISTS.

HÆMACHATES, the *blood-coloured agate*, in the *Natural Hiſtory of the Ancients*, the name of an agate found at this time in the Eaſt Indies, and in ſome parts of Germany, and called by Dr. Hill *ſubtilis ſanguineus variegatus*, or the blood-coloured variegated AGATE.

It is one of the moſt beautiful of the agate kind, and was extremely well characterized by the name the ancients gave it, being always of a ſtrong and deep red like that of blood. Often it is only of this plain and ſingle colour throughout the maſs, but more frequently it is found beautifully variegated with a pale blue, and with brown; the blue in this caſe always ſurrounding the red, and appearing like the ſerum which ſeparates from and floats above the blood, when it has been ſome time out of the body. The brown or hair-colour is often the baſis or ground colour of the ſtone, and the red in ſpots only, and variegations, ſurrounded with this thin bluiſh colour; it is very hard, and takes a fine poliſh, and is cut into the tops of ſnuff-boxes, and other toys, and much valued by our lapidaries.

HÆMAGOGOUS, *of* αἷμα, *blood*, and ἀγω, *I throw away*, the name of a medicinal compoſition deſcribed in Myrepſus, and intended to bring away the lochia, or forward the menſtrual diſcharges. It conſiſts of black hellebore and the ſcarlet grains, with honey.

HÆMALOPS, of αἷμα, *blood*, and ὀψ, ὠπ, a term uſed by many authors for that blackneſs which appears about the eyes from blows; but Hippocrates uſes it to expreſs a black, thick, and faculent blood, overſpreading the chorion in the formation of the fœtus, and rejected afterwards as of no uſe, and diſcharged into the ſpace between the uterus and chorion. Some authors alſo uſe the word for ſpitting of blood.

HÆMANTHUS, in *Botany*. See BLOOD-*flower*.

HÆMATITES, from αἷμα, *blood*, in *Natural Hiſtory*, the *blood-ſtone*, a kind of ruddy mineral ſubſtance; thus called, either on account of its reſembling dry, curdled blood, or of its reputed faculty of ſtanching blood.

Pliny reckons five kinds of blood-ſtone; *viz.* the *Æthiopic*, *anthracites*, the *Arabic*, the ELATITES or *emites*, and the SCHISTOS; beſides that commonly called in his time the *magnes hæmatites*, from the property it hath of attracting iron.

The five ſorts differ chiefly in point of hardneſs: the beſt, according to Dioſcorides, is that which is friable, hard, black, and ſmooth, without either gritty parts, or veins. That commonly uſed by the painters is factitious, being made of Armenian bole, and other drugs.

The common native, or the foſſil kind, comes from Egypt, Bohemia, &c. This is of various figures; ſpherical, ſemi-ſpherical, pyramidal, or cellular; compoſed of ſmall pyramids, the apices of which appear, in a tranſverſe ſection, in the centre. It contains a large portion of iron; but the iron is obtained with ſuch difficulty, and is of ſo bad a quality, that this ore is not commonly ſmelted. This ſtone, when expoſed to a moderately ſtrong fire, *falls by* degrees into ſcales; and in this ſtate is attracted by the magnet, and gives out its iron to acids. It has divers uſes in medicine; being held cooling and aſtringent, and, in that quality, preſcribed in hæmorrhages and uterine obſtructions. It inquires in ſubſtance, in form of a fine powder, from one ſcruple to three or four, for a doſe. It is alſo uſed in diſtempers of the eyes; but pure iron, or the preparations of iron, muſt be preferable to this ſtone in the ſame intention.

The gilders uſe it for burniſhers, to poliſh their metals. Boetchius has an expreſs treatiſe on the *lapis hæmatites*.

HÆMATION, a word uſed, among the *Ancients*, for a ſort of reddiſh garon, made of the inteſtines and blood of fiſhes macerated in ſalt.

HÆMATOCELE, of αἷμα, *blood*, and κηλη, *tumor*, is a tumor of the ſcrotum, or of the ſpermatic proceſs, occaſioned by extravaſated blood. This diſeaſe is diſtinguiſhed by Mr. Pott into four kinds; two of which have their ſeat in the *tunica vaginalis*; the third within the *albuginea*; and the fourth in the *tunica communis* of the ſpermatic veſſels. The two former happen in conſequence of the operation of tapping the hydrocele of the *tunica vaginalis*; ſo that either by the diviſion of a blood-veſſel in the original coat, or by the burſting of ſome of the veſſels after the operation, the cavity which had been filled with water, becomes in a very little time diſtended with blood; and muſt in both caſes, if not abſorbed or diſſipated, be diſcharged by opening the containing bag: but in neither of theſe, ſays Mr. Pott, is caſtration ever neceſſary: the mere diviſion of the faculus, and the application of dry lint to its inſide, will in general reſtrain this kind of hæmorrhage, and anſwer every purpoſe for which ſo ſevere as well as unneceſſary a remedy has been preſcribed.

The third kind happens, when the blood is extravaſated within the *tunica albuginea*, in conſequence of a great relaxation, and, as it were, diſſolution of part of the vaſcular compages of that gland. In this caſe, the hæmorrhage proceeds from the ſubſtance of the teſticle, and from the convolutions of the ſpermatic artery within the *tunica albuginea*: the teſticle itſelf is injured and rendered uſeleſs, and caſtration is the only certain cure.

The laſt ſpecies of *hæmatocele* conſiſts of a rupture or breach of a branch of the ſpermatic vein, between the groin and ſcrotum, in the ſpermatic proceſs, which may be occaſioned by external violence and ſtraining, as well as by a wound in theſe parts. In this caſe, the extravaſation is made into the cellular membrane, inveſting the ſpermatic veſſels; the hazard is ſometimes conſiderable, and caſtration often the only remedy. Pott's Chirugical Works, vol. II. p. 382, &c. 1779. See HYDROCELE.

HÆMATOCHYSIS, of αἷμα, *blood*, and χυω, *I pour forth*, a term uſed by Willis, and ſome others, for a hæmorrhage.

HÆMATOPUS, in *Ornithology*, a bird called by others the PICA *marina*, or *ſea-pye*. This, in the Linnæan ſyſtem of nature, makes a diſtinct genus of birds of the order of the *grallæ*; the diſtinguiſhing characters of which are, that the feet are formed for running, the toes are three in number on each foot, and ſeparate, and the apex of the bill, which is compreſſed, in form of a wedge.

HÆMATOPUS *ardea*, the red-legged heron, a very beautiful bird common in Italy, and called by the ancients CEREUS; it is one of the smallest of the heron kind, and is of a yellowish chesnut colour.

HÆMATOSIS, formed of *αἷμα, blood*, in *Medicine*, the action whereby the chyle is converted into blood: called also SANGUIFICATION.

The chief of the vital actions are the chylosis, and *hæmatosis*.

HÆMATOXYLON, in *Botany*. See LOGWOOD.

HÆMIONIUM, in *Botany*, a name by which Dioscorides calls the *asplenium*.

HÆMITYBION, in the *Writings of the Ancients*, a linen piece of apparel fringed on both sides. Others call it a soft kind of handkerchief to wipe off sweat; but Galen makes it signify a slick piece of linen cloth. In this he has an eye to some passages of Hippocrates, where the word seems plainly to be used in that sense; others of the ancients have also used it exactly in the same meaning.

HÆMOCHRINUS, of *αἷμα, blood*, and *κρήνη, fountain*, *wasps of the throat*, in *Medicine*, a term used by some of the old writers for a spitting of blood, attended with a rattling noise in the note and fauces.

HÆMODIA, a flupor of the teeth, caused by auftere and acid fubftances.

HÆMOPTOE, in *Medicine*. See HÆMOPTYSIS.

HÆMOPTYSIS, formed of *αἷμα, blood*, and *πτύειν, to fpit*, corruptly alfo called HÆMOPTOSIS, and HÆMORTOE, in *Medicine*, fpitting of blood; occafioned by the rupture or erofion of fome veffel of the lungs; and accompanied ufually with a cough, and a fenfe of preffure on the breaft.

The *hæmoptyfis* differs from a vomiting of *blood*, in that in the *hæmoptyfis* the blood comes from the lungs, and for that reafon is florid and frothy; whereas in vomiting of blood, it comes from the ftomach, and is blackifh.

The *hæmoptyfis* is either *accidental* or *habitual*. The latter is a fymptom of the phthifis.

This diforder is by fome confounded with the fputum cruentum, or bloody fpit, but very improperly; fince in this cafe the blood is thrown up pure and florid from the lungs, and without any violent efforts; whereas in the other the faliva is only thrown out tinged or ftreaked with blood, and that with much trouble and laborious hawking; and fometimes a flight erofion of the gums or fauces tinging the faliva with blood, will occafion the fame appearance. The *hæmoptyfis* differs alfo from the VOMITING *of blood*, in that the blood is arterial and unmixed, and voided without emotion, and with a little cough; whereas in the other cafe there is always a ftraining to vomit, and the blood is venal, and ufually coagulated, and there is no cough.

Signs of it. The *hæmoptyfis* is generally preceded by a fenfation of oppreffion and narrownefs of the breaft; or more rarely by a fort of itching or titillation felt all along the afpera arteria; and in moft cafes there is a dry, and not very violent or troublefome cough, for fome time before. Sometimes it is preceded by fhivering, coldnefs of the extremities, coftiveneſs, great laffitude, flatulence, pain of the back and loins, &c. Sometimes however, the blood is voided without any of thefe antecedent fymptoms, and only with a fenfation of fomething warm coming up out of the breaft to the mouth.

Perfons fubject to it. This is a cafe that more rarely happens than moft other of the complaints of the lungs; and the perfons afflicted with it are principally young men between eighteen and twenty-five; it very rarely happens after thirty, and principally affects perfons of a plethoric habit, or fuch as ufe high-feafoned food. Perfons of a ſlender make and lax fibres, who have long necks and ſtrait breaſts, are moſt liable to this diſeaſe. Women are more ſubject to it than men, from the frequent diſturbances nature meets with in the menſtrual diſcharges; and people who are accuſtomed to loud ſpeaking or ſinging, are ſometimes afflicted with it, from the violent diſtentions they give to the veſſels of the breaſt. Sometimes alſo it ſeizes perſons who have changed an active life to a ſedentary one; and more than any others thoſe who have had ſome other hæmorrhage, or natural and habitual evacuation, ſtopped upon them, without having the caution to bleed or evacuate properly on the occaſion. Accordingly it has been a common obſervation, that thoſe who have been ſubject to bleeding at the noſe when young, are afterwards moſt liable to this diſorder.

Cauſes of it. Youth and a pletho'ric habit, with too great a derivation of the blood upon the lungs, are ſometimes the natural cauſes of this; but external accidents frequently concur, or of themſelves bring it on: ſuch are all violent ſtrainings of the breaſt; violent attempts to lift or carry burdens to which the body is not accuſtomed, blowing vehemently in the playing on trumpets and other wind inſtruments, exceſſive drinking, and violent paſſions, as anger, &c. and violent motions in wreſtling, running, jumping, or the like; violent coughing may alſo bring it on; but this is not the caſe ſo often as is ſuppoſed, the cough attending this diſorder, and ſuppoſed to be the cauſe of it, being uſually only a ſymptom of it.

This diſeaſe may alſo proceed from wounds of the lungs, and from a polypus, fcirrhous concretion, or any thing that obſtructs the circulation of the blood in the lungs. It is ſometimes occaſioned by breathing too rare an air, as in the caſe of thoſe who work in furnaces, glaſs-houſes, &c. or of thoſe who aſcend very high mountains.

Progneſtics from it. This is a diſorder of the utmoſt conſequence, and is by far the moſt dangerous of all hæmorrhages; and though the quantity of blood voided is ſeldom ſo great as to bring on ſudden death, yet what remains extravaſated in the lungs eaſily corrupts there, and brings on a phthiſis, of which death is the conſequence. The uſe of violent aſtringents is often the cauſe of this alſo, where nature would have eſcaped it. However, if the patient is ſtrong, and of a ſound conſtitution, the danger is not very great; but the diſorder is with difficulty removed from perſons of a delicate frame and lax fibres. If it proceeds from a polypus, or ſcirrhus of the lungs, it is alarming; and when the diſcharged blood is occaſioned by an ulcer of the lungs, it is generally fatal. In ſome caſes, as in pleuriſies, peripneumonies, and many other fevers, it is not an unfavourable ſymptom; but in a dropſy, ſcurvy, or conſumption, it indicates an ulceration of the lungs.

The method of cure. When the quantity of blood brought up is ſmall, and the ſymptoms not violent, ſuch things only are to be given as quiet the violent emotions of the blood; ſuch are nitre and cinnabar, made into powders with crabs-eyes, or any other abſorbent. If the caſe is more violent, a gentle anodyne or opiate may be added, ſuch as the pill *de ſtyrace, or de cynoglofſe*. In more violent caſes, where the attemperating medicines take no effect, the milder aſtringents are to be uſed; or if the urgency of the ſymptoms make it neceſſary, even the ſtronger; ſuch as the acid elixir of vitriol, fifteen or twenty drops of which may be given in a glaſs of water, three or four times a day; but with theſe there ſhould always be given a gentle opiate. Thus, ten or twelve drops of laudanum may be given in a cup of barley water, twice a day, and continued for ſome time, provided they be found beneficial; the antimonial crocus of ſteel, and the vitriolic colcothar, may then be given with the roſin-pill. Revulſion muſt alſo be attempted by diaphoretics, bleeding in the foot, and cluſters, and gentle purges; and finally, the cure is to be completed by pectorals and detergents.

Dr. Dickſon very much recommends, from his own experience, the uſe of nitre in this diſorder: the mode in which he adminiſters it is in the form of an electary, prepared of four ounces of conſerve of red roſes, and half an ounce of nitre; and he directs the quantity of a large nutmeg to be taken four, ſix, or eight times a day, according to the urgency of the caſe. This electary, he ſays, is almoſt as much to be depended upon, when given early in an *hæmptoe*, as the *cortex Peruvianus* in a genuine intermittent. In private practice, the nitre joined with ſpermaceti, or p. c trag. c. has produced equally good effects. Junker's Conſ. Med. p. 30. London Med. Obſ. vol. iv. p. 220. Buchan's Dom. Med. p. 367. ed. 5.

When the pulſe is hard and full, blood-letting ſhould be occaſionally repeated. Thoſe who are ſubject to frequent returns of this diſeaſe, ſhould avoid all exceſs: their diet ſhould be light and cool, conſiſting chiefly of milk and vegetables; and every liquor that is uſed, ſhould be drank cold. Above all, they ſhould beware of vigorous efforts of the body, and violent agitations of the mind.

If a ſuppreſſion of the menſes, or hæmorrhoidal diſcharges, have been the cauſe of the diſtemper, great care is to be taken to bring them on regularly again, by bleeding in the foot, applying leeches to the hæmorrhoidal veſſels, and the like means. Authors diſtinguiſh an *hæmoptoe* into a great many ſpecies, ſuch as *anaſtomoſis, diarroſis, diapedeſis, pleuriſis*, and *diabrofis*; and write a great deal of the different cauſes of theſe *hæmoptoes*, and of the ſigns by which they are to be diſtinguiſhed. But a late author thinks this of little importance. He thinks it moſt advantageous to conſider a *hæmoptoe* ſimply as a preternatural efflux of blood, and as ſuch it agrees with the hæmorrhage of the noſe, vomiting of blood, dyſentery, bloody urine, too great flow of the menſes, &c. all which have the ſame immediate cauſes, the ſame effects and conſequences, and ſuggeſt the ſame indications of cure; which are, in the beginning, to diminiſh the quantity of blood, and to make a revulſion by opening a vein in the arm, foot, &c. then to moderate the velocity and rarefaction

faction of the blood by cooling medines; and laſtly, to contract and ſtrengthen the veſſels by aſtringents. The ſame method muſt take place in all; and therefore the general ſtyle of the cure of diſeaſes ought to be hæmorrhage. *See* Medic. Eſſ. Edinb. vol. i. art. 25.

HÆMORRHAGE, compounded of *αἷμα*, *blood*, and *ῥήγνυμι*, *I burſt forth*, in *Medicine*, a flux of blood at any part of the body ariſing either from a rupture of the veſſels, as when they are too full, or too much preſſed; or from an eroſion of the ſame, as when the blood is too ſharp and corroſive.

The *hæmorrhage*, properly ſpeaking, as underſtood by the Greeks, was only a flux of blood at the noſe; but the moderns extend the name to any kind of flux of blood, whether by the noſe, mouth, lungs, ſtomach, inteſtines, fundament, matrix, or whatever part.

Hæmorrhages are divided, by the medical writers, into *natural* and *preternatural*.

HÆMORRHAGES, *natural*, comprehend bleeding at the noſe; ſpitting of blood, the fluxes of the hæmorrhoids and menſes, the lochia in lying-in women, vomiting of blood, and voiding blood by urine.

HÆMORRHAGES, *preternatural*, are ſuch as derive their origin from external accidents, as falls, blows, and wounds. Some alſo comprehend, under this term, the artificial evacuations, by bleeding, cupping, and the like.

HÆMORRHAGES differ much, according to the age and ſtate of the patient, and other accidents. Thoſe from the noſe are moſt frequent in young perſons; thoſe of the hæmorrhoids in people of a middle age, or later in life; the ſpitting of blood, to perſons in a middle age; and voiding blood by urine uſually to older people. Some *hæmorrhages* are periodical, which are the efforts of nature to relieve herſelf, and ſhould by no means be obſtructed, from whatever part of the body they proceed, unleſs they are very violent; and others vague or uncertain. The firſt obſerve ſome ſtated periods of time for their return upon people; the laſt are wholly uncertain in that particular. Some are alſo termed critical; theſe are ſuch as happen at the *criſis* of fevers. There are uſually violent pains about the part whence natural *hæmorrhages* are to proceed; but theſe always go off as ſoon as the bleeding comes on in due quantity.

HÆMORRHAGES, *perſons moſt ſubject to*. Young perſons of a healthy and florid conſtitution are moſt ſubject to *hæmorrhages*; people of pletboric habits are alſo much ſubject to them, and eſpecially ſuch whoſe blood is found and ſizable, not ſubject to any dyſcrecy. Thoſe who drink much wine, or eat high-ſeaſoned foods; and, more than all theſe, perſons who are ſubject to violent paſſions, eſpecially to anger. Hence it is, that brutes are very rarely afflicted with them.

HÆMORRHAGES, *cauſes of*. Among the principal of theſe are to be numbered a plethora, a laxity of the veſſels, an inflammatory diſpoſition of the blood, generally attended with ſome degree of fever, a diſſolved ſtate of the blood, as in putrid fevers, the dyſentery, the ſcurvy, the malignant ſmall-pox, &c. or occaſioned by the too liberal uſe of medicines which tend to diſſolve it, as canthariides, the volatile alkaline ſalts, &c. violent commotions of the body, and violent paſſions of the mind, hot foods and liquors, ſtrong purges and vomits, a heat of the ſeaſon, and a ſudden cooling of the body after violent heat and paſſion. Junker's Conſp. Med. p. 12.

Prognoſtics from them. *Hæmorrhages* from the lungs, and vomiting, and voiding blood by urine, are all very dangerous. The others, when regulated, and in due proportion, are ſalutary, and often prevent diſeaſes. And the common cuſtom of ſtopping them by aſtringents, or otherwiſe, is often productive of ſtagnations, inflammations, and violent fevers.

Method of cure. *Hæmorrhages* flowing moderately, and from natural paſſages, require no aſſiſtance of medicine; when they happen to pletboric perſons, they are to be ſuffered to continue a ſufficient time. When the quantity of blood is leſſened by theſe diſcharges, its quality, if diſtempered, is next to be amended by internal remedies; if ſulphureous and acrid, by nitrous medicines and abſorbents, and by gentle acids; to this purpoſe ſal prunelle, crabs-eyes, lemon-juice, and the like, are excellent; if the blood be too thick, a greater quantity of food, and a larger of drink, is to be preſcribed; and to this the reſolvent and attenuating medicines are to be added, as the neutral ſalts and diuretic roots. Theſe are the neceſſary things out of the way; and during the bleeding ſuch things are to be given as repreſs the violent emotion of the blood, ſuch as cucumber, nitre, and crabs-eyes, ſalted with a vegetable acid. Spirit of hartſhorn, and tincture of antimony, may next be given; and, after theſe, moderately ſtyptic and anodyne medicines; but the ſtronger ſtyptics and aſtringents are not to be uſed but with great caution; becauſe, by increaſing the force of the circulation, they muſt be prejudicial.

The STYPTIC *powder* of Helvetius has been found excellent in *hæmorrhages*.

The VITRUM *antimonii ceratum* has likewiſe proved very efficacious in UTERINE *hæmorrhages*.

The cure of a hæmorrhage muſt be adapted to its cauſe. When it proceeds from too much blood, or a tendency to inflammation, bleeding, with gentle purges, and other evacuations, will be neceſſary. It will likewiſe be proper for the patient in this caſe to live chiefly upon a vegetable diet, to avoid all ſtrong liquors, and food that is of an acrid, hot, or ſtimulating quality. The body ſhould be kept cool, and the mind eaſy.

When a *hæmorrhage* is owing to a putrid or diſſolved ſtate of the blood, the patient ought to live chiefly upon acid fruits with milk, and vegetables of a nourithing nature, as peas, beans, &c. His drink may be wine, diluted with water, and ſharpened with the juice of lemon, vinegar, or ſpirits of vitriol. The beſt medicine in this caſe is the Peruvian bark, which may be taken according to the urgency of the ſymptoms.

When a flux of blood is the effect of acid food, or of ſtrong ſtimulating medicines, the cure is to be effected by mild and mucilaginous diet. The patient may likewiſe take frequently about the bulk of a nutmeg of Locatelli's balſam, or the ſame quantity of ſpermaceti.

When an obſtructed perſpiration, or a ſtricture upon any part of the ſyſtem, is the cauſe of a *hæmorrhage*, it may be remedied by drinking warm diluting liquors, lying in bed, bathing the extremities in warm water, &c. Buchan's Dom. Med. p. 359. ed 5.

Dr. Hunter obſerves, that the faintneſs which comes on after *hæmorrhages*, inſtead of alarming the by-ſtanders, and making them ſupport the patient by ſtimulating medicines, as ſpirits of hartſhorn and cordials, ſhould be conſidered as ſalutary; as this ſeems to be the method which nature takes to give the blood time to coagulate. This obſervation has been confirmed by an experiment of the late ingenious Mr. Hewſon, who found, that the diſpoſition of the blood to coagulate is increaſed as the animal becomes weaker; and, therefore, the medicines likely to be of ſervice in ſtopping *hæmorrhages*, are ſuch as cool the body, leſſen the force of the circulation, and promote that languor or faintneſs. Phil. Tranſ. vol. lx. p. 404, &c.

Theſe experiments alſo ſhew, that a vein may be opened with propriety, even where there is no plethora, in order ſuddenly to bring on weakneſs; by which the momentum of the blood may be ſo diminiſhed, and the diſpoſition of the lymph to coagulate may be ſo increaſed, as to ſtop the *hæmorrhage*.

Soft compreſſion is, by Garengeot, thought more effectual to ſtop *hæmorrhages* than hard ſubſtances, and its uſe recommended even when ſtitches of arteries give way, in which caſe the uſe of vitriol buttons is condemned.

HÆMORRHAGES, *internal*. The momentum itſelf is not free from being the ſeat of fatal internal *hæmorrhages*, though this rarely happens. The Peterſburg Commentaries give us an account of a woman, who dying almoſt immediately of a blow ſhe received on the belly, was opened, and the cavity of the abdomen was found greatly diſtended with blood, which had plainly been diſcharged from the momentum, as a great number of grumes of blood were found lodged between its foldiges. It was obſerved alſo, in this ſubject, that the omentum was firmly attached to the fundus of the uterus.

The ſame paper gives an account alſo of another very remarkable internal *hæmorrhage*; this was of the ſtomach. In this caſe the patient died inſtantaneouſly; and the blood having been diſcharged into the ſtomach too faſt, either for its being ejected upwards or downwards, when the body was opened, the ſtomach was found greatly diſtended, and completely filled with one great grume or maſs of coagulated blood. It is remarkable, that in this ſubject, the ſtomach was found in a perfectly ſound ſtate, but the ſpleen was found putrid and rotten. Act. Petropol. vol. i. p. 382.

HÆMORRHAGE, or *bleeding of the noſe*, is uſually preceded by ſome degree of quickneſs of the pulſe, flushing in the face, pulſation of the temporal arteries, heaviness in the head, dimneſs of the ſight, heat and itching of the noſtrils, &c. This diſcharge is of conſiderable ſervice in many diſeaſes; it often cures a vertigo, the headach, a phrenſy, and even an epilepſy; it is in very beneficial in fevers, inflammations of the liver and ſpleen, and often in the gout and rheumatiſm; in all caſes where bleeding is neceſſary, a ſpontaneous diſcharge of blood is much more ſerviceable than the ſame quantity drawn away with a lancet. Whenever bleeding at the noſe relieves any bad ſymptom, and does not proceed ſo far as to endanger the patient's life, it ought not to be ſtopped: but when it returns frequently, or continues till the pulſe becomes low, the extremities begin to grow cold, the lips pale, or the patient complains of being ſick or faint,

it

it muſt immediately be ſtopped: for this purpoſe the patient ſhould be ſet nearly upright, with his head reclining a little, and his legs immerſed in water of the warmth of new milk; his hands ſhould likewiſe be put in lukewarm water; his garters may be tied a little tighter than uſual; and ligatures applied to the arms, which ſhould be gradually ſlackened as the blood begins to ſtop. If dry lint, put up the noſtrils, does not ſtop the bleeding, doſſils of lint, dipped in ſtrong ſpirits of wine or brandy may be applied in the ſame manner: blue vitriol, diſſolved in water, may alſo be uſed for this purpoſe, or a tent dipped in the white of an egg beat up, and rolled in a powder made of equal parts of white ſugar, burnt alum, and white vitriol, may be put up the bleeding noſtril. If the genitals be immerſed for ſome time in cold water, the bleeding will almoſt always be ſtopped. The internal medicines proper in this caſe is Glauber's ſalt and manna, of each of which half an ounce, diſſolved in four or five ounces of barley-water, may be taken for a doſe, and repeated till it produces the effect. Ten or twelve grains of nitre may alſo be taken in a glaſs of cold water and vinegar, every hour, or oftener, if the ſtomach will bear it.

Mr. Le Dran propoſes to make a ſeton, like that mentioned in the article POLYPUS, ſerve for ſtopping *hæmorrhages* of the noſe; for which purpoſe he faſtens two doſſils to the cord, and, after drawing one out at the noſtril, to bring away the clotted blood, he continues to draw the cord, and ſo fills up the poſterior part of the noſtril with the other, which ought to be larger and well wet in a ſtyptic liquor; by which, not only the *hæmorrhage* will be ſtopped, but if it ſhould continue, the blood and medicines will be effectually prevented from running down the throat, which commonly occaſions a cough or vomiting that increaſes the bleeding.

Thoſe who are ſubject to bleeding at the noſe ſhould often bathe their feet in warm water, and keep them warm and dry; and their blood, if they have too much, may be leſſened by a vegetable diet and an occaſional cooling purge: but if the diſorder proceeds from a thin diſſolved ſtate of the blood, the diet ſhould be rich and nourihing. Infuſions of the bark in wine ought likewiſe to be taken and perſiſted in for a conſiderable time. Med. Eſſ. Edin. vol. ii. p. 318. Buchan's Dom. Med. p. 361. 5th edit.

HÆMORRHAGES, *unnatural*, a term uſed by ſome medical writers to expreſs ſuch diſcharges of the blood as are made from parts not naturally, or, in the common courſe of things, admitting ſuch evacuations. Of theſe we have a very remarkable inſtance, recorded in the Philoſophical Tranſactions: it is of a young child, which bled firſt at the noſe and ears, and afterwards at the hinder part of the head, where there was no ſore, and afterwards at the ſhoulders, waiſt, and at the fingers and toes, and the bending of the arms.

HÆMORRHAGES *from wounds*. Profuſion of blood, from wounds, ariſes from injuries of the veins or arteries, received in the inflicting the wound: and the violence of the *hæmorrhage* is ever in proportion to the ſize of the wounded veſſel: it is no wonder, therefore, that great weakneſs, fainting fits, and ſometimes inſtant death, are the dreadful conſequences attending this ſymptom, according to the ſize of the wounded veſſel. The ſurgeon ought, for this reaſon, never to be without the proper remedies to ſtop blood about him; but there are ſome caſes in which it is by no means proper to ſtop the *hæmorrhage* inſtantly. In a young plethoric habit, or in a wound got in a drunken fit, or even in a fit of great paſſion, it is beſt to let the blood run as long as it continues to do ſo without inconvenience to the patient; for, by a moderate loſs of blood, the inflammation, tumor, pain, and fever, are either entirely prevented, or much leſſened; beſides, the divided arteries become more capable of contracting, and the blood more readily coagulates, two circumſtances that ſeem to concur in cloſing the bleeding orifices.

The ſtopping of *hæmorrhages* is to be done by various ways: if no large veſſel is wounded, dry lint alone is always ſufficient; the wound is to be filled with this, and a proper compreſs and bandage put over it. The wound muſt be filled pretty cloſely with the lint, and a proper degree of preſſure given over the compreſs with the hand, by which more is done ſometimes than by all the bandages or violent remedies in the world. But if the *hæmorrhage* is too large to be ſtopped by the application of dry lint alone, the uſe of aſtringent medicines is to be called in: the uſual application, in this caſe, is rectified ſpirit of wine applied cold to the wound, filling it up with doſſils dipped in the ſame ſpirit, and covering it with large compreſſes wrung out of the ſame liquor, and making a proper preſſure over all with a bandage: the other aſtringents, uſed on this occaſion, are vinegar, the lycoperdon, or puff-ball oil, and ſpirit of turpentine, alum, vitriol, or ſaccharum ſaturni, diſſolved in water and vinegar, or the dry powders of bole armeniac, bloodſtone, dragon's blood, &c.

When veſſels of a larger ſize are divided, we are to have recourſe to cauſtic medicines inſtead of aſtringents; the common medicine, in this intention, is the Roman vitriol, which being coarſely powdered and ſprinkled upon cotton, is to be applied to the wound, dreſſing up with doſſils, a compreſs, and bandage. It is uſually neceſſary to be very cautious in the application of this, that it only be laid to the bottom of the wound, or the part where the veſſel wounded lies, otherwiſe the other parts will ſuffer too great an eroſion from it.

If all theſe applications prove fruitleſs, it will be proper wholly to divide the artery, yet only divided in part; for, by this means alone, it will contract and hide its end under the muſcular fleſh, and its orifice will, by that means, either be entirely choaked up, or at leaſt it will be more ready to yield to the force of the medicines before adviſed to be uſed on ſuch occaſions. This method of treatment is moſt uſually neceſſary in wounds of the temporal arteries, and thoſe of the cubits and tibiæ.

If this method ſhould fail, you muſt then have recourſe to the hot iron or actual cautery; the orifices of veſſels being burned, a cruſt is formed over them, and this method is ſo very effectual, that it is ſcarce poſſible for an *hæmorrhage* to happen in wounds of the external parts, which may not certainly be ſtopped by it. In this caſe, two cauteries ſhould be always ready, that, if one ſhould be extinguiſhed before the operation is finiſhed, the other may be at hand without waiting for it. Cauteries are made of different ſhapes and ſizes, according to the parts they are intended to be applied to. The great inconvenience attending the uſe of the cautery is, that, after two or three days, the eſchar ſometimes falls off, and then a ſecond, and that commonly a fatal *hæmorrhage* ſucceeds; to prevent this fatal accident, the wounds muſt be handled very tenderly at the time of dreſſing, and every time the wound is dreſſed, to be provided with a cautery ready heated, to repeat the operation if it ſhould be neceſſary. This caution is to be obſerved, in regard to the larger arteries, for fourteen days; after this there is no great danger of a return of the complaint; but when the crural or axillary arteries are wounded, the cautery is of no uſe.

In very dangerous wounds of the large arteries, ſuch as the crural and axillary, and in amputations of the limbs, the ſafeſt method is that of making a ligature round the veſſels: if this is performed by paſſing a ſtrong waxed thread under the artery, by means of a crooked needle, the blood is preſently ſtopped, and the orifices of the artery coalеſce.

Inſtruments for the ſtopping of *hæmorrhages* have alſo been in uſe in all ages, which, by their forcible compreſſion on the part, ſtop the mouths of the veſſels, the moſt convenient of which is thus compoſed: a braſs plate, three fingers long, and two fingers broad, is perforated in the middle to admit a ſtrong ſcrew, which is provided at the lower end with a ſmall round plate; a piece of leather is ſtrongly faſtened to one end of the braſs plate, of equal breadth with it. In violent *hæmorrhages* this inſtrument is fitted to the wounded part. The end of the leather is brought round the part, and, by means of holes made through it, is faſtened, at the proper part, to two ſmall hooks made on the braſs plate, at the end oppoſite to that where the leather is faſtened; this is to be adjuſted in ſuch manner, that the ſmall plate at the bottom of the ſcrew is to be brought to preſs exactly upon the compreſſes and dreſſings that cover the wound; the handle of the ſcrew is then to be turned round with a gentle preſſure, till it is found turned far enough to make a preſſure of force, to ſtop the blood: it is then to be left in this condition for a day or two, or till it may be ſafely taken off. Heiſter's Sur. p. 45.

Mr. Petit, in examining all the different methods employed by ſurgeons for ſtopping *hæmorrhages*, aſſures us, that in each of them a piece of clotted blood is contained in the veſſel, which ſerves to keep the blood from eſcaping, after the effect of the medicine, firſt employed, ceaſes: where abſorbents or aſtringents are uſed, that there is not only a cylindrical piece of clotted blood in the veſſel, but there is a covering of it on and round the orifice of the cut veſſel, which cylindrical form makes it eaſily puſhed out. Cauſtics have much the ſame effects, only the covering on the extremity of the veſſel is firmer, by the ſolid parts being confounded with the clotted extravaſation. When a ligature is uſed, there is no clotted covering, and the internal plug is of a pyramidal figure, therefore it is with difficulty that ſuch a clotted piece can be puſhed out. Beſides this advantage, the ſides of the veſſel, which are brought to be contiguous by the liga-

ture, will probably grow together; for which reason, and the saving both pain to the patient, and loss of substance to the stump, he prefers compression to all the other methods. In proof of the effects of coagulated blood stopping the efflux of blood from large arteries, he relates two histories; in one the artery was ossified, and in the other it lay in a bony groove: so that, in both, it must have been a plug which prevented the *hæmorrhage*. He endeavours to prove that the plug is stronger and firmer when formed of coagulated lymph than when composed of red blood. For executing the compression right, after amputation of the larger extremities, he has contrived a machine, composed of a large circular belt to be put round the trunk of the body, or superior part of the member, which are to sustain the bandage by straps going from it, which are fastened at the other end to a lesser circular belt, that is put round the part of the member where the tourniquet is commonly applied. This lesser belt is to have two screws, &c. in the form of his screw tourniquet. From this lesser belt four straps go out, to cross over two plates with their screws, as in the tourniquet, placed on the stump. When the operation is performed, he applies thick bolsters of lint on the side of each large artery farthest from the bone, and placing the interior convex plate of the small tourniquet on them, he secures it in the right situation with the four straps, and screws down the plate on the bolsters and vessel, which being pressed between the instrument and the bone, can allow no blood to pass. See Mem. de l'Acad. des Sciences, 1731 and 1732.

Mr. Morand imagines, that the change which happens to the artery on being wounded, affists greatly in stopping the flux of blood, and that this and the coagulation are usually joint agents in this case. When the artery is either empty, or at least less distended than usual with blood, it naturally will collapse, in some degree, and become more or less flatted; and if this goes so far as that the sides come to touch one another, they naturally unite, and the whole cure is performed by this alone: and this is very frequently the case in wounds of small arteries, and in internal *hæmorrhages*. Nor is it more difficult for a large vessel to become flatted and collapse in the same manner, *till its sides touch*, provided that the course of the blood through it be by any means restrained. Mr. Morand gave the Academy of Sciences of Paris a very remarkable account of a thing of this kind, which fell within his knowledge. A countryman having received a violent blow upon his arm, had afterwards no pulsation in the artery, in that part of the arm beneath the place where the blow had been given, though he had a plain one in that part of the artery which was above it. There was at first some fear that the arm must have been taken off, but Mr. Morand saved it, and, as the cure went on, the pulse was observed gradually to be felt again in the hand and lower part of the arm. The occasion of this was plainly, that the artery had become flatted by the blow, and the blood was unable to force the opposition, and circulated only through the small vessels, while the injury from the blow remained violent, but gradually made its way again as the parts restored themselves to their natural state.

A wounded artery, in case it be cut quite asunder, is in the same state with a cord which is cut in two while it is on the stretch. We well know, that when this is done, the two ends recede a great way from one another, and that in proportion to the tension they had before: the case is wholly the same with an artery, and that for the same reason. Its longitudinal fibres are drawn back and shortened, and its circular ones are, by this very action, compelled to run together more close than they naturally should, and form thicker rings about the extremities of the divided vessel; the consequence of which is, that they make the inner hollow narrower. This is a thing of great importance, as not only the sides of the vessel are brought nearer together, and therefore they more easily may come to touch; but the diameter of the bore of the artery being less, a smaller mass of congealed blood may stop it, and this blood adhering to the sides of the vessel on every hand, fills up the passage as it congeals, and, by degrees, brings them together.

Mr. Petit, in confirmation of his opinion, that *hæmorrhages* are stopped by plugs of clotted blood, shewed the Academy of Sciences at Paris such a plug, in an artery which had been opened. See Hist. de l'Acad. des Scienc. 1735.

What is remarkable is, that this plug of clotted blood had lost nothing of its consistence, nor of its adhesion to the aperture of the artery, after lying two months in water, and three years in brandy. This shews the plug to be analogous to a scar: nor is this strange, since both are formed from the juices destined to the nourishment of the part. Hist. de l'Acad. Par. 1736.

A *hæmorrhage* at the anus is more usually called a DYSENTERY.

HÆMORRHOIDAL, an epithet given to the veins and arteries of the intestinum rectum and the fundament, as being the seat of the *hæmorrhoids* or piles.

The *hæmorrhoidal* arteries are two; the one *internal*, the other *external*.

The *internal* is a branch of the lower mesenteric, which, running along the rectum, terminates at the fundament.

The *external* springs from the hypogastric artery.

The *hæmorrhoidal* veins are also *internal* and *external*.

The *internal* carries back the blood of the rectum and fundament, which it embraces regularly; and is inserted sometimes into the splenic branch of the porta, and sometimes into the mesenteric. The *external* brings back the blood from the musculous parts about the fundament, and terminates the hypogastric vein.

HÆMORRHOIDS, in *Medicine*, a disease of the fundament, popularly called the *piles*.

The word is formed of *αιμα, sanguinis profluvium*, flux of blood; which is compounded of *αιμα, blood*, and *ῥεω, I flow*.

The *hæmorrhoids* are a painful, periodical tumor in the lower part of the intestinum rectum; usually appearing external in the anus. They may be considered as a sort of varicous tumors in the hæmorrhoidal veins; arising from the too great abundance of morbid blood therein.

The disease is either *simple*, as when the veins alone are tumefied; or *compound*, as when the neighbouring parts become also infected, or an exacrescence arises therefrom, as a *ficus crista galli, condyloma*, or the like.

Hæmorrhoids again are either open, *fluentes*, that is, when there is a discharge of blood from the hæmorrhoidal vessels, or blind, *cæcæ*, where the parts are only tumid, and there is no discharge: the former are vulgarly called the bleeding, and the latter the blind piles. In the first, the vessels of the *rectum* are open; in the latter, there is some obstruction, which occasions them to swell.

The *hæmorrhoids* sometimes are internal, and cause great pain in going to stool, especially if the faeces be indurated; after which they soon appear externally, and blood is seen upon the excrements.

Emuller is careful in distinguishing the genuine hæmorrhoidal flux from a bloody diarrhœa, frequent in scorbutic cases. The *hæmorrhoids* are usually opened by the attrition of the excrements in a stool, so that the blood flows at the same time with the excrements: but if it flows promiscuously before as well as after the excrements, and without pain, it is a scorbutic flux.

HÆMORRHOIDS are distinguished from the manner and time of their return upon the patient, into regular or periodical, which are a salutary discharge, and ought by no means to be stopped, and vague or irregular.

HÆMORRHOIDS, *signs of*. They are generally preceded by a sensation of pain and tension in the *hypochondria*, and vibrative or spastic motions about the stomach, mesentery, and spleen: and what is much more obvious than these, there is a fenstation, as it were, of a hard *nucleus* sticking in the extremity of the *rectum*; and the more high up in that intestine this is felt, the more difficult will be the erruption of the hæmorrhoidal discharge, and the longer before its appearance. With these symptoms there also very frequently comes on a *tenesmus*: these are the usual antecedent signs, but there are some in whom they appear without any previous notice.

When present, there is a discharge of blood, and that usually very pure and florid in persons who have them frequently and regularly: in others who have them seldom and imperfectly, the blood appears black and grumous, and in some cases especially in persons who never had a genuine and proper flux of this kind, there is exonerated a sanious matter instead of pure blood. The evacuation of the blood from this is seldom voluntary, but usually is forced out by the pressure and hardness of the stools.

HÆMORRHOIDS, *persons subject to them*. They equally affect both sexes, but are oftener met with in men than in women, especially those who are of a sanguine plethoric habit, or of a melancholy disposition, or in those who live high, and lead a sedentary inactive life. They are most frequent in the middle and advanced ages of life, and when they happen to young people they are usually hereditary.

HÆMORRHOIDS, *causes of them*. Among these are to be reckoned a *plethora*, and thickness of the blood, for an extreme thinness and acrimony of it are seldom the cause, though very often supposed to be so. Violent concussions of the abdomen, as by violent exercises of riding or walking, will also bring them on, as will a sedentary life, in which, by the compression of the abdomen, the circulation is impeded at the vena portæ: also an omission

of

of any cuſtomary evacuations of blood, great coſtiveneſs, cold in the parts affected by them, an abuſe of hot foods and ſpirituous liquors, and the taking of aloes, or other the like medicines. In Saxony the *hæmorrhoids* are very frequent, from their taking great quantities of elixir proprietatis; and in Hungary, from their eating large quantities of garlic: violent binding of the bowels, and paſſions of the mind, eſpecially anger and fear, and the venereal infection, will alſo frequently bring them on; but this laſt cauſe chiefly brings on the blind piles, or ſuch as do not bleed.

HÆMORRHOIDS, *prognoſtics from them.* The *hæmorrhoids*, when they flow naturally and moderately, are very beneficial to health, and often prevent violent diſeaſes. They are peculiarly the moſt certain of all remedies in the hypochondriacal affections; they eaſe deliriums, and very often are peculiarly beneficial in the gout, rheumatiſm, aſthma, colics, and inflammatory fevers. With all theſe advantages derived from them, when moderate, they are, however attended when immoderate, or when too long continued, with bad ſymptoms, and are often dangerous: they bring on great weakneſs, and in length of time, induce cachectic diſpoſitions; but they very ſeldom are attended with ſo copious a hæmorrhage as to endanger life on the ſudden, though this has ſometimes happened. The ſudden ſtopping them is always dangerous, and often brings on immediate fatal ſymptoms, ſcirrhuſes of the viſcera, inflammations, melancholy, madneſs, vomiting of blood, and dropſies; and jaundices are often the conſequence of ſuch practice. Thoſe perſons who have them while very young, generally are attended regularly with them through their lives, and ſeldom live to be very old; on the contrary, when they do not appear till perſons are advanced in years, and continue regular and moderate afterwards, they promiſe a long life. Finally, when the *hæmorrhoids* are continual, and flow without any intermiſſions, there is great cauſe to ſuſpect a ſcirrhous or ulcerated ſtate of ſome of the abdominal viſcera.

HÆMORRHOIDS, *method of treatment.* When the *hæmorrhoids* have never yet appeared, but there are ſigns of their approaching, it is not always adviſeable to forward or promote their diſcharges, for they ſeldom anſwer exactly to expectation; but when there is room to fear the ſucceſs, it is better to endeavour at a revulſion by bleeding in the arm or foot, and at the ſame time to ſtrengthen the tone of the parts by a decoction of yarrow, or the like medicines: and the bleeding is to be repeated afterwards at ſtated periods, and the uſe of the internal means continued, if neceſſary; but when the *hæmorrhoids* have already been uſed to flow, as ſoon as the patient feels the ſignals of their approach, their diſcharge is always to be gently promoted, by a moderate uſe of elixir proprietatis or tincture of black hellebore, or its reſin made with ſpirit of wine; and externally by the application of leeches, or, if that is not ſufficient, by opening the veins with a lancet. Junker's Conſp. Medic. p. 47.

During the time of the flux, if that be moderate, there is no occaſion for any aſſiſtance from medicines, but a proper diet is to be obſerved; all windy foods are to be avoided, as alſo all aſtringent ones; the uſe of ſpirituous liquors is to be reſtrained, and the mind kept quiet and free from the commotions of any of the paſſions. When the diſcharge is too ſmall, it is to be promoted; and when it is really too great, and the ſtrength of the patient cannot bear it, then the nitrous, cinnabarine, and abſorbent medicines are to be given, as powders prepared of ſal prunellæ, cinnabar either native or antimonial: if there be urgent neceſſity ſome gentle opiate may be added to theſe, as the pill de ſtyrace, or de cynogloſſo. After this, gentle clyſters are to be injected, and then the uſe of ſpecifics is to be entered on; among theſe, a decoction of the common yarrow is of ſingular virtue: decoctions of maidenhair alſo, and other like herbs, are of great uſe. After the fit is over, bleeding muſt be repeated at the equinoxes, and gentle purges given at times, eſpecially ſmall doſes of rhubarb, which has an abſtergent virtue that renders it peculiarly proper; and this may be given even in the time of the fit, in ſmall doſes. Old conſerve of red roſes has been recommended as a very good medicine in this caſe; it may be mixed with new milk, and an ounce of it taken three or four times a day; a tea-cup full of the tincture of roſes may be taken about an hour after every doſe of the conſerve. Half a dram of the Peruvian bark taken in a glaſs of red wine, ſharpened with a few drops of the elixir of vitriol, three or four times a day, will be uſeful as a ſtrengthener and aſtringent.

HÆMORRHOIDS, *blind, hæmorrhoides cæcæ.* or *external*, are infarctions of the external *hæmorrhoidal* veſſels about the orifice of the inteſtinum rectum, which ſometimes form ſimply turgeſcent, ſometimes inflammatory tumors, and are meant by nature for the diſcharge of blood from this part to relieve *hæmorrhages*.

The *blind piles* are of two kinds, either ſimply turgeſcent, or tumid, the latter kind are painful, the former wholly indolent. The turgeſcent *blind piles* reſemble a ſoft tranſparent veſicle filled with a blackiſh blood, and are attended with no ſenſible uneaſineſs, except at the time of going to ſtool, when they occaſion a ſenſation reſembling that of a bean or plum ſtone, or the like, ſtopping in the paſſage; and at times there is an uncommon heat in the parts.

The tumid *blind piles* are ſituated a little deeper within the verge of the extremity of the inteſtine, and reſemble a hard and inflammatory tumor; theſe are properly indeed no other than *furuncli* of this part, and occaſion very violent and exquiſite pains from the ſenſibility of the nervous and muſcular coat which lines the inteſtines. Many authors reckon beſide theſe under the name of *blind piles* all the tumid excreſcences, and fungous and ulcerated protuberances, that happen about the anus: theſe are diſtinguiſhed indeed by the appellation of ſpurious *hæmorrhoids*; they uſually owe their origin to venereal taints, but ſometimes ariſe from the *turgeſcent piles*, which in bad habits, and bodies ſubject to ulcerous ſcrofities, ſometimes degenerate into theſe dry and verrucoſe ſwellings, and are called *thymi*, *myrſiti*, and *ficus ani*. Junker's Conſp. Med. p. 233.

The external or *blind piles* differ from the *internal*, in regard to the veſicles to which they owe their origin, the internal ariſing from the vena porta, the external from the vena cava; they differ alſo in their ſize, and in the quantity of blood they diſcharge; the internal ones uſually diſcharge a moderate quantity, and if they are any way diſturbed they will throw off a great deal; whereas the external rarely bleed at all, but only ſhew themſelves in theſe blind tumors. The internal alſo have their regular periods, and very frequently obſerve the monthly diſcharges of menſtrua in women, returning as regularly in men as theſe in that ſex: the others have no regular periods, but principally appear about ſpring and autumn; and they appear the larger, and have the more blood derived to them, the oftener they have already been in a perſon. Their magnitude is very different in different perſons: in ſome they are of the ſize of a hazel-nut, in others of a walnut, and in ſome they often grow to the ſize of a pigeon's or even a hen's egg.

The *turgeſcent piles* either break naturally, or are to be opened by a ſurgeon: and when this is done, they not only diſcharge the blood they contained, but alſo ſupply a farther quantity afterwards. The tumid ones have all the ſigns of inflammatory tumors, attended with the moſt exquiſite pain.

HÆMORRHOIDS, *blind, perſons ſubject to them.* The turgeſcent external piles are principally incident to thoſe of a phlegmatic and pituitous habit; they often indeed appear in women during their going with child, without their being of this temperament, eſpecially toward the latter part of their time, if they fit much; and ſometimes they happen even during the labour-pains, when the fœtus preſſes heavily upon the pelvis.

HÆMORRHOIDS, *blind, cauſes of them.* The general cauſe of them is a plethora attended with a thickneſs of blood; whence nature, attempting to relieve herſelf by an hæmorrhage of thoſe veſſels, derives a larger quantity of blood than ordinary to them, where it remains, and according to its different ſtate, forms either ſimple veſicles or inflammatory tumors. The accidental cauſes which bring them on, are immoderate attritions in theſe parts, from riding long journeys by perſons unuſed to that exerciſe, from an itching or ſharp humour about the part, from the painful voiding of the excrements in perſons very coſtive, and from labour-pains in women. Junker ſays, that they are ſometimes got by ſitting down in the ſeat in which a perſon has been juſt ſitting, who has the ulcerated piles, while it is yet warm from him. To theſe it is to be added, that they frequently come on from an omiſſion of accuſtomed bleedings, from an improper uſe of aloetic, helleborine, and other hot medicines, and from too high-ſeaſoned foods, and the immoderate uſe of ſpirituous liquors.

HÆMORRHOIDS, *blind, prognoſtics in them.* The *blind piles* are always in a ſtate of tendency to a ſalutary end, that is the evacuation of part of the abundant blood in plethoric habits; but from the ſmalneſs of the veſſels where they are formed, they very often miſs of their proper end. When they either burſt naturally, or are opened by art, they then afford for ſome time a diſcharge that may ſupply the place of that by the *internal hæmorrhoids*. When they burſt of themſelves, they eaſily become ulcerated afterwards, but this is not attended with any violent pain. As ſoon as opened, the veſſel which formed the tumor becomes flaccid and rugoſe in that part, and forms a ſort of papulæ or little tubercles, which, if not taken care of in the proper way, often continue to diſcharge a ſmall quantity of blood at every time the perſon has a

hard ſtool; and even in ſome caſes theſe papulæ have continued without intermiſſion diſcharging a ſmall quantity of blood for many years; ſometimes alſo they degenerate into ſerpiginous and pruriginous little ulcers, which are called *ſerpigo ani*, or *prurigo ani*. This is a troubleſome complaint, and it is not unfrequent in people ſubject to the external *hæmorrhoids*, though not much regarded by authors; it never ſpreads far, but often continues many months in the ſame ſpot; and if by unſkilful treatment it be repelled from thence, it ſometimes returns again more violently in the neighbouring parts, and ſome times occaſions diſorders of a worſe nature in the more diſtant ones.

The tumid and *turgeſcent piles* are both without danger to the life of the patient, unleſs in ſuch caſes where they are violently ſuppreſſed, on perſons who have been long ſubject to them. The tumid are however attended with one danger, which the turgeſcent are free from; this is, that if unſkilfully managed, they will ſometimes come to a ſuppuration, which terminates often in a fiſtulous ulceration. This too often happens when they are cut too deeply into, during the time of their ripening, and are kept open too long afterwards without being well cleanſed. When *hæmorrhoidal* affections become ulcerous, they are more contagious than almoſt any other diſeaſe; and as this is not commonly known, many ſuffer by it.

HÆMORRHOIDS, *blind, method of cure*. The *turgeſcent piles*, if treated in the common way of tumors and little ulcers by a ſkilful ſurgeon, are very rarely attended with any bad conſequences. The tumid give much more trouble. The firſt attempt muſt be to diſcuſs them; and to this end bleeding in the foot is one of the firſt things to be done, in caſes where there is a plethoric habit; and very ſtrong decoctions of yarrow are to be given, ſeveral doſes in a day, and external remedies, ſuch as the unguentum linariæ, and the root of the ſcrophularia are to be applied; theſe are by ſome eſteemed ſpecifics, and botanical authors boaſt wonders of their effects. The patient may ſit over the ſteams of warm water; or apply a linen-cloth dipped in warm ſpirit of wine to the part, or poultices made of bread and milk, or of leeks fried with butter. The body may be kept gently open by ſmall doſes of equal quantities of the flowers of brimſtone and cream of tartar; a tea-ſpoon full of which may be taken two or three times a day: or an ounce of the flowers of brimſtone and half an ounce of purified nitre may be mixed with three or four ounces of the lenitive electary, and a tea-ſpoonful of it taken three or four times a day: or, an electary may be prepared of one ounce of flowers of ſulphur, half an ounce of cream of tartar, a ſufficient quantity of treacle, and taken as the other: emollient clyſters are alſo beneficial, or if the aſtriction of the anus prevents the injection of theſe, a vomit will have good effect. Buchan's Dom. Med. p. 366. If by theſe means, after three or four days trial, there appears no hope of their being diſcuſſed, then they are to be maturated by all means ſent with all ſpeed that may be. To this purpoſe a cataplaſm of a roaſted onion with linſeed-oil and veal-fat, is by many greatly recommended; and when the pains are violent, internal medicines are to be given, ſuch as nitre with the cooling emulſions, and, when neceſſary, a gentle opiate. Oil of eggs is greatly recommended alſo for external uſe, to allay the pain, or, for this purpoſe, a liniment made of two ounces of emollient ointment and half an ounce of liquid laudanum, beat up with the yolk of an egg, may be applied. When they are brought to maturation, they are to be diſcharged by fixing leeches on or near them; or, if theſe will not fix, by carefully opening them with a lancet; and the cleanſing and healing them up are then to be forwarded by all poſſible means. Internally, gentle laxative medicines are to be given, ſuch as the lenitive electary, and the like, with manna, ſenna, and other gentle purges; then medicines which purify the blood, and ſuch as quiet its too violent emotions. After the cure is completed, the beſt method to prevent a return is bleeding in ſpring and autumn, and applying leeches to the *hæmorrhoidal* veins at any time when threatened with a relapſe. Junker's Conſp. Med. p. 240.

HÆMORRHOIDS, *ſuppreſſion of them*. Phyſicians conſider the ſuppreſſion of the *hæmorrhoids* in three reſpects: 1. When they have never yet flowed at all, but all the attempts of nature are obſerved toward their appearance, and all the preceding ſymptoms of them ſeen. 2. When they have been uſed to flow habitually, but their courſe has uſually been impeded by accidents; this is often the caſe in what are called the *blind piles*. And, 3. When they have been uſed to flow regularly and well, and at ſtated times, for a long courſe of time; the ſuppreſſions in theſe different ſtates are attended with different ſymptoms and different diſorders.

HÆMORRHOIDS, *ſigns of ſuppreſſions of them*. Theſe are frequently the common hypochondriacal affections, firſt appearing in pains and tenſion of the left hypocondrium, extending to the region of the loins. Theſe are ſucceeded by ſpaſtic pains, violent colics, inflations of the ſpleen, reachings to vomit, obſtinate coſtiveneſs, a hardneſs of the abdomen, and finally, inſarctions and ſcirrhuſes of the viſcera, melancholy, madneſs, and a vomiting of blood; theſe are the ſucceſſion of ſymptoms, which naturally attend ſuppreſſions of the internal *hæmorrhoids*. The ſuppreſſions of the external are often violent fits of the gout, nephritic complaints, and the voiding of blood by urine; add to theſe, that the moſt frequent ſymptom attending the ſuppreſſion, either of the external or internal, is an aſthmatic difficulty of breathing, often attended with a cough. The perſons moſt ſubject to theſe ſuppreſſions from natural cauſes, are thoſe of a melancholic diſpoſition, ſuch as are eaſily terrified, or grieved at trifles and ſuch as have ſuddenly changed a life of labour into a ſedentary one.

The internal and natural cauſes of theſe ſuppreſſions are principally a thickneſs of the blood, or a violent orgaſtic commotion of it; the external and accidental cauſes of it are the improper uſe of aſtringent medicines, the drinking of large draughts of cold liquors when very hot, a thick and heavy diet, and a too great coldneſs of the abdomen. The ſuppreſſion is uſually very difficult to be removed, but in general is found much more eaſily to give way to medicines when owing to natural cauſes than to accidental; and it is to be obſerved, that a ſuppreſſion of them in the firſt attack is leſs dangerous than when they have appeared.

HÆMORRHOIDS, *method of cure*. In caſes where *hæmorrhoids* have never yet appeared, but only the antecedent ſymptoms are perceived, great caution is neceſſary to determine, from the habit and conſtitution of the patient, whether it be proper to encourage and promote their appearance, and aſſiſt nature in the way ſhe is endeavouring to eaſe herſelf: or whether it may not be better to carry off the redundant blood ſome other way. If the body be in ſuch a ſtate as to promiſe a ſucceſsful flux from them, it is to be promoted by gentle aperients; but if otherwiſe, the blood is to be derived another way by bleeding in the arm, and the patient is to be ordered to uſe frequent exerciſe. In caſes of ſuppreſſions of uſual and habitual fluxes of the *hæmorrhoids*, the ſymptoms are to be firſt alleviated by bleeding in the arm, then emollient clyſters are to be adminiſtered, ſuch as chamomile-flowers boiled in milk, and after theſe the quality of the blood is to be amended by proper internal medicines, its violent emotions to be taken off by *nitre*, abſorbents, and the like, and its ſpiſſitude removed by attenuants. After this, its derivation to the proper parts is to be promoted by gently ſtimulating medicines; ſuch are aloes and all its preparations, particularly elixir proprietatis; and ſaffron and borax may alſo be given in ſmall doſes; to this may be added the uſe of ſtimulating clyſters and acrid ſuppoſitories, and the application of leeches to the parts. Junker's Conſp. Med. p. 8.

HÆMORRHOSCOPIA, formed of *αἷμα blood, ῥέω, I flow, σκοπέω I obſerve*, an old term uſed by the writers in *Medicine* to expreſs an examination of the blood drawn from a patient by phlebotomy, in order to judge of the nature of a diſeaſe by it.

HÆMORRHUS, in *Zoology*. See *Blood* SNAKE.

HÆMOSTASIA, formed of *αἷμα* and *ϛάσις, ſtation*, or *reſt*, occurs in ſome writers as the name of a diſeaſe occaſioning ſudden death; and it is ſaid to be a total ſtagnation of the whole maſs of blood from a plethora.

HÆMOSTATICA, formed of *αἷμα* and *ϛάω, I ſtop*, a name given by ſome authors, to medicines uſed to ſtop hæmorrhages, whether internally taken, or externally applied.

HÆPHESTITES *lapis*, in *Natural Hiſtory*, a name given by authors, to a ſtone of a reddiſh colour, and capable of a high poliſh. The ancients gave it this name, from its property of ſetting fire to ſtrong ſubſtances by reflection when formed into a concave ſpeculum. They hence called it the *Vulcanian-ſtone*, or *fire-ſtone*, not conſidering that the ſhape into which they formed it, and not the nature of the ſtone, was the cauſe of the effect; any ſtone being capable of the ſame, if hard enough to bear a proper poliſh. About Hildersheim they have, at this time, a ſort of blackiſh-red coarſe jaſper, which they take to be the *hæpheſtites* of the ancients, and uſe it, at this day, for the ſame purpoſes, hollowing large pieces of it into ſpeculums, and ſetting them, when well poliſhed, in proper frames, and uſing them as burning-glaſſes.

HÆREDE *abducto*, is a writ which anciently lay for the lord, who, having by right the wardſhip of his tenant under age, could not obtain his body, as being conveyed away by another.

HÆREDE *deliberando alii qui habet custodiam terræ*, a writ directed to the sheriff, willing him to command one that had the body of him who was ward to another, to deliver him to the person whose WARD he was on account of his land.

HÆREDE *rapto*. See RAVISHMENT *de gard*.

HÆREDIPETA, in *our Ancient Law Books*, the next HEIR.

Et medius hæredipeta sua propinquus vel extraneus periculosa sane custodia committatur. Leg. Hen. I. cap. 70.

HÆREDITAS. See ABEYANCE.

HÆRESIARCH, HÆRESIARCHA, of the Greek αἱρεσιάρχης, an arch-heretic. See HERETIC.

HÆRESIS, *heresy*. See HERESY.

HÆRETICO *comburendo*, a writ which anciently lay against a heretic, who, having once been convicted of heresy by his bishop, and having abjured it, afterwards falling into it again, or into some other, is thereupon committed to the secular power. This writ is thought by some to be as ancient as the common law itself; however the conviction of heresy by the common law was not in any petty ecclesiastical court, but before the archbishop himself in a provincial synod, and the delinquent was delivered over to the king to do with him as he pleased: so that the crown had a control over the spiritual power. But by 2 Hen. IV. cap. 15. the diocesan alone, without the intervention of a synod, might convict of heretical tenets; and unless the convict abjured his opinions, or if after abjuration he relapsed, the sheriff was bound *ex officio*, if required by the bishop, to commit the unhappy victim to the flames, without waiting for the consent of the crown. This writ remained in force, and was actually executed on two Anabaptists in the seventh of Elizabeth, and on two Arians, in the ninth of James I.

Sir Edward Coke was of opinion, that this writ did not lie in his time; but it is now formally taken away by statute 29 Car. II. cap. 9. But this statute does not extend to take away or abridge the jurisdiction of Protestant archbishops or bishops, or any other judges of any ecclesiastical courts, in cases of atheism, blasphemy, heresy, or schism, and other damnable doctrines and opinions; but they may prove and punish the same according to his majesty's ecclesiastical laws, by excommunication, deprivation, degradation, and other ecclesiastical censures, not extending to death, in such sort and no other, as they might have done before the making of this act. Sec. 2. See HERESY.

HÆRETICUS, *heretic*. See HERETIC.

HÆRETULA, in *Natural History*, a name given by Mr. Lhuyd, to a species of FOSSILE oyster-*shell*.

HÆRMIA, an Indian fruit, resembling pepper, esteemed good to strengthen the stomach, disperse flatulencies, and restore the *uvula* when relaxed.

HAFFHERT, in *Ornithology*, the name of a bird described by Hoier, which is seen usually at sea, and is supposed to be a foreteller of storms. It is of the size of a common hen, and resembles the falcon in shape. It is all over of a greyish colour, variegated with spots of white. Its beak is strong and hooked like the falcon's, but it is shorter. The fishermen dread the appearance of this bird, and at sight of it always make to shore as fast as possible, expecting tempests and bad weather.

HAFIZH, or HAFIZLER, is a name given in Turky to those who learn the whole Alcoran by heart; and who, on this account are held in great veneration by the people.

HAGA, in our *Old Writers*, has different significations. In Doomsday it is taken for a house in a city or borough. An ancient anonymous author says it is a house with a shop, *Domus cum shopa*.

HAGABLUM, in our *Old Writers*, the same with *gabulum* or *gabel*.

HAGGAI, a canonical book of the Old Testament, so called from the prophet of that name, who in all probability was born at Babylon, from whence he returned with Zerubbabel.

This prophet, in the second year of Darius, or the five hundred and twentieth before Christ, exhorted the Jews, after their return from their captivity to finish rebuilding the temple which they had intermitted for fourteen years. His remonstrances had the desired effect; and to encourage them to proceed in the work, he assured them from God that the glory of this latter house should exceed the glory of the former; which was accordingly fulfilled when Christ honoured it with his presence: for with respect to the building, this latter temple was not to be compared with the former.

HAGGARD, in *Falconry*, a HAWK, or FALCON, not taken in the nest; but after she had been enured to liberty, and preying for herself. The word is French, and signifies *fierce*; some derive it from the Latin *agreste, wild*; others from the German *hag*, incloiure, fortified place. Whence Mr. Hoet observes, the word *haggard* is sometimes applied to a man who becomes hardy and proud, in consideration of the strength of the place he is in.

Haggard hawks are hard to tame, and bring under discipline.

HAGGAS, a kind of fiery meteor appearing on men's hair, or horses mains; now known to be electrical phenomena.

HAGIAM, in the *Materia Medica*, a name given by some of the Arabian Physicians, to a kind of *schæranoth*, or camel's hay. The Greeks made several kinds of this, according to the plates from whence they received it; the *schæranoth* of different countries differing in virtue: but the Persian was, in many ages, esteemed the best kind; and this is probably what the Arabs called *hagiam*. The interpreters of Avicenna leave this word wholly unexplained. Garcias, according to what shall be had in the Arabic, supposes it the name of the city Damascus, and given to such *schæranoth* as came from that part of the world: but this seems erroneous. The Arabs called all other nations barbarians; and this term gentilism or barbarism, was, in their language, expressed by the word *hagiam*; they hated the Persians beyond all other nations in the world, and called them *hagiam* by way of eminence, and therefore *hagiam* and Persian were a sort of synonymous words. It is probable they had their *schæranoth* principally from Persia; and that this, whether better or worse than the Nabatæan *schæranoth* of their own country, was distinguished by the epithet of *foreign*, and that with the word by which they expressed Persian.

HAGIOGRAPHY, a name given to part of the books of Scripture, called by the Jews *Cetubim*. See CANON.

The word is compounded of ἅγιος, *holy*, and γράφω, *I write*. The name is very ancient: St. Jerom makes frequent mention of it; before him, St. Epiphanius called these books simply ΓΡΑΦΑΙ.

The Jews divide the sacred writings into three classes: the Law which comprehends the five books of Moses; the Prophets, which they call *Neviim*; and the *Cetuvim*, כתובים, called by the Greeks, &c. *Hagiographa*; comprehending the book of Psalms, Proverbs, Job, Daniel, Ezra, including also the book of Nehemiah, Chronicles, Canticles, Ruth, the Lamentations, Ecclesiastes, and Esther.

The Jews sometimes call these books the Writings, by way of eminence, as being written by immediate inspiration of the Holy Spirit. Thus says Kimchi, in his preface to the Psalms, Maimonides in *More Nevoch*, and Elias Levita in his *Thisbi*, under the word כתב.

They distinguish the *hagiographers*, however, from the prophets; in that the authors of the former did not receive the matters contained in them by the way called Prophesy, which consists in dreams, visions, whispers, extasies, &c. but by mere inspiration, and direction of the Spirit.

HAGIOSIDERON, or HAGIOSIDIRON, compounded of ἅγιος, *holy*, and σίδηρος, *iron*. The Greeks who are under the dominion of the Turks, being prohibited the use of bells, made use of an iron wherewith to call people to church, called *hagiosideron*.

Mogius gives us the description of a *hagiosideron* he had seen. It is a plate of iron, about three inches broad, and fifteen long, fastened by the middle to a chain or cord, whereby it is suspended at the church-door. On this they strike with an iron hammer, with some measure and cadence, so as to make no disagreeable noise. They also carry a *hagiosideron* before the priest, in a procession of the sacrament to any sick person, beating on it from time to time, to advertise the people to adore it; much as in the Romish church they do with a bell.

HAIHALEM *mœsi*, in *Botany*, a name by which the modern Ægyptians call the plant we name *hyoscyamus*, and *soporovium aquaticum*, the water-soldier, and water-bonesleeck. The last of these names is a verbal translation of the Ægyptian one. Some have supposed that the *nilufar* was called by this name by the ancient Ægyptians, but this is an error; the plants are so perfectly different from one another, that they have nothing but the growing in water in common between them.

HAIL, a name used by the Brasilians, for an animal we call the sloath, or *ignavus*. The word seems pronounced by the creature itself, as its common note, and thence became used as its name.

HAIL, *grando*, in *Physiology*, an aqueous concretion, in form of white or pellucid spherules, descending out of the atmosphere.

Hail is conceived to be formed of drops of rain, frozen in their passage through the middle region. Others take it for the fragments of a frozen cloud, half-melted, and thus precipitated, and congealed again. Accordingly the Cartesians define *hail* to be a cloud, either wholly, or in part, liquified; which tending downwards by its own gravity, is, in its passage, frozen again

by the action of ſome very cold wind; and thus precipitated, for the moſt part, in round tranſparent globes. They add, that if the cloud hath been totally liqueſied, the *haiſtones* are pellucid; otherwiſe they are only partly ſo. *Hail* aſſumes various figures, according to the degrees of heat or cold of the air which it paſſes through in its deſcent: ſometimes it is round, ſometimes angular, triangular, pyramidical, &c. ſometimes thin and flat, ſtar-like, with ſix equal points, &c.

Signior Beccaria ſuppoſes, that it is formed in the higher regions of the air where the cold is intenſe, and where the electric matter is very copious. In theſe circumſtances, a great number of particles of water are brought near together, where they are frozen, and in their deſcent collect other particles; ſo that the denſity of the ſubſtance of the *hail*-ſtone grows leſs and leſs from the *centre*; this being formed firſt in the higher regions, and the ſurface being collected in the lower. Accordingly, in mountains, *hail*-ſtones as well as drops of rain, are very ſmall; and both agree in this circumſtance, that the more intenſe is the electricity that forms them, the larger they are.

Hail is obſerved frequently to attend thunder and lightning; with regard to which, Beccaria obſerves, that as motion is known to promote freezing, ſo the rapid motion of the electrified clouds may promote that effect in the air.

Natural hiſtories furniſh us with a great variety of inſtances of extraordinary ſhowers of *hail*. See Phil. Tranſ. N° 203. and Hiſt. de France, tom. ii. p. 339.

HAILE, a ſea-term, ſignifying either to call to a ſhip, to know from whence ſhe comes, and whither ſhe is bound, or elſe to ſalute her, and wiſh her well.

HAIR, ſmall filaments, iſſuing out of the pores of the ſkins of animals; and ſerving moſt of them as a tegument, or covering.

In lieu of *hair*, the nakedneſs of ſome animals is covered with feathers or wool.

Hair is found on all parts of the human body, except the ſoles of the feet, and the palms of the hands. But it grows longeſt on the head, chin, breaſt, and arm-pits, and about the privities.

Dr. Tyſon obſerves, that though the outward ſurface of the body be the uſual place where the *hair* grows; yet it has been ſometimes found on the tongue, in the heart, the breaſts, kidnies, &c. but that there is ſcarce any inward part more ſubject to it than the ovary, or teſticles, of females. Hooke, Philoſoph. Collect. N° 2.

Phyſicians diſtinguiſh the *hair* into ſeveral kinds, and give it divers denominations; but this only in Greek and Latin. The *hair* of the head they call *capillus*: that of women particularly, *coma*, from κομεω, to dreſs and adjuſt; and that of men *caeſaries*, from *caedendo*, becauſe often cut: that of the back of the head, *juba* and *crines*; that hanging behind the ears, *cincinni*; q. d. curled and buckled.

The ancients held the *hair* to be a ſort of excrement, fed only with excrementitious matters, and no proper part of a living body. They ſuppoſed it generated of the ſuliginous parts of the blood, exhaled by the heat of the body to the ſurface, and there condenſed in paſſing through the pores. Their chief reaſons were, that the *hair*, being cut, will grow again apace, even in extreme old age, and when life is very low; that in hectic and conſumptive people, where the reſt of the body is continually emaciating and attenuating, the *hair* ſhall thrive very well: nay, and that it will grow even on dead carcaſes. They add, that *hair* does not feed and grow like the other parts, by introſuſception, i. e. by a juice circulating with it; but like the nails, by juxtapoſition, each part next the root thruſting forward that immediately before it.

But the moderns are agreed, that every *hair* does properly and truly live, and receive nutriment to fill and diſtend it like the other parts; this they argue hence, that the roots do not turn grey in aged perſons ſooner than the extremities, but the whole changes colour at once. And the like is obſerved in boys, &c. which ſhews, that there is a direct communication, and that all the parts are alike affected alike. We are told of inſtances of perſons, who by intenſe grief, fear, or ſtudy, have grown grey in a night's time.

It may be obſerved, however, that in propriety, the life or growth of *hair* is of a different kind from that of the reſt of the body, and is not immediately derived therefrom, or reciprocated therewith; it is rather of the nature of vegetation. They grow as plants do out of the earth, or as ſome plants ſhoot from the parts of others; from which though they draw their nouriſhment, yet each has, as it were, its ſeveral life, and a diſtinct oeconomy. They derive their food from ſome juices of the body, but not from the nutritious juices of it; whence they may live, though the body be ſtarved.

The *hairs* examined by the microſcope, appear to be ſiſtulous bodies like horns. Their tubulous ſtructure is alſo confirmed from the diſeaſe called *plica Polonica*, wherein the blood oozes out at their extremities.

Each *hair* is found to conſiſt of five or ſix other *leſſer* ones, all wrapped up in one common tegument: they are knotted like ſome ſorts of graſs, and ſend out branches at the joints. They have each an oval bulbous root, which lies pretty deep in the ſkin, being implanted in the pyramidal papillæ: and by this they imbibe, or ſecrete, their proper food from the adjacent humours. This oval root is covered by a whitiſh ſtrong membrane, in ſome meaſure elaſtic, and is connected either to the ſkin, to the *corpus adipoſum*, or to both, by a great number of very fine veſſels and nervous filaments. The ſtem having reached the ſurface of the ſkin, pierces the bottom of a ſmall foſſa between the papillæ, or ſometimes a particular papilla, and there it meets the epidermis, which ſeems to be turned round it and united with it. A ſort of unctuous matter tranſudes through the ſides of the foſſula, which is beſtowed on the ſtem, and accompanies it more or leſs, as it runs out from the ſkin, in form of a *hair*. Their extremities ſplit or divide into two or three branches, eſpecially when kept dry, and left to grow too long; ſo that what to the naked eye appears only a ſingle *hair*, to the microſcope ſeems a bruſh.

They turn grey on the fore part of the head, and particularly about the temples, ſooner than behind; the back part affording them the proper juice longer than the reſt. For the like reaſon they alſo fall ſooneſt from the crown of the head.

Their ſize, or thickneſs, depends on the magnitude of the pores they iſſue from: if thoſe be ſmall, theſe are fine; if the pores be ſtrait, the *hairs* are ſtrait; if thoſe be oblique or ſinuous, the *hair* is curled.

Thoſe who have by nature, ſoft, thin, and ſhort *hair*, which with great difficulty receives and retains a buckle, and thoſe who readily become bald, or ſhed their *hair* toward the ſpring, are certainly of a looſe, flabby, and relaxed ſtate of nerves. For the *hair* ſeems to be only ſome of the fleſhy fibres lengthened outward, and hardened: at leaſt they ſeem to be of the ſame kind and nature with the other fibres, conſiſting of many leſſer filaments, contained in a common membrane, and are ſolid, tranſparent, and elaſtic. And as the *hairs* are in ſtrength, bulk, and elaſticity, ſo generally are the fibres of the body. Therefore thoſe whoſe *hair* ſheds, turns thin, lank, or refuſes buckle, if it does not happen to them after recovering from an acute diſtemper, ought to be careful of falling into nervous diſorders.

Other things being equal, thoſe of the fairneſt, cleareſt, and lighteſt coloured *hairs*, are of the looſeſt and weakeſt ſtate of fibres and nerves; not only becauſe the faireſt and lighteſt is the moſt rare, tranſparent, and ſungous, but becauſe bodies of the lighteſt parts conſiſt of parts of a weaker union, which adhere with leſs force, and conſequently are leſs elaſtic, firm, and ſpringy, than thoſe of darker and more opake colours. It is generally obſerved that perſons of very fine and white *hair*, eſpecially if ſo after they are come to maturity, are of tender and delicate conſtitutions: and thoſe who deal in making artificial coverings for men and women, find that ſuch *hair* will never ſerve thoſe purpoſes with any credit to them, and ſeldom honeſtly employ it to that end.

Hairs ordinarily appear in general round, or cylindrical; but the microſcope alſo diſcovers triangular, and ſquare ones; which diverſity of figures ariſes from that of the pores; to which the *hairs* always accommodate themſelves. Their length depends upon the quantity of the proper humour to feed them; and their colour on the quality of that humour: whence at different ages of life the colour uſually *differs*.

The *hairs* of different animals are very *different* in their appearance before the microſcope. Malpighi diſcovered *hairs* to be tubular, or compoſed of a number of extreamely minute tube or pipes; this he diſcovered in examining the *hairs* of the mane and tail of a horſe, and the briſtles of a boar; and theſe tubes were much more diſtinguiſhable near the ends of the tubes than elſewhere, as they there appeared more open, and ſometimes above twenty of them might be reckoned in one *hair*. In the hedge-hog's prickles alſo, which are of the nature of *hairs*, theſe tubes are very elegantly diſcovered, and may ſeem to have a medullary part, and valves, and cells. There are alſo in the *hairs* of many animals, in ſome tranſverſe, and in others ſpiral lines, ſomewhat of a darker colour, and running from top to bottom in a very elegant manner; a mouſe's *hairs* are of this ſort, and appear in joints, as it were, like the back-bone; they are not ſmooth, but jagged on the ſides, and terminate in the ſharpeſt point imaginable. The *hairs* taken from the mouſe's belly are the leaſt opake, and ſtreſt for the microſcope.

microscope. The darker medullary parts, or lines, Dr. Derham observes, are no other than fibres convolved round, and lying closer together than in the other parts of the *hair*. They run from the bottom to the top of the *hair*; and, he imagines, may serve to make a gentle evacuation of some humour out of the body. Hence the *hair* of hairy animals, this author suggests, may not only serve as a fence against cold, &c. but as an organ of insensible perspiration.

The *hairs* of men, and of horses, sheep, &c. are composed of small, long, tubular fibres or smaller *hairs*, encompassed with a rind or bark; and from this structure a split *hair* appears like a stick shivered by beating. They have roots of different kinds in different animals, and are always thicker at the middle than at either end. *Hairs* of the Indian deer are perforated from side to side, and those of our English ones seem covered with a kind of scaly bark or rind. The whiskers of a cat, cut transversely, have in the middle something which resembles the pith of elder; and the quills of the hedge-hog and porcupine have somewhat of a pith in a star-like form. The *hairs* taken from the different parts of the human body, differ very much in their figures, appearing like different species of the same genus in plants. Hook's Microgr. p. 157. Baker's Microle. p. 246.

HAIR, *diseases of*. Among the many remedies for diseases of the *hair*, the following are recommended in the Philosophical Tranfactions. To make *hair* grow, take a quantity of the largeft and fineft roots of the common burdock that can be collected; let them be taken out of the ground in the month of December; bruife them in a marble mortar, and boil them in a quantity of white-wine till there only remains as much as will cover them; let this be carefully ftrained off, and every night, going to bed, let the head be waſhed with ſome of it warm. The other preſcription is this: burn the ſlender twigs of vines to aſhes, and boil theſe aſhes in ſuch a quantity of common water as will make a ſtrong ley; let this be ſtrained clear off, and the head waſhed every night with ſome of it warm. When the *hair* is good, but in danger of falling off by degrees, the aſhes of the vine branches are to be boiled in red-wine inſtead of water, and this ley is to be uſed inſtead of the other. When the perſon wears powder, let ſome hermodactyls be reduced to fine flour and mixed with it: let this be the only powder uſed, and the liquor conſtantly employed in waſhing the head every night, and the falling of the *hair* will be wholly prevented. Philoſ. Tranſ. N° 288. p. 90.

Wulrerus, in Philoſophical Collections, gives an account of a woman, buried at Norimberg, whoſe grave being opened forty-three years after her death, there was *hair* found iſſuing forth plentifully through the cleſts of the coffin; inſomuch that there was reaſon to imagine, the coffin had ſome time been covered all over with *hair*. The cover being removed, the whole corpſe appeared in its perfect ſhape; but from the crown of the head to the ſoal of the foot covered over with a thick-ſet *hair*, long and curled. The ſexton going to handle the upper part of the head with his fingers, the whole ſtructure fell at once, leaving nothing in his hand but a handful of *hair*: there was neither ſkull, nor any other bone left: yet the *hair* was ſolid, and ſtrong enough.

Mr. Arnold, in the ſame collection, gives a relation of a man hanged for theft, who, in a little time, while he yet hung upon the gibbet, had his body ſtrangely covered over with *hair*.

It was eſteemed a peculiar honour among the ancient Gauls, to have long hair; and hence came the appellation *Gallia comata*. For this reaſon Julius Cæſar, upon ſubduing the Gauls, made them cut off their *hair*, as a token of ſubmiſſion. It was with a view to this, that ſuch as afterwards quitted the world, to go and live in cloiſters, procured their *hair* to be ſhaven off; to ſhew that they bid adieu to all earthly ornaments, and made a vow of perpetual ſubjection to their ſuperiors.

Greg. de Tours aſſures us, that, in the royal family of France, it was a long time the peculiar mark and privilege of kings and princes of the blood, to wear long *hair*, artfully dreſſed and curled; every body elſe were obliged to be polled, or cut round, in ſign of inferiority, and obedience. Some writers aſſure us, that there were once different cuts of the *hair* for all the different qualities and conditions; from the prince, who wore it at full length, to the ſlave or villain, who was quite cropt. Hottoman treats at large of this privilege of the kings of France, Franco-Gallia, cap. 11.

To cut off the *hair* of a ſon of France, under the firſt race of kings, was to declare him excluded from the right of ſucceeding to the crown, and reduced to the condition of a ſubject.

In the eighth century it was the cuſtom of people of quality, to have their children's hair cut the firſt time by perſons they had a particular honour and eſteem for; who, in virtue of this ceremony, were reputed a *ſort* of ſpiritual parents, or godfathers to them; though this practice appears to have been more ancient; inaſmuch as we read that Conſtantine ſent the pope the hair of his ſon Heraclius, as a token that he deſired him to be his adoptive father.

The parade of long *hair* became ſtill more and more obnoxious in the progreſs of Chriſtianity; as ſomething utterly inconſiſtent with the profeſſion of perſons who bore the croſs. Hence numerous injunctions and canons to the contrary. Pope Anicetus is commonly ſuppoſed to have been the firſt who forbad the clergy to wear long *hair*; but the prohibition is of older ſtanding in the churches of the Eaſt; and the letter wherein that decree is wrote, is of a much later date than that pope. The clerical tonſure is related, by Iſidore Hiſpalenſis, as of apoſtolical inſtitution.

Long *hair* was anciently held ſo odious, that there is a canon ſtill extant, of the year 1096, importing, that ſuch as wore long *hair* ſhould be excluded coming into church while living, and not be prayed for when dead.

We have a furious declamation of Lactrantd againſt the emperor Phocas, for wearing long *hair*, after the manner of all the other emperors of the Eaſt, except Theophilus; who being bald, enjoined all his ſubjects to ſhave their heads.

The French hiſtorians and antiquaries have been very exact in recording the heads of *hair* of their ſeveral kings. Charlemagne wore it very ſhort, his ſon ſhorter; Charles the Bald had none at all. Under Hugh Capet it began to appear again: this the eccleſiaſtics were diſpleaſed with, and excommunicated all who let their *hair* grow. Peter Lombard expoſtulated the matter ſo warmly with Charles the Young, that he cut off his own *hair*; and his ſucceſſors, for ſome generations, wore it very ſhort. A profeſſor of Utrecht, in 1650, wrote expreſly on the queſtion, Whether it be lawful for men to wear long *hair*? And concluded for the negative. Another divine, named Reeves, who had wrote for the affirmative, replied to him.

The Greeks, and after their example the Romans, wore falſe *hair*.

HAIR makes a very conſiderable article in commerce; eſpecially ſince the mode of perukes has obtained.

The *hair* of the growth of the northern countries, as England, &c. is valued much beyond that of the more ſouthern ones; as Italy, Spain, the ſouth parts of France, &c.

The merit of good *hair* conſiſts in its being well fed, and neither too coarſe, nor too ſlender; the higheſt rendering it leſs ſuſceptible of the artificial curl, and diſpoſing it rather to friz'le; and the ſmalleſt making its curl of too ſhort duration. Its length ſhould be about twenty-five inches; the more it falls ſhort of this, the leſs value it bears.

There is no certain price for *hair*; but it is ſold from five ſhillings to five pounds an ounce, according to its quality.

The ſcarceneſs of grey and white *hair* has put the dealers in that commodity upon the methods of reducing other colours to this. This is done by ſpreading the *hair* to bleach on the graſs like linen; after firſt waſhing it out in a lixivious water.

This ley, with the force of the ſun and air, brings the *hair* to ſo perfect a whiteneſs, that the moſt experienced perſon may be deceived therein; there being ſcarce any way of detecting the artifice, but by boiling and drying it, which leaves the *hair* of the colour of a dead walnut-tree leaf.

There is alſo a method of dying *hair* with biſmuth; which renders ſuch white *hair* as borders too much upon the yellow, of a bright ſilver colour: boiling is the proof of this too, the biſmuth not being able to ſtand it.

HAIR, made perfectly clean, and imoiſtened with the ſolution of ſilver in aqua fortis, expoſing it to the ſun, in order to haſten the appearance and deepen the colour, will be changed from a red, grey, or other diſagreeable colours, to a brown or deep black. The ſolution for this purpoſe ſhould be fully ſaturated with the ſilver, diluted only with diſtilled water or pure rain water; and for the farther dulcification of the acid, it will be proper to add a little rectified ſpirits of wine. The liquids commonly ſold under the name of *hair*-waters, are in reality no more than ſolutions of ſilver, much diluted with water.

Hair which does not curl or buckle naturally, is brought to it by art; by firſt boiling, and then baking it in the following manner: after having picked and ſorted the *hair*, and diſpoſed it in parcels, according to lengths, they roll them up, and tye them tight down, upon little cylindrical inſtruments, either of wood or earthen ware, a quarter of an inch thick, and hollowed a little in the middle, called pipes; in which ſtate they are put in a

pot

not over the fire, there to boil for about two hours. When taken out, they let them dry; and when dried, they spread them on a sheet of brown paper, cover them with another, and thus send them to the pastry-cook; who making a crust, or coffin, around them of common paste, sets them in an oven, till the crust is about three-fourths baked.

The end by which a *hair* grew to the head, is called the *head of the hair*; and the other, with which they begin to give the buckle, the *point*. Formerly the peruke-makers made no difference between the ends, but curled and wove them by either indifferently; but this made them unable to give a fine buckle; *hair* woven by the point never taking a right curl. Foreigners own themselves obliged to the Engliſh for this diſcovery, which was firſt carried abroad by a peruke-maker of our country.

HAIR is alſo uſed in divers arts and manufactures.

The *hair* of beavers, hares, conies, &c. is the principal matter whereof hats are made.

Spread on the ground, and left to putrefy on corn lands, *hair*, as all other animal ſubſtances, viz. horns, hoofs, hinds, garbage, &c. proves good manure.

Hair alſo makes an ingredient in the compoſition of plaiſter.

HAIR, in the *Manage*, and among *Farriers*, is popularly called the *coat*, and makes an object of principal conſideration in reſpect of horſes, &c.

If the *hair* of a horſe, eſpecially that about the neck, and parts uncovered, be ſleek and ſmooth, and cloſe, it is an indication of his being in health, and good caſe: if rough and ſtaring, or any way diſcoloured, it denotes a cachexie, poverty, or ſome inward defect. To make the *hair* ſmooth, ſleek, and ſoft, he muſt be kept warm, ſweated often, and when ſweated the coat muſt be well ſcraped, and rubbed down.

The *hair* growing on the ſetlock ſerves as a defence to the prominent part thereof, in travelling on ſtony ways, or in froſty weather.

If a place be bare, or thin of *hair*, or the *hair* be too ſhort, the ancient farriers uſed to waſh it with the urine of a young boy; and after that with a ley of unſlaked lime, ceruſe, and litharge. The moderns have various other ways: ſome waſh the parts with the decoction of the roots althea; others, with goats milk, wherein agrimony has been pounded; others rub the part with nettle-ſeed, bruiſed with honey-water and ſalt; others anoint it with the juice of an onion, or radiſh; others with a mixture of alum, honey, goats dung, and ſwines blood; others with the root of white lily, boiled in oil; others with tar, oil of olives, and honey; and others with green walnut-ſhells powdered, and mixed with honey, oil, and wine. To take off *hair* in any part, they apply a plaiſter made of unſlacked lime, boiled in water, with orpiment added.

HAIR-*balls*, maſſes of *hair* of different ſhapes and ſizes found in the ſtomachs of cows, oxen, calves, deer, and other animals. Some of theſe are covered with a ſmooth, thin, hard, and ſhining coat or ſhell, and others have no covering at all, but ſhew the naked *hairs* on their ſurfaces. Some are of a cheſnut-brown, others of an aſh-colour, and others of yet different colours. They are often found to ten or eleven inches in circumference, ſometimes more, but very often much leſs; ſome of them are pretty exactly ſpherical, others of the figure of a prolate ſpheroid, others oblong and compreſſed, and others regularly oval.

Theſe balls are found in one or other of the four ventricles of the animal, and are ſometimes voided by ſtool. It is very evident they are formed of the *hair* of the animal, which it has licked off and ſwallowed, and which, by the motion of the ſtomach, which in theſe creatures is very ſtrong and frequent, is wrought and compacted together very firmly, and the thin, ſmooth, and ſhining coat which is found upon ſome of them, ſeems formed of the ſlimy matter of the ſtomach.

Among calves, that ſome have theſe *hair-balls*, and others not, ſeems in one reſpect owing to their being the firſt or latter offspring of the creature, ſince thoſe that ſuck of a heifer which never had a calf before, take off a large quantity of *hair* from the paps. There is always found more or leſs *hair* in the fourth ventricle of thoſe calves that have ſucked young heifers, which has unqueſtionably been licked off from the paps, and waſhed down with the milk, and which at times form theſe balls. See BALLS.

HAIR-*bell*, in *Botany*. See HYACINTH.

HAIR, *capillus*, in *Botany*, is the firſt degree of the Linnæan ſcale for meaſuring plants, or the twelfth part of a line.

HAIR-*cloths*, in *Military Affairs*, are large pieces of cloth made with hair; they are uſed for covering the powder in waggons, or upon batteries; as alſo for covering charged bombs, or hand-grenades, and many other uſes in magazines.

HAIR-*powder*. See STARCH.

HAIR, *Adiantum*, in *Botany*. See ADIANTUM.

Horſe-hair worms. See ANIPHISBENA.

HAIR-*weed*, *confervæ*, in *Botany*, the name of a genus of algæ, or flags, the characters of which are theſe: it is a water-plant, deſtitute of flower and ſeed, ſo far as has hitherto been obſerved, and compoſed only of ſimple and uniform filaments, which uſually extend to a great length, and are often branched, and uſually of a cylindric figure. The generality of authors have ſuppoſed that theſe are not produced of ſeeds, but are formed of ſome viſcous or gelatinous matter floating in the water, by mere appoſition of parts; but this ſeems erroneous, and is actually confuted by the diſcovery of their ſeeds, and of the fructification of this claſs of plants, made by Mr. Ellis, as well as in the ſea-fucuſes, and in many other genera of plants ſuppoſed formerly to want them. Phil. Tranſ. vol. lxii. art. 40. p. 424. &c.

The *confervæ* are uſually divided into ſeveral orders, according to the nature of the filaments they conſiſt of. Some conſiſt of equable and even threads, others are knotted or jointed in the manner of a worm, or other ſuch inſect. Theſe are called the geniculated *confervæ*, to diſtinguiſh them from the other ſimple ones; and finally, others are compoſed, as it were, of ſeveral globules joined one to another: theſe laſt are called the knotty *confervæ*.

Of the firſt kind, or ſimple *confervæ*, there are twenty-four ſpecies.

Of the ſecond order, or the *geniculated confervæ*, there are fourteen kinds.

Of the third order, or the knotted *confervæ*, there are only eight known ſpecies. See CONFERVA, and *Tab.* XIII. *Botany*, N° 2.

HAIR-*worm*, in *Zoology*. See CHAETIA.

HAIRS *breadth*. This is accounted the forty-eighth part of an inch.

HAIRY *roots*. See FIBROUS *roots*.

HAKE, in *Ichthyology*, the Engliſh name of a fiſh common in the Engliſh and ſome other ſeas, and called by authors the MERLUCIUS and *lucius marinus*.

This fiſh was uſed of old dried and ſalted. Hence the proverb obtains in Kent, *as dry as a hake*. Paroch. Antiq. 575.

HAKEL, or HATCHEL. See HATCHEL.

HAKETON, in our *Old Writers*, a military coat of defence.

HALBARD, or HALBERT, in the *Art of War*, an offenſive weapon, conſiſting of a ſhaft, or ſtaff, five feet long, with a ſteel head, partly in form of a creſcent.

The word is formed of the German *hal*, *hult*; and *hard*, an *hatchet*. Voſſius derives it from the German *hallebaart*: of *hel*, *clarus*, *ſplendens*, and *boetz*, ax.

The *halberd* was anciently a common weapon in the army; where there were companies of *halbardiers*. It is ſtill carried by the ſerjeants of foot.

It is called the *Daniſh ax*, becauſe firſt bore by the Danes: they carried it on the left ſhoulder. From the Danes it was derived to the Scots, and from the Scots to the Engliſh, and from them to the French.

HALBERT, among *Farriers*, &c. is a piece of iron, an inch broad, and three or four inches long, ſoldered to the toe of a horſe's ſhoe, that jets out before; to hinder a lame horſe from reſting or treading upon his toe.

Halbert-ſhoes of neceſſity conſtrain a lame horſe to tread, or reſt on his heel, when he goes a moderate pace; which lengthens and draws out his hock-ſinew, that was ſomewhat ſhrunk before.

HALCRYTTUM, a name given by Dr. Hill to a peculiar ſalt diſcovered in the chalybeate waters, and mentioned by Hoffman and ſome other authors, though not before known by any peculiar name.

The word is derived from ἁλς, *ſalt*, and κρυπτω, *to hide*, it being the moſt latent, and with the greateſt difficulty diſcoverable or ſeparable, of the native ſalts. It is defined to be a ſalt found naturally in a fluid form, ſuſpended in ſmall quantities in certain waters, ſcarce diſcernible in them by its taſte, and very difficulty ſeparable from them: but by a proper evaporation to be procured in a dry form in extreamely ſmall particles, in form of powder; which, when carefully prepared by a proper ſolution and evaporation, affords extremely minute, oblong, and quadrangular cryſtals. Hill, Hiſt. of Foſſ. p. 397.

It has been long ſuppoſed that alkaline ſalts could not be cryſtallized; but this ſalt, the natrum of the ancients, and the common borax, ſhew very evidently that we have yet formed but very imperfect ideas of the nature of alkaline ſalts. The boras ſhewing us that the ſuppoſed invariable properties of alkaline ſalts are not ſo conſtant, certain, and incommunicable as they were ſuppoſed to be, as it has ſome, and has not others of them. See the article BORAX. And this which is a true alkali in many reſpects; as alſo the natrum of the ancients, being by proper care reducible into regular cryſtals.

The chalybeate waters all afford this salt in some degree, but none so plentifully as the Pyrmont.

This salt forms of the utmost importance to the water, in which it is contained, since it can be supposed to contain no other alkali, and without an alkali it is not easy to account for its properties; to which it may be added, that, by means of the common alkali of tartar, and a solution of the pyrites, or even of iron, in an acid mixed with common water, a liquor may be made, very much resembling the natural Pyrmont water.

HALCYON, in *Ornithology*. See KING-FISHER.

HALCYON-*days*, *dies alcyonii*, a phrase that frequently occurs, among writers, to denote a time of peace and tranquility.

The expression takes its rise from a sea-fowl, called, among naturalists, *halcyon*, or *alcyon*, which is said to build its nest about the winter solstice, when the weather is usually observed to be still and calm.

To this circumstance the ancient poets often refer: thus Theocritus,

Χ' ἁλκυονες ἐγρεσθαι τὸ κυμασι τοις ἁλιοισιν,
Τοις τ' ἀνεμοι, τοις τ' ὑγρον, ὁ λεγομεν ὡραιον πασιν, &c.
Idyll. vii. l. 57.

And also Ovid,

Per que dies placidæ hiberno tempore septem,
Incubat halcyone *pendentibus æquore nidis:*
Tum via tuta maris; ventos custodit, et arcet
Æolus egressu. Met. lib. ii.

Halcyon-days, according to ancient tradition, are the seven days before, and as many after, the brumal solstice; called also *St. Martin's Summer*: these are famous for the calmness of the weather, which emboldens the *halcyon* to build, and brood its eggs on the rocks, on the very brink of the sea.

Columella gives the denomination, *halcyonii dies*, to a number of days commencing on the eighth of the calends of March; on account of the great stillness of the Atlantic ocean, then usually observed.

HALE, in the *Sea Language*, signifies, *pull*: hence, to *hale* a ship, denotes, to pull her on shore.

HALECULA, in *Ichthyology*, a name given, by some authors, to the anchovy. The word is a diminutive of halec, a name for the herring. See ENCRASICHOLUS.

HALEL-ÆUM, formed of ἁλς, *salt*, and ελαιον, *oil*, a medicine composed of oil and salt, and recommended by the ancients for external use in cases of tumors of the joints.

HALESIA, in *Botany*, a genus of the *decandria monogynia* class: the characters of which are, that the calyx and corolla are divided into four segments; and that the fruit is a quadrangular nut, containing two seeds.

HALF-*blood*, in *Law*. See BLOOD, *whole* and *half*.

HALF-*blown*. See *Half-*BLOOM.

HALF *files*. See FILE.

HALF-*mark*, *dimidia marca*, is a noble.

Fitzherbert says, that in case a writ be brought, and the seisin of the demandant, or his ancestor, alledged; the seisin is not traversable by the defendant, but he must tender the *half-mark* for the inquiry of the seisin; which is, in plainer terms, that the defendant shall not be admitted to deny that the possessor, or his ancestor, was seised of the land in question, and to prove his denial; but that he shall be admitted to tender *half a mark* in money, to have an inquiry made, whether the demandant, &c. were seised or not.

HALF-MOON, in *Fortification*. See DEMI-LUNE and RAVELIN.

HALF-PENNY, a copper coin, whose value is expressed by its name, in reference to the penny.

HALF-*seal* is that used in chancery, for the sealing of commissions to delegates appointed upon any appeal in ecclesiastical or marine causes.

HALF *tangents*, on a scale. See SCALE and GUNTER.

HALF *tongue*, *mediatas linguæ*. See MEDIETAS *linguæ*.

HALGAZAR, in the *Materia Medica* of the earlier writers, is the name for parsnip. Avicthoca frequently used the word in this sense.

HALIÆTUS, a species of eagle which frequents the sea, and feeds on fishes, called also the *aquila marina*, *ossifraga*, or osprey, and the *falco ossifragus* of Linnæus. Aldrovandus has described the English bald buzzard under the name of the *haliætus*, but erroneously, and his description of the ossifraga proves very plainly, that it is the *balbuzard* of other authors. It is a very large bird, weighing often eleven pounds. Its head and neck are all covered with long and narrow feathers, and it has a sort of beard of fine slender feathers, like hairs, hanging from its chin, and has, for this reason, been called the bearded eagle, *aquila barbata*, by Pliny and Belonius. It is of three colours, a whitish, a brown, and a rust colour, and it is remarkable, that every distinct feather of its body has all these colours; but its wing feathers are of a plain chesnut-colour, and its tail-feathers have very little of the brown, and are principally black and white. The legs are yellow, strong and thick, and feathered but little below the knees. The claws are of a deep shining black, very large and strong, and hooked into a perfect semicircle. This species is found in Ireland and several parts of Great Britain. Its principal food is fish, which it takes as they are swimming near the surface, by darting down upon them: it also preys on water fowl. Willughby and Pennant.

HALICACCABUM, in *Botany*, the name given by the ancient Greeks to the winter cherry, or alkekengi.

HALIEUTICS, Halieutica, ἁλιευτικα, formed of ἁλιευω, *fishermen*, which is derived from ἁλς, *sea*) books treating of fishes, or the art of fishing.

We have still extant the *Halieutics* of Oppian.

HALIGEMOTE. See HALYMOTE.

HALIMAR, a name given, by some of the old chemists, to COPPER.

HALIOTIS. See EAR-*shells*.

HALITUS *igneus*. See VAPOUR.

HALL, a word anciently used for a mansion-house, or habitation.

HALL, *salle*, in *Architecture*, is a large room, at the entrance of a fine house, palace, or the like.

Vitruvius mentions three sorts of *halls*: the *tetrastyle*, which has four columns supporting the plafond, or ceiling; the *Corinthian*, which has columns all round, let into the wall, and is vaulted over; and the *Egyptian*, which had a peristyle of insulated Corinthian columns, bearing a second order with a ceiling: these are called etc.

The *hall* is properly the first and finest partition, or member of an apartment; and in houses of ministers of state, public magistrates, &c. is that wherein they dispatch business, and give audience.

In very magnificent buildings, where the *hall* is larger and loftier than ordinary, and placed in the middle of the house, it is called a *saloon*.

The length of a *hall* should be at least twice and a quarter its breadth, and in great buildings three times its breadth. As to the height of *halls* it may be two thirds of the breadth; and if made with an arched ceiling, it will be rendered much handsomer, and less subject to fire. In this case its height is found by dividing its breadth into six parts, five of which will be the height from the floor to the under side of the key of the arch.

A royal apartment is said to consist of a *hall*, or chamber of guards, *aula prætoriana*; an ante-chamber, *prætoria*; a chamber, *camera*; a cabinet, *cubiculum*; and a gallery, *porticus*.

HALL is also a public building erected for the administration of the policy and justice of a city or corporation.

In this sense we say, the *town-hall*, a *company's hall*, &c.

A stately building in the city of London, and the great court of judicature for that city, is called GUILD-*hall*.

HALL is also particularly used for a court of justice; or an edifice wherein there is one or more tribunals.

In Westminster-*hall* are held the great courts of this kingdom, viz. the King's-Bench, Chancery, Common-Pleas, and Exchequer.

In adjoining apartments is likewise held the high court of parliament. Westminster-*hall* was the royal palace, or place of residence of our ancient kings; who ordinarily held their parliaments, and courts of judicature, in their dwelling-houses (as is still done by the kings of Spain,) and frequently sat in person in the courts of judicature, as they still do in parliament.

A great part of this palace was burnt under Henry VIII. what remains is still reserved for the said judicatories. The great *hall*, wherein the courts of King's-bench, &c. are kept, is said to have been built by William Rufus; others say, by Richard I. or II. It is reckoned superior, in point of dimensions, to any *hall* in Europe; being 300 feet long, and 100 broad.

HALLAGE, a fee due for cloth brought for sale to Blackwell-hall in London.

The word is also used for toll paid to the lord of a fair, or market, for commodities sold in the common hall of the place.

HALLAMAS, in our *Old Writers*, the day of *All-Hallows*, or *All-Saints*, viz. Nov. 1. It is one of the cross quarters of the year, which was computed, in ancient writings, from *Hallamas* to Candlemas.

HALLELUJAH, a term of rejoicing, sometimes sung, or rehearsed, at the end of verses on such occasions.

The word is Hebrew; or rather, it is two Hebrew words joined together: one of them הללו, *hallelu*, and the other יה, *jah*, an abridgment of the name of God, יהוה *Jehovah*. The first signifies *laudate*, *praise ye*; and the other *Dominum*, *the Lord*.

St. Jerome firſt introduced the word *hallelujah* into the church-ſervice: for a conſiderable time it was only uſed once a year in the Latin church, viz. at Eaſter; but in the Greek church it was much more frequent. St. Jerome mentions its being ſung at the interments of the dead, which ſtill continues to be in that church, as alſo on ſome occaſions, in the time of Lent.

In the time of Gregory the Great, it was appointed to be ſung all the year round, in the Latin church, which raiſed ſome complaints againſt that pope; as giving too much into the Greek way, and introducing the ceremonies of the church of Conſtantinople into that of Rome. But he excuſed himſelf, by alledging, that this had been the ancient uſage of Rome; and that it had been brought from Conſtantinople at the time when the word *hallelujah* was firſt introduced under pope Damaſcus.

HALLERIA, in *Botany*, a genus of the *didynamia angioſpermia* claſs. This plant, which was named from Dr. Haller, profeſſor of botany at Gottingen, is called by ſome gardeners the African fly-honeyſuckle, from its reſemblance to the upright or fly-honeyſuckle. Its characters are theſe: the flower has a permanent empalement of one leaf, cut into three parts at the top; it has one petal of the grinning kind, whoſe chops are ſwollen and inflexed; it has four ſtamina, which are briſtly, two of them longer than the other; in the bottom of the tube is ſituated an oval germen, which becomes a roundiſh berry with two cells, each containing one hard ſeed. There is but one ſpecies. Miller.

HALLIARDS, or HALYARDS, in a *Ship*, are the ropes or tacks uſually employed to hoiſt or lower any ſail upon its reſpective maſt, or ſtay.

HALLIER. See BRAMBLE-*net*.

HALM. See HAUM.

HALMOTE, or HALIMOTE, from the Saxon *healr*, *hall*; and *gemot*, *meeting*; is the ſame with what we now call a *court-baron*; the word implying, a meeting of the tenants of the ſame *hall* or manor.

Omnis curſa tercentorum, vel hundredo, vel comitatu, vel halimote, ſeum habentium, vel dominorum curia. LL. Hen. I. cap. 10. *Halmote* and *halimote* are often confounded with FOLKMOTE, though originally they were diſtinct courts. The *halmote* being properly the lord's COURT, or a court-baron held in the MANOR, in which differences between the tenants were determined.

The name is ſtill retained at Lufton, and other places in Herefordſhire.

HALMOTE is ſometimes alſo taken for a convention of citizens in their public hall, more properly called FOLK-MOTE.

HALMYRAX, a name given by Pliny to the NATRUM of the ancients, when found in a dry form on the ſurface of the earth.

HALMYRHAGA, in the *Materia Medica* of the *Ancients*, was a name given, by ſome authors, to the NATRUM, when in a purer ſtate. They diſtinguiſhed, according to Pliny, two kinds of this ſalt; one they called by this name *halmyrhagа*, which was the purer; the other, which was fouler, and mixed with earth, they called *agrium*. The firſt of theſe they had from Media, the other from Thrace.

HALMYRODES, of ἅλμυρος, *ſalt*; from ἅλς, *ſea*; a word uſed by Hippocrates, as the name of a peculiar ſpecies of fever, in which, as Galen explains it, the external parts, when touched, communicate ſuch an itching ſenſation, as is perceived on touching ſalt ſubſtances. The ſame word is ſometimes uſed to expreſs a roughneſs of the ſkin, and is applied to many of the excretions, when ſalt and acrimonious.

HALO, in *Phyſiology*, a meteor in form of a luminous ring or circle, of various colours, appearing round the bodies of the ſun, moon, planets, or fixed ſtars.

The word is formed of the Greek ἅλως, or ἄλων, *area*. That round the moon is the moſt uſual, and is alſo called CIRCLE, or CROWN.

Theſe *halos* are ſometimes white, and ſometimes coloured like the rainbow; but their colours are more dilute than thoſe of the rainbow, and they are in a different order, according to their ſize. Sometimes only one is viſible, and ſometimes ſeveral concentric *halos* or *coronæ* appear at the ſame time. They are very various in their ſize; thoſe which have been ſeen about Sirius and Jupiter were never more than 3, 4, or 5 degrees in diameter; thoſe, alſo, which ſurround the moon, are ſometimes no more than 3 or 5 degrees; but theſe, as well as thoſe which ſurround the ſun, are of very different magnitudes, ſome of them being 90°, or even larger, and their diameters vary during the time of obſervation.

Theſe *halos* are very frequent. M. Muſchenbroeck ſays, that in Holland fifty may be ſeen in the day-time, almoſt every year: in North America there is generally one or two about the ſun every week, and as many about the moon every month. *Halos* round the ſun are very common in Ruſſia. There are ſeveral ways of exhibiting phenomena ſimilar to theſe: the flame of a candle, placed in the midſt of a ſteam in cold weather, or placed at the diſtance of ſome feet from a glaſs window that has been breathed upon, whilſt the ſpectator is alſo at the diſtance of ſome feet from another part of the window, or placed behind a glaſs receiver, when air is admitted into the vacuum within it to a certain denſity, will, in each of theſe circumſtances, appear to be encompaſſed by a coloured *halo*. M. Muſchenbroeck obſerved, that when the glaſs windows of his room were covered with a thin plate of ice, on the inſide, the moon appearing through it, was ſurrounded with a large and variouſly coloured *halo*; and, opening the window, he found that it aroſe entirely from that thin plate of ice, becauſe none was ſeen except through this plate.

Naturaliſts conceive the *halo* to ariſe from a refraction of the rays of light in their paſſing through the fine rare veſiculæ of a thin nebecula or vapour towards the top of our atmoſphere: which account they confirm from hence; that a quantity of water being thrown up againſt the ſun, as it breaks and diſperſes into drops, forms a kind of *halo* or iris, exhibiting the colours of the natural rainbow.

Deſcartes obſerves, that the *halo* never appears when it rains; whence he concludes, that this phenomenon is occaſioned by the refraction of light in the round particles of ice, which are then floating in the atmoſphere; and to the different protuberance of theſe particles he aſcribes the variation in the diameter of the *halo*. Gaſſendi ſuppoſes, that a *halo* is occaſioned in the ſame manner with the rainbow, the rays of light being, in both caſes, twice refracted and once reflected within each drop of rain or vapour, and that the difference between them is wholly owing to their different ſituation with reſpect to the obſerver. Dechales alſo endeavours to ſhew, that the generation of the *halo* is ſimilar to that of the rainbow; and the reaſon, he ſays, why the colours of the *halo* are more dilute than thoſe of the rainbow, is owing principally to their being formed, not in large drops of rain, but in very ſmall vapour. But the moſt conſiderable and generally received theory, relating to the generation of *halos*, is that of Mr. Huygens.

Mr. Huygens ſuppoſes *halos*, or circles round the ſun, to be formed by ſmall round grains of a kind of hail, made up of two different parts, one of which is opake, and incloſed in the other, which is tranſparent; which is the general ſtructure actually obſerved in hail.

He ſuppoſes, that the grains or globules that form theſe *halos* conſiſted at firſt of ſoft ſnow, and that they have been rounded by continual agitation in the air, and thawed on their outſide by the heat of the ſun. In order to illuſtrate this hypotheſis, let ABCD (*Tab. II. Opticks, fig. 27.*) repreſent one of theſe globules, and EF the kernel of ſnow in the middle of it; if the rays of light, coming from GH, fall on the ſide AD, it is manifeſt they will be ſo refracted at A and D as to bend inwards, and many of them will ſtrike upon the kernel EF. Other rays, however, as GA and HD, will only touch the ſides of the kernel, and being again refracted at B and C, will emerge in the lines BK and CK, croſſing each other in the point K; whoſe neareſt diſtance from the globule is ſomewhat leſs than its apparent diameter. If, therefore, BK and CK be produced towards M and L, (*fig. 28.*) it is evident that no light can reach the eye placed within the angle LKM, but may fall upon it when placed out of that angle, or rather the cone repreſented by it. For the ſame reaſon, every one of theſe globules will have a ſhadow behind it, in which the light of the ſun will not be perceived. If the eye be at N, and that point be conceived to be the vertex of a cone, the ſides of which, NR, NQ, are parallel to the ſides of the former cone, KL, KM, it is evident that none of the globules within the cone QNR can ſend any rays of the ſun to the eye at N. But any other globule out of this cone, as X, may ſend thoſe rays, which are more refracted than XZ, to the eye; ſo that this will appear enlightened, while thoſe within the cone will appear obſcure. From hence it appears, that a certain area or ſpace, quite round the ſun, muſt appear dark, and that the ſpace next to this area will appear luminous, and more ſo in thoſe parts that are neareſt to the obſcure area; becauſe, Mr. Huygens ſays, it may eaſily be demonſtrated, that thoſe globules which are neareſt to the cone QNR exhibit the largeſt image of the ſun. A corona muſt be produced in the ſame manner, whatever be the ſun's altitude, becauſe of the ſpherical figure of the globules. In confirmation of this hypotheſis, he directs us to expoſe to the ſun a thin glaſs bubble, filled with water, and having ſome opake ſubſtance in the center of it; and he ſays we ſhall find, that we ſhall not be able to ſee the ſun through it, unleſs at a certain diſtance from a place oppoſite to the centre of it; but as ſoon as we perceive

perceive the light, the image of the ſun will immediately appear the brighteſt, and coloured red, for the ſame reaſon as in the rainbow. Theſe coronæ, he ſays, often appear about the moon; but the colours are ſo weak as to appear only white. The liveline's of the colours depends on the number of globules floating in the atmoſphere, and at the ſame time the area within the corona will be the darker. The apparent diameter of the corona, which is generally about 45 degrees, depends upon the ſize of the dark kernel; for the larger this is with reſpect to the whole globules, the larger will be the dark cone behind it. In order to have the diameter of this magnitude, he proves, that the ſemi-diameter of the globule muſt be to the ſemi-diameter of the kernel of ſnow very nearly as 1000 to 480; and for a corona of 100 degrees, it muſt be as 1000 to 680. Phil. Tranſ. Abr. vol. ii. p. 189. After the ſame manner he accounts for the parhelia; only that there he imagines the icy grains of an oblong figure, and rounding at the ends, like cylinders with round convex tops. Where ſome of theſe cylinders are in an erect poſition, the circle they form will be white, becauſe of the reflection of the rays of the ſun on the ſurface of theſe cylinders.

Mr. Weidler endeavours to refute Huygens's manner of accounting for *halos*, by a vaſt number of ſmall vapours, each with a ſnowy nucleus, coated round with a tranſparent covering. Mr. Weidler ſays, that when the ſun paints its image in the atmoſphere, and, by the force of its rays, puts the vapours in motion, and drives them towards the ſurface, till they are collected in ſuch a quantity, and at ſuch a diſtance from the ſun on each ſide, that its rays are twice refracted, and twice reflected, by the time they reach the eye, they exhibit the appearance of a *halo*, adorned with the colours of the rainbow; which may happen in globular pellucid vapours without ſnowy nuclei, as appears by the experiment of hollow glaſs ſpheres filled with water: therefore, whenever thoſe ſpherical vapours are ſituated as before mentioned, the refractions and reflections will happen every where alike, and the figure of a circular crown, with the uſual order of colours, will be the conſequence. Phil. Tranſ. N° 458. § 2.

The light which comes through drops of rain by two refractions, without any reflection, ſir Iſaac Newton obſerves, ought to appear ſtrongeſt at the diſtance of about 26 degrees from the ſun, and to decay gradually both ways, as the diſtance from him increaſes and decreaſes; and the ſame is to be underſtood of light, tranſmitted through ſpherical hail-ſtones. And if the hail be a little flatted, as is often the caſe, the light tranſmitted may grow ſo ſtrong at a little leſs diſtance than that of 26 degrees, as to form a *halo* about the ſun or moon; which *halo*, as often as the hail-ſtones are duly figured, may be coloured; and then it muſt be made red within by the leaſt refrangible rays, and blue without by the moſt refrangible ones, eſpecially if the hail-ſtones have opake globules of ſnow in their centre, to intercept the light within the *halo*, as Huygens has obſerved, and make the inſide thereof more diſtinctly defined than it would otherwiſe be.

Such hail-ſtones, though ſpherical, by terminating the light by ſnow, may make a *halo* red within and colourleſs without, and darker in the red than without, as *halos* uſed to be; for of thoſe rays which paſs cloſe by the ſnow, the rubiform will be leaſt refracted, and ſo will come to the eye in the directeſt lines. Optics, p. 155. Thus ſir Iſaac Newton accounted for the larger and leſs variable appearances of *halos*; but he conſidered the leſs and more variable appearances as depending on the ſame cauſe with the colours of thin plates. If the diameter of a ſmall drop or globule of water be about the 500th part of an inch, ſo that a red making ray, in paſſing through the middle of this globule, has 250 fits of eaſy tranſmiſſion within the globule; and all the red making rays, which are at a certain diſtance from this middle ray round about it, have 249 fits within the globule; and all the like rays, at a certain farther diſtance round about it, have 248 fits; and all thoſe at a certain farther diſtance 247 fits, and ſo on; theſe concentric circles of rays, after their tranſmiſſion, falling on a white paper, will make concentric rings of red upon the paper, ſuppoſing the light which paſſes through one ſingle globule ſtrong enough to be ſenſible; and in like manner, the rays of other colours will make rings of other colours. Suppoſe, now, that in a fair day the ſun ſhould ſhine through a thin cloud of ſuch globules of water or hail, and that the globules are all of the ſame ſize, the ſun ſeen through this cloud ought to appear ſurrounded with the like concentric rings of colours, and the diameter of the firſt ring of red ſhould be 7°, that of the ſecond 10°, that of the third 12° 33'; and according as the globules of water are bigger or leſs, the ring ſhould be leſs or bigger.

This curious theory was confirmed by actual obſervation in June, 1692, when the author ſaw by reflection, in a veſſel of ſtagnated water, three *halos*, crowns, or rings of colours about the ſun, like three little rainbows concentric to his body. Theſe crowns included one another immediately, ſo that their colours proceeded in this continual order from the ſun outward: blue, white, red; purple, blue, green, pale yellow, and red; pale blue, pale red. The like crowns appear ſometimes about the moon. The more equal the globules of water or ice are to one another, the more crowns of colours will appear, and the colours will be the more lively. Optics, p. 283. M. Muſchenbroeck concludes his account of coronæ with obſerving, that ſome denſity of vapour, or ſome thickneſs of the plates of ice, divides the light in its tranſmiſſion, either through the ſmall globules of water or their interſtices, into its ſeparate colours; but what that denſity is, or what is the ſize of the particles which compoſe the vapour, he does not pretend to determine. Introd. ad Phil. Nat. p. 1637.

It has been often obſerved, that a *halo* about the ſun or moon does not appear circular and concentric to the ſun or moon, but oval and excentric, with its longeſt diameter perpendicular to the horizon, and extended from the moon farther downwards than upwards: Dr. Smith illuſtrates this phenomenon to the apparent concave of the ſky being leſs than a hemiſphere; for by the theory of Huygens, above explained, it appears, that the rays, which cauſe the viſible appearance of *halos*, compoſe the ſurface of a cone, whoſe ſection made by a plane perpendicular to the ray that comes to the eye from the ſun or moon, is circular and concentric to the ſun or moon; and, therefore, an oblique ſection of it, made, as it were, by the apparent concavity of the ſky, which is the ſame as the perſpective projection of it upon that concave, muſt be an oval figure. When the angle which the diameter of a *halo* ſubtends at the eye is 45° or 46°, and the bottom of the *halo* is near the horizon, and conſequently its apparent figure is moſt oval, the apparent vertical diameter is divided by the moon in the proportion of about two to three or four, and is to the horizontal diameter drawn through the moon as four to three, nearly. See farther on the ſubject of this article, Prieſtley's Hiſt. and Preſent State of Diſcoveries relating to Viſion, &c. p. 506—513. and Smith's Optics, art. 167. 513, &c. 526, 527, &c.

HALO, in *Anatomy*, the name given by authors to that round red circle, or areola, about the nipple, from its ſimilitude to the circles formed round the ſun and moon at certain times, and called *halos*.

HALOSACHNE, formed of ἅλς, *ſea*, and σάχνη, *froth*, in the *Materia Medica of the Ancients*, was a name given to a peculiar ſea-ſalt, made by the evaporation of ſmall quantities of ſea-water on rocks, by the ſun's heat. It no way differed from the common ſea-ſalt in its qualities or properties, except that it did not crackle ſo much in the fire; and this was merely owing to its being compoſed of finer particles, and in form of a fort of powder, in which ſtate even common ſea-ſalt will no more crepitate in the fire than this. Hiſt. Foſſ. p. 386.

Though this, however, was the common appearance of the *halsachne*, it was not its univerſal one; for it was found ſometimes concreted on, or embodied in the alcyonia and other marine productions, and then appeared in a harder form.

HALOSANTHOS, of ἅλς, *ſea*, and ἄνθος, *flower*, *flower of ſalt*, in the *Materia Medica of the Ancients*, was a ſubſtance, though commonly ſuppoſed only an efflorescence of common ſalt, yet really a bituminous matter mixed with ſome particles of ſalt.

It was a tough, viſcous, and fatty ſubſtance, found ſwimming on the waters of ſome ſprings and rivers, and was of a looſe conſiſtence and of a yellow colour: and the ſame ſubſtance is ſtill found in the ſame places, and that not only yellow, but of various other colours, as blackiſh, green, or blue; theſe it takes up, according to the various earths it has waſhed againſt on the ſhores, or the ſubſtances mixed among it at its original concretion. The deſcription Dioſcorides gives of it is very expreſs; he ſays it was found ſwimming on the waters of the Nile, and ſome lakes, and was of a yelloviſh colour, very ſharp to the taſte, fattiſh, and of an unpleaſant ſmell. This, though that author did not diſtinguiſh to what claſs of foſſils it properly belonged, is enough, however, to teach us what it truly was; and it is ſomething wonderful, that thoſe who have accounted it a ſalt, ſhould not obſerve that the ſame author adds, that it was ſoluble in oil and not in water. Hiſt. Foſſ. p. 386.

HALSFANG. See HEALFANG and PILLORY.

HALT, in *War*, a pauſe or ſtop in the march of a military body.

Some derive the word from the Latin *halitus*, *breath*, it being a frequent occaſion of *halting*, to take breath, other

others from *alte*, because in *halts* they raise their pikes, &c. on end.

HALTER, in the *Manege*, a head-stall for a horse, of Hungary leather, mounted with one, and sometimes two straps, with a second throat-band, if the horse is apt to unhalter himself.

HALTER-*cast* is an excoriation of the pastern, occasioned by the halter's being entangled about the foot, upon the horse's endeavour to rub his neck with his hinder feet. For the cure of this, anoint the place, morning and evening, with equal quantities of linseed oil and brandy, well mixed.

HALTER-*strap* or *string*, a cord or long strap of leather, made fast to the head-stall and to the manger, to tye the horse.

HALTERISTÆ, in *Antiquity*, a sort of players at discus, so denominated from a peculiar kind of discus, by the Greeks called ἅλμη, and by the Latins *halter*.

Budæus, and others, take the halter to have been a leaden weight or ball, which the vaulters bore in their hands, to secure and keep themselves more steady in their leaping. Nor will these authors allow of any sort of halter besides this weight; nor other *halteristæ* but those vaulters. Others, as Cornarius, Constantine, and Perna, will have the halter to be a lump or mass of lead or stone, with a hold or handle fixed to it, by which it might be carried; and that the *halteristæ* were those who exercised themselves in removing these weights from place to place. These authors add, that the weight or ball mentioned by Budæus, was not called ἅλμος, *halter*, but ἅλμος, *alter*, which signifies *helper*, *defender*.

Hier. Mercurialis, in his treatise De Arte Gymnastica, lib. ii. cap. 12. distinguishes two kinds of *halteristæ*; for though there was but one halter, there were two ways of applying it. The one was to throw or pitch it in a certain manner; the other only to hold it out at arm's end: and in this posture to give themselves divers motions, swinging the hands backwards and forwards, &c. according to the engraven figures thereof given us by Mercurialis.

The halter was of a cylindrical figure, smaller in the middle (where it was held) by one diameter, than at the two ends. It was about a foot long, and there was one for each hand: it was made either of iron, stone, or lead. Galen, de Valend. Valetud. lib. i. lib. v. and lib. vi. speaks of this exercise, and shews of what use it is in purging the body of peccant humours; making it equivalent both to purgation and phlebotomy.

HALTING, among *Farriers*, &c. an irregularity in the motion of a horse, arising from a lameness or other injury in the shoulder, leg, or foot; which leads him to spare the part, or use it too timorously.

An acquaintance with this disorder, in its several circumstances, is a thing of great extent in the affairs of the manege; for which reason we shall add the principal points relating to it. If a horse *halts*, it is either *before*, in which case his complaint lies either in the shoulder, the legs, or feet; or *behind*, where it must lie in the hip, ham, or the like.

1. The signs which indicate it in the *shoulder*, are his not lifting up his leg, but trailing it on the ground, or his casting one leg more than the other, and with his knee, in a manner, unbent. Add, that in turning short he will visibly favour the leg on the same side. Again, if the ailment be found on the shoulder, it must either be in the top of the shoulder-blade, called the *withers*, which is known by his *halting* most when a person is on his back, his shrinking much, and offering to bite when griped and handled about the top of the shoulder-blade, or in the bottom of the shoulder-blade, joining to the marrow-bone, which is the fore-pitch of the breast, which is known by his treading his steps thick, and shrinking, ready to fall down, when prest on that part; or in the elbow, which joins the marrow-bone to the leg, which is known by wincing and taking up his foot when pinched there.

2. If the grievance be in the *leg*, it either lies in the knee or pastern joint, which he discovers by refusing to bow the one or the other, and going stiffly on it; or in the *shank*, which is discovered by some splint, screw, wind-gall, or other visible malady thereon.

3. If it be in the *foot*, it is either in the coronet, and owing to some strain, or to be distinguished by some tumor or breaking thereon, or its appearing hot and burning to the touch; or in the *heel*, owing to an over-reach, or the like, and visible to the eye; as also by his treading altogether on his toe; or in the *quarters*, between the middle of the hoof and the heel, which is known by his *halting* more when on the edge of a bank than when on plain ground. This is sometimes occasioned by being pricked with a nail in the shoeing; and the faulty nail is distinguished by pinching the head of each nail, and the hoof together, with a pair of pincers.

If a horse *halt behind*, from a disorder in the hip or huckle-bone, he will go side-long, and not follow so well with that leg as the other; nor will he turn on that side without favouring the leg: add, that he shews it more in walking on the side of a bank with the worst leg highest.

If a horse has any hidden infirmity, that will bring him to *halt* when he comes to travel well, it may be discovered by running him in hand on a smooth way, at the length of the halter, and observing how he sets down his legs: if he favour none of them, he is to be farther proved, by riding him roundly till heated; then letting him stand still an hour, and after that running him in the hand at halter's length, as before.

HALYMOTE, properly signifies a holy or ecclesiastical court. See HALMOTE.

There is a court held in London by this name, before the lord-mayor and sheriffs, for regulating the bakers. It was anciently held on the Sunday next before St. Thomas's day, and for this reason called the *halymote*, or holy court. The title thereof runs thus: *Curia sancti mensis tenta in Guildhalda civitatis Londin. coram majore & vicecom. &c.*

HALYWERCFOLK anciently signified such persons of the province of Durham as held lands on condition of defending the corpse of S. Cuthbert; and who hereupon claimed the privilege, not to be forced to go out of the bishoprick either by king or bishop.

HAM, a Saxon word, properly signifying a *house* or *dwelling-place*.

HAM is also used to denote a street or village.

Hence it is that the names of many of our towns end with it; as Nottingham, Buckingham, Walsingham, &c.

HAM is also a part of the leg of an animal; being the inner or hind part of the knee, or the ply or angle in which the leg and thigh, when bent, incline to each other.

HAM, in *Commerce*, &c. is used for a leg or thigh of pork, dried, seasoned, and prepared to make it keep, and to give it a brisk agreeable flavour.

Westphalia *hams*, so much in vogue, are prepared by salting them with salt-petre, pressing them in a press eight or ten days, then steeping them in juniper-water, and drying them by the smoke of juniper-wood.

A *ham* may be salted in imitation of those of Westphalia, by sprinkling a *ham* of young pork with salt for one day, in order to fetch out the blood; then wiping it dry, and rubbing it with a mixture of a pound of brown sugar, a quarter of a pound of salt-petre, half a pint of bay salt, and three pints of common salt, well stirred together in an iron pan over the fire till they are moderately hot; let it lie three weeks in this salting, and be frequently turned, and then dry it in a chimney.

HAMADRYADES, formed of ἅμα, *together*, and δρῦς, *δρυὸς*, of ἅμη, *oak*, in *Antiquity*, certain fabulous deities revered among the ancient heathens, and believed to preside over woods and forests, and to be inclosed under the bark of oaks.

The *Hamadryades*, ἁμαδρυάδες, were supposed to live and die with the trees they were attached to; as is observed by Servius on Virgil, Eclog. x. ver. 62. after Minucius, the scholiast of Apollonius, &c. who mentions other traditions relating thereto.

The poets, however, frequently confound the *Hamadryades* with the NAIADS, NAPÆÆ, and rural nymphs in general; witness Catullus, Carm. lxviii. ver. 23. Ovid, Fast. iv. 229. Met. i. ver. 695. xiv. ver. 628. Propertius, Eleg. xx. 32. Virg. Ecl. x. ver. 64. Georg. iv. ver. 382, 383.

Festus calls them *Querquetulanæ*, as being issued or sprung from oaks.

An ancient poet, Pherenicus, in Athenæus, lib. iii. calls the vine, fig-tree, and other fruit-trees, *hamadryades*, from the name of their mother the oak.

This common idea among the ancients, of nymphs or intellectual beings annexed to trees, will account for their worshipping of trees; as we find they did, not only from their poets but their historians. Livy speaks of an ambassador's addressing himself to an old oak, as to an intelligent person and a divinity. Lib. iii. § 25.

HAMAMELIS. See *Witch* HAZEL.

HAMAXOBII, HAMAXOBIANS, in the *Ancient Geography*, a people who had no houses, but lived in carriages.

The word is formed from ἅμαξα, a *carriage* or *chariot*, and βίος, *life*.

The *Hamaxobii*, called also *Hamaxobitæ*, were an ancient people of Sarmatia Europæa, inhabiting the southern part of Muscovy, who, instead of houses, had a sort of tents made of leather, and fixed on carriages, to be ready for shifting and travel.

HAMBOROUGH *company*. See COMPANY.

HAMELLIA, in *Botany*, a genus of the *pentandria monogynia* class; the characters of which are, that the corolla

is divided into five segments, and the fruit is a five-celled berry containing several seeds.

HAMFARE, in *our Old Writers*, a breach of the peace in a house.

HAMELING, or HAM-*stringing*, the act of cutting the great tendon, vulgarly called the *hamstring*.

Hameling or *hambling* of dogs, amounts to the same with EXPEDITATION or lawing.

HAMLET, a diminutive of *ham*, signifies a little village, or rather a part of a village.

Spelman, upon these words, shewing the difference between *villa integra* and *villa dimidia & hamleta*, says, Hamleta *vero, quæ mediocritatem fribargii non obtinent hoc est ubi quinque capitales plegii non deprehensi sint.* The stature of Exon. 14 Edw. I. mentions this word thus, *Les noms de toutes les villes & hamlets que sont en son wapentake.* In the ancient MS. *hamlet* is expounded the seat of a freeholder.

HAMMA, *ἅμμα*, of *ἅπτω*, *I tie*, a word used, by some chirurgical writers, for a knot that fastens a bandage.

HAMMER, an instrument of iron, with a handle of wood used, in most mechanic arts, to beat, stretch, drive, &c. Bodies capable of being stretched or extended under the *hammer*, are said to be *malleable*.

The Latins call it *malleus*, anciently *martulus* or *marculus*; by which name Pliny calls it when he says, that Cyniras, son of Agrippa, invented the *hammer* and pincers. Hist. Nat. lib. vii. cap. 56. Vide Hardouin, Not. ad loc.

The *hammers* of our great FORGES are moved or worked by a water-mill.

HAMMER, in the *Manege*. See SHOEING-*hammer*.

HAMMER *hardening*. See HARDENING.

HAMMER *of a clock*. See CLOCK.

HAMMER, in *Anatomy*. See MALLEUS and EAR.

HAMMER-*headed shark*. See SHARK.

HAMMER, *yellow*, in *Ornithology*. See YELLOW *Hammer*.

HAMMERING, the act of beating or extending, and fashioning a body under the hammer.

When it is performed on iron heated for the purpose, the smiths usually call it *forging*.

HAMMERING, in *Coining*. A piece of money, or a medal, is said to be *hammered* when struck, and the impression given with a hammer and not with a mill.

For the method of coining with the HAMMER, see COINING.

HAMMOC, or HAMAC, a kind of hanging bed, suspended between two trees, pols, hooks, or the like; much used throughout the West Indies, as also on board of ships.

The Indians hang their *hammocs* to trees, and thus secure themselves from wild beasts and insects, which render lying on the ground there very dangerous.

The people of the Caribbee islands are wonderfully superstitious with regard to their *hammocs*, and do not make them without many ceremonies.

According to F. Plomier, who has often made use of the *hammoc* in the Indies, it consists of a large strong coverlet or sheet of coarse cotton, about six feet square: on two opposite sides are loops of the same stuff, through which a string is run, and thereof other loops are formed, all which are tied together with a cord; and thus is the whole fastened to two neighbouring trees in the field, or two hooks in houses.

This kind of couch serves, at the same time, for bed, quilt, sheets, pillow, &c.

The *hammoc* used on board of ships is made of a piece of canvas, six feet long and three feet wide, gathered or drawn together at the two ends; there are usually from fourteen to twenty inches in breadth allowed between decks for every *hammoc* in a ship of war; but this space must in some measure depend on the number of the crew, &c. In time of battle the *hammocs* and bedding are firmly corded and fixed in the nettings on the quarter-deck, or wherever the men are too much exposed to the view or fire of the enemy.

Mr. Le Cat has contrived a *hammoc* of Turkey leather, which may be easily raised or let down, with a sick person in it, by ropes and pullies. See Phil. Transf. N° 468. § 3.

HAMMON, in the *Heathen Mythology*. See AMMON.

HAMMOSTEUS, the OSTROCOLLA of the shops.

HAMPER. See HANAPER.

HAMSOKEN, the liberty or privilege of a man's own house; also a franchise granted to lords of manors, whereby they hold pleas, and take cognizance of the breach and violation of that immunity: and it likewise signifies *quietantiam visneti seu assa intrusionis in alienum domum vi & injuste*. Fleta, lib. cap. 47. In Scotland, violations of this kind are equally punishable with ravishing a woman. And our old records express burglary under the word *hamsocne*.

HAMUS, or HAMULUS, a HOOK.

Surgeons also make use of an instrument thus called, to extract the child in difficult labours.

HANAB ALTHALEB, in the *Materia Medica*, a name used, by the ancient Arabian writers, to express the *hyoscyamum* or *pomum amoris*. The meaning of the name is the wolfs-grape; and the Greeks have called it by an exactly corresponding term, *lycophysion*. We generally call it lycopersicon, or the wolfs-peach. Some have supposed this the name of a plant differing from the pomum amoris; but it appears, on a strict enquiry, to be wholly the same. Some of the Greeks have used the word *strychnos* in this sense alone; and Alexander Trallian, in particular, always makes it the name of an esculent plant; but Dioscorides and Theophrastus use it as the common name of the esculent nightshade, and of the poisonous kinds.

HANAPER, or HAMPER, an office in CHANCERY, under the direction of a master, his deputy and clerks, answering, in some measure, to the FISCUS among the Romans.

HANAPER, *clerk of the*, sometimes styled *warden of the hanaper*, an officer who receives all money due to the king for seals of charters, patents, commissions, and writs, and attends the keeper of the seal daily in term time, and at all time of sealing, and takes into his custody all sealed charters, patents, and the like, which he receives into bags, but anciently, it is supposed, into *hampers*, which gave denomination to the office.

There is also an officer who is COMPTROLLER of the *hanaper*.

HANCES, in a *Ship*, are falls or descents of the sise-rails, which are placed as banisters in the poop, &c. and down to the gang-way.

HANCES, or HANSES, in *Architecture*, are the ends of elliptical arches, which are arcs of smaller circles than the scheme or middle part of the arch.

HAND, *manus*, a part or member of the body of man, making the extremity of the arm.

The mechanism of the hand is very curious; excellently contrived to fit it for the various uses and occasions we have for it, and the great number of arts and manufactures it is to be employed in. It consists of a compages of nerves, and little bones joined into each other, which give it a great degree of strength, and at the same time an unusual flexibility, to enable it to handle adjacent bodies, lay hold of them, and grasp them, in order either to draw them toward us or thrust them off. Anaxagoras is represented, by ancient authors, as maintaining, that man owes all his wisdom, knowlege, and superiority over other animals, to the use of his *hands*. Galen represents the matter otherwise: man, according to him, is not the wisest creature, because he has *hands*; but he has *hands* given him because he was the wisest creature; for it was not our *hands* that taught us arts, but our reason. The *hands* are the organs of reason, &c. De Usu Part. lib. i. cap. 3.

The *hand*, among anatomists, extends from the shoulder to the fingers ends: this is called also the *greater hand*. It is divided into three parts. The first reaching from the shoulder to the elbow, properly called the *arm*, *brachium*. The second reaches from the elbow to the wrist. The third is the *hand*, *manus*, properly so called; called also the *lesser hand*, or *extreme manus*. This is subdivided into three other parts: the *carpus*, which is the wrist; the *metacarpus*, which is the body of the *hand*, including the *dorsum* and *vola*; and the fingers, *digiti*. See CARPUS, METACARPUS, and FINGERS.

The muscles whereby the *hand* is moved and directed, are the *palmares*; the *flexor* and *extensor*, *carpi*, *ulnaris*, and *radialis*; *perforatus*; *perforans*; *lumbricales*; *interossei*; *extensori*, *adductor*, and *flexores* of the fingers. See each in its place, PALMARIS, FLEXOR, EXTENSOR, &c.

HAND, *cartilages of the*. All the bones of the carpus, metacarpus, and fingers, are crusted over with cartilages, at those places called cartilaginous surfaces, in the descriptions of those bones; but in the fresh bones they are much thicker, softer, and whiter, than in the skeleton. In adult subjects, their figure indeed remains the same in both states, but it changes in the dried bones of younger subjects, particularly those of children. Winslow's Anatomy, p. 143.

HAND, *ligaments of the*. The ligaments of the carpus are very numerous. Some of them serve to tie each bone of it to the neighbouring bones in the same rank; and these are so very short as to allow these bones only a very small degree of motion: some of them tie the bones of one row to those of another; these are likewise made up of numbers of filaments, but are not so short as the former, and allow these bones a more manifest motion; and lastly, there are other ligaments of the wrist, by which the three first bones of the first row are connected with those of the arm, and to these may be added those of the second row, by which its bones are connected to those of the metacarpus, and to the first phalanx of the thumb. Beside all these short ligaments belonging to each bone, in both rows, the rough surfaces of all the bones, especially of those which form the convexity of the carpus, give insertion to a great many ligamentary fasciculi, which

which are ſtretched over, and cloſely united to the former ſmall ligaments, and probably ſerve to ſtrengthen them: there is likewiſe a conſiderable ligament, called the inner tranſverſe ligament of the carpus. It has formerly been called an annular ligament, and may ſtill juſtly enough retain that name.

The bones of the metacarpus, beſides thoſe ligaments by which they are tied to the ſecond row of the bones of the carpus, have ſeveral others by which both their baſes and heads are connected together. The baſes of the third and fourth bones are not ſo cloſely connected as the reſt, and therefore have a very ſenſible motion. The heads of theſe bones are firmly tied to each other by a ſtrong ligament, ſituated tranſverſely in the palm of the hand, and fixed, by diſtinct productions, in the neighbouring parts of the heads. The firſt phalanx of the thumb is fixed to the os trapezium by ſhort ligaments, which paſs obliquely over the articulation. The firſt phalanges of the four fingers are joined to the heads of the metacarpal bones by ligaments like the former, and almoſt in the ſame manner. The third phalanx of the thumb is joined to the ſecond, and the ſecond phalanges of the other fingers to the firſt, and the third to the ſecond, by lateral ligaments, almoſt in the ſame manner as the bones of the fore-arm to the os humeri; that is, theſe ligaments ſpread from a point fixed in the lateral tubercles of the heads of the phalanges, and are inſerted in their other extremity like rads in the baſes of the neighbouring phalanges. The two firſt phalanges of each finger have a ſtrong ligamentary vagina, inſerted in the rough lines or ridges, on their flat ſides; theſe vaginæ are lined with a mucilaginous membrane, which runs like a tube from one phalanx to the other, over the articulation. They ſerve for ſtrata to the flexor muſcles of the fingers, the tendons of which paſs through them. Winſlow's Anatomy, p. 143.

HAND, *luxation of the.* Notwithſtanding that the *hand* is very accurately connected to the ulna and radius, by means of the carpus, and ſtrong ligaments, yet it is liable to luxations, and ſometimes ſuffers them in all directions either outward or inward, or on either ſide; but is generally not ſo eaſy to be luxated ſideways, as in the other directions, becauſe of the two proceſſes of the radius and ulna which guard it on each ſide. The *hand* is ſaid to be luxated forwards or inwards, when it recedes from the muſcles which bend the fingers; and to be luxated backward, when it departs from the muſcles which extend the fingers. Much in the ſame manner alſo the *hand* is ſaid to be luxated outwards, when the carpus makes a tumor near the thumb, and a cavity near the little finger; and to be luxated inward, when the contrary of this happens.

To reduce luxations of the *hand*, it muſt be ſufficiently extended by two aſſiſtants, one of which is to lay hold of the *hand*, and the other of the humerus, pulling in oppoſite directions; and that part of the extended *hand* where the ſinus is, muſt be placed on a flat and even table, that whatever ſticks up may be depreſſed into its place; by which method the *hand*, in whatever part luxated, may be very readily reduced into its natural ſeat. It alſo ſometimes happens, that one or two of the eight little bones of the carpus are luxated and diſtorted from their natural ſeat by ſome external violence. When this happens, there will be perceived a tumor in one part, and a cavity in another, which may be perceived by the feeling, as well as by the ſight, and the patient will feel very violent pains. This is a luxation very readily and eaſily cured, by extending the *hand* as before directed, and replacing the bone. Heiſter's Surg. p. 165.

The *hand* makes the ſubject of the art of palmiſtry, which is employed in conſidering the ſeveral lines and eminences of the palm of the *hand*, their ſignifications, &c. Among the Egyptians, the *hand* was uſed as a ſymbol of ſtrength; among the Romans, it was held a ſymbol of fidelity; and, accordingly, was conſecrated to that goddeſs, by Numa, with great ſolemnity.

HAND, in *Falconry*, is uſed for the foot of the hawk. To have a clean, ſtrong, ſlender, glutinous *hand*, well clawed, are ſome of the good qualities of a hawk, or falcon.

HAND, in the *Manege*, is a term variouſly uſed. Sometimes it ſtands for the fore-feet of a horſe.

Hand is alſo uſed for a diviſion of the horſe into two parts, with reſpect to the rider's *hand*. The *fore-hand* includes the head, neck, and fore-quarters; the *hind-hand* is all the reſt of the horſe.

Spear-hand, or *ſword-hand*, is uſed for horſeman's right *hand*.

Bridle-hand is the horſeman's left *hand*.

Your regular cavalier holds his *bridle-hand* two or three inches above the pommel of the ſaddle.

A horſeman is ſaid to have *no hand*, when he only makes uſe of the bridle unreaſonably; not knowing how to give the aids, or helps, of the *hand* with diſcretion.

To keep a horſe *upon the hand*, ſignifies to feel him in the ſtay upon the *hand*, and to be always prepared to avoid any ſurprize from him. When the horſe obeys and anſwers the effects of the *hand*, he is ſaid to *reſt well upon the hand*.

A horſeman ought to have a *light hand*, i. e. he ought only to feel the horſe upon his *hand*, ſo as to reſiſt him whenever he attempts to ſlip from it; and as ſoon as he has made his reſiſtance, he ought to lower the bridle, inſtead of cleaving to it.

If a horſe, by a too great eagerneſs to go forward, *preſſes* too much *upon the hand*, it ought to be ſlackened at certain times, and at other times to be kept hard, in order to diſappoint him from continually preſſing upon the bit. This facility, or liberty, of the horſeman, of ſlackening or ſtiffening the *hand*, makes what they call a *good hand*.

A horſe is ſaid to *force the hand*, when he does not fear the bridle, but runs away in ſpite of the rider.

To *work a horſe upon the hand*, is to manage him by the effects of the bridle, without any other helps, except the calves of the legs.

To be *heavy upon the hand*, is underſtood of a horſe, which, on account of the ſoftneſs of his neck, the weakneſs of his back, the largeneſs of his head, and the weight of his fore-quarters, or his wearineſs, throws himſelf upon the bridle, without making any reſiſtance, or effort, to force the horſeman's *hand*.

To make a horſe reſt upon the *hand*, and free in the *ſtay* or *reſt*, he muſt be taught to know the *hand* by degrees, and gentle methods; the horſeman muſt turn him, or change *hands*; ſtop him, and manage with dexterity the *appui*, or preſſure of his mouth, ſo as to make him ſuffer chearfully and freely the effect of the bit-mouth, without reſiſting or reſting heavy upon the *hand*. The ſhort, or *hand*-gallop, teaches horſes to be right upon the *hand*.

HAND is alſo found, in many other terms, or phraſes of art, belonging to the manege, as,

HAND, *to ſlack or yield to*, is to ſlacken the bridle.

HAND, *to hold up, or ſuſtain the*, is to pull the bridle in.

HAND, *to guide a horſe by the*, is to turn or change *hands* upon one tread.

HAND, *appui, or ſtay of the*. See APPUI.

HAND, *beat upon the*. See BEAT and CHECK.

HAND, *to preſs upon the*. See PRESS.

HAND, *to change the*. See CHANGE.

HAND, *effects of the*. See EFFECTS.

HAND, *haſten the*. See HASTE.

HAND, *to feel a horſe upon the*. See FEEL.

HAND, *full, or full reſt upon the* HAND. See APPUI and MOUTH.

HAND, *to have mares covered in the*. See HORSE and MARE.

HAND, *to make a horſe part from the*, or ſuffer him *to ſlip from the* hand, is to put on at full ſpeed.

HAND, *to make a horſe part right from the*, he ſhould not put himſelf upon his back or reins, but bring down his hips.

HANDS, *all*. A horſe is ſaid to turn upon *all hands*, that is not reſty for one *hand*. This is called in French ENTIRE.

HAND, *harmonical*, in *Muſic*, is uſed, by ſome writers for the ancient diagramma, or ſcale of muſic, upon which they learned to ſing.

The reaſon of the appellation was, that Guido Aretin, upon inventing the notes, *ut, re, mi, fa, ſol, la*, diſpoſed them on the fingers of the figure of a *hand* ſtretched out. He changed the letters of the alphabet, uſed till that time to expreſs the notes, for theſe ſix ſyllables, which he took out of the firſt ſtrophe of the hymn of St. John Baptiſt, compoſed by Paulus Diaconus.

Ut *queant laxis re-ſonare fibris*
Mi-*ra geſtorum fa-muli tuorum*,
Sol-*ve polluti la-bii reatum*.
Sancte Joannes.

HAND *of juſtice*, is a ſceptre, or batoon, a cubit long, having an ivory *hand* at the extremity thereof; uſed as an attribute of certain kings, wherewith they are painted in their royal robes; as on the coronation day.

Authors uſually call it *virga*. Louis X. of France firſt took the *hand of juſtice* for his device.

HAND, *impoſition of*, or *laying on of* HANDS, ſignifies the conferring of holy orders; a ceremony wherein the *hands* are laid on the head of another, as a ſign of a miſſion, or of a power given him to exerciſe the functions of the miniſtry belonging to the order.

The apoſtles began to appoint miſſionaries by the impoſition of *hands*. See IMPOSITION.

Waſhing one's HANDS of a thing, ſignifies the witneſſing that a perſon has no part or concern in an affair; and that he will not be anſwerable for it: this Pilate did in reſpect of our Saviour's death. In this ſenſe, a man is ſaid to have *clean hands*; becauſe the *hands* are the chief inſtruments of action; and particularly a judge does this, to denote that he has not been corrupted by bribes or preſents.

HAND, *left*. To marry with the *left-hand*, is to eſpouſe a woman of inferior degree, whoſe children, in virtue of ſuch marriage, are not to ſucceed to the father, nor ſhare with the other children, but are to be contented with what fortune the huſband ſhall appoint them the next day after marriage.

This method of taking *left-handed wives* obtains at this time in Germany.

HAND is alſo uſed for the INDEX of a clock, watch, or the like, ſerving to point the hour, &c.

HAND, *long, longimanus*, a kind of title, or ſurname, aſſumed by certain princes. Artaxerxes, the ſon of Xerxes, and his ſucceſſor in the Perſian empire, was thus denominated; as having *hands* ſo long, that he could touch his knees with them when he ſtood upright.

HAND, *ſhort*. See TACHYGRAPHY.

HAND, *bloody*. See BLOODY *hand*.

HAND is alſo figuratively uſed in painting, ſculpture, &c. for the manner, or ſtyle, of this or that maſter.

HANDS are borne in coat-armour, *dexter* and *ſiniſter*; that is, right and left; expanded or open; and after other manners.

Azure, a *dexter hand* couped to the wriſt, and extended in pale argent, is borne by the name of Broome. Argent, three *ſiniſter hands*, couped to the wriſt, gules, by the name of Maynard.

Knights BARONETS are to bear in a canton, or in an eſcutcheon, as they pleaſe, the arms of Ulſter; viz. in a field argent, a *ſiniſter hand* couped to the wriſt, gules.

HAND, or HANDING, in the *Sea-Language*. When a thing is to be delivered away, or paſſed from one to another, or to be brought to any one, then the word is, *hand* it this way, or that way. Alſo, when more men are wanted to do any labour, as hoiſing, &c. they call for more *hands*, not more men.

Handing the ſails is the ſame operation as FURLING them.

HAND *in and out*, in our *Old Writers*, the name of an unlawful game, now diſuſed and prohibited by the ſtatute 17 Edw. IV. cap. 3.

HAND-*barrow*, in the *Military Art*, is commonly made of hard light wood. It is of great uſe in fortification, for carrying earth from one place to another, and in a ſiege, for carrying bombs, or cannon-ball, along the trenches, and for ſeveral other uſes.

HAND-*borow*, a pledge, or ſurety, of the lower rank.

Eſt quoſd vas, ans ſidejuſſor manuriſe, hoc eſt, minor, ſeu inferior; nam hand-borow, vas eſt capitalis, vel ſuperior. Spelman.

HAND-*breadth*, is ſometimes uſed for a meaſure of three inches.

HAND-*cuffs*, an inſtrument formed of two circular pieces of iron, each fixed by a hinge on the ends of a ſhort iron bar, which being locked over the wriſts of a malefactor, prevents his uſing his hands.

HAND-*grenades*. See GRANADO.

HAND-*over-hand*, in *Sea Language*, is an order to the men, who pull upon any rope, to paſs their hands alternately one before, or above the other, if they are hoiſing. In order to haſten the ſervice. A ſailor is ſaid to go aloft, *hand-over-hand*, when he aſcends into the tops by a ſingle rope, as a ſhroud or back-ſtay, without the help of the rattlings, by the dexterity of throwing one *hand* above the other, and lifting his weight along with it.

HAND-*ſcrew*. See JACK.

HAND-*ſpike*, or *hand-ſpec*, a lever, or piece of aſh, elm, or other ſtrong wood, five or ſix feet long, cut thin like a wedge at one end, that it may get the eaſier betwixt things which are to be ſeparated, or under any thing that is to be raiſed; it is better than a crow of iron, becauſe its length allows a better poiſe.

Hand-ſpikes are uſed in ſhips, to traverſe the ordnance, to heave with in a windlaſs, to weigh up the anchor, &c. The gunners *hand-ſpike* is ſhorter and ſlatter than the other, and armed with two claws, for the purpoſe of managing the artillery in battle, &c.

HAND, or HANDFUL, is a meaſure of four inches, by the ſtandard; according to the ſtatute 33 Hen. VIII. cap. 5. The *hand*, among *ſeekers*, is four fingers breadth, and is the meaſure of the ſiſt clenched; by this the height of horſes is meaſured.

A horſe for war ſhould be ſixteen or eighteen *hands* high.

A *handful* of corn or bran is alſo underſtood to be as much grain or bran as two *hands* will hold, when joined together; a quantity frequently ordered to be given horſes.

HAND-HABEND, in our *Ancient Cuſtoms*, denotes a thief taken in the very fact.

Hand, or *hand-haland*, from the Saxon *hand*, *hand*, and *habend*, *having*, is a circumſtance of manifeſt theft, when the party is taken with the mainor, or mainover, i. e. the thing ſtolen, in his *hand*.

Bracton alſo uſes *hand-berend* in the ſame ſenſe. *Sic Latro manifeſtus.*

So in Fleta, *Furtum manifeſtum eſt ubi aliquis intra deprehenſus fuiſſus de aliquo latrocinio* hand-habbende, & back-berende, *& inſecutus fuerit per aliquam cujus res illa fuerit, quæ dicitur Scabengh, & tunc licet inſecutori rem ſuam petere criminaliter ut furatam.* Lib. i. cap. 38. § 1.

HAND-HABEND alſo ſignifies the right which the lord has to judge and determine of this offence in his court.

HANDACOCHA, in *Botany*, a name by which Pliny, and ſome other authors, have called the *treſolium bituminoſum*, or ſtinking treſoil.

HANDGRITH, in our *Old Writers*, peace or protection given by the king with his own hand. *Hæc mittunt hominem in malefactoribus regis, infractio ſeu violatio pacis quam per manum ſuam dabit alicui.* Leg. Hen. I.

The word is Saxon, from *hand*, or *hond*, *manus*, and *grith*, *pax*.

HANDLING, a term uſed in reſpect of fighting cocks; ſignifying the meaſuring the girth of them, by griping one's hands and fingers round the cock's body.

HANDY-*warp*, in our *Old Writers*, a kind of cloth mentioned in ſtat. 4 & 5 Phil. & Mar. cap. 5.

HANG-*beaches*, in *Mining*. See STOWS.

HANGING *in chains*. See CHAINS.

HANGINGS, linings for rooms, made of arras, tapeſtry, or the like.

HANIG, in our *Old Writers*, a term for cuſtomary labour to be performed.

HANK *for hank*, in *Sea Language*, is a phraſe uſed for two ſhips which tack and make a progreſs to windward together.

HANKS, in a *Ship*, are certain wooden rings fixed upon the ſtays of a ſhip, whereby to confine the ſtay-ſails to them at different heights. They are a later invention, and much more convenient than the GROMMETS, and uſed inſtead of them.

HANTELODE, in our *Old Writers*, ſignifies an arreſt.

The word is Saxon; from *hant*, *hand*, and *lead*, i. e. *lead*; *manut immiſſio*, becauſe arreſts are made by laying hold on the debtor, &c.

HANGWITE, HANGWITA, a mulct impoſed for the hanging a thief, or felon, without courſe of law; or even for ſuffering him to eſcape out of legal cuſtody.

The word is alſo written, corruptly, *hangwith*, or *hondwite*. It is formed from the Saxon *hangian*, *to hang*, and *wite*, *mulct*, *compoſition*.

HANGWITE, *to be quit of, quietus eſſe de hangwita*, in *Royal Charters*, denotes an immunity or freedom from the mulct or penalty above mentioned. *Quia de larcin pendu ſans forfaicte le roy.*

HANSE, or HANS, an ancient name for a ſociety or company of merchants; particularly that of certain cities in Germany, &c. hence called *hanſe-towns*.

The word *hanſe* is obſolete High Dutch, or Teutonic; and ſignifies, as Lambecius obſerves in his Origines Hamburgenſes, *alliance*, *confederacy*, *aſſociation*, &c. In this ſenſe it is uſed in two of king John's charters, in 1199, to Dunwich in Norfolk, and the city of York. Some, as Werdenhagen, who has been followed by many later authors, derive it from the three German words, *an-herſen*, that is, *on the ſea*; becauſe the firſt *hanſe towns* were all ſituate on the ſea-coaſt; whence the ſociety is ſaid to have been firſt called *an-der-ſee ſteten*, that is, *cities on the ſea*; and afterwards, by abbreviation, *hanſee*, and *hanſe*.

HANSE *towns* are certain free towns of Germany, and the North, united in ſtrict league, under laws and magiſtrates of their own appointing, for the better carrying on of commerce, and for their mutual ſafety and aſſiſtance.

This celebrated aſſociation, which makes ſo great a figure in the hiſtory of commerce, is ſuppoſed by Werdenhagen to have commenced in the year 1160, immediately after the incurſions and piracies of the Danes, &c. The learned Lambecius is of opinion, that it did not properly commence till after the league between Lubeck and Hamburgh, in the year 1241; Thuanus, in lib. II. Hiſt. Sui Temp. traces the origin of it to the year 1200; others trace its firſt riſe to the year 1140; but be its origin when it will, it was confirmed and re-eſtabliſhed in 1226 and 1284; and an extraordinary general aſſembly was held every ten years, at which they ſolemnly renewed their league, admitted new members, and excluded old ones, if they were refractory, &c.

At firſt it only conſiſted of twelve towns, ſituate on the coaſts of the Baltic ſea, or not far from it. But its ſtrength and reputation increaſing, ſcarce any trading city in Europe but deſired to be admitted into it. However, it ſeems to have been a ſtanding rule of this confederacy, that no city ſhould be admitted into the *hanſe* league, but ſuch as were either ſituated on the ſea, or on ſome navigable river, commodious for maritime commerce.

Under our king Henry III. who, in the year 1266, made a com-

a conſiderable grant of immunities to the *hanſe* towns, the *hanſe* conſiſted of no leſs than ſeventy-two cities: to which were afterwards added ſeveral more. France furniſhed to the confederacy Calais, Rouen, St. Malo, Bourdeaux, Bayonne, and Marſeilles; Spain, Barcelona, Seville, and Cadiz; England, London; Portugal, Lisbon; the Low Countries, Antwerp, Bruges, Rotterdam, Oſtend, and Dunkirk; and Italy and Sicily, Meſſina, Leghorn, and Naples. However, the number of the *hanſe* towns, which were properly members of the *hanſeatic* league, and contributed to its ſupport, was ſixty-four, in the year 1370, which was the period when this mercantile confederacy was in its zenith of power and glory; moſt of which have long ſince deſerted the league; ſome about the year 1512, and ſome afterward. Beſides theſe there were forty-four towns that were properly allies of the confederacy, and were exempted from annual contributions; and to theſe ſeveral others, ſuch as thoſe above mentioned, were added.

The *hanſe* was divided into four claſſes, or members, which were thoſe of Lubeck, Cologn, Brunſwick, and Pruſſia or Dantzick. Theſe four cities were the heads of the four members; and Lubeck was the head of the whole *hanſe*.

Beſides this, the *hanſe* had four principal factories, or ſtaples, called the *compoires* of the confederacy: theſe were at London, Bruges, Novogrod, and Bergen; that of Bruges was afterwards removed to Antwerp. But the firſt and principal was that of Lubeck, which ſtill remains the head of the aſſociation. That of London was called *Guildhalla Teutonicorum*, or the *Steel-yard*.

The government of the *hanſe* was at firſt ariſtocratical: then it came under the ſole direction of the grand-maſter of the Teutonic order; and, at length, divers princes and lords made intereſt for it.

The end of the fourteenth century, and the beginning of the fifteenth, were the moſt flouriſhing times of this alliance. Theſe towns were then in a condition to proclaim war againſt kings: hiſtory is not ſilent as to that they waged againſt Waldemar king of Denmark, about the year 1348, and againſt Eric, in 1428; particularly this laſt, when the *hanſeatic* fleet conſiſted of two hundred and ſixty ſhips, containing about twelve thouſand regular troops, beſides the ſeamen.

But the ſeveral princes, whoſe principal cities were entered into the aſſociation, began to think it policy to put ſome bounds to the power, which, in time, might have proved formidable to themſelves. The means were eaſy, and ſhort: each withdrew the merchants of his country from the aſſociation; by which in a little time, from the great number of cities it had comprehended, the aſſociation found itſelf ſunk to thoſe few which had begun the confederacy; which henceforth was called the *Teutonic hanſe*: though theſe are ſtill ſo conſiderable in point of commerce, that they are admitted to make treaties with the greateſt kings.

The diviſions that were got among them, contributed greatly to their fall; nor muſt it be forgot, that the eſtabliſhment of the republic, and commerce of Holland, had its ſhare therein.

The four cities which formed the league, were Lubeck, Cologn, Brunſwick, and Dantzick, which were called *mother towns*; as thoſe afterwards added thereto, were called *daughters* thereof.

A great number of towns in Germany ſtill retain the title of *hanſe towns*; but this is rather an empty title which they affect, than any argument of their continuing to trade under the laws and protection of the ancient alliance; there being ſcarce any but Lubeck, Hamburgh, Bremen, Roſtock, Brunſwick, and Cologn, that are truly *hanſeatic*, and that have deputies at the aſſemblies held on the common occaſions thereof.

The great trade the Dutch maintain with the *hanſe towns*, contributes not a little towards maintaining ſome part of them in their ancient reputation; and it is principally to their alliance with that flouriſhing republic, that they owe the preſervation of their liberties; the ſucceurs ſome of them have received from the Dutch having ſaved them more than once from the enterprizes of the neighbouring princes.

HANSEATIC, ſomething belonging to the alliance, or company of the HANSE.

Thus we ſay, the *hanſeatic* body; the *hanſeatic* towns, &c.

HANSGRAVE, the title of an officer in Germany. The *hansgrave* is the chief of a company, or ſociety.

The word is compounded of the German *hanſe* and *graf*, *count*. See GRAVE.

HAP, or HAPP, in *Law*, ſignifies, to catch or ſnatch a thing. Thus we meet with, to *hap* the poſſeſſion of a deed-poll. Littleton, fol. 8. alſo, to *hap* the rent. If partition be made between two parceners, and more land be allowed the one than the other, ſhe that hath moſt of the land charges it to the other, and *happeth* the rent whereon aſſize is brought.

HAPPINESS, in *Ethics*. See GOOD.

HAQUE, in our *Old Writers*, a little hand-gun, prohibited to be uſed for deſtruction of game, &c. by ſtatute 33 Hen. VIII. cap. 6. and 2 & 3 Ed. VI cap. 14. There is alſo the *half-haque*, or *demi-haque*, within the ſaid acts.

HAQUENY, HACKNEY, an old French word for an ambling horſe.

HAQUEBUT, a kind of fire-arm, otherwiſe called an *hagbut*, or HARQUEBUSS.

HARACH, in the *Eaſtern Revenues*, is a poll-tax laid on the Chriſtians and Jews in Egypt. This had long been in the hands of the janizaries, but of late has got into the power of an officer, called the *harach aga*, ſent from Conſtantinople. Before this the Chriſtians paid but a trifle, by capitulation with ſultan Selim; and this capitulation the Coptis ſay they have in their own hands, it was only two dollars and three quarters a head. The great men conſented to this; and now they pay their two or three quarters, or five and a half, or eleven, according to their ſubſtance, each dollar being about half a crown. The perſons who pay this are thoſe only who have arrived at the age of fifteen. Pococke's Egypt, p. 173.

HARAHA, in *Botany*, a name uſed, by ſome authors, for the GOURD.

HARAM. See SERAGLIO.

HARANGUE, a modern French name for a ſpeech, or oration, i. e. a diſcourſe made by an orator in public.

Menage derives the word from the Italian *arengo*, which ſignifies the ſame; formed, according to Ferrari, from *arringo*, *a juſt*, or *place of juſting*. Others derive it from the Latin *ara*, *altar*; becauſe the firſt *harangues* were made before altars: whence the verſe of Juvenal,

Aut Lugdunenſis rhetor dicturus ad aram.

The word is alſo frequently uſed in an ill ſenſe; viz. for a too pompous, prolix, or unſeaſonable ſpeech or declamation. In Homer the heroes generally *harangue* before they come to fight; as, in England, criminals *harangue* on the ſcaffold before they die.

HARANKAHA, in the *Materia Medica*, a name by which ſome authors have called ZEDOARY.

HARBINGER, an officer of the king's houſhold, having four yeomen under him, who ride a day's journey before the court when it travels, to provide lodgings, &c.

HARBOUR, a ſea-port, or a ſtation where ſhips may ride ſafe at anchor.

The word is chiefly applied to thoſe cloſed and ſecured with a boom, or chain; and that are furniſhed with a mole, &c. See PORT.

To HARBOUR, *verb*; popularly ſignifies to lodge, receive, or entertain; or to find a retiring place.

Among hunters, a hart is ſaid to *harbour*, when he goes to reſt; whence to *unharbour* a deer, is to diſlodge him.

HARD *beam*, in *Botany*. See HORNBEAM.

HARD *bodies*, in *Natural Hiſtory*. By *hard bodies* are underſtood ſuch bodies as are abſolutely inflexible by any ſhock or colliſion whatſoever.

This is the common meaning of the term; but Huygens, by *hard bodies* (*corpora dura*) meant what others call perfectly elaſtic bodies; for he thus expreſſes himſelf: *Quæcunque ſit cauſa, corporibus duris, a mutuo contactu reſilientibus cum ſe invicem impingunter; ponimus, eum corpora duo inter ſe æqualia, æquali celeritate, ex adverſo ac directe ſibi mutuo occurrunt, reſilire utrumque eadem qua advenit celeritate.* Huyg. De Motu Corp. ex Percuſſ. Hypoth. 2. But this hypotheſis is conſiſtent only with perfect elaſticity, and not with the common ſuppoſition of *hardneſs* or inflexibility, which produces no reſilition.

The laws of motion for *hard bodies* are the ſame as for ſoft bodies; and theſe two ſorts of bodies might be comprized under the common name of *undaſtic*.

Some who follow Leibnitz's doctrine, concerning the meaſure of the moving FORCE of bodies, deny the exiſtence of *hard* or inflexible bodies. And it is ſo far true, that no experience ever taught us, that there are any ſuch. The *hardeſt* bodies, to appearance, do not preſerve their figures in colliſion, ſuch bodies being only elaſtic, yielding to the ſtock, and then reſtoring themſelves.

Mr. Bernouilli goes ſo far as to ſay, that *hardneſs*, in the vulgar ſenſe, is abſolutely impoſſible, being contrary to the law of CONTINUITY. For ſuppoſing two ſuch *hard bodies* of equal maſſes, and with equal velocities, to meet directly, they muſt either ſtop or return after the colliſion. The firſt ſuppoſition is commonly admitted; but then it follows, that theſe bodies muſt inſtantaneouſly paſs from motion to reſt, without going through ſucceſſive diminutions of their velocities till they ſtop: but this is

is thought to be contrary to the fundamental laws of nature. See Bernoulli Oper. tom. iii. p. 10.

Hence this author rejects perfectly ſolid and inflexible atoms, which others think a conſequence of the impenetrability of matter. See Maupert. Mem. de l'Acad. Berlin. tom. ii. p. 284.

HARD *horſe*, in the *Manege*, is one that is inſenſible of whip or ſpur.

HARD-*a-lee*, in *Sea Language*, denotes the ſituation of the helm, when it is puſhed cloſe to the lee-ſide of the ſhip, either to tack or keep her head to the wind, when lying-by, or trying. It expreſſes alſo the order to put the helm in this poſition.

HARD-*a-weather*, is the order to put the helm cloſe to the weather or windward-ſide of the ſhip, and it ſignifies this poſition of the helm.

HARDENING, the act of communicating a greater degree of *hardneſs* to a body than it had before.

The *hardening* and tempering of iron and ſteel make a conſiderable article in the mechanical arts.

There are divers ways of effecting it: as by the hammer, quenching it when hot, in cold water; caſe hardening, &c. See TEMPERING and STEEL.

HARDENING, *hammer*, is moſtly uſed on iron and ſteel plates, for ſaws, ſprings, rules, &c.

HARDENING, *caſe*, which is a ſuperficial converſion of iron into ſteel (ſee CASE-*hardening*) is thus performed: take cow-horn or hoof, dry it well in an oven, and beat it to powder; put as much bay-ſalt as of this powder into ſtale urine, or white-wine vinegar, and mix them well together; cover the iron, or ſteel, all over with this mixture, and wrap it up in loam, or plate-iron, ſo as the mixture touch every part of the work; then put it in the fire, and blow the coals to it, till the whole lump have a blood-red heat, but no higher; laſtly, take it out, and quench it. See STEEL, under which article other proceſſes for this purpoſe are deſcribed.

HARDENING *of timber*. The Venetians are famous for the ſoundneſs of their ſhips, which do not rot as thoſe of other nations, but will endure much longer than the others. Tachenius tells us, that the whole ſecret of this conſiſts in the manner of their *hardening* their timber intended for this ſervice; and that this is done by ſinking it in water while green, and leaving it there many years. This prevents the alkali, or that ſalt which furniſhes the alkali in burning, from exhaling afterwards; and by this means the TIMBER becomes almoſt as incorruptible as ſtone. It is evident that the exhaling of this ſalt, and the rotting of wood, have ſome very great connexion with one another, ſince the more ſound any piece of timber is, the more ſalt it proportionably yields; and the wood which is rotten is found on trial to contain no ſalt at all. Tachen. Hippocr. Chym.

HARDER, in *Zoology*, a name given by ſome to a fiſh of the mullet kind, called by Maregrave PASTOR *piſcis*.

HARDNESS, *Durities*, in *Philoſophy*, that quality in bodies whereby their parts cohere firmly together, ſo as to reſiſt the touch.

In this ſenſe, *hardneſs* coincides with what, on other occaſions, we call *firmneſs*, and ſometimes *ſolidity*; in oppoſition to *fluidity*.

More ſtrictly ſpeaking, a body is ſaid to be *hard*, when its parts mutually cohere, ſo as not to yield inwards, or give way to an external impulſe; and therefore are not ſubject to any motion in reſpect of each other, without breaking the body. In which ſenſe *hardneſs* ſtands oppoſed to *ſoftneſs*, where the parts do readily give way.

The Peripatetics make *hardneſs* a ſecondary quality; as ſuppoſing it to ariſe from *dryneſs*, which is a primary one, and to be in proportion thereto.

Its remote cauſes, according to them, are either heat or cold, according to the diverſity of the ſubject: heat producing dryneſs, and by that means *hardneſs* in clay; and cold doing the like in wax.

The Epicurean and corpuſcular philoſophers account for *hardneſs*, from the figure of the component parts, and their union together. Accordingly, ſome aſcribe it to the atoms, or particles of the body being hooked, and thus mutually catching and hanging upon one another; but this is directly bringing that for an anſwer, which was the queſtion. For how do thoſe hooked parts cohere?

Again, the Carteſians will have the cohęſion of hard bodies effected by reſt; that is, by nothing at all.

Sir Iſaac Newton ſhews, that the primary particles of all bodies, whether ſolid or fluid, are *hard*, perfectly *hard*; and are not capable of being broken or divided by any power in nature.

Theſe particles he maintains to be connected together by an attractive power; and according to the circumſtances of this attraction, the body is either hard, or ſoft, or even fluid.

If the particles be ſo diſpoſed or fitted for each other, as to touch in large ſurfaces, ſuch body will be hard; and the more ſo, as thoſe ſurfaces are the larger. If, on the contrary, they only touch in ſmall ſurfaces, the body, by the weakneſs of the attraction, will remain ſoft.

HARDS, or HURDS, of FLAX or HEMP, denote the coarſer parts ſeparated in the dreſſing of it, from the neat, or fine ſtuff.

HARDWICK. See HEREWICK.

HARDY-*horns*, a name given by the people in ſome parts of England to the *ſcus araneus*, called more uſually the *ſcorn*, or the EARE W-*muſk*.

HARE, *Lepus*, in the Linnæan ſyſtem of *Zoology*, makes a diſtinct genus of animals of the order of *glires*; the characters of which are, that the animals of it have feet made for running, with five toes on the fore ones, and four on the hinder, have very long ears, a ſhort tail, and two cutting teeth in each jaw. Under this GENUS the author takes in all the creatures of the *hare* and rabbit kind.

What is moſt particular in the *hare* is, that the hinder legs are much longer than the fore ones, and are furniſhed with extremely ſtrong muſcles; by which means the creature, naturally delicate, is furniſhed with a power of running very ſwiftly from its purſuers, and of aſcending ſteep places; and on this account the *hare* always makes towards the riſing ground when ſtarted. The head is roundiſh, the eyes prominent, and the upper lip ſplit; its ears are very long; and it is ſaid to ſleep with its eyes open, for fear of danger; it lies hid all day, but in the night goes out in ſearch of food, and returns to its form by the ſame way, by which it had left it.

The colour of the *hare* approaches near to that of the ground; and in northern countries this, as well as other animals, changes colour, and becomes white at the beginning of winter, ſo that they are leſs conſpicuous in the ſnow: we have accidental inſtances of white *hares*. The food of this animal is entirely vegetable; and it is particularly fond of pinks, parſley, and birch. The *hare* never pairs; but in the rutting ſeaſon, which begins in February, the male purſues and diſcovers the female, by the fagacity of its noſe. The female breeds often in the year; goes with young a month, and brings uſually two, and ſometimes three or four, at a time. *Hares* are very ſubject to fleas; and Linnæus tells us, that the Dalecarlians make a ſort of cloth of the fur, called filt, which preſerves the wearer from their attacks. The fur of *hares* is a very conſiderable article in the hat manufacture, and many thouſand of the ſkins are annually imported for that uſe from Ruſſia and Siberia.

The ſportſmen diſtinguiſh four ſorts of this animal: the one lives in the mountains; the ſecond kind in open fields; a third kind in marſhy grounds; and the fourth is a rambler, having no particular fixed ſpot of reſidence. It is eaſy to ſee that theſe are no diſtinctions in the eye of the naturaliſt: but they have their ſeveral properties, according to theſe differences of place, which are of conſequence to the ſportſmen. Thus the mountain *hares* are the ſwifteſt of all, and the marſh *hares* the ſloweſt; the field *hares* have a middle degree of ſwiftneſs between theſe; and the rambling *hares* are the moſt difficult of all others to hunt, for they are not only conſiderably ſwift, but they generally know all the coverts and thickets, and have the art to make a thouſand doublings and eſcapes that the others would not think of. See *Hare*-HUNTING.

Hares and rabbits are very miſchievous to new planted orchards, by peeling off the barks of the tender and young trees for their food. They do alſo the ſame ſort of miſchief to nurſeries; for the prevention of which, ſome bind ropes about the trees up to ſuch a height as they are able to reach; ſome daub them with tar; but though this keeps off the *hares*, it is itſelf miſchievous to the trees; but this hurtful property of it is in ſome degree taken off by mixing any kind of fat or greaſe with it, and incorporating them well over the fire. This mixture is to be rubbed over the lower part of the trees in November, and will preſerve them till that time the next year, without any danger from theſe animals. It is only in the hard weather in the winter ſeaſon, when other food is ſcarce, that theſe creatures feed on the barks of trees.

People who have the care of warrens, pretend to an odd way of making *hares* fat when they get them there. This is the ſtopping up their ears with wax, and rendering them deaf. The *hare* is ſo timorous a creature, that ſhe is continually liſtening after every noiſe, and will run a long way on the leaſt ſuſpicion of danger; ſo that ſhe always eats in terror, and runs herſelf out of fleſh continually. Theſe are both prevented by her feeding in a ſafe place, and that without apprehenſion; and they ſay ſhe will always readily be fattened in this way.

However delicious the *hare* may be eſteemed now, our anceſtors thought it a crime to taſte it, as we learn from

Cæsar, Com. lib. v. in which they agreed with the Jews. Among the Romans it was reckoned a great delicacy. Thus Martial, xiii. 92.

Inter quadrupedes gloria prima lepus.

And Horace, in the second satire of his fourth book, extols the wing of the fruitful *hare*:

Fœcundi leporis sapiens sectabitur armos.

Though the *hare* lives on vegetables and water only, yet the habitual exercise of this animal exalts its salts, and renders it somewhat alcalescent; and this tendency is much increased, if it is killed immediately after being heated by strong exercise.

HARE, *Alpine*, which inhabits the summits of the highland mountains of Scotland, Norway, Lapland, Russia, Siberia, and the banks of the Wolga, has shorter ears, and more slender legs, and is less in size than the common *hare*. Its hair is soft, and in summer of a grey colour, mixed with a little black and tawny; but in winter the whole animal changes to a snowy whiteness, except the tips and edges of the ears. The alteration of colour begins in September; and in April it resumes its grey coat; but in Greenland it is always white. This species never descends into the vales, nor mixes with the common species; it does not run fast, and is easily tamed; when pursued, it shelters beneath stones, or in the clefts of rocks; it is full of ferstick; fond of honey and carraway comfits, and is observed to eat its own dung before a storm. Pennant.

The *hare* of North America differs little in form or colour from that of Europe, but it is a third less; its legs are shorter in proportion to the body; and the fur has a tinge of cinereous; when pursued, it takes refuge in a hollow tree; frequents marshes and meadows, and is very destructive to the turnip and cabbage fields.

HARE, *Tavo*, or *Sumatra*, or *mus leporinus* of Linnæus, has the same general characters with the GUINEA-*pig* kind; its head is small and slender; its ears prominent, naked, and round; the colour of the upper part of the body is reddish; the breast and belly are white; the legs long, with four toes on the fore-feet, and three on the hind; the tail is short, and the animal is of the size of a *hare*.

HARE, in *Astronomy*. See LEPUS.

HARE, *sea*. See SEA-*hare*.

HARE'S *ear*, *Bupleurum*, in *Botany*, a genus of the *pentandria digynia* class. Its characters are these: it is a plant with an umbellated flower; the rays of the principal umbel are thin; the involucrum of the great umbel is composed of many leaves; those of the small have five: the flower hath five small heart-shaped petals, which are inflexed, and hath five slender stamina; the germen is situated below the flower, and becomes a roundish compressed fruit, which is channelled, dividing in two parts, containing two oblong channelled seeds. There are several species.

The common *hare's ear* grows naturally in chalky land among wheat in several parts of England; so is seldom admitted into gardens. The leaves and seed of this plant are used in medicine; the herb is esteemed good for dissolving scrophulous tumours, and is by some used for internal ailments, ruptures, and bruises from a fall. Miller.

HARE'S *ear*, *hollow'd*. See PHYLLIS.

HARE'S *foot trefoil*. See TREFOIL.

HARE'S *lettuce*. See SOW-*thistle*.

HARE'S *stone*. See *Hog's* FENNEL.

HARENARIA, in *Botany*, a name used by some authors for the buckshorn plantain.

HARENGIFORMES, in *Ichthyography*, a genus of fishes approaching to the herring in shape; the principal character of which is, a serrated line made up of scales running along the bottom of the belly; to which may be added, that the sides and belly are of a bright silver colour, and that the scales are large and loose.

HARENGUS, in *Ichthyology*. See HERRING.

HARIOT, or HERIOT, a due, or service, belonging to the lord at the death of his tenant; consisting of the best beast the tenant had at the time of his decease.

Coke, on Littleton, observes, that *heriot* in Saxon is called *hereget*, q. d. the *lord's beast*; *here* signifying *lord*, and *geat*, *beast*; which others reject, urging, that *here*, in Saxon, signifies an *army*; and *geat*, a *march*, or *expedition*; and that the Saxon *heregeat*, whence we derive our *heriot*, signified *provision for war*, or a *tribute*, or *relief*, given to the lord of a manor, for his better preparation towards war. Spelman.

By the laws of Canutus, tit. De *Heriotis*, it appears, that at the death of the great men of this nation, so many horses and arms were to be paid, as they were in their respective life obliged to keep for the king's service. The first establishment, if not introduction, of compulsory *heriots* into England, was by the Danes.

But *heriot* is now wholly taken for a beast, which the lord by custom chooses out of all the store of his deceased tenant, be it horse, ox, &c. and in some manors, the best piece of plate, jewel, or even the best moveable.

HARIOT is of two sorts; viz. HARIOT *custom*, where *heriots* have been paid time out of mind by custom, after the death of a tenant for life.

In some places, there is a customary composition in money, as ten or twenty shillings in lieu of a *heriot*, by which the lord and tenant are both bound, if it be an indisputably ancient custom; but a new composition of this sort will not bind the representatives of either party.

HARIOT *service*, when a tenant holds by such service to pay *heriot* at the time of his death; which service is expressed in the deed of feoffment.

For this latter the lord shall distrain; and for the other he shall seize, and not distrain.

If the lord purchase part of the tenancy, *heriot-service* is extinguished; but it is not so of *heriot-custom*.

HARLE. See GOOSANDER, and MERGANSER.

HARLEIAN *Collection of Manuscripts*, is a valuable collection begun near the end of the last century, by Robert Harley, esq. afterwards earl of Oxford, and increased in the year 1725 to near 6 thousand books, fourteen thousand original charters, and five hundred rolls. This collection was further enlarged by his son, and amounted at his death, in 1741, to eight thousand volumes, and above forty thousand original rolls, charters, letters patent, grants, and other deeds and instruments of great antiquity. By stat. 26 Geo. II. it was enacted, that this collection should be purchased for the sum of ten thousand pounds, and placed and continued in the same repository with the Cottonian library. See *British* MUSEUM.

HARLEQUIN, in the *Italian Comedy*, a buffoon, dressed in party coloured cloaths; answering much the same purpose as a merry-andrew, or jack-pudding, in our droles, on mountebanks stages, &c. We have also introduced the *harlequin* upon our theatres; and this is one of the standing characters in the modern grotesque, or PANTOMIME *entertainments*.

The term took its rise from a famous Italian comedian, who came to Paris under Henry III. and who frequenting the house of M. de *Harlay*, his companions used to call him *Harlequin*; q. d. *little Harlay*; a name which has descended to all those of the same rank and profession.

HARLOT, a woman given to incontinency: or that makes a habit, or trade, of prostituting her body. See COURTISAN.

The word is supposed to be used for the diminutive *whorelet*, a *little whore*. Others derive it from *Arlotta*, mistress to Robert duke of Normandy, and mother to William the Conqueror. Camden derives it from one *Arlotha*, concubine to William the Conqueror: others from the Italian *arlotta*, a *proud whore*.

HARMONIA, in *Music*, &c. See HARMONY.

HARMONIA, *Aquosa*, in *Anatomy*, a sort of juncture, or articulation of the bones.

Harmonia is a species of the *synarthrosis*, or juncture intended for absolute rest.

Two bones are said to be joined *per harmoniam*, by *harmonia*, when the juncture is in one uniform, right, or circular line; or when the bones meet with even margins; in contradistinction from *sutura*, where they are indented.

The bones of the upper jaw, and most of the epiphyses, are joined *per harmoniam*.

HARMONICA, HARMONICS, a branch, or division, of the ancient music.

The *harmonica* is that part which considers the differences and proportions of sounds, with respect to acute and grave; in contradistinction from RHYTHMICA, and METRICA.

The only part of their music, the ancients have left us any tolerable account of, is the *harmonica*; which itself is but very general and theoretical. It is defined by Ptolemy, a perceptive power of the differences of sounds, according to acute and grave. Vide Ptolem. p. 1. edit. Wallis.

Mr. Malcolm has made a very industrious and learned enquiry into the *harmonica*, or harmonic principles, of the ancients. They reduced their doctrine into seven parts; viz. of *sounds*; of *intervals*; of *systems*; of the *genera*; of the *tones*, or *modes*; of *mutations*; and of the *melopœia*. See each considered under its proper article.

HARMONICAL *arithmetic*, is to much of the theory and doctrine of numbers as relates to making the comparisons, reductions, &c. of musical intervals, which are expressed by numbers, in order to our finding their musical relations, compositions, and resolutions.

HARMONICAL *composition*, in its general sense, includes the composition both of harmony and melody; i. e. of music, or song, both in a single part, and in several parts.

In

In its more proper and limited ſenſe, *harmonical compoſition* is reſtrained to that of harmony. In which ſenſe it may be defined, the art of diſpoſing and concerting ſeveral ſingle parts together, in ſuch manner as to make one agreeable whole.

The art of harmony has been long known under the name of *counterpoint*.

At the time when parts were firſt introduced, muſic being then very ſimple, there were no different notes of time; and the parts were in every note made concord.

This they afterwards called *ſimple*, or *plain counterpoint*, to diſtinguiſh it from another kind, then introduced, wherein notes of different value were introduced, and diſcords brought in between the parts.

This they called *figurative* COUNTERPOINT.

HARMONICAL *interval*. See INTERVAL.

HARMONICAL *proportion*. See *Harmonical* PROPORTION.

HARMONICAL *ſeries*, is a ſeries of many numbers in continual *harmonical* proportion.

If there be four or more numbers, whereof every three immediate terms are *harmonical*, the whole makes an *harmonical ſeries*, of continual *harmonical* proportionals; as, 30:20:15:12:10

Or if every four immediately next each other are *harmonical*, it is alſo a continual *harmonical ſeries*, but of another ſpecies; as, 3, 4, 6, 9, 18, 36, &c.

HARMONICAL *ſound*, is an appellation given by Mr. Sauveur to ſuch ſounds as always make a certain determinate number of vibrations, in the time that ſome other fundamental ſound, to which they are referred, makes one vibration.

Harmonical ſounds are produced by the parts of chords, &c. which vibrate a certain number of times while the whole chord vibrates once.

By this they are diſtinguiſhed from the third, fifth, &c. where the relations of the vibrations are four to five, or five to ſix, or two to three.

The relations of ſounds had only been conſidered in the ſeries of numbers, 1:2, 2:3, 3:4, 4:5, &c. which produced the intervals called *octave, fifth, fourth, third*, &c. M. Sauveur firſt conſidered them in the natural ſeries, 1, 2, 3, 4, &c. and examined the relations of the ſounds ariſing therefrom. The reſult is, that the firſt interval, 1:2, is an octave; the ſecond, 1:3, a twelfth; the third, 1:4, a fifteenth, or double octave; the fourth, 1:5, a ſeventeenth; the fifth, 1:6, a nineteenth, &c.

This new conſideration of the relations of ſounds is more natural than the old one: it expreſſes and repreſents the whole of muſic, and is, in effect, all the muſic that nature gives without the aſſiſtance of art. The ſtring of a harpſichord, or a bell, beſides their general ſound, which is proportionate to their length, tenſion, &c. do alſo, at the ſame time, yield other ſubordinate and acuter ſounds, which a nice ear, with a good attention, clearly diſtinguiſhes.

Theſe ſubordinate ſounds ariſe from the particular vibrations of ſome of the parts of the ſtring, or bell, which are, as it were, detached from the reſt, and make ſeparate vibrations: in effect, every half, every third, every fourth, &c. of the chord, performs its vibrations apart, while a general vibration is made of the whole chord. Now all theſe ſubordinate ſounds are *harmonical* with regard to the whole ſound: the leaſt acute which we hear is octave with the whole ſound; the leaſt acute that follows, makes a twelfth with the whole ſound; the next a ſeventeenth, &c. till they grow too acute for the ear to perceive them. Now throughout the whole, we hear no ſuch thing as a ſound that makes a fifth, or a third, &c. with regard to the whole ſound; none, in ſhort, but what are comprized in the ſeries of *harmonical* ſounds.

Add, that if the breath, or bellows, that blow a wind-inſtrument, be played ſtronger and ſtronger, the tone will be continually raiſed, but this only in the ratio of the *harmonical ſounds*. So that it appears, that nature, when ſhe makes, as it were, a ſyſtem of muſic herſelf, uſes no other but this kind of ſounds; and yet they had, till of late, remained unknown to the muſicians: not but that they frequently fell into them, but it was only inadvertently, and without knowing what they did. M. Sauveur ſhews, that the ſtructure of the organ depends entirely on this to long unknown principle.

HARMONY, in *Muſic*, the agreeable reſult of an union of ſeveral muſical ſounds, heard at one and the ſame time; or, the mixture of divers ſounds, which together have an agreeable effect to the ear.

The word is ἁρμονία, formed of the verb ἁρμόζω, *conveniro, congruere, to agree, quadrate, match*, &c.

As a continued ſucceſſion of muſical ſounds produces melody; ſo does a continued combination of them produce *harmony*.

Among the ancients, however, as ſometimes alſo among the moderns, *harmony* is uſed in the ſtrict ſenſe of *conſonance*; and ſo is equivalent to the *ſymphony*.

The words *concord* and *harmony* do really ſignify the ſame things; though cuſtom has made a little difference between them. Concord is the agreeable effect of two ſounds in conſonance; and *harmony* the effect of any greater number of agreeable ſounds in conſonance.

Again, *harmony* always implies conſonance; but concord is alſo applied to ſounds in ſucceſſion; though never but where the terms can ſtand agreeably in conſonance. The effect of an agreeable ſucceſſion of ſeveral ſounds, is called *melody*; as that of an agreeable conſonance is called *harmony*.

The ancients ſeem to have been entirely unacquainted with *harmony*, the ſoul of the modern muſic. In all their explications of the melopœia, they ſay not one word of the concert or *harmony* of parts. We have inſtance, indeed, of their joining ſeveral voices, or inſtruments, in conſonance; but then theſe voices, &c. were not ſo joined, as that each had a diſtinct and proper melody, ſo making a ſucceſſion of various concords; but they were either uniſons, or octaves, in every note; and ſo all performed the ſame individual melody, and conſtituted one ſong.

When the parts differ, not in the tenſion of the whole, but in the different relations of the ſucceſſive notes, it is this that conſtitutes the modern art of *harmony*.

Harmony is well defined, the ſum or reſult of the combination of two or more concords; i. e. of three or more ſimple ſounds ſtriking the ear altogether; and different compoſitions of concords make different *harmony*.

To underſtand the nature, and determine the number and preference, of *harmonies*; it is to be conſidered, that in every compound ſound, where there are no more than three ſimple ones, there are three kinds of relations; viz. the primary relation of every ſimple ſound to the fundamental, or graveſt, whereby they make different degrees of concord with it: the mutual relations of the acute ſounds with each other, whereby they mix either concord or diſcord into the compound; and the ſecondary relation of the whole, whereby all the terms unite their vibrations, or coincide more or leſs frequently.

Suppoſe, e. gr. four ſounds, A, B, C, and D, whereof A is the graveſt; B next; then C; and D the acuteſt. Here, A is the fundamental; and the relations of B, C, and D, to A, are primary relations: ſo, if B be a third above A, that primary relation is 4 to 5; and if C be fifth to A, that primary relation is 2 to 3; and if D be octave to A, that is 1 to 2. For the mutual relations of the acute terms B, C, D, they are had by taking their primary relations to the fundamental, and ſubtracting each leſſer from each greater: thus, B to C is 5 to 6, a third; B to D is 5 to 8, a fifth; &c. Laſtly, to find the ſecondary relation of the whole, ſeek the leaſt common dividend to all the leſſer terms or numbers of the primary relations; i. e. the leaſt number that will be divided by each of them exactly: this is the thing ſought; and ſhews, that all the ſimple ſounds coincide, after ſo many vibrations of the fundamental as the number expreſſes.

So, in the preceding example, the leſſer terms of the three primary relations are 4, 2, 1, whoſe leaſt common dividend is 4; conſequently, at every fourth vibration of the fundamental, the whole will coincide.

Now *harmony*, we have obſerved, is a compound ſound, conſiſting of three or more ſimple ſounds. Its proper ingredients are concords; and all diſcords, at leaſt in the primary and mutual relations, are abſolutely forbidden. It is true, diſcords are uſed in muſic; but not for themſelves ſimply, but to ſet off the concords by their contraſt and oppoſition.

Hence, any number of concords being propoſed to ſtand in primary relation with a common fundamental, we diſcover whether or no they conſtitute a perfect *harmony*, by finding their mutual relations. Thus, ſuppoſe the following concords, or primary relations, viz. the greater third, fifth, and octave, given, their mutual relations are all concord, and therefore may ſtand in *harmony*: for the greater third and fifth are to one another as 5:6, a leſſer third; the greater third and octave are as 5:8, a leſſer ſixth; and the fifth and octave are as 3:4, a leſſer fourth. But if fourth, fifth, and octave, be propoſed, it is evident they cannot ſtand in *harmony*; becauſe, betwixt the fourth and fifth there is a diſcord, viz. the ratio 8:9. Again, ſuppoſing any number of ſounds, which are concord each to the next, from the loweſt to the higheſt, to know if they can ſtand in *harmony*, we muſt find the primary, and all the mutual relations, which muſt be all concord: ſo let any number of ſounds be as 4:5:6:8, they may ſtand in *harmony*, becauſe each to each is concord; but the following ones cannot, viz. 4, 6, 9, becauſe 4. 9 is diſcord.

The neceſſary conditions of all *harmony*, then, are concords in the primary and mutual relations; on which footing, a table is eaſily formed of all the poſſible varieties:

but

but to determine the preference of *harmonies*, the fecondary relations are likewife to be conſidered. The perfection of *harmonies* depends on all the three relations; it is not the beſt primary relations that make the beſt *harmony*, for then a fourth and fifth muſt be better than a fourth and ſixth; whereas the firſt two cannot ſtand together, becauſe of the diſcord in the mutual relation. Nor does the beſt ſecondary relation carry it; for then would a fourth and fifth, whoſe ſecondary relation with a common fundamental is 6, be better than a leſſer third and fifth, whoſe ſecondary relation is 10: but here, alſo, the preference is due to the better mutual relation. Indeed, the mutual relations depend on the primary, though not ſo as that the beſt primary ſhall always produce the beſt mutual relation: however, the primary relations are of the moſt importance, and, together with the ſecondary, they afford us the following rule for determining the preference of *harmonies*, viz. comparing two *harmonies*, which have an equal number of terms, that which has the beſt primary and ſecondary relations is ſure to be moſt perfect: but in caſes where the advantage is in the primary relation of the one, and the ſecondary of the other, we have no certain rule. The primary are certainly the moſt conſiderable; but how the advantage in theſe ought to be proportioned to the diſadvantage in the other, or *vice verſa*, we know not: ſo that a well tuned ear muſt be the laſt reſort in theſe caſes.

Harmony is divided into *ſimple* and *compound*.

HARMONY, *ſimple*, is that where there is no concord to the fundamental above an octave.

The ingredients of *ſimple harmony* are the ſeven ſimple original concords, of which there can be but eighteen different combinations that are *harmony*, which we give in the following table from Mr. Malcolm.

Table of ſimple HARMONIES.

2dary rel.	2dary rel.
fifth octave 2 third f fifth octave 3 third f fifth octave	
fourth octave 3 third f fifth 10 third f fifth octave	
fifth g octave 1 fourth, fifth g 3 fourth fifth f octave	
third f octave 4 third f fifth g 12 third f fifth g octave	
third f octave 5 third f fifth f 15 third f fifth f octave	
fifth f octave 5 fourth, fifth f 15 fourth fifth f octave	

Theſe are all the poſſible combinations of the concords that make *harmony*; for the octave is compounded of a fifth and fourth, or a fixth and third, which have a variety of greater and leſſer; out of theſe are the firſt ſix *harmonies* compoſed: then, the fifth being compoſed of the greater third and leſſer third, and the ſixth of fourth and third, from theſe proceed the next ſix of the table; then an octave joined to each of theſe ſix, makes the laſt ſix.

The perfection of the firſt twelve is according to the order of the table: of the firſt ſix each has an octave; and their preference is according to the perfection of the other leſſer concord joined to the octave. For the next ſix, the preference is given to the two combinations with the fifth, wherein that which has the third is beſt; then to theſe two combinations with the ſixth of fourth, of which that which has the fourth is beſt. For the laſt ſix, they are not placed laſt as being the leaſt perfect, but becauſe they are the moſt complex, and are the mixtures of the other twelve with each other. In point of perfection they are plainly preferable to the preceding ſix, as having the very ſame ingredients, and an octave more.

HARMONY, *compound*, is that which to the ſimple *harmony* of one octave, adds that of another octave.

For the *compound harmonies*, their variety is eaſily found out of the combinations of the ſimple *harmonies* of ſeveral octaves.

HARMONY, again, may be divided into that of *concords*, and that of *diſcords*.

The *firſt* is that we have hitherto conſidered, and wherein nothing but concords are admitted.

The *ſecond* is that wherein diſcords are uſed, intermixed with the concords.

For compoſition of HARMONY, *ſee* HARMONICAL *compoſition*.

HARMONY is ſometimes alſo uſed, in a laxer ſenſe, to denote an agreement, fuitableneſs, union, conformity, &c. In muſic we ſometimes apply it to a ſingle voice, when ſonorous, clear, and ſoft; or to a ſingle inſtrument, when it yields a very agreeable ſound. Thus, we ſay, the *harmony* of her voice, of his lute, &c.

In *Matters of Learning*, we uſe *harmony* for a certain agreement between the ſeveral parts of the diſcourſe, which renders the reading thereof agreeable. In this ſenſe we ſay, *harmonious* periods, *&c.*

In *Architecture*, *harmony* denotes an agreeable relation between the parts of a building. See SYMMETRY.

In *Painting*, they ſpeak of a *harmony*, both in the ordonnance and compoſition, and in the colours of a picture. In the ordonnance it ſignifies the union or connexion between the figures, with reſpect to the ſubject of the piece. In the colouring it denotes the union or agreeable mixture of different colours. See COLOURING. M. De la Chambre derives the *harmony* of colours from the ſame proportions as the *harmony* of ſounds. This he inſiſts on at large, in his treatiſe Of the Colours of the Rainbow. On this principle, he lays down green as the moſt agreeable of colours, correſponding to the octave in muſic; red, to a fifth; yellow, to a fourth, *&c.*

HARMONY, or *Evangelical* HARMONY, is alſo a title of divers books, compoſed to ſhew the uniformity and agreement of the accounts given by the four Evangeliſts, by reducing them to the order of time in which the events recorded really happened.

The firſt attempt of this kind is attributed to Tatian or Theophilus of Antioch, under the title of Diateſſaron, or *of the four*, in the ſecond century. After his example, divers other *Harmonies* have been compoſed by Ammonius of Alexandria, Euſebius of Cæſarea, Janſenius, biſhop of Ghent, Mr. Toinard, Mr. Whiſton, Lamy, Le Clerc, Doddridge, Macknight, Prieſtley, Newcome, *&c.* Theſe ſeveral *harmonizers* have entertained very different opinions with regard to the period of our Lord's public miniſtry, which have neceſſarily occaſioned a correſponding diverſity in the diſpoſition of their reſpective *Harmonies*. Dr. Prieſtley, in an excellent work of this kind, publiſhed in 1777, has adopted the opinion propoſed by Mr. Mann, in his Diſſertations on the Times of the Birth and Death of Chriſt, and ſtrenuouſly maintained, that he preached no longer than one year, or one year and a few months. This opinion is, undoubtedly, very ancient: it was the opinion of Origen, and alſo of Clemens Alexandrinus; Irenæus and Tertullian aſcribe the ſame opinion to the Valentinians. See Origen. De Princip. lib. 4. ſect. 5. apud Oper. tom. i. p. 160. ed. Benedict. Clem. Alex. Strom. lib. i. p. 340. ed. Sylb. *vel* apud Oper. tom. i. p. 407. ed. Oxon. Irem. lib. i. cap. 3. num. 3. Tertull. lib. Adverſus Judæos, cap. 18.

However, it has been objected by others, and particularly by biſhop Newcome, in his *Harmony* of the Goſpels, publiſhed in 1778, that this period of one year is much too ſhort for the ſeveral journies of our Saviour in Galilee, and the tranſactions connected with them; and he has offered ſeveral arguments to prove the more common opinion, firſt advanced by Euſebius, viz. that our Lord's miniſtry continued three years and a half, and included in that ſpace of time four Paſſovers. Sir Iſaac Newton is of opinion, that our Lord's miniſtry included five Paſſovers; the firſt of which happened A. D. 30. the ſecond A. D. 31. the third A. D. 32. the fourth A. D. 33. and the fifth on Friday, April 23. A. D. 34. anſwering to the 4747th year of the Julian period. See his Obſervations on Prophecy, book i. chap. xi. p. 144—168.

HARMONY *of the ſpheres*, or *celeſtial* HARMONY, is a ſort of muſic much ſpoken of by many of the philoſophers and fathers; ſuppoſed to be produced by the regular ſweetly-tuned motions of the ſtars and planets.

Plato, Philo Judæus, St. Auguſtine, St. Ambroſe, St. Iſidore, Boethius, and many others, are ſtrongly poſſeſſed with the opinion of this *harmony*, which they attribute to the various proportionate impreſſions of the heavenly globes upon one another; which, acting under proper intervals, form a *harmony*. It is impoſſible, according to them, that ſuch ſpacious bodies, moving with ſo much rapidity, ſhould be ſilent; on the contrary, the atmoſphere, continually impelled by them, muſt yield a ſet of ſounds proportionate to the impulſions it receives: conſequently, as they do not all run the ſame circuit, nor with one and the ſame velocity, the different tones ariſing from the diverſity of motions, directed by the hand of the Almighty, muſt form an admirable ſymphony or concert. St. Irenæus, St. Baſil, and St. Epiphanius, *&c.* have appeared againſt the notion.

Pythagoras is ſuppoſed to have had a view to the gravitation of celeſtial bodies, in what he taught concerning the *harmony* of the ſpheres.

A muſical chord gives the ſame notes as one double in length, when the tenſion or force with which the latter is ſtretched is quadruple; and the gravity of a planet is quadruple of the gravity of a planet at a double diſtance. In general, that any muſical chord may become uniſon to a leſſer chord of the ſame kind, its tenſion muſt be increaſed in the ſame proportion as the ſquare of its length is greater; and that the gravity of a planet may become equal to the gravity of another planet nearer the ſun, it muſt be increaſed in proportion as the ſquare of its diſtance from the ſun is greater. If, therefore, we ſhould ſuppoſe muſical chords extended from the ſun to each planet, that all theſe chords might become uniſon

it would be requisite to increase or diminish their tensions in the same proportions as would be sufficient to render the gravities of the planets equal; and from the similitude of those proportions, the celebrated doctrine of the *harmony of the spheres* is supposed to have been derived. Plin. lib. ii. cap. 22. Macrob. in Somn. Scip. lib. ii. cap. 1. Plutarch de Animal. Procreatione, & Timæo. See Maclaurin's View of Newton's Discov. book i. chap. ii. p. 32. ed. 4to. See GRAVITY.

HARMONY, *pre-established*, a celebrated system of M Leibnitz, by means whereof he accounts for the union or communication between the soul and body.

The philosophers had universally held, that the soul and body act really and physically on each other. Des Cartes first appeared, and shewed that the heterogeneity of their nature did not allow of such real union; and that they could only have an apparent one, whereof God is the mediator.

M. Leibnitz, unsatisfied with either of these hypotheses establishes a third. A soul or spirit, he observes, is to have a certain series of thoughts, desires, and wills; a body, which is only a machine, is to have a certain series of motions, to be determined by the combination of its mechanical disposition with the impressions of external objects.

If, now, there be found a soul and a body so framed, that the whole series of wills of the soul, and the whole series of motions of the body, exactly correspond; and at the same time, for instance, when the soul desires to go to any place, the two feet move mechanically that way; this soul and body will have a relation to one another, not by any actual union between them, but by the constant and perpetual correspondence of the several actions of both. Now, God puts together this soul and body, which had such a correspondence antecedent to their union; such a *pre-established harmony*. And the same is to be understood of all the other souls and bodies that have been, or ever will be joined.

In effect, the laws of motion in the body, succeeding in the order of efficient causes, do also agree and correspond with the ideas of the soul; to that the body is determined to act at the time when the soul wills. So that upon this hypothesis, the volitions of the mind are followed instantly by the desired motions of the body, not in consequence of those volitions in the least, but of the nice and well-adjusted machinery of the body; and the impressions produced in the fantasy have no effect on the mind, but the corresponding idea arises, at that precise time, in consequence of a chain of causes of a different kind; and, therefore, all that men do or say, is no more than the effect of exquisite machinery.

The same principle he extends farther, and makes a *pre-established harmony* between the kingdoms of nature and grace; to account for the apparent communication between them, and make physical and moral evil correspond.

Such is the system of *pre-established harmony*. The author's way of stating and enforcing it, may be seen in his Essais de Theodicée.

This hypothesis was first published in the Journal des Sçavans of Paris, in 1695, and strenuously defended by Wolfius, who, on this account, was banished by Frederick, king of Prussia; it was opposed by Bayle, in the article Rorarius of his Dictionary, and since his time by Newton, Clark, Stahl, &c. See LEIBNITZIAN *philosophy*.

HARMONY, *in Anatomy*. See HARMONIA.

HARMOS, from ἁρμὸς, *apto, I fit*, a word used by the old medicinal writers, for the flesh growing between the teeth.

HARMOSTES, or HARMOSTA, in *Antiquity*, a sort of magistrate among the Spartans, whereof there were several, whose business was to look to the building of citadels, and repairing the forts and fortifications of the cities.

The word is ἁρμοστὴς formed of ἁρμὸς, *apto, convenio, I adapt, connect*, &c.

HARMOSYNIANS, ἁρμοσύνοι, in *Antiquity*, were magistrates among the Spartans, who, after the death of Lycurgus, were appointed to enforce the observance of that law of the Spartan legislator, which required married women to wear a veil when they appeared in the streets, whereby they were distinguished from single females, who were allowed to appear abroad with their faces uncovered.

HARNESS, a complete armour, or the whole equipage and accoutrements of a cavalier heavily armed; as casque, cuirass, &c.

The word is formed of the French *harnois*, which some derive from the Greek ἁρμὸς, *a man's skin*, because they anciently covered themselves therewith. Du-Cange observes that the word *harnesium* is used in the corrupt Latin in the same sense, and that it comes from the High Dutch *harnas* or *harnisch*. Others derive it from the Italian *arnese*; others from the Celtic *harnes, a coat of*.

Under king Richard II. it was expressly forbidden all men to ride in *harnois* with launce-gays. Vide Stat. 7 Ric. II. cap. 13. In the statute 2 Hen. VI cap. 14. *harnois* seems to include all kinds of furniture for offence as well as defence, both of men and horse; as swords, buckler-bats, girdles, &c.

HARNESS is also used for the furniture put on a horse, to draw in a coach or waggon, or other carriage; such as collars, feathers, traces, &c.

HARNESS-*galls*, in *Farriery*, are swellings or soreness on the breasts of coach-horses, occasioned by the galling of the *harness*. For the cure of this, first cut off the hair about the sore very close, and rub the whole breast with a lather of water and black soap; then wash that part of the breast which is usually covered by the patrel with salt water, suffering it to dry of itself. Bolsters may be applied to the *harness* by way of prevention.

HARO, HAROU, or HAROL, in the *Norman Customs*, *Clameur de* HARO is a cry or formula of invoking the assistance of justice against the violence of some offender, who, upon hearing the word *haro*, is obliged to desist, on pain of being severely punished for his outrage, and to go with the party before the judge.

The word is commonly derived from *ha* and *raul*, as being supposed an invocation of the sovereign power, to assist the weak against the strong, on occasion of Raoul first duke of Normandy, about the year 912, who rendered himself venerable to his subjects by the severity of his justice; so that they called on him, even after his death, when they suffered any oppression. Some derive it from Harold, king of Denmark, who, in the year 826, was made grand conservator of justice at Mentz; others from the Danish *ao rau*, q. d. help me! a cry raised by the Normans in flying from a king of Denmark, named Roux, who made himself duke of Normandy.

The letters of the French chancery have usually this clause, *Nonobstant clameur de haro*, &c.

The *haro* had anciently such vast power, that a poor man of the city of Caen, named Asselin, in virtue hereof, arrested the corpse of William the Conqueror, in the middle of the funeral procession, till such time as his son Henry had paid the value of the land in question, which was that whereon the chapel was built where he was interred.

HARP, a musical instrument of the string kind, being of a triangular figure, and placed upright between the legs of the person who plays upon it.

Papias, and Du-Cange after him, will have the *harp* to have taken its name from the *Arpi*, a people of Italy, who were supposed the first that invented it; and from whom they say it was borrowed by other nations. Menage, &c. derives the word from the Latin *harpa*, and that from the German *herp* or *harp*. Others bring it from the Latin *carpo*, because touched or thrummed with the fingers. Dr. Hickes derives it from *harpa* or *heorpa*, which signify the same thing; the first in the language of the Cimbri, the second in that of the Anglo-Saxons. The English priest who wrote the life of St. Dunstan, and who lived with him in the tenth century, says, cap. ii. n. 12. *Somefit ferum ex more citharam fuam, quam paterna lingua* heargam *vocamus*; which intimates the word to be Anglo-Saxon.

There is some diversity in the structure of *harps*. That called the *triple harp* has ninety-seven strings or chords, in three rows, extending from C in the tenor cliff, to double G in alt, which make five octaves: the middle row is for the semitones, and the two outside rows are perfect unisons. On the base side, which is played with the right hand, there are thirty-six strings; on the treble side, twenty-six; and in the middle row, thirty-five strings. There are two rows of pins or screws on the right side, serving to keep the strings tight in their holes, which are fastened at the other end to three rows of pins on the upper side.

The *harp*, within the last forty years, has been in some degree improved, by the addition of eight strings to the unison, viz. from E to double F in alt.

This instrument is struck with the finger and thumb of both hands. Its music is much like that of the spinnet, all its strings going from semitone to semitone; whence some call it an *inverted spinet*.

It is capable of a much greater degree of perfection than the lute. The editor is indebted to Mr. Evans, a very celebrated performer on this instrument, for the above account of the structure and compass of the Welch *harp*. King David is usually painted with a *harp* in his hands; but we have no testimony in all antiquity, that the Hebrew *harp*, which they call *chinnor*, was any thing like ours. On a Hebrew medal of Simon Maccabæus we see

two sorts of musical instruments: but they are both of them very different from our *harp*, and only consist of three or four strings. All authors agree, that our *harp* is very different from the *lyra*, cithara, or barbiton, used among the Romans.

Fortunatus, lib. vii. carm. 8. witnesses, that it was an instrument of the barbarians.

Romanusque lyra, plaudat tibi barbarus harpa,
Græcus Achilliacho, cratis Britanna canat.

HARP, *harpa*, a musical instrument of the stringed kind, thus called from its being swung about by those who play upon it, like a flail. It is about three feet long; its strings are of brass or steel wire, fixed at one end, and stretched across the sound-board, by screws fixed at the other end. It comprehends four octaves, and the strings are struck with the thumbs, the right hand playing the treble, and the left the bass; and, in order to draw the sounds the clearer, the thumbs are armed with a little wire pin.

HARP, *Ænæ's*. See ÆOLUS's *harp*.

HARP, in *Mythology*, is the symbol of Apollo.

HARP, in the *Manage*. See GRAPPLE.

HARP-*shell*. See DOLIUM.

HARPAGIUS, in *Antiquity*. See ANTAGIUS.

HARPAX, a name given by some naturalists to amber, and by some of the chemists to quick-lime, and by others to sulphur.

HARPE, in *Natural History*, the name of a kind of shell-fish of very great beauty. It is of the genus of the dolium or concha globosa. See LYRA.

HARPEGGIATO, or HARPEGGIO, in the *Italian Music*, signifies the causing the several sounds of one accord to be heard, not together, but distinctly one after the other, beginning with either at pleasure, but commonly with the lowest.

HARPIES, 'APIETIAI, HARPYIÆ, in *Antiquity*, a rapacious impure sort of monsters, of the bird kind, mentioned among the poets.

They are represented with wings, ears like bears, bodies like vultures, faces like women, and feet and hands hooked like the talons of birds of prey. See Virgil, *Æneid*, lib. iii. who gives a description of them.

The ancients looked on the *Harpies* as a sort of genii or demons. Some make them the daughters of Tellus and Oceanus, the *earth* and *ocean*; whence, says Servius, it is, that they inhabit an island, half on land and half in water. Valerius Flaccus makes them the daughters of Typhon.

There were three *Harpies*, Aello, Ocypete, and Celæno, which Lall Homer calls *Podargi*. Hesiod, in his Theogony, ver 267. only reckons two, Aello and Ocypete, and makes them the daughters of Thaumas and Electra, affirming that they had wings, and went with the rapidity of the wind. Zephyrus begat of them Balius and Xanthus, Achilles's horses. Pherecydes relates, that the Boreades expelled them from the Ægean and Sicilian seas, and pursued them as far as the islands, which he calls Plotæ, and Homer Calymnæ; and which have since been called the Strophades.

Vossius, De Idolol. lib. iii. cap. 09. p. 63. thinks, that what the ancients have related of the *Harpies*, agrees to no other birds so well as the bats found in the territories of Darien in South America. These animals kill not only birds, but dogs and cats, and prove very troublesome to men by their peckings. But the ancients, as the same Vossius observes, knew nothing of these birds. By the *Harpies*, therefore, he thinks they could mean nothing else but the winds; and that it was on this account they were made daughters of Electra, the daughter of Oceanus. Such is the opinion of the Scholiasts of Apollonius, Hesiod, and Eustathius. Their names, Aello, Ocypete, Celæno, are supposed to suggest a farther argument of this.

Mr. Bryant supposes that the *Harpies* were a college of priests in Bithynia, who, on account of their repeated acts of violence and cruelty, were driven out of the country: their temple was called Arpi, and the environs Arpiæ, whence the Greeians formed Αρπυια; and he observes further, that *Harpa*, Ἅρπη, was certainly of old the name of a place. Anal. of Anc. Mythol. vol. ii. p. 43.

HARPINEER, or HARPOONER, an engineer or fisherman, who manages and throws the harping-iron in the whale-fishing. See *Whale* FISHERY.

HARPING-*iron*, HARPAGO, HARPEGO, a sort of dart or *lance* fastened to a line, wherewith they catch whales and other large fish, as sturgeons, &c.

The *harping-iron* is a large javelin of forged iron, generally about twenty ounces in weight, and about two feet long, with a sharp, cutting, triangular point, barbed like that of an arrow. At the upper end is engraven the harpineer's name, near a ring to which the line is fastened, which they let down as soon as the fish is struck, to give him room to dive, &c. See *Whale* FISHERY.

The *harpoon* cannot be struck with certainty at any considerable distance; so that unless the harpooner is within a yard of a whale, or directly above, this instrument cannot be used with any great success. In the year 1731, a new sort of gun was invented for shooting the *harpoons* into the bodies of whales at a greater distance than they could be thrown by hand, and this was used for two or three seasons with some success; but further experience has proved the inutility of this contrivance. It was afterwards proposed to substitute the ancient BALISTA in the room of the gun; but the scheme, we believe, terminated in mere speculation. Phil. Transf. vol. xlvii. p. 429.

HARPINGS, in a *Ship*, properly denote her breadth at the bow. Some also call the fore part of the wales, which go round the bow, and are fastened into the stem, the *harpings*.

HARPINGS, *cut*. See CAT-*harpings*.

HARPOCRATES, in *Mythology*, the son of Isis and Osiris.

This is an Egyptian deity, whose distinguishing attribute is, that he is represented with his fingers applied to his mouth, denoting that he is the God of Silence. The statue of this idol was fixed in the entrance of most of the Egyptian temples, and he was commonly exhibited under the figure of a young man naked, crowned with an Egyptian mitre, holding in one hand a cornucopia, and in the other the flower of lotus, and sometimes bearing a quiver.

HARPOCRATIANS, a sect of heretics mentioned by Celsus, and the same with CARPOCRATIANS.

HARPSICHORD, or HARPSICHON, a musical instrument of the string kind, played after the manner of an organ. The Italians call it *clavo cimbalo*, and the French *clavecin*. In Latin it is usually called *grave cymbalum*, q. d. large or deep cymbal.

The *harpsichord* is furnished with a set of keys; sometimes two sets. The touching or thinking of these keys moves a kind of little jacks, which move a double row of chords or strings of brass or iron, stretched on the table of the instrument over four bridges.

HARQUEBUSS, in our *ancient Statutes*, called also ARQUEBUSE, HAQUEBUT, or HACBUT, is a hand-gun, or a fire-arm of a proper length, &c. to be borne in the arm.

The word is formed of the French *arquebuse*; and that from the Italian, *arcobuso*, or *arco baso*, *of arco, a bow*, and *buso, a hole*; on account of the touch-hole, at which the powder is put to prime it, and that it succeeded to the bows of the ancients.

The *harquebuss* is properly a fire-arm, of the ordinary length of a musquet or fowling-piece, cocked usually with a wheel. Hainzelet prescribes its legitimate length to be forty calibres; and the weight of its ball one ounce seven eighths; its charge of powder as much.

There is also a larger kind, called *harquebuss a croc*, much in the nature of our blunderbusses, used in war for the defence of places, being usually rested on something when discharged. The first time these instruments were seen was in the imperial army of Bourbon, who drove Bonnivet out of the state of Milan: they were so big and heavy, that there were two men to carry them. They are now little used except in some old castles, and by the French in some of their garrisons.

HARRIER, or *Leverer*, a kind of hound, called in Latin *fagax*, from his tracing or chasing by foot; being endowed with an incredible gift of fine-ling, and also very bold in the pursuit of his game.

There are several kinds, all differing in their services; being for the *hare*, *fox*, *wolf*, *hart*, *buck*, *badger*, *otter*, *polecat*, *weasel*, or *coney*; some, in short, for one game, some for another, &c. See DOG and HUNTING.

HARRIGATE *water*, a strong sulphureous water, containing besides sulphur, marine salt and nitre, or nitre only and earth. See WATER.

HARRIOT. See HARIOT.

HARROW, in *Fortification*, is a GATE made of timber, whose dimensions are commonly six by four inches, and six inches distant from each other, well fastened to three or four cross bars, and secured with iron.

HARROW, in *Husbandry*, a drag made in a square form, set with long iron teeth, to break the clods of earth after ploughing.

It consists of three parts. 1. The *harrow-bulls*, which are the holes where the nails go in. 2. The *flats*, which are the cross pins. 3. The *harrow-tines*, pins, or *tilbers*, which are great iron nails.

Besides these there are, 4. The hook, being that which fastens the horse to them. 5. The *couples*, when two *harrows* are tied together.

Harrows have been commonly made to drag, and those of this sort have been constructed of different forms according

according to the purpoſes to which they have been applied; however, there have been ſome contrived with rollers.

HARROW, *reſt*, in *Botany*. See REST *harrow*.

HARSCHEF, in *Botany*, the name by which Avicenna, Serapion, and the reſt of the Arabian writers, call the *cinara*, or ARTICHOKE. Some who have been puzzled for an etymology for the word hurſchoke or artichoak, as we differently ſpell it, have ſuppoſed that it was derived by corruption from this Arabian word, *harſchef*, which the Engliſh phyſicians, who practiſed according to the rules of Serapion and Avicenna, might bring into uſe, and adopt in their own language, as the name of the ſame plant.

The word *harſchef* ſeems, however, like the word *cinara*, and all the other names of the artichoak, to take in alſo another plant of the ſame kind, called by us the chardoon, a ſort of garden thiſtle, the tender ſtalks of which are earthed up and blanched, and are eaten by us, and were ſo by the Greeks. The moſt moderate accounts of the Perſians tell us alſo, that they eat the young ſhoots and tender ſtalks of the *harſchef*, which, as the artichoak plant is not uſed for blanching in this manner, probably ſignifies in this ſenſe the chardoon.

HART, in the *Foreſt Laws*, a ſtag or male deer of five years old complete. See DEER and STAG.

If the king or queen hunt him, and he eſcape, he is called a *royal hart*.

And if by ſuch hunting he be chaſed out of the foreſt, proclamation is commonly made in the places adjacent, that in regard of the paſſions the beaſt has afforded the king or queen, none ſhall hurt or hinder him from returning to the foreſt; upon which he is called an *hart-royal proclaimed*.

Harts at one year old have no horns; but only bunches; and at two years they are very imperfect, being ſtraight and ſingle; at three years old they grow out into two ſpears; at four, into three; and ſo increaſe every year in number of branches, till they are ſix years old; but after that their age is not to be known by their heads. February and March are the months in which they caſt their horns; and, in general, the older ones caſt them ſooner than the young ones. Thoſe that have been injured at rut, or which have been gelded, never caſt them at all; if they are gelded while young, they never have any horns; if after their horns are grown, they keep thoſe which they had on at the time as long as they live. The horns of ſome are reddiſh, thoſe of ſome black, and thoſe of others ſtrailly are white. The red horns are generally the largeſt and ſtrongeſt, the black are uſually ſhorter, and the white are worſt of all, being the leaſt ſolid or ſtrong.

This animal is the moſt cunning in its care of itſelf of all the deer kind. It is the moſt timorous of any, and by its winding and turnings, and other ſubtilties, as the running among herds of cattle, often deceives the huntſman, and puts a fool upon the dogs. In the chaſe, which generally is a long one, he takes over hedge, ditch, river, or whatever comes in his way, nothing ſtopping him.

This creature loſes its horns in the ſpring-time, as the other deer do; but, during the time that it is without them, does not appear, but abides in the thick woods, and only comes out in the night-time for food.

HART-*hunting*. See HUNTING.

HART'*s-horn, cornu cervi*. See *Hart's* HORN.

HART'*s-horn*, in *Botany*. See PLANTAIN.

HART'*s-tongue*, *Lingua cervina*, in *Botany*, the name of a genus of plants, the characters of which are theſe: the leaves reſemble the tongue of an animal in ſhape, or are, at leaſt, vulgarly ſuppoſed to do ſo; they are uſually plain and ſimple, but ſometimes they are jagged, and in ſome ſpecies they are compoſed of many ſegmens affixed to a middle rib; the flowers are not diſcovered, but the ſeeds grow on the under part of the leaf, in ſeveral long, ſulcated, and ſeemingly ſingle furrows; theſe are filled with oblong capſules, each of which is furniſhed with an elaſtic ring, by the contraction of which they are burſt when the ſeeds are ripened.

The ſpecies of *hart's-tongue*, enumerated by Mr. Tournefort are fifty-nine. In the Linnæan ſyſtem this is a ſpecies of *ſplenium*. See MILT-*weſt*.

Theſe plants commonly grow from the joints of old walls, where they are moiſt and ſhady, and alſo upon ſhady moiſt banks, but are ſeldom cultivated in gardens.

Hart's-tongue is principally uſed in diſorders of the liver and ſpleen, being good to diſſolve hard ſcirrhous tumors in either; it is alſo ſerviceable for the rickets in children; for ſpitting of blood, and the bloody flux. Dioſcorides commends it againſt the biting of ſerpents, and Mr. Ray praiſes it, either given in powder, or a conſerve of the green leaves, as particularly uſeful for hyſteric and convulſive fits, and the palpitation of the heart. Miller.

Externally applied it cleanſes wounds and ulcers.

Sea-HART'*s-tongue*, *phyllitis marina*, in *Natural Hiſtory*, a name given by ſome authors to a ſpecies of ſea plant, the leaves of which, in ſome degree, reſemble thoſe of the common *hart's-tongue*. It grows on the rocks at great depths and is ſeldom ſeen, unleſs when taken up by the coral fiſhers; its leaves are ſometimes ſingle, ſometimes they divide into two; they are of a dulky green colour, and are about two inches in length; they have each a nerve or rib running along the middle; they are very thin and tranſparent, and are of a ſort of cartilaginous ſtructure, and each has ſeveral rows of ſmall points on each ſide of the middle rib, which not inaptly reſemble the ſeed ſpots on the leaves of ſome of the capillary plants; but not on thoſe of the *phyllitis*, or *hart's-tongue*, in particular, becauſe they are in that plant not round but oblong, and ſtand only in a ſingle row on each ſide of the rib. When this plant is viewed by the microſcope, it appears in all parts of the leaf full of little holes, and thoſe which are ſo plain to the naked eye, are no other way different from the imperceptible ones, but in that they are larger. See COMPARISON.

HART-*wort*, *ſeſeli*, in *Botany*. *See Wild* SESELI.

HART-*wort of Crete*, *tordylium*, in *Botany*, a genus of the *pentandria digynia* claſs. Its characters are theſe: it hath an umbelliferous flower, the principal umbel conſiſting of many ſmall ones, compounded of ſeveral rays; the involucrum of the greater umbel is compoſed of narrow leaves, as long as the rays of the umbel; thoſe of the rays are half the length, the umbels are deformed; the flowers have five heart-ſhaped, inflexed petals, which are equal, and have each five hair-like ſtamina, terminated by ſingle ſummits; it has a roundiſh germen ſituated under the flower, ſupporting two ſmall ſtyles crowned by obtuſe ſtigmas: the germen turns to a roundiſh compreſſed fruit longitudinally indented, dividing in two parts, each containing one roundiſh compreſſed ſeed, with an indented border. There are eight ſpecies, which are annual plants, are propagated by ſeed, and will grow in any ſoil or ſituation. Miller. See SESELI *creticum*.

HART-*wort*, *ſhrubby Ethiopian*, is a ſpecies of the *buplevrum*, or HARE'S-*ear*.

HART, or STAG-*evil*, in the *Manege*, a fort of rheum or deflution that falls upon the jaws, and the other parts of the forehand of a horſe, which hinders him from eating; ſometimes alſo this diſtemper affects the parts of the hinder quarters.

HARTANTHE, in the *Materia Medica* of the ancient Arabi, was one of the names of the ſtruthium, or ſaxatile herba of the Greeks and Romans, a kind of thiſtle the root of which was uſed in the cleaning of wool. Avicenna, following the Arabic tranſlation of Dioſcorides, extant in his time, gives, under this name, a deſcription of the leontopetalon, and the virtues of the CYCLAMEN, or bow-bread; but he finds out the error himſelf, and charges it upon the interpreter, acknowledging that in his time *harthan the*, or *atranta*, was not a name either of bow-bread or of the leontopetalon, but of the ſtruthium.

HARVEST, probably derived from a Saxon word ſignifying *herh-teoſt*, is that ſeaſon of the year when the corn is ripe and fit to be reaped and gathered into barns.

HARVEST-*fly*, *cicada*, in *Natural Hiſtory*, the name of a large fly, remarkable for the noiſe which it makes in the ſummer-months, and particularly about the time of harveſt. The generality of authors have very improperly tranſlated *cicada* by the Engliſh word graſshopper, but this is extremely erroneous, the *cicada* having not the leaſt reſemblance to the graſshopper. It is called the *cigale* in France, in the provinces of Languedoc, *&c.* it is very common in that country: Italy and all the hot countries abound with it; and it is in moſt of thoſe places called by the common people by a name expreſſing the *harveſt-fly*, but in England we have not the inſect, and few of us have any notion of what it is. It is probable, that people who found the cicada, according to the deſcription of ancients very noiſy, fancied the graſshopper muſt be the ſame creature, this being of all our inſects the moſt noiſy in the ſummer-months.

The cicada is a large fourwinged fly; its body is ſhort and thick, and its wings long and large: the great or common cicada is by far the largeſt of the known ſpecies of ſhort-bodied flies, and the ſmaller kinds are larger than the hornet.

Ariſtotle, and the other ancient writers who have treated of the cicada, have mentioned two ſpecies, which they have diſtinguiſhed by the names of acherne and tettigonia; theſe have been commonly underſtood to mean the two general kinds now known: the acherne being our large cicada, and the tettigonia our ſmall ones; but Mr. Reaumur has added to theſe two kinds a third, which is of a middle ſize between the other two; this he ſuppoſes to have been the tettigonia of the ancients, and ſeems very confident that our ſmall kind was wholly unknown to them.

These three kinds do not only differ in size, but also in colour; the large kind is of a deep and blackish brown, with a little yellow on the breast, and on some of the rings of the body; the middle-sized kind is of a paler brown, and has much more of the yellow in it, particularly it has on the body two cross lines of yellow, which represent in some sort the letter X: the third kind, or smallest of all, are called cigalons by the French; they are very different from both the others, having a red dish cast on the body, and more yellow than the largest, and less than the middle kind. These distinctions we owe to Mr. Reaumur, who very candidly acknowledges, that he had not so great opportunities of examining the cicadæ of different countries as he could have wished; and is of opinion, that further observations will give us several more kinds of them.

It has been the common opinion, that the noise which the cicada makes was occasioned by a swift motion of the wings and their rubbing against the breast, and the grating of the under pair of wings in their passage against the upper ones; were this the case, there is no reason why the female cicada should not make a noise as well as the male, since she has wings and all the other requisites to singing, according to this system; but in reality the matter is far otherwise, and the bare inspection of the body of the male cicada will shew that the noise is owing to other causes. If we are determined to call nothing a voice but the articulation of air thrown from the lungs in its passage through the larynx and other parts, then the cicada has properly indeed no voice; but if we extend the meaning of the term further, and take in the several sounds made by insects in other manners yet intelligible to other insects, we must allow the cicada has a voice, and a very strong one, the organs of which are not in the lungs and throat, but in the belly. See a particular description of these organs, in Reaumur's Hist. of Insects, vol. iv. p. 508.

Though the female cicada wants the organs of singing of the male, she has however a part in her body which the male has not, and which deserves a peculiar attention. The eggs of the cicada must be lodged in the substance of wood, in order to their happily succeeding in the hatching, and the instrument of the female is intended for the purpose of lodging them properly. A very exact account of this instrument is given at large in Reaumur, to whom we refer the reader.

Most other insects which lodge their eggs in wood, do it in the young shoots and tender branches of shrubs and trees while yet living, where the eggs receive juices and nourishment from the sap. See Rose-fly.

The cicada, on the contrary, knowing that her eggs only want a proper lodgment, not a nourishing juice, always lays them in dry or dead sticks. The creature never regards what kind of wood she meets with, but seizes the dead twigs of any tree, and bores a row of holes in it, putting an egg into each. These creatures deposit their first exuvia in the nest, and after this they come out at the same hole at which the egg was let in, and they are no sooner out than they fall to the ground, and immediately make their way into it and bury themselves; they live some time under ground in the form of a hexapode worm. After living some time under ground they become transformed into a sort of nymphs, which have also a motive power, and have yet a part of their growth to attain to: these nymphs were well known to the ancients. The creature remains in this nymph state two years, and when the time of its final transformation into the fly state approaches, it leaves the earth, and crawls up the body of the tree, and there fastening itself to some of the branches, it changes into the fly in the manner that all the other creatures pass into the state, that is, by breaking through its several coverings by means of the repeated inflations of its body; when the fly first comes out of this case, it is green, but it becomes brown by degrees, and in a few hours loses all its first agreeable colour.

These insects are extremely troublesome, by their noise, in most of the hot countries; they are now made no use of any where, but we find that the ancient revenged themselves by eating them: they accounted them an excellent dish in all their states, but the nymph, or tettygometra, was what they were most fond of; they salted them in the fly state, and were so nice as to distinguish their sexes and seasons: they preferred the females when they were full of eggs, and the males before that time, while they were full of semen. Reaumur, ubi supra, p. 230.

Harvest-*home*, denotes the feast often observed at the close of *harvest*, and also the song used on that occasion. See December.

Haruspex, or Aruspex, in *Antiquity*, a sort of priest or diviner, who inspected and considered the entrails or beasts, particularly those of victims, to find signs or indications of something he wanted to know. See Aruspices.

Cicero, De Divinat. lib. ii. explains the difference between auspex and *haruspex*.

Hasche, in *Botany*, a name by which some authors have called thyme.

Hasel, in *Botany*. See Hazle.

Hasela, in *Ichthyology*, the name of a fresh water fish of the malacostomous, or leather-mouthed kind, called by some a species of the mullet, by others, of the chub, and in many places the hasler; it is a smooth, soft, and small fish, of an oblong and slender body, and seldom exceeding six or seven inches in length. They are caught in lakes and rivers, but those from running waters are esteemed the best, and April and May are accounted the months in which they are in highest season; they are eaten also in June and July, but seldom after these months.

Hasinellas, in the *Glass-making Trade*, are a number of hooks fastened to the sides of the working furnace, by means of which the workmen are able to rest and turn their vessels as they heat them. Neri's Art of Glass, p. 242.

Hassa *alrbai*, in the *Materia Medica of the Arabian Physicians*, a name given to a plant, the virtues of which they commend on many occasions.

The meaning of the words *hassa alrbai* is *virga pastoris*, shepherd's rod; and hence they have been led to suppose, that the plant we call *virga pastoris*, or Dipsacus *minor*, the smaller teasel, or shepherd's rod, has the virtues given to the *hassa alrbai*, and was the same plant. But though it happens that the names of these two plants agree in signification, there is nothing else in which they agree, the *hassa alrbai* being the same plant with the *pugnarum* of the early writers, which, with the epithet of *muscatum*, stood for the common knotgrass; and when the word *feminarum* was added, signified the common *equisetum*, or horsetail, which was called *pugnum*, for the same reason the knotgrass was, that is, because its stalks were composed of a great number of joints. These two plants agree in the virtues of agglutinants and astringents, neither of which virtues our *virga pastoris* has any title to.

Hasselquistia, in *Botany*, a genus of the *pentandria digynia* class: the characters of which are, that the disc is hemispheric and urceolated, and that the rays are oval, plane, marginated, and convex in the middle; and that the fruit is a smooth seed.

Hassock, denotes a bass, or cushion made of rushes, to kneel or rest the feet on in churches.

Hasta, or Hasta *pura*, among *Medallists*, signifies a kind of spear or javelin, not shod, or headed with iron: or rather an ancient sceptre, somewhat longer than ordinary, occasionally given to all the gods.

The *hasta* is supposed a symbol of the goodness of the gods, and of the conduct of providence, which is equally mild and forcible.

Hasta, in some countries, is a measure, or quantity of ground amounting to thirty paces: thus called, according to M. Du-Cange, from the *hasta*, or rod, wherewith it was measured.

Hastated *leaf*, among *Botanists*. See Leaf.

Hastati, or Hastarii, among the *Romans*, soldiers armed with spears, who were always drawn up in the first line of battle.

Hastle, or Quicken *tree band*, in the *Manege*, called in French, *bottes de main* or *botes, bales*, is an expression frequently used by riding-masters, when a scholar works a horse upon volts, and the master leads him: he should turn his hand quicker to the side on which the horse works; to that if the horse works to the right, he turns quicker with his shoulders to the right: and the contrary is observed, if the horse works to the left.

Hasting-*pear*, a name given by the gardeners, to a species of *pear*, called also by some, the green chissel *pear*; this is a moderately large pear, and is longish towards the pedicle; its skin is thin, and of a whitish green; the pulp is melting, and of a sugary flavour. It ripens in July.

Hastive, a French term, sometimes used in English for *early*, *forward*, or something that comes before the ordinary time, or season.

The *hastive* fruits are strawberries and cherries. We have *hastive* pear, &c.

Hat, a covering for the head, worn by the men throughout the western part of Europe.

Hats are chiefly made of hair, wool, &c. worked, felted, and fashioned to the figure of the head.

Hats are said to have been first seen about the year [illegible] at which time they became of use for country [illegible] riding, &c. F. Daniel relates, that when Charles [illegible] made

made his public entry into Rouen, in 1449, he had on a *hat* lined with red velvet, and surmounted with a plume, or tuft of feathers: he adds, that it is from this entry, or at leaſt under this reign, that the uſe of *hats* and caps is to be dated, which henceforward began to take place of the chaperoons and hoods, that had been worn before. In the proceſs of time, from the laity, the clergy alſo took this part of the habit, but it was looked on as a great abuſe, and ſeveral regulations were publiſhed, forbidding any prieſt, or religious perſon, to appear abroad in a *hat* without coronets, and enjoining them to keep to the uſe of chaperoons, made of black cloth, with decent coronets; if they were poor, they were at leaſt to have coronets faſtened to their *hats*, and this upon penalty of ſuſpenſion and excommunication. Indeed the uſe of *hats* is ſaid to have been of a longer ſtanding among the eccleſiaſtics of Brittany, by two hundred years, and eſpecially among the canons; but theſe were no other than a kind of caps, and from hence ariſe the ſquare caps worn in colleges, &c.

Lobineau obſerves, that a biſhop of Dol, in the twelfth century, zealous for good order, allowed the canons alone to wear ſuch *hats*; enjoining that if any other perſon come with them to church, divine ſervice ſhould immediately be ſuſpended. Tom. i. p. 845.

Hats make a very conſiderable article in commerce: the fineſt, and thoſe moſt valued, are made of pure hair of an amphibious animal, called the caſtor or beaver, frequent in Canada, and other provinces of North America. See BEAVER.

HATS, *method of making*. *Hats*, we have obſerved, are made either of wool, or hair of divers animals, particularly of the caſtor, hare, rabbit, camel, &c. The proceſs is much the ſame in all; for which reaſon we ſhall content ourſelves to inſtance in that of caſtors.

The ſkin of this animal is covered with two kinds of hair; the one long, ſtiff, gloſſy, and pretty thin ſet; this is what renders the ſkin, or fur, of ſo much value: the other is ſhort, thick, and ſoft, which alone is uſed in *hats*.

To tear off one of theſe kinds of hair, and cut the other, the hatters, or rather the women employed for that purpoſe, make uſe of two knives, a large one like a ſhoemaker's knife, for the long hair; and a ſmaller, not unlike a vine knife, wherewith they ſhave, or ſcrape off, the ſhorter hair.

When the hair is off, they mix the ſtuff: to one third of dry caſtor putting two-thirds of *old coat*, i. e. of hair which has been worn ſome time by the ſavages, and card the whole with cards, like thoſe uſed in the woollen manufactory, only finer; this done, they weigh it, and take more or leſs, according to the ſize or thickneſs of the *hat* intended. The ſtuff is now laid on the *hurdle*, which is a ſquare table, parallel to the horizon, having longitudinal chinks cut through it; on this hurdle, with an inſtrument called a *bow*, much like that of a violin, but larger, whoſe ſtring is worked with a little bow-ſtick, and thus made to play on the furs, they fly and mix together, the duſt and filth at the ſame time paſſing through the chinks; this they reckon one of the moſt difficult operations in the whole, on account of the juſtneſs required in the hand to make the ſtuff fall preciſely together, and that it may be every where of the ſame thickneſs. In lieu of a bow, ſome hatters make uſe of a ſieve, or ſearce of hair, through which they paſs the ſtuff.

After this manner they form gores, or two capades, of an oval form, ending in an acute angle at top; and with what ſtuff remains, they ſupply and ſtrengthen them in places where they happen to be ſlenderer than ordinary; though it is to be remembered, that they deſignedly make them thicker in the brim, near the crown, than toward the circumference, or in the crown itſelf.

The capades thus finiſhed, they go on to harden them into cloſer and more conſiſtent flakes by preſſing down a *hardening ſkin*, or leather, thereon: this done, they are carried to the *boſſon*, which is a ſort of bench with an iron plate fitted thereto, and a little fire underneath it; upon which laying one of the hardened capades, ſprinkled over with water, and a ſort of mould being applied thereon, the heat of the fire, with the water and preſſing, imboſs the matter into a ſlight hairy ſort of ſtuff, or felt; after which turning up the edges all round the mould, they lay it by, and thus proceed to the other; this finiſhed, the two next are joined together, ſo as to meet in an angle at the top, and only form one conical cap, after the manner of a manica Hippocratis, or flannel bag.

The *hat* thus boſoned, they remove it to a large kind of receiver or trough, reſembling a mill-hopper, going ſloping or narrowing down from the edge or rim, to the bottom, which is a copper kettle, filled with water and grounds, kept hot for that purpoſe. On the deſcent or ſloping ſide, called the *plank*, the boſoned *hat*, being firſt dipped in the kettle, is laid, and here they proceed to work it, by rolling and unrolling it again and again one part after another, firſt with the hand, and then with a little wooden roller, taking care to dip it from time to time, till at length by thus fulling and thickening it four or five hours, it is reduced to the extent or dimenſions of the *hat* intended. To ſecure the hands from being injured by this frequent rolling, &c. they uſually guard them with a ſort of thick gloves.

The *hat* thus wrought, they proceed to give it the proper form, which is done by laying the conical cap on a wooden *block*, of the intended ſize of the crown of the *hat*, and thus tying it round with a packthread, called a *commander*: after which with a piece of iron, or copper bent for that purpoſe, and called a *ſlomper*, they gradually beat or drive down the commander all round, till it has reached the bottom of the block, and thus is the crown formed; what remains at bottom below the ſtring, being the brim.

The *hat* being now ſet to dry, they proceed to *ſinge* it, by holding it over a flare of ſtraw, or the like; then it is *pounced*, or rubbed over with pumice, to take off the coarſer knap; then rubbed over afreſh with ſeal-ſkin to lay the knap a little finer; and laſtly, carded with a fine card to raiſe the fine cotton, with which the *hat* is afterwards to appear.

Things thus far advanced, the *hat* is thus ſent, upon its block, and tied about with a packthread as before, to be dyed. The dyer's copper is uſually very large, holding ten or twelve dozen of *hats*. The dye, or tincture, is made of logwood, verdigris, copperas, and alder-bark; to which ſome add galls and ſumac.

Here the *hat* is kept boiling for about three quarters of an hour; then taken out and ſet to cool, and then returned to the dye, and this for ten or twelve times ſucceſſively. For the method of dying *hats*, ſee DYING *of hats*.

The dye being complete, the *hat* is returned to the hatter, who proceeds to dry it, by hanging it in the top, or roof, of a ſtove or oven, at the bottom of which is a charcoal fire; when dry, it is to be ſtiffened, which is done with melted glue or gum ſenegal, applied thereon by firſt ſmearing it, and beating it over with a bruſh, and then rubbing it with the hand. The next thing is to *ſteam* it on the *ſteaming baſon*, which is a little hearth, or fire-place, raiſed three feet high with an iron plate laid over it, exactly covering the hearth; on this plate they firſt ſpread cloths, which being ſprinkled over with water to ſecure the *hat* from burning, the *hat* is placed brim downwards thereon; when moderately hot, the workman ſtrikes gently on the brim, with the flat of his hand, to make the joinings incorporate and bind ſo as not to appear; turning it from time to time, this way and that way, and at laſt overturning and ſetting it in the crown.

When ſteamed ſufficiently, and dried, they put it again on the block, and bruſh and *iron* it on a table or bench for the purpoſe, called the *ſtall-board*; this they perform with a ſort of irons like thoſe commonly uſed in ironing linen, and heated like them, which being rubbed over and over each part of the *hat*, with the aſſiſtance of the bruſh, ſmoothens and gives it a gloſs, which is the laſt operation; nothing now remaining but to clip the edges even with ſciſſars, and ſew a lining to the crown.

Hats for women have been made in various forms, of ſilk, ſtraw, ſhavings of wood, ivory, feathers, gold, and ſilver.

HAT is alſo figuratively uſed for the dignity of a cardinal or a promotion to that dignity.

In this ſenſe they ſay, to expect a *hat*; to claim, or have preſenſion to the *hat*, &c.

Pope Innocent IV. firſt made the *hat* the ſymbol or cognizance of the cardinals; enjoining them to wear a *red hat*, at all ceremonies and proceſſions, as a token of being ready to ſpill their blood for Jeſus Chriſt. See CARDINAL.

HAT, *in Heraldry*. See CHAPEAU.

HATCHEL, or HITCHEL, in the *Manufactory of Flax, Hemp, &c.* a tool, not unlike a CARD, for dreſſing and combing them into fine hairs.

They conſiſt of ſharp-pointed iron pins, or teeth, ſet orderly in a board.

Of theſe there are ſeveral ſorts, ſome with finer and ſhorter teeth, others with them coarſer and longer.

HATCHES, *in a Ship*, a ſort of trap-doors in the midſhip, or between the main-maſt and fore-maſt, through which goods of bulk are let down into the hold. There are ſeveral of theſe ſquare or oblong paſſages in the deck of a ſhip, leading from one deck to another, and into the hold or lower apartments. Hence the

HATCH-*way* is that place where the *hatches* are. See *Tab. Ship. fig.* 2. *n.* 40.

To lay any thing in the *hatch way*, is to put it so that the *hatches* cannot be come at, or opened.

HATCHES, *coamings of the.* See COAMINGS.

HATCHES are also flood-gates, fet in a river, &c. to ſtop the current of water.

The word is particularly uſed for certain dams, or mounds, made of rubbiſh, clay, or earth, to prevent the water that iſſues from the ſtream-works, and tin-waſhes in Cornwall, from running into the freſh rivers.

The tenants of Bulyſtoke, and other manors, are bound to do certain days work to the *hatches*.

HATCHES, in *Mining*, a term uſed in Cornwall, to expreſs any of the openings of the earth, either into mines, or in ſearch of them; the fruitleſs openings are called eſſay *hatches*; the real mouths of the veins, TIN-*hatches*; and the places where they wind up the buckets of the ore, WIND-*hatches*.

HATCHET, an inſtrument wherewith to hew wood. The *hatchet* is a ſmaller, lighter ſort of ax, with a ſtaff edge on its left ſide; having a ſhort handle, as being to be uſed with one hand.

HATCHET, a ſmall ax, uſed by the pioneers, who go before to prepare the ways for an army, by cutting down hedges, buſhes, ſtyles, or gates. The grenadiers carry ſometimes each a *hot hot* by his ſide; and the French dragoons, who have but one piſtol, have a *hatchet* hanging at their ſaddle bows, on the right ſide.

HATCHET *vetch*, in *Botany*. See VETCH.

HATCHING, the act whereby ſecundated eggs, after ſeaſonable incubation, exclude their young.

Hatching, with reſpect to the viviparous tribe, amounts to the ſame as parturition, or delivery, in the viviparous. In Egypt they *hatch* all their chickens by the heat of an oven: the method whereof is given us by Mr. Greaves, in the Philoſophical Tranſactions, N° 117, or Abridgment, vol. ii. p. 851, &c.

They have houſes built for the purpoſe, having a long entrance, on each ſide whereof are twelve or fourteen ovens, whoſe bottoms and ſides are formed of ſun-dried bricks, lined with mats for the eggs to lie on; and the tops covered with ſticks, except two ſpaces, which are brick, and ſerve as hearths to build the fires on wherewith the eggs are to be heated; over theſe is another ſtory of ovens, having holes, which are either ſtopped with tow, or left open at pleaſure, to govern the heat of the ovens below.

They begin to heat the ovens in the middle of January, ſpending on them every morning about a hundred pound weight of camels or buffalos dung, and the like quantity at night, till the middle of February; by which time the ovens are too hot for the hand to be held to the walls. After this they put in the eggs to *hatch*, which they continue ſucceſſively to the end of May.

The eggs are firſt put upon the mats in the lower ovens, upon the ground, 7 or 8000 eggs in number, and laid only double one upon another: in the ovens over theſe, the fire is made in the little channels, from whence the heat is conveyed into the lower; the eggs directly under theſe hearths lie three-fold.

At night when they new-make their fires in their hearths, they remove the eggs that were directly undermoſt, laying three upon one another, in the place of thoſe which lay on the ſides only double; and theſe being now removed, they lie treble under the hearth, becauſe the heat is greater there than on the ſides.

Theſe eggs continue in the lower ovens fourteen days and nights; after which they remove them into the upper; and in theſe, there being no more fire uſed, they turn the eggs four times every twenty-four hours.

The 21ſt, or 22d day the chickens are *hatched*, which the firſt day do not eat; the ſecond day they are fetched away by women who give them corn, &c. The maſter of the ovens hath a third part of the eggs for his coſt and pains, out of which he is to make good to the owners (who have two thirds in chickens for their eggs) if any happen to be ſpoiled or miſcarry.

The fire in the upper ovens, when the eggs are placed in the lower, is thus proportioned: the firſt day there is the greateſt fire, the ſecond leſs than the firſt; the fourth more than the third, the fifth leſs; the ſixth more than the fifth, the ſeventh leſs; the eighth more, the ninth without fire; the tenth little fire in the morning; the eleventh they ſhut all the holes with ſtaz, &c. making no more fire; for if they ſhould, the eggs would break. They take care that the eggs be no hotter than the eye of a man, when they are laid upon it, can well endure. When the chickens are *hatched*, they put them into the lower ovens.

The number of theſe ovens in different parts of the country, which are attended by the inhabitants of a village called Permi, is about 386, and they uſually keep them at work for ſix months; as, therefore, each brood is perfected in twenty-one days, it is eaſy to every one of them to *hatch* eight different broods of chickens. If we ſuppoſe that only two thirds of the eggs are *hatched*, and each brood conſiſts of at leaſt 30000 chickens, the ovens of Egypt are capable of producing, yearly, at leaſt 92640000 chickens.

Mr. Reaumur has diſcovered, that the heat neceſſary for this purpoſe, is nearly the ſame with that marked 32, upon his thermometer, or that marked 96 on Fahrenheit's. If, therefore, theſe eggs be kept in this degree of heat, they will as certainly *hatch*, as if the parent-hen had ſat upon them; and indeed it is impoſſible it ſhould be otherwiſe, ſince this heat anſwers nearly to that of the ſkin of the hen, or even of mankind; ſo that the empreſs Livia, as Pliny relates, might truly *hatch* a chicken in her boſom, if ſhe had but the patience to keep an egg there for the ſame number of days that it ought to have continued under a hen.

After many experiments, Mr. Reaumur found, that ſtoves heated by means of a baker's oven, ſucceeded equally well with thoſe made hot by layers of dung. The furnaces of glaſs-houſes, and thoſe of the melters of metals, might no doubt be made to anſwer the ſame purpoſe: if, therefore, an eaſy method could be found to regulate the heat of the ſtove, it would be extremely convenient for bakers or paſtry-cooks to *hatch*, with little or no expence, a very great number of chickens, which they might diſpoſe of to the country people, to be reared till marketable. Should a thermometer be judged neceſſary for this purpoſe, it will be ſufficient to mark on it only ſuch degrees as are abſolutely neceſſary; by which means the inſtrument will not only come cheaper, but be more readily underſtood by the ignorant people, for whoſe uſe it is deſigned.

Such an inſtrument however may be wholly diſpenſed with; a lump of butter, of the ſize of a walnut, mixed with half as much tallow, ſerving to indicate the heat of the ſtove with ſufficient exactneſs; when the heat is too great, this mixture, which is kept in a phial, will become as liquid as oil; and when the heat is too ſmall, it will remain fixed in a lump; but it will flow like thick ſyrup, upon inclining the bottle, if the ſtove be of a right temper: great attention therefore ſhould be given to keep the heat always at this degree, by letting in freſh air, if it be too great, or ſhutting the ſtove more cloſe, if it be too ſmall.

But this is not all. That all the eggs in the ſtove may equally ſhare the irregularities of the heat, it will be neceſſary to ſhift them from the ſides to the centre, and *vice verſâ*; thereby imitating what the hens themſelves do by thoſe upon which they ſit; for hens are frequently ſeen to make uſe of their bills to puſh to the outer parts thoſe eggs which were neareſt to the middle part of their neſt, and to bring into that middle part ſuch as before lay neareſt to the ſides of the ſame.

As to the form of the ſtoves, no great nicety is neceſſary; a chamber over an oven will do very well, only in order to aſcertain the due degree of heat, it will be neceſſary to have phials of butter, as directed above, in ſeveral parts of the rooms; and when the heat wants to be either increaſed or diminiſhed, it is ſufficient to diminiſh or increaſe the communication between the air in the room and that abroad, by opening or ſhutting ſome of the openings made in the wall for that purpoſe.

In order to cheriſh the new *hatched* chickens, capons may be taught to tend them in the ſame manner as hens do. Mr. Reaumur tells us, that he has ſeen above two hundred chickens at once, all led about and defended by only three or four ſuch capons, which clucked like hens, to call in the chickens that had ſtrayed too far off; and even redoubled their call, when they found any nice bits, to invite the young brood to come and pick them up: nay cocks may be taught to do the ſame office, which they as well as capons will continue to do all their lives afterwards.

But Mr. Reaumur, not ſatisfied with the aſſiſtance he could procure from cocks and capons, has invented a ſort of low boxes without bottoms, and lined with furs; theſe, which he calls artificial parents, not only ſhelter the chickens from the injuries of the air, but afford a kindly warmth, ſo that they preſently grow fond of them, and take the benefit of their ſhelter as readily as they would have done under the wings of a hen.

For a few weeks after *hatching*, it will be neceſſary to keep the chickens in a room artificially heated, and furniſhed with theſe boxes; but afterwards they may be ſafely expoſed to the air in the court-yard, in which it may not be amiſs to place one of theſe artificial parents to ſhelter them, ſhould there be any occaſion.

As to the manner of feeding the young brood, they are generally a whole day after being *hatched*, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, or millet [illegible]

mixed with the crumbs; after which they will begin to pick up infects and grafs for themfelves.

People in the country, who have plenty of conveniences for the raifing of poultry, will hardly give themfelves the trouble to hatch *chickens* in this artificial manner. It is in villages near great towns, and principally in the neighbourhood of the capital city, that it would be of the greateft importance to promote the eftablifhment of this kind of ftoves. Vide Mr. Tremblay's Abftract of the *Art of* Hatching domeftic Fowls, tranflated from the original Treatife of Mr. Reaumur, where he explains every difficulty.

HATCHING *of bees*. See *Generation of* BEES.

HATCHING, or HACHING, in *Defigning and Engraving*, fignifies the making of lines with a pen, pencil, graver, or the like; and interfecting, or going acrofs thofe lines, with others drawn over them another way.

The depths and fhadows of draughts are ufually formed by *hatching or both-work*. See ENGRAVING and ETCHING.

HATCHING, among *Miners*. See DIGGING.

HATCHINGS are of great ufe in heraldry, to diftinguifh the feveral COLOURS of an efcutcheon, without its being illuminated.

The firft kind of *hatching* in pale, or from top to bottom, fignifies *gules*, or *red*: the fecond in *fefs*, acrofs the coat, *azure*, or *blue*.

Hatching in pale, counter-*hatched* in fefs, fignifies *fable*, or *black*. *Hatching* in bend, proceeding from right to left, fignifies *green*; and that in bars, from left to right, *purple*.

When the coat is only dotted, it is fuppofed to be *or*, or *gold*; and when quite bare or void, *argent*, or *white*.

This invention is commonly afcribed to F. Pietra Sancta; though the Sieur de la Colombiere has difputed his title to it.

HATCHMENT, in *Heraldry*, the marfhalling of feveral coats of arms in an efcutcheon.

HATCHMENT is alfo a popular name for an ATCHIEVEMENT.

By thefe *hatchments* or funeral efcutcheons, it may be known after any perfon's deceafe, what rank either he or the held when living; and if it be a gentleman's *hatchment*, whether he was a bachelor, married man, or widower, with the like diftinctions for gentlewomen. In the *hatchment*, (*Tab. IV. Heraldry, fig.* 123.) are reprefented the arms of a private gentleman and his wife parted per pale, the dexter fide, which is *gules, three bars or*, for the husband; having the ground without the efcutcheon black, which denotes the man to be dead; and the ground on the finifter fide being white fignifies that the wife is living. When a married gentlewoman dies firft, the *hatchment* is diftinguifhed by a contrary colour from the former; that is, the arms on the finifter fide have the ground without the efcutcheon black, whereas thofe on the dexter fide, for her furviving husband, are upon a white ground: befides, the *hatchment* of a gentlewoman is differenced by a cherub over the arms inftead of a creft. See *fig.* 124. When a batchelor dies, his arms may be depicted fingle or quartered, with a creft over them, but never impaled as the others are; and the whole ground without the efcutcheon is black. See *fig.* 125. When a maid dies, her arms, which are placed in a lozenge, may be fingle or quartered, have the whole ground black, and inftead of a creft have a cherub over them. See *fig.* 126. When a widower dies, his arms are reprefented impaled with thofe of his deceafed wife, having a helmet, mantling and creft over them, and the whole ground without the efcutcheon black. See *fig.* 127. When a widow dies, her arms are impaled with thofe of her deceafed husband, but inclofed in a lozenge, over them is placed a cherub inftead of a creft, and the whole ground without the efcutcheon is black. See *fig.* 128. If a widower or bachelor fhould be the laft of his family, the *hatchment* is depicted as in *fig.* 129. and that of a maid or widow, whofe family is extinct by her death, is depicted as in *fig.* 130. having a death-head generally annexed to each *hatchment*, denoting that death has conquered all. The fame rules are obferved with refpect to the efcutcheons placed on the hearfe and horfes ufed in pompous funerals, except that they are not furmounted with creits but always plain; however, herald-painters commonly enfign thofe of peers with coronets, and that of a maiden lady with a knot of ribbands. Porny's El. of Her. p. 240, &c.

HATTEMISTS, in *Ecclefiaftical Hiftory*, the name of a modern Dutch fect, fo called from Pontian Van Hattem, a minifter in the province of Zealand, towards the clofe of the laft century, who being addicted to the fentiments of Spinoza, was on that account, degraded from his paftoral office. The VERSCHORISTS and *Hattemifts* refemble each other in their religious fyftems, though they never fo entirely agreed as to form one communion. The founders of thefe fects deduced from the doctrine of abfolute decrees, a fyftem of fatal and uncontroulable neceffity; they denied the difference between moral good and evil, and the corruption of human nature: from hence they further concluded, that mankind were under no fort of obligation to correct their manners, to improve their minds, or to obey the divine laws: that the whole of religion confifted not in acting but in fuffering; and that all the precepts of Jefus Chrift are reducible to this one, that we bear with chearfulnefs and patience the events that happen to us through the divine will, and make it our conftant and only ftudy to maintain a permanent tranquility of mind. Thus far they agreed; but the *Hattemifts* farther affirmed, that Chrift made no expiation for the fins of men by his death, but had only fuggefted to us by his mediation, that there was nothing in us that could offend the deity; this, they fay, was Chrift's manner of juftifying his fervants, and prefenting them blamelefs before the tribunal of God. It was one of their diftinguifhed tenets, that God does not punifh men for their fins, but by their fins. Thefe two fects, fays Mofheim, ftill fubfift, though they no longer bear the names of their founders. Mofh. Eccl. Hift. vol. iv. p. 553, &c. 8vo. edit. 1768.

HATTOCK, a fhock of corn, containing twelve fheaves. Others make it only three fheaves laid together.

HATUMURUNGHA, in *Botany*, a name by which fome authors have called the tree whofe fruit is the ben-nut, the balanus myrepfica, or glans unguentaria, and whofe wood is the lignum nephriticum of the fhops.

HAVELDA, in *Ornithology*, the name of a bird of the duck kind, common in Iceland, and known, among the natives, by this name, called by authors *anas caudata Islandica*, the *long tailed Iceland-*DUCK.

HAUBERGETTUM, in our *Old Writers*, the fame with *haubergeon*, and habergeon, which all fignify a coat of mail.

HAVEN, a feaport, or HARBOUR for fhips. See PORT.

The word is derived from the Saxon *hauen*, or the German *hafen*, or the French *havre*; which all fignify the fame thing.

HAVER, a name given in fome parts of the kingdom to OATS.

HAVERSACK, in *Military Language*, is a kind of bag, made of coarfe grey linen, in which the foldiers carry bread and provifions on a march. They are only ufed in the field and in cantonments, each foldier having one.

To HAUL, in *Sea Language*, to pull a fingle rope without the affiftance of blocks, or other mechanical powers. See BOWSE.

To HAUL *the wind*, is to direct the fhip's courfe nearer to that point of the compafs from which the wind arifes.

HAUM, HALM, or HAWM, among *Farmers*, denotes the ftem or ftalk of corn, peas, beans, &c. from the root to the ear.

HAUNCH, or HANCH, the hip, or that part of the body between the laft ribs and the thigh.

The *haunches* confift of three bones, joined together by cartilages, which in courfe of time grow dry, hard, and bony; fo that in adults, the three only feem to conftitute one continued bone.

HAUNCHES, or hips of a horfe, are thofe parts of the hind quarters which extend from the reins or back, to the hough or ham.

The *haunches* of a horfe are too long, if, when ftanding in the ftable, he limps with his hind legs farther than he ought to do; and when the top or onfet of his tail is not in a perpendicular line to the top of his hocks, as it always is in horfes whofe *haunches* are of a juft length.

One of the moft neceffary leffons in managing the great horfe, is that of *putting him upon his haunches*; which, in other terms, is called to *couple* him well, or to put him well together, or make him compact.

A horfe that does not bend or lower his *haunches*, throws himfelf too much upon his fhoulders, and is heavy upon the bridle. To *difeg the haunches*, is to change the leading foot in galloping.

To make a horfe bend, or lower his *hips*, you muft frequently make him go backwards, and make ufe of the aids of the hands, and of the calves of your legs, in giving good ftops; and if that does not fucceed, he muft be tried upon a *caleade*, or ftoping ground, after the Italian fafhion.

Head in and *hips in*. See HEAD.

To gallop with the haunch in. See GALLOP.

HAUNT, among *Sportfmen*, denotes the place to which game are accuftomed to refort; and among *Hunters*, it fignifies the walk of a deer, or the place of his ordinary paffages. See HUNTING.

HAVRE, in *Geography*, &c. a French term, fignifying the fame with *haven* or *harbour*.

HAUGH, the ſame with HAW.

HAURIANT, in *Heraldry*, denotes the poſture of a fiſh when borne directly upright. See *Tab.* II. *Heraldry*, *fig.* 53.

HAUSTELLUM, in *Natural Hiſtory*, a name given by ſome authors to a peculiar kind of ſhell fiſh, of the purpura kind, which the French have named the BECASSE, and we the woodcock-ſhell. It is remarkable for its extremely long and ſlender beak. There are a very elegant echinated or ſpinoſe kind, and two or three ſmooth ones.

HAUSTILIA *foſſilia*, in *Natural Hiſtory*, a term uſed to expreſs that kind of amber, or, more properly ſpeaking, thoſe maſſes of amber which are obtained by dragging the bottoms of the ſea near Pruſſia, or found on the ſhores, in diſtinction from thoſe pieces which are found foſſile in the ſame or other kingdoms.

The foſſile amber itſelf very much differs, not only in degree of beauty and purity, but alſo in hardneſs; ſome of it being ſo poor, ſo coarſe, and ſo brittle, as not to be worthy the name of amber; and ſome, that is yet ſomewhat better than this, breaking in the taking up.

This difference in purity, hardneſs, and goodneſs, ſeems wholly owing to the different proportion in which the ſalts are mixed with the bitumen, in the compoſition of the amber; and it is no wonder that the ſea or *hauſtile* amber is never of the ſame coarſe kind with ſome of the worſt that is dug, becauſe ſuch is ſtubbed in pieces by the waves, and deſtroyed, and only the good preſerved. The *hauſtile* amber is alſo fy found in irregular maſſes, for the moſt part wholly diveſted of its rough coat, and often broken, ſo that its original ſhape cannot well be aſcertained; but the foſſile amber generally carries the marks of its origin with it, and is either found in form of large drops of a roundiſh or oval figure, or elſe in flatted cakes, formed by the narrow ſpaces it is found in, between the layers of the matrix, which is always a kind of ſoliated or flakey ſubſtance, by ſome miſtaken for foſſile wood, or the barks of trees preſſed together, though, in reality, it is no other than a bituminous earth coagulated by ſalts, and hardened by the gradual evaporation of its ſuperfluous moiſture by the ſun's heat. Phil. Tranſ. N° 258. p. 18. See AMBER and MATRIX.

HAUTBOY, or HOBOY, a ſort of muſical inſtrument, of the wind kind, with a reed, by means of which it is blown or ſounded.

The word is French, *haut-bois*, q. d. *high wood*; and is given to this inſtrument, becauſe its tone is higher than than that of the violin.

The *hautboy* is ſhaped much like the flute, only that it ſpreads or widens more towards the bottom. The treble is two feet long, and has ten holes, nine only of which are harmonical: the tenor goes a fifth lower, when blown, or ſounded open; it has eight holes, ſeven of which are only harmonical. The baſe is five feet long, and has eleven holes.

HAUTIN, in *Ichthyology*, the name by which ſome call the fiſh, more uſually called *ſwin*, and known, among the writers on fiſhes, by the name of OXYRYNCHUS.

HAW. A ſmall parcel of land is ſo called in Kent; as a *long-haw*, or *bean haw*, lying near the houſe, and incloſed for thoſe uſes. But Sir Edward Coke, in an ancient plea concerning Feverſham in Kent, ſays *haws* are houſes. See HAGA.

HAW, HAWGH, or HOWGH, is uſed, in the North of England, for a green plot in a valley.

HAW, among *Farriers*, &c. an excreſcence reſembling a griſtle growing between the nether eye-lid and the eye of a horſe, or other beaſt, and which will put the eye quite out, if not timely taken away.

It comes by groſs, tough, and phlegmatic humours, falling from the head, and knitting together, which in the end grow to this infirmity; the ſigns whereof are the watering of the eye, and involuntary opening of the nether lid.

Every common farrier can cut it out: the affected beaſt is to be held faſt by the head, and with a ſtrong double thread, a needle is to be put in the midſt of the upper eye-lid, and tied, if it be a bullock, to his horn; then taking the needle again, with a long thread, and putting it through the griſtle of the *haw*, with a ſharp knife cut the ſkin finely round, and ſo pluck out the *haw*. That done, they dreſs the eye, take out the blood, waſh it with beer or ale, and caſt in a good deal of ſalt; then waſh it again, afterwards ſtroaking it down with their hands, and ſo let him go. To cure a ſheep of this malady, they drop into the eye the juice of chamomile, or crow-foot.

HAWFINCH, in *Ornithology*, an Engliſh name for the COCCOTHRAUSTES, called alſo the groſsbeak, and by the Italians the *fringuone*. This bird is the LOXIA *coccothraustes* of Linnæus

HAWK, *accipiter*, a bird of prey, of a bold and generous nature; wherever there are ſeveral ſpecies.

In the Linnæan ſyſtem, the *hawk* gives denomination to a whole order of birds, diſtinguiſhed by a hooked beak projecting on both ſides from the upper mandible, and comprehending four genera, viz. the VULTURE, the FALCON, the OWL, and LANIUS.

The *hawk* makes the ſubject of a particular art, called *hawking*, or *falconry*.

Naturaliſts diſagree about the number and diviſion of the *hawk* kind. The moſt commodious diſtribution is that into *long-winged* and *ſhort-winged hawks*.

To the *long-winged*, which may be alſo called the *noble* tribe, belong the falcon, haggard-falcon, ger-falcon, lanner, hobby, ſaker, merlin, and bawler; all which are reclaimed, manned, fed, and mewed, much after the ſame manner. Of the *ſhort-winged* ſpecies, or *hawks* properly ſo called, are the *gos-hawk* and *ſparrow-hawk*.

The former are generally brought to the lure, and ſeize their prey with the foot; breaking the neck-bone with their beak, before they proceed to plume or tire it: the latter are brought to the fiſt, and kill their game by ſtrength and force of wing, at random, and proceed immediately to plume them.

It is to be noted, that the female of all birds of prey is much larger, ſtronger, and more courageous, than the male; which is diſtinguiſhed from it by ſome diminutive name. Thoſe of the *falcon* and *gos-hawk*, are called *tiercels*, or *tiercelets*; that of the ger-falcon, *jerkin*; that of the merlin, *jack*; that of the hobby, *robbin*; that of the *ſparrow-hawk*, *muſket*; and that of the lanner, *lannaret*.

The *hawk* has different names, according to their different ages. The firſt year ſhe is called a *ſoaring*; the ſecond, an *entaſſor*; the third, a *white hawk*; the fourth, a *hawk of the firſt coat*.

Add, that they have different denominations, according to the different ſeaſons when they are taken. Thoſe taken in the ayrie, are called *eyaſſes*, or *nyeſſes*; thoſe which had forſaken it, and were fed in ſome place not far off, by the old ones, *branchers*; thoſe which had begun to prey for themſelves, *ſoar hawks*: thoſe which have changed their feathers once or more, *mewed-hawks*; and thoſe which lived at large, and preyed for themſelves about the woods, *haggards*.

We ſhall here, according to our method in other caſes, give the reader what relates to the ſeveral ſpecies of *hawk*, referring for what is common to them all, to the article HAWKING.

1. Of the *falcon*, or *falcon-gentle*, her nature and qualities, with the manner of luring and reclaiming, and bringing her up to the ſport, we have elſewhere ſpoken under the article FALCON. See *Tab. of Birds*, N° 3.

2. The *haggard falcon*, called alſo *peregrine falcon*, *paſſenger*, and *traveller*, becauſe it is no native of our iſland; or rather, on account of its roving, and wandering more than any other ſort, is not inferior to the beſt of the tribe, for ſtrength, courage, hardineſs, and perſeverance. She is diſtinguiſhed from the common falcon, as being larger, longer, armed with a longer beak and talons, a higher neck, &c. See FALCON. She will lie longer on the wing, and is more deliberate and adviſed in her ſtooping than the others.

The haggard falcon, when wild and unreclaimed, takes the greateſt liberty of all birds, living either by land or ſea; and is of ſuch abſolute power, that wherever ſhe comes, all flying fowl ſtoop under her ſubjection; even the tiercelet, though her natural companion, dares not ſit by her, or approach her reſidence, except in cawking time; when, for procreation-ſake, ſhe admits him in a ſubmiſſive manner to come near and woo her.

When very young, ſhe is apt to attack birds too ſtrong for her; which ſhe perſiſts in, till a found beating has brought her to a better underſtanding. She is an inceſſant point-taker; no weather diſcouraging her from her game. When, unreclaimed, as ſoon as ſhe has ſeized her prey, and broken the ink or neck, ſhe falls on the crop, and feeds firſt on what is contained there; then on the other parts. When ſhe has filled her gorge, ſhe flies to ſome ſolitary place, near the water, where ſhe ſits all day, and at night takes wing to ſome convenient place, where ſhe has before purpoſed, to perch till morning.

For the method of reclaiming, manning, entering, &c. a haggard falcon, or other ſort of hawk, *with the terms of art uſed in reſpect thereof*, ſee HAWKING.

3. The *ger-falcon*, or *gyr-falcon*, is the largeſt bird of the falcon kind, coming next to the ſize of a vulture, and is of the greateſt ſtrength next an eagle; ſhe is ſtoutly armed, and in all reſpects a lovely bird to the eye.

Her head and eyes are like thoſe of the haggard; her beak great and bending, her nares large; her falls long and ſharp pointed, and her train and mail much like the lanner's, having a large marble-feared foot; and plumed black, brown, and ruſſet. She may alſo be called a *paſſenger*, her ayrie or breeding-place being in Pruſſia, Muſ-

covy,

tory, and the mountains of Norway. See GYRFALCON. The ger-falcon is of a fierce and fiery nature, and is very hardly managed and reclaimed; but being once overcome, she proves an excellent *hawk*, scarce refusing to ſtrike at any thing. She does not naturally fly the river; but always purſues the herons, ſhovelers, &c. In going up to their gate, they do not hold the courſe, or way, which others uſe to do, but climb up upon the train, when they find any fowl; and, as ſoon as they have reached her, pluck her down, if not at the firſt, yet at the ſecond or third encounter.

4. The *ſaker*, or *ſacre*, is the third in eſteem, next the falcon and ger-falcon, but difficult to be managed, being a *paſſinger*, or *peregrine hawk*, whoſe ayrie has not yet been diſcovered; but the young are chiefly found in the iſlands of the Levant.

She is ſomewhat longer than the haggard falcon; her plume ruſty and ragged: the fear of her foot and beak like the lanner; her pounces ſhort; her train the longeſt of all birds of prey. See SACRE.

She is very ſtrong and hardy againſt all kinds of fowl, being a great deal more diſpoſed to the field than the brook, and delighting to prey on great fowl, as the heron, gooſe, &c. but for the crane ſhe is not to tree as the haggard falcon. She alſo eates of the leſſer fowl, as pheaſants, partridges, &c. and is much leſs dainty in her diet, as long-winged *hawks* uſually are.

The ſaker makes excellent ſport with the kite; which as ſoon as he ſees the ſaker caſt off, immediately betakes himſelf to, and trufts in the goodneſs of his wings, and gets to his pitch, as high as poſſibly he can, by making many tours and wrenches in the air; which, together with the variety of conteſts and bickering between them, affords a curious ſpectacle.

5. The *lanner* or *lanar*, is a *hawk* common in moſt countries, eſpecially in France; mating her ayrie on lofty trees in foreſts, or on high cliffs near the ſea-ſide. See LANNARIUS.

She is leſs than the falcon-gentle, fair plumed, and of ſhorter talons than any other falcon. Such as have the largeſt and beſt faſhioned heads, are eſteemed the beſt.

Mewed *lanners* are not eaſily known from *ger-hawks*, or falcers: the chief marks and characteriſtics are, that they are blacker, have leſs beaks, and are leſs armed and pounced than any other *hawks*.

Of the whole *hawk* tribe, there is none ſo fit for a young falconer as this, becauſe ſhe is not inclined to ſurfeits, and ſeldom melts greaſe by being over-flown.

There is another ſort of *lanners*, whoſe ayrie is in the Alps, having their heads white, and flat aloft, large and black eyes, ſlender nares, ſhort and thick beaks, being leſs than the haggard and falcon-gentle, though there are different ſizes of them; their tail is marble, or ruſſet; their breaſt feathers white and full of ruſſet ſpots, and the points and extremities of their feathers full of white drops; their ſails and trains long; they are ſhort-legged, with a foot leſs than that of a falcon, and marble-feathered. This *hawk* never lies upon the wing, after ſhe has flown to a mark; but after once ſtooping, makes a point, and, like the *ger-hawk*, waits the fowl. She is more valued abroad than in England; here ſhe is conſidered as ſlothful, and hard-mettled. The truth is, a very ſtrict hand muſt be kept over her, as being of an ungrateful diſpoſition. She is flown at field or brook, and will maintain long flights; by which means much fowl is killed. To fly them, they muſt be kept very ſharp; and becauſe they have their caſtings long, they muſt have hard caſtings, made of tow, and knots of hemp.

6. The *merlin* is the ſmalleſt of all birds of prey, and bears a reſemblance to a haggard falcon in plume, as alſo in the fear of the foot, beak, and talons; and is not unlike her in conditions. See MERLIN.

When well manned, lured, and carefully looked after, ſhe proves an excellent *hawk*, eſpecially at partridge, thruſh, and lark; but ſhe is very buſy and unruly, and ſpecial care muſt be had, leſt ſhe unnaturally eat off her own feet and talons, as ſhe has been often known to do. She is very bold; and will fly at birds bigger than herſelf with ſuch eagerneſs, as to purſue them even into a town or village. Though the merlin be accounted a *hawk* of the firſt, ſhe may be brought to take delight in the lure: when you have made her come to the lure, ſo that ſhe will patiently endure to hood, you ſhould make her a train with a partridge; if ſhe foot and kill it, reward her well: then fly her at the wild partridge; and if ſhe take or make it at firſt or ſecond flight, being retrieved by the ſpaniels, feed her upon it with a reaſonable gorge, chearing her in ſuch a manner with the voice, that ſhe may know it another time: if ſhe do not prove hardy at the firſt or ſecond time, ſhe will always be good for nothing.

7. The *hobby* is a ſort of *hawk* that naturally preys on doves, larks, and other ſmall game. See HOBBY, and *Tab.* II. *Birds*, N° 21.

She has a blue beak, but the fear thereof and legs are yellow; the crimels, or little feathers under the eye, very black; the top of the head between black and yellow. She has alſo two white ſeams on her neck; the plumes under the gorge, and about the brows, are reddiſh, without ſpot or drop; the breaſt-feathers, for the moſt part, are brown, yet interſperſed with white ſpots; her back, train, and wings, are black aloft, having no great ſcales upon the legs, unleſs a few behind: the three ſtretchers and pouncers are very large, with reſpect to her ſhort legs; her brail-feathers are tinctured between red and black; the pendant ones, or thoſe behind the thigh, of a ruſty ſmoky hue.

She is a *hawk* of the lure, and not of the firſt; and is a high flyer, being in every reſpect like the ſaker, but that ſhe is of a much leſs ſize; for ſhe is not only nimble and light of wing, but dares encounter kites, buzzards, or crows, and will give ſouſe for ſouſe, and blow for blow, till ſometimes they ſiege, and come tumbling down to the ground together. But ſhe is chiefly for the lark, which poor little creature does ſo dread the ſight of her, ſoaring in the air over her, that ſhe will rather chooſe to commit herſelf to the mercy of men or dogs, or to be trampled on by horſes, than venture into the element, when ſhe ſees her mortal enemy there.

The hobby alſo makes excellent ſport with nets and ſpaniels; for when the dogs range the field, to ſpring the fowl, and the hobby ſoars aloft over them, the poor birds, apprehenſive of a conſpiracy between the *hawks* and dogs to their utter ruin, dare not commit themſelves to their wings, but think it ſafer to lie cloſe on the ground, and ſo are taken in the nets. This ſport is called *daring*.

8. The *ger-hawk*, or *goſs-hawk*, q. d. *groſs hawk*, is a large ſhort-winged *hawk*, of which there are ſeveral ſorts, differing in goodneſs, force, and hardineſs, according to the diverſity of their choice in cawking; at which time the ſeveral ſorts of birds of prey aſſemble themſelves with the *ger-hawk*, and gallant it together. See GOSHAWK.

There *are ger-hawks* from moſt countries, but none better than thoſe bred in the north of Ireland. This *hawk* ought to have a ſmall head, a long and ſtrait face, a large throat, great eyes deep ſet; the apple of the eye black; nares, ears, back, and feet, large and black; a black long beak, long neck, big breaſt, hard fleſh, long fleſhy thighs, the bone of the leg and knee ſhort, long large pounces and talons; and to grow round from the ſtern, or train, to the breaſt forward. The feathers of the thighs, towards the train, ſhould be large, and the train-feathers ſhort and ſoft, ſomewhat tending to an iron mail.

The brail-feather ought to be like thoſe of the breaſt; and the covert-feathers of the train ſpotted, and full of black rundles; but the extremity of every train-feather black-ſtreaked.

To diſtinguiſh the ſtrength of this bird, tie divers of them in ſeveral places of one chamber, or mew; and that *hawk* that flies and mates higheſt and fartheſt off, may be concluded to be the ſtrongeſt.

The *ger-hawk* flies at the pheaſant, mallard, wild gooſe, hare, and coney; nay, ſhe will venture to ſeize a kid, or goat. She is to be kept with care, as being very choice and dainty in eatings, &c.

9. *Sparrow hawk*, *fringillarius accipiter*, or *falco viſus* of Linnæus, is alſo a kind of ſhort-winged *hawk*, wherein there are ſeveral ſorts, different in plumes; ſome ſmall plumed and black; others of a larger feather; ſome plumed like a quail; ſome brown, or of a canvas-mail, &c. In ſome, the back, head, coverts of the wing and tail, are of a deep bluiſh grey; in others of a deep brown, edged with a ruſty red; the quill feathers are duſky, barred with black on their exterior webs, and ſpotted with white on the lower part of their inner webs; the tail is of a deep aſh-colour, marked with fine broad black bars, the tip being white; the breaſt and belly are of a whitiſh yellow, adorned with tranſverſe waved bars; in ſome of a deep brown colour, in others orange; the cere, irides, and legs, yellow. The colours of the female differ from thoſe of the male: the head is of a deep brown; the back and coverts of the wings are duſky, mixed with dove-colour; the coverts of the tail are of a brighter dove-colour; the waved lines that croſs the breaſt are more numerous than thoſe on that of the male; and the breaſt itſelf is of a pure white. This is the moſt pernicious *hawk* which we have; and makes great havock among pigeons as well as partridges. It builds in hollow trees, in old neſts of crows, large ruins, and high rocks; lays four white eggs, encircled near the blunter end with red ſpecks. Pennant.

The *ſparrow-hawk*, ſo far as her ſtrength will give her leave, is a good *hawk*; and he that knows how to man, reclaim, and fly with a *ſparrow-hawk*, may eaſily attain to the keeping and managing of all others. In this reſpect ſhe really excels, that ſhe ſerves both for winter or

fet ſummer, with great pleaſure, and will fly at all kinds of game, more than the falcon.

The Engliſh legiſlature has thought theſe birds worthy of its protection: taking their eggs out of any man's ground, is puniſhable by impriſonment for a year and day, and by a fine at the king's will, one half to him, and half to the owner of the ground. Stat. 11 Hen. VII. cap. 17. Stealing *hawks*, in diſobedience to the rules preſcribed by the ſtat. 37 Edw. III. cap. 19. is felony. See FALCONRY.

HAWK, *mate*, in *Falconry*, a name given to an old ſtaunch *hawk*, which being wiſed to fly, will teach a young one to fly.

HAWK-*weed*, *hieracium*, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs. Its characters are theſe: it has a flower compoſed of many hermaphrodite *florets*, included in one common ſcaly empalement; the *florets* are equal and uniform; they have one petal, ſhaped like a tongue, indented in five parts at the point; and have each five ſhort, hairy ſtamina; at the bottom of the petal is fituated a germen, which becomes a ſhort four-cornered ſeed, crowned with down, ſtanding in the empalement. There is a great number of the ſpecies of this plant, which grow naturally as weeds in England. Miller therefore only ſelects ſeven, which he eſteems worth cultivating.

HAWK *weed*, *baſtard*, *crepis*, in *Botany*, a genus of the *ſyngeneſia polygamia æqualis* claſs. Its characters are theſe: it has a flower compoſed of many hermaphrodite *florets*, which are included in a double empalement; theſe *florets* are of one leaf, uniform, tongue-ſhaped, and are indented at the top in five parts, having each five ſhort, hairy ſtamina: the germen is ſituated in the centre of the *florets*, which afterward becomes an oblong ſeed, crowned with a long feathery down, which ſits upon little foot-ſtalks. There are four ſpecies, which Miller ſelects out of numbers which he ſays grow as weeds in divers parts of Europe.

HAWKERS, anciently were fraudulent perſons, who went from place to place, buying and ſelling braſs, pewter, and other merchandize, which ought to be uttered in open market. In this ſenſe the word is mentioned, anno 5 Hen. VIII. cap. 6. and 33 ejuſdem, cap. 4.

The appellation *hawkers* ſeems to have ariſen from their uncertain wandrings, like thoſe who, with *hawks*, ſeek their game where they can find it.

The term is now uſed as ſynonymous with pedlars; a perſon who travels about the country ſelling wares.

Every *hawker* muſt take out an annual licence, for which he muſt pay 4*l.* and if he travels with a horſe, aſs, or mule, for every one of them 8*l.* If he travels without a licence, or contrary to it, he forfeits for every offence to the informer, and the poor of the parith where diſcovered, 10*l.* If he travels with a forged licence, he forfeits 50*l.*

The acts relating to *hawkers* do not extend to makers of goods, or their agents; or to thoſe who ſell goods in fairs or markets; to the ſellers of fiſh, fruit, or other victuals; nor to the venders of books and news-papers. 9 and 10 W. cap. 27. 3 and 4 Anne, cap. 4. But *hawkers* ſhall not, by virtue of ſuch licence, ſell or offer to ſale any tea, or ſpirituous liquors, though with a permit, under the penalty of having the ſame ſeized, and impriſonment and proſecution of the offender. 9 Geo. II. cap. 35. And if any foreign cambrick or French lawn ſhall be found in the poſſeſſion of any *hawker*, &c. the ſame ſhall be ſolediled, together with all the goods in his pack; and he ſhall be adjudged to have forfeited his licence. 7 Geo. III. cap. 39.

HAWKERS is a term alſo applied to thoſe who go up and down London ſtreets, and country towns, ſelling news-papers, pamphlets, &c.

HAWKING, the art of exerciſe or chaſing and taking wild fowl, by means of *hawks*, or birds of prey.

Hawking is the ſame thing with what we otherwiſe call FALCONRY.

The word *hawking*, in its latitude, alſo includes the taming and diſciplining of hawks, and fitting them for the ſport.

Hawking, though an exerciſe now much diſuſed among us, in compariſon of what it anciently was, does yet furniſh a great variety of ſignificant terms, which ſtill obtain in our language. Thus, the parts of a hawk have their proper names. The legs, from the thigh to the foot, are called *arms*: the feet, the *petty-ſingles*; the claws, the *pounces*. The wings are called the *pails*; the long feathers thereof, the *beams*; the two longeſt, the *principal feathers*; the next thereto, the *flags*. The tail is called the *train*; the breaſt-feathers, the *mails*; thoſe behind the thigh, the *pendant feathers*. When the feathers are not yet full grown, ſhe is ſaid to be *unfummed*; when they are complete, ſhe is *fummed*. The craw, or crop, is called the *gorge*. The pipe next the fundament, where the feces are drawn down, is called the *pearl*; the ſlimy ſubſtance lying in the panel, is called the *glet*. The upper and crooked part of the bill is called the *beak*; the nether part, the *clap*; the yellow part between the beak and the eyes, the *ſere*, or *ſeres*; the two ſmall holes therein, the *nares*.

As to her furniture: the feathers, with bells buttoned on her legs, are called *ornaments*. The leathern thong, where by the falconer holds the hawk, is called the *leam* or *leaſh*; the little ſtraps, by which the leaſe is faſtened to the legs, *ſeſſes*: and a line or packthread faſtened to the leaſe, in diſciplining her, a *creance*. A cover for her head, to keep her in the dark, is called a *hood*; a large wide hood, open behind, to be worn at firſt, is called a *caſter hood*; to draw the ſtrings, that the hood may be in readineſs to be pulled off, is called *ſaſtring the hood*. The blinding a hawk juſt taken, by running a thread through her eye-lids, and thus drawing them over the eyes, to prepare her for being hooded, is called *ſeeling*. A figure, or reſemblance of a fowl, made of leather and feathers, is called a *lure*. Her reſting place, when off the falconer's fiſt, is called the *perch*. The place where her meat is laid, is called the *bock*; and that wherein ſhe is ſet, while her feathers fall and come again, the *mew*.

Something given to a hawk, to cleanſe and purge her gorge, is called *caſting*. Small feathers given her to make her caſt, are called *pellmongs*. Gravel given her to help to bring down her ſtomach, is called a *rangle*. Her throwing up filth from the gorge after caſting, is called *pleaming*. The purging of her greaſe, &c. *enfeaming*. A being ſtuffed is called *gorgiting*. The inſerting a feather in her wing, in lieu of a broken one, is called *imping*. The giving her a leg, wing, or pinion of a fowl to pull at, is called *tiring*. The neck of a bird the hawk preys on, is called the *neck*. What the hawk leaves of her prey, is called the *pill*, or *pelf*.

There are alſo proper terms for her ſeveral actions. When ſhe ſtutters with her wings, as if ſtriving to get away, either from perch or fiſt, ſhe is ſaid to *bate*. When, ſtanding too near, the fighting with each other, is called *wrabbling*. When the young ones ſquiver, and ſhake their wings in obedience to the elder, it is called *cowering*. When ſhe wipes her beak after feeding, ſhe is ſaid to *feak*. When ſhe ſleeps, ſhe is ſaid to *pitch*. From the time of exchanging her coat, till ſhe turn white again, is called her *intermewing*. Treading is called *cawking*. When ſhe ſtretches one of her wings after her legs, and then the other, it is called *mantling*. Her dung is called *mutting*; when ſhe mutes a good way from her, ſhe is ſaid to *ſhoot*; and when ſhe does it directly down, inſtead of yerking backwards, ſhe is ſaid to *ſtoop*; and if it be in drops, it is called *dropping*. When ſhe, as it were, ſneezes, it is called *ſalting*. When ſhe raiſes and ſhakes herſelf, ſhe is ſaid to *rouſe*. When, after mantling, ſhe croſſes her wings together over her back, ſhe is ſaid to *ronſir*.

When a hawk ſeizes, ſhe is ſaid to *bind*. When, after ſeizing, ſhe pulls off the feathers, ſhe is ſaid to *plume*. When ſhe raiſes a fowl aloft, and at length deſcends with it to the ground, it is called *trufſing*. When, being aloft, ſhe deſcends to ſtrike her prey, it is called *ſtooping*. When ſhe flies out too far from the game, ſhe is ſaid to *rake*. When, forſaking her proper game, ſhe flies at pyes, crows, &c. that chance to croſs her, it is called a *check*. When, miſſing the fowl, ſhe betakes herſelf to the next check, ſhe is ſaid to *ſly at head*. The fowl or game ſhe flies at is called the *quarry*. The dead body of a fowl, killed by the hawk, is called a *pot*. When the flies away with the quarry, ſhe is ſaid to *carry*. When, in ſtooping, ſhe turns two or three times on the wing, to recover herſelf before ſhe ſeizes, it is called *cancelling*. When ſhe hits the prey, yet does not truſs it, it is called *ruff*. The making a hawk tame and gentle, is called *reclaiming*. The bringing her to endure company, *manning* her. An old ſtaunch hawk, uſed to fly and ſet example to a young one, is called a *make howk*.

The reclaiming, manning, and bringing up a hawk to the ſport, are not eaſily brought to any preciſe ſet of rules. They conſiſt in a number of little practices and obſervances, calculated to familiarize the falconer to his bird, to procure the love thereof, &c. The principal hold and foundation which the falconer has to work upon, is the bird's ſtomach. This great principle of appetite he is to make uſe of a hundred ways, to lead the bird obliquely to what he would have from her: all he can do is, to divert nature, and make her ſubſervient to his purpoſes, to make it the intereſt of the bird, either real or apparent, to do what the falconer requires of her. The courſe, it is evident, will be different, according to the ſtate and condition of the bird to be managed. An *eyaſs*, e. g. needs

no reclaiming; she is to be carefully nursed and brought up in her natural tameness.

A *haunter, jour-hawk*, or *ramage-hawk*, needs no nursing; she is to be brought down from her wildness, and habituated to another course of life; and in pursuance of her own views and interests, she is to be made subject to those of her master.

To reclaim, e. g. a *hargard falcon*, they begin with shutting her up from the light, by pulling a hood over her eyes, and fixing her by a *creance*, which makes her more accessible.

The next thing is, to handle her frequently; taking her up, often stroaking her, setting her on the hand, and carrying her about; unhooding, and presently hooding her again; and this for eight or nine days, without ever suffering her to sleep.

All the while she is to be kept sharp set, but to be frequently fed with a little at a time, unhooding her for the purpose; and, when unhooded, the voice is to be continually used to her, that she may learn it; and that the hearing of the voice may naturally put her in hopes of being fed. This done, she is to be invited to come from the perch to the fist, by unstriking her hood, shewing her some meat, using the voice, and calling her till she come to it, and feed thereon. If she still refuse, keep her sharp set till she will do it. Proceed then to bring her to the lure, by giving her to some person to hold, and calling her with a lure, well garnished with meat on both sides, and give her a bit: use her to this for six or seven days; after which, tempt her to come gradually farther and farther off to the lure, waving it, and calling it round your head, &c. and if she come to it roundly, reward her: in three or four days more call her to your lure, well garnished as above, as far as it is possible for her to see or hear you; and let her loose from all her furniture.

The hawk thus manned, reclaimed, and lured, you may go with her into the fields, and whistle her off your fist, to see whether she will take out, or no: if she mount and fly round you in circles, as a good hawk ought to do, after two or three turns call to her with your voice, and fling out the lure about your head, and upon her stooping or coming to it, give her a chicken, or pigeon, and let her kill and feed thereon. Being thus far initiated, give her still stones every evening, to prepare her body for castings; and then castings, to cleanse and scour her body, and make her eager. This course continue, till she have endewed and muted enough to enter upon business.

If the hawk be intended for some particular sort of game, let her lure be a resemblance of that sort of game; and make a practice of frequently feeding and rewarding her thereon, or on a train of the same kind; calling her, when feeding, as if she were called to the lure. Add, that it may be proper to feed her in such sort of places as those her game is chiefly to be found in.

To *enter a hawk*, it may be convenient to take a well-quarried hawk, and let her stoop a fowl, on brook or plash; this done, reward, hood, and set her; and taking the young hawk, go half a bow-shot up the wind, loose her hood, and softly whistle her off the fist, till the have soused, or mured; then let her fly with her head into the wind, and when she is at a proper height, let go a fowl for her to stoop and truss. See FALCON.

HAWM. See HAUM.

HAWSE, or HAUSE, denotes the situation of the cable before the ship's stem, when she is moored with two anchors out from forward; viz. one on the starboard, and the other on the larboard bow. *Hawse* denotes also any small distance a-head of a ship, or between her head and the anchors employed to ride her.

HAWSER, or HALSER, belonging to a ship, is a rope consisting of three strands; being a kind of little cable, serving for many uses on board; as to fasten the main and fore-shrouds, to warp a ship over a bar, &c.

HAWSES, or HAWSE-*holes*, in a *Ship*, are two round holes under her head, through which the CABLES pass when she lies at ANCHOR. See *Tab. Ship. fig.* 2. n. 10.

HAWSE, *burning in the*, is when the cable endures an extraordinary stress.

HAWSE, *foul*, is when the holes are high above the water.

HAWSE, *slowing the*, is untwisting of two cables, which being let out at *different hawses*, are entangled or twisted about one another. Or, directing the cables to their anchors, without lying athwart the stem.

HAWSE, *foul*, implies that the cables lie across the stems, or beat upon each other, so as to be rubbed or chafed by the motion of the vessel.

HAWSE-*full, or to ride* HAWSE-*full*, at sea. See RIDE.

HAWSE, *stopping the*. When there is reason to suspect the cable may be fretted in those holes, they veer out a little, to let another part endure the stress. This they call to *stop the hawse*.

Stopping the hawse is also used when new pieces are laid upon the cable in the *hawse*.

HAWSE, *riding upon the*, is when any weighty substance lies across, or falls directly before the *hawse*.

HAWSE-*pieces*, denote the foremost timbers of a ship, whose lower ends rest upon the knuckle-timber, or the foremost of the cant-timbers. They are generally parallel to the stem, having their upper ends sometimes terminated by the lower part of the beak-head; and otherwise, by the top of the bow, particularly in small ships and merchantmen.

HAWTHORN, in *Botany*. See MEDLAR.

HAY, in *Agriculture*, is a general name for any kind of grass, cut and dried for the food of cattle.

Whatever uplands are designed to be mowed for *hay*, are to be shut up in the beginning of February, and no cattle suffered to come upon them afterwards; but the meadows and marsh-lands, where the grass grows quicker, need not be shut up till April, except the spring be bad; and many farmers feed those meadows which are in danger of overflowing, till the first of May, and then shut them up for mowing.

In spring, the stones, sticks, and all other kinds of foulness that lie upon the land, are to be picked up, and the mole-hills all levelled and spread, because they hinder the mowers. If the meadows lie uneven, or if they have been trodden down in winter, they should be rolled all over with a large wooden roller; the mowers will then be able to cut much closer; for this, and the quantity of the *hay*, will very well answer the trouble.

The time of mowing the grass must be proportioned to its ripeness; nothing can be more prejudicial to the crop, than the cutting it too soon, because the sap is not then fully come out of the root, and such grass when dried into *hay*, shrinks up almost into nothing. It is very wrong also to let it stand too long; for when the seed has been ripened, and is shed, the moisture of the sap all dries away out of the stalks, and they become no better than so much stubble, as is plainly seen by those grasses which grow in hedges, and not being mowed, die away after they have perfected their seed, and become tasteless, and very different from *hay*. The middle or latter end of June is the general season for mowing; and the red flowers of the honey-suckle beginning to wither, generally give the farmers notice that the time is coming on. But he may be more assured of this, by the tops or heads of the grass looking full, bending downwards, and looking brown; it is then in the proper state to be cut down. If there is great plenty of the *hay*, and it lie thick in the swarth, the hay-makers should follow the mowers, and turn the swaths as they cut them, unless there seems danger of wet weather; but in that case it is better to let them lie in the swarth. At night it must be made up into little cocks, and these in the morning must be spread again and turned, so that the other side may wither. After this it is to be made into small cocks again, and the next day it is to be spread again, and drawn into long rows, which they call wind-rows. From these it is to be made into large cocks after a little drying; and these large ones, if any wet comes, are to be spread open once again before they are carried in.

Mowing of land too often, and continuing it too long, are a very great prejudice to it, unless it have the advantage of being fed and renewed by land floods at times. The former who has not this advantage to his lands, should feed them once in two or three years, instead of making *hay* from them, unless he chooses to lay on manure constantly to keep them in heart. Feeding the *hay*-lands is the same sort of respite that fallowing is to corn-lands, both very necessary and advantageous. See LUCERNE, SAINTFOIN, and TREFOIL.

Mr. Boyle tells us, that by surrounding glasses with refuse *hay*, well prested and uniformly wetted, it would for several days afford such a heat, as rendered that of horsedung useless. Works abr. vol. i. p. 72.

It is well known that *hay* laid up in wet stacks, often takes fire. Hence the custom of the ancients to place their *hay-stacks*, or *furnices*, out of their villages.

Infusions of *hay*, or any other vegetable production in water, will, after some days, yield a sort of whitish scum or mother-mists, which will appear on the surface, and, when examined by the microscope, will be found to contain an inexpressible number of minute living creatures, or ANIMALCULES, of various sizes, forms, and kinds. Many of these are the same with some of the animals in pepper-waters; for there are some which are found indifferently in all watery fluids exposed to the air. The most common sort are oval, some what resembling an ant's egg in shape. These run to and fro with great velocity; and they will occasionally stop, and turn several times with surprising swiftness round their own axis. This kind of motion is owing to a number of legs or fins with which they are furnished, placed in a circular order; and the same

ſame motion is obſerved in many other animalcules. There is another kind very like the former, except that they have one end conſiderably ſharper than the other; and they always move with the ſharp end foremoſt; they are moſtly tranſparent, but ribbed longitudinally like a melon; others are only tranſparent at their ſmaller end; theſe have no legs nor fins. Another ſort are alſo found in theſe infuſions, which are nearly as long as thoſe of the largeſt ſize in pepper-water; they are very nimble, and have a power of contracting and extending themſelves as they ſwim along. Theſe have ſeveral feet, viſible at the end, which ſeems to be the coſe-pair, which are moſt diſtinguiſhable as the water dries up, and the body of the animal ſhrinks into a globular form. There is another ſpecies of theſe animals, whoſe bodies are ſpherical, but pointed like a pear, and reſembling bladders filled with water, in which a great number of dark particles are obſerved in continual agitation. The motion of theſe animals is chiefly a revolving one, which they perform a hundred times in a minute, firſt one way, and then the contrary, without moving a hair's breadth out of their place; but they are able alſo, when they pleaſe, to move backwards and forwards very nimbly. Animalcules in the ſhape of eels are often met with in theſe infuſions, and in many other liquors; their ſize is extremely different, ſome of them being an hundred times larger than others. Baker's Micr. 1743. p. 77, &c.

HAY-*market*. Carts of *hay* which ſtand to be ſold in the *hay-market*, are to pay 3*d.* per load towards paving and repairing the ſtreet; and ſhall not ſtand loaded with *hay* after three o'clock in the afternoon, &c. on pain of forfeiting 5*s.* *Hay* ſold in London, &c. between the firſt of June and the laſt of Auguſt, being new *hay*, is to weigh ſixty pounds a truſs; and old *hay*, during the remainder of the year, fifty-ſix pounds, under the penalty of 2*s.* 6*d.* for every truſs offered to ſale. 2 W. & M. cap. 6. 8 & 9 W. cap. 4. 31 Geo. II. cap. 40.

HAY-*worms*. Beſide the ſmall worms or animalcules bred in water, in which *hay* has been infuſed, which are only the objects of microſcopical obſervations, we find that it is a proper nidus of itſelf, ſometimes, for a much larger ſpecies of inſect called the *hay-worm*, whoſe origin and changes have not, as yet however, been properly obſerved. An animal which can be produced from the egg, and grow to its full ſize during the ſhort time that *hay* is laſt in the field in making, muſt be very quick in its growth; but yet it is found that multitudes of ſuch are produced, though probably few come to perfection, the removing of the *hay* naturally deſtroying many. In the Philoſophical Tranſactions we have an account of the ſame ſort of inſect breeding among cocks of barley while laſt in the field, many millions of them being diſcovered together on ſtirring or lifting up the cocks with a cane. They are alſo found in the barns where barley is laid up, and are ſo numerous that they ſtrew the way the carts go that carry the barley home by the multitudes that are ſhook off. They are about half an inch long, as thick as a pigeon's feather, and of a whitiſh colour ſhaded with faint ſtripes of a yellowiſh brown. They have fourteen feet, and ſeem evidently by all their marks to be true caterpillars. They are of an offenſive ſmell; and their excrements are hard white pellets of grey flour, like that of barley; whence it is plain that they eat the grain.

HAY, *Burgundian*, in *Botany*. See *Snail* TREFOIL.

HAY, HAYA, or HAYE, a fence or incloſure, formed of rails; wherewith ſome foreſts, parks, &c. were anciently ſurrounded.

HAY is ſometimes alſo uſed for the park itſelf; and ſometimes for a hedge, or a place hedged round.

HAYE alſo denote a particular kind of nets, for the taking of rabbits, hares, &c.

HAYBOTE, HEDGBOTE, in our *Ancient Cuſtoms*, a mulct, or recompence, for hedge-breaking; or rather, a right to take wood neceſſary for making hedges either by a tenant for life, or for years, though not expreſſed in the grant or leaſe.

It is mentioned in the Monaſt. tom. ii. pag. 134. *Et concedo ei, ut de boſco meo* heybot, &c. In the ſame place, *haybote* ſignifies a right to take timber to repair the houſe. See BOTE.

HAYWARD, or HAWARD, a keeper of the common herd of cattle of a town; who is to look that they neither break nor crop the hedges of incloſed grounds; and is ſworn in the lord's court for the due performance of his office. See AGILLARIUS.

HAZARD, a game on dice, without tables, is very properly ſo called, ſince it ſpecially makes a man, or undoes him.

It is played with only two dice; and as many may play at it as can ſtand round the largeſt round table.

Two things are chiefly to be obſerved, viz. main and chance; the latter belonging to the caſter, and the former, or main, to the other gameſters. There can be no main thrown above nine, nor under five: ſo that five, ſix, ſeven, eight, and nine, are the only mains ſtung at *hazard*. Chances and nicks are from four to ten: thus four is a chance to nine, five to eight, ſix to ſeven, ſeven to ſix, eight to five; and nine and ten a chance to five, ſix, ſeven, and eight: in ſhort, four, five, ſix, ſeven, eight, nine, and ten, are chances to any main, if any of theſe nick it not. Now nicks are either when the chance is the ſame with the main, as five and five, or the like; or ſix and twelve, ſeven and eleven, eight and twelve. Here obſerve, that twelve is out to nine, ſeven, and five; eleven is out to nine, eight, ſix, and five; and ames-ace, and duce-ace, are out to all mains whatever.

But to illuſtrate this game by a few examples: ſuppoſe the main to be ſeven, and the caſter throws five, which is his chance; he then throws again, and if five turn up, he wins all the money ſet him; but if ſeven is thrown, he muſt pay as much money as there is on the board: again, if ſeven be the main, and the caſter throws eleven, or a nick, he ſweeps away all the money on the table; but if he throws a chance, as in the firſt caſe, he muſt throw again: laſtly, if ſeven be the main, and the caſter throws ames-ace, duce-ace, or twelve, he is out; but if he throws from four to ten, he hath a chance; though they are accounted the worſt chances on the dice, as ſeven is reputed the beſt and eaſieſt main to be ſtung. Four and five are bad throws (the former of which being called by the tribe of nickers, little dick-ſtuer) as having only two chances, viz. trey-ace and two duces, or trey-duce and quater-ace; whereas ſeven hath three chances, viz. cinque-duce, ſice-ace, and quater-trey. Nine and ten are in the like condition with four and five; having only two chances. Six and eight have indeed the ſame number of chances with ſeven, viz. three; but experienced gameſters nevertheleſs prefer the ſeven, on account of the difficulty to throw the doublets, two quaters, or two treys. It is alſo the opinion of moſt, that at the firſt throw the caſter hath the worſt of it. On the whole, *hazard* is certainly one of the moſt bewitching and ruinous games played on the dice. Happy, therefore, the man who either never heard of it, or who has reſolution enough to leave it off in time. See De Moivre's Doct. of Chances, p. 160, &c. See CHANCE, and GAMING.

HAZLE, or NUT-*tree*, *Corylus*, in *Botany*, a genus of the *monœcia polyandria* claſs. Its characters are theſe: it hath male and female flowers growing at remote diſtances on the ſame tree; the male flowers are produced in long ſcaly catkins, having no petals, but eight ſhort ſtamina faſtened to the ſide of the ſcale; the female flowers are included in the future bud, ſitting cloſe to the branches, having a thick two-leaved pericranthium: theſe have no petals, but a ſmall round germen occupies the centre, which afterward becomes an oval nut, ſhaved at the baſe, and compreſſed at the top, ending in a point. Miller enumerates three ſpecies; the wild *hazle nut*, the FILBERT, and the Byzantine nut.

All theſe ſorts may be propagated by layers, or by ſowing their nuts in February; which, in order to preſerve them good, ſhould be kept in ſand in a moiſt cellar, where the vermin cannot come to deſtroy them; nor ſhould the external air be excluded from them, which would occaſion their growing mouldy. Miller.

No great uſe is made of the nut-tree in medicine; ſome account the juli and nut ſhells to be reſtringent or binding; the kernels are hard of digeſtion, and ſtuffing, cauſing ſhortneſs of breath and wheezing; yet an emulſion made of them with mead, is commended for an old dry cough.

Filberts are more nouriſhing than nuts; and are by ſome eſteemed pectoral. The moderate uſe of them agrees at all times with every age and conſtitution, provided there be a good ſtomach. James.

Nuts and filberts will purge when taken in conſiderable quantities. The cream of theſe nuts is good for the ſtone, and heat of urine; emulſions may be made of them. Quercetan gave a dram of the powder of nut-ſhells, mixed with an equal quantity of prepared coral, in a glaſs of the water of carduus benedictus, or corn-poppy, in the pleuriſy.

HAZLE *earth*, in *Agriculture*, a moderately compact earth, much approaching to the nature of the chalky ſoil, and indeed properly a ſpecies of it, but always containing a large quantity of teſin-coloured ſand.

HAZLE-*hen*, in *Ornithology*, the name of bird of the gallinaceous kind, common in the woods of Germany, and ſuppoſed by many to be the ATTAGEN of the ancients.

It is of the ſize of a very ſmall pullet; its belly is all over perfectly white; its breaſt white variegated with black; its throat is reddiſh, and under the beak black, in the male, but in the female, of the ſame colour with the

reſt; it has on each ſide of the head a white line; its head is of a greyiſh brown, and its back and rump much of the ſame colour with the partridge; its ſides are of a yellowiſh or reddiſh brown, variegated with white; its wings are variegated with black, brown, and white, as is alſo the tail, but that has an admixture of red. It is caught in thick woods, and feeds on vegetables. Ray's Ornithology, p. 126.

HAZLE, *witch*, in *Botany*, *hamamelis*, a genus of the *tetrandria digynia* claſs. Its characters are theſe: it is male and female in different plants; the male flowers have a four-leaved empalement, four narrow petals which are reflexed, and four narrow ſtabmina which are ſhorter than the petals; the female flowers have a four-leaved involucrum, in which are four flowers, with a four-leaved coloured empalement; they have four narrow petals, and four nectariums adhering to the petals; in the centre is ſituated an oval hairy germen, which afterward becomes an oval capſule ſtuing in the involucrum, having two cells, each containing one hard, oblong, ſmooth ſeed. We have but one ſpecies of this plant, a native of North America, which is rather preferred in gardens for variety than for beauty.

HEAD, *caput*, the uppermoſt or foremoſt part of the body of an animal.

Pliny, and other of the ancient naturaliſts, ſpeak of a nation of people without *heads*, called BLEMMYES.

We have accounts, in modern geographers and travellers, of people whoſe *heads* are as flat as the hand; it being the cuſtom among them to flatten the children's *heads*, when new-born, by paſſing them through a preſs, or laying them between two planks with a conſiderable weight thereon. Theſe are ſaid to be the inhabitants of the province of Coſoquas, on the river Amazons, in South America.

Anatomiſts account the *head* of man the firſt or uppermoſt venter; being that which comes laſt in order of diſſection, becauſe its contents are not ſo ſubject to corruption as thoſe of the others.

The *head* is divided into two parts: the firſt, the *calvaria* or ſcalp, being that part covered with hair.

The ſecond ſmooth, or without hair, called the *face* or viſage; by the Latins, *vultus*; and by the Greeks, *proſopon*, q. d. looking forward.

The former is ſubdivided into four, viz. the *front* or forehead, which is reputed the moſt humid, called by phyſicians the *ſinciput*, q. d. *ſemman caput*.

The hind or back-part, called *occiput*, by the Greeks, *inion*; becauſe all the nerves, which among them are called *neu*, ariſe from this part.

The middle or top-part, called the *crown* of the *head*, and by anatomiſts *vertex*, *à vertendo*, becauſe the hair turns round there.

Laſtly, The ſides are called the *temples*, *tempora*, as being the places where the hair firſt begins to turn grey and diſcover the age.

The bone or baſis of the *head* is called by one general name, *ſkull* or *cranium*, conſiſting of ſeveral parts or leſſer bones.

The bone of the forehead is called *os frontis*, or *puppis*, or *coronale*, or *verecundum*; whence impudent perſons are ſaid to be *frontiſ*.

The bone of the ſcalp is called *os ſincipitis* or *bregma*.

The bone of the back of the *head*, *os occipitis* or *proræ*.

And thoſe of the temples, *temporalia*, or *oſſa temporis*.

Thoſe bones are connected or joined together by *ſutures*.

In the *head* are ſeated the principal organs of ſenſe, viz. the *eye*, *ear*, &c. and in it is likewiſe the *brain*, inveſted with its *meninges*, the ſuppoſed ſeat of the ſoul.

The *head* is moved by ten pair of muſcles, viz. the *ſcalenum*, *complexum*, *rectum minus externum*, *rectum minus externum*, *obliquum ſuperius*, *obliquum inferius*, *maſtoideum*, *rectum internum majus*, *rectum internum minus*, and *rectum lateralis*.

See each deſcribed under its reſpective article.

HEAD, *cartilages of the*. The condyloide apophyſes of the os occipitis, the glenoide cavities, or articular ſockets of the oſſa temporum, the eminences next theſe cavities, and the condyloide apophyſes of the lower jaw, are all cruſted over with very white and ſmooth cartilages, and there is likewiſe an interarticular or moveable cartilage in each articulation of the lower jaw with the temporal bones. The remaining cartilages of the *head* are the cartilaginous ſeptum, and other cartilages of the noſe; the ſmall cartilaginous ring in each orbit, the cartilages of the outer ear, and thoſe which are joined to the os hyoides; which ſee in their proper places.

HEAD, *ligaments of the*. The ligaments of the bones of the *head* are theſe: thoſe between the occipital condyles and the ſuperior apophyſis of the firſt vertebra of the neck; thoſe between the os occipitis and the apophyſis dentiformis of the ſecond vertebra; thoſe of the articulation of the lower jaw with the temporal bones; and thoſe by which the os hyoides is connected to the ſtyloide apophyſes. To theſe muſt be added the ligaments which connect the cartilages of the ear, thoſe of the noſe, the ſmall cartilaginous pulleys of the orbits, and the ciliary cartilages.

The ligaments of the occipital condyles reſemble thoſe of the vertebræ, and conſiſt of a ſtrong texture of ligamentary filaments, placed cloſe by each other round the whole articulation, and fixed by one end in the occipital bone, by the other in the ſuperior apophyſis of the firſt vertebra, and ſurrounding the capſular ligaments.

The ligaments which go from the os occipitis to the apophyſis dentiformis are very thick, and diſpoſed in ſeparate faſciculi, which afterwards unite, and the ligaments of the articulation of the lower jaw are very ſtrong, and diſpoſed and inſerted in ſuch a manner as thoſe by which the clavicle is inſerted into the ſternum. They are fixed, by one extremity, round the glenoide cavity, or articular ſockets and eminence of each temporal bone, by their middle, round the interarticular cartilage, and by the other extremity round each condyle of the lower jaw. Wiſſlow's Anatomy, vol. i. p. 151.

HEAD, *the diſeaſes of the*, are often miſtaken, even by phyſicians, for thoſe of other parts. Mr. Lieutaud, of the French Academy, gives an extraordinary caſe of this kind. A man had a fever, with a violent diſorder of the *head*; he afterwards was ſeized with a violent cough, and brought up a large quantity of matter: it was not doubted but that this was from the lungs, and no one queſtioned but that the man had an abſceſs there. On opening the body, however, the lungs were found perfectly ſound, and all his diſorder was found to be in his *head*, where the ſphenoidal, frontal, and maxillary ſinuſes were found ſo full of matter, that they could contain no more.

Some phyſicians tell us, that perſons who are ſubject to diſorders of the *head*, ought not to take any food at night. Dr. Bryan Robinſon of the Food and Diſcharges of Human Bodies, p. 95.

M. Le Dran, in his Obſervations on Wounds of the *Head*, ſhews how much more dangerous the caſe is, when the cranium does not break by violent blows, &c. than when it is fractured, becauſe of the greater commotion of the brain, &c. and therefore concludes it neceſſary to perform the operation of the trepan oftener than is commonly practiſed. Med. Eſſ. Edinb.

M. Winſlow has given us ſome very particular and curious remarks on the motions of the *head* and neck, in the Memoires de l'Acad. Royale des Sciences, an. 1730.

HEAD, *ulcers of the*. There are ſeveral ulcers which the hairy part of the *head* is ſubject to, and which the writers in medicine have diſtinguiſhed by the ſeveral names of *tineæ*, *favi*, and *achores*; though they do not all agree about the determinate ſignification of each of thoſe words. By the term *favi*, however, we now generally underſtand ſuch ulcers of the *head* as are full of cavities like a honey-comb; by *achores*, thoſe which are full of ſmall holes, and contain a moderately viſcid humour. Many call theſe diſorders by the common name of tinea, becauſe, from the abundance of ſmall holes in them, they make the *head* look like a moth-eaten garment; but this is a vague ſignification of the word, and we uſually now underſtand it, in a more determinate ſenſe, to mean a large and dry ſcab, to which the *heads* of children are ſubject, and which is full of thick foul ſcales, and very offenſive to the ſmell. This ſometimes alſo extends itſelf to the face, in which caſe it is called *creſta galtea*. It is often of a mild and benign nature, but is ſometimes very ill-conditioned and dangerous. There is alſo a yet worſe kind of tinea than this, which covers the whole hairy ſcalp with an aſh-coloured thick cruſt, attended with a violent itching and grievous ſtench: this is generally very difficult of cure, and the perſons afflicted with it have generally a pale unhealthy countenance; it much more frequently affects young perſons than adults, and is generally occaſioned either by the nurſe's irregular courſe of life, or the child's being uſed to foul feeding. Sometimes alſo ulcers of this kind from the ſame cauſes, break out in adults, and are very difficult to cure; theſe much reſemble the leproſy; and in the pox it is common to find the head and face, particularly the forehead, ſpread with dry ſcabs and ſcabby ulcers.

When ulcers of theſe kinds are ſlight, gentle purges, with the addition of calomel, ſhould be given at proper intervals, adminiſtering between whiles, to adults, the decoctions of the woods, with the ſweetening powders. Infants at the breaſt may take diaphoretic powders, and their nurſes ought to proſecute the other methods. Externally it is proper to uſe cream, with a ſmall quantity of ceruſs mixed in it, or the oil of eggs or of wax, with the elecampane ointment, or that of ceruſs or the diapompholygos.

pompholygor. And if the ulcers are of a worse kind, doses of calomel are to be given more frequently, and a little crude quicksilver may be added to the external applications with great success. But in worse cases, and where mercurials may not be employed, it will be necessary to take off all the hair; this may be done either by degrees or at once, by means of a pitch plaster spread upon strong cloth, and applied all over the scalp after the hair has been cut pretty short. When a plaster of this kind has lain on twelve, or four and twenty hours, the method is to pull it off at once, and it brings away with it both all the hair and the scabs. This, though a good method, is however a very harsh one, and cannot be done without great pain and effusion of blood. When the plaster is taken off, the blood is to be wiped away with dry lint, and then the *head* anointed with oil of bricks, and a small admixture of oil of wax among it, and afterwards the whole scalp should be covered with a plaster of frogs spawn, with a small admixture of camphor. This dressing should be repeated every day, till the injured parts are clean, and then they may be healed with the oil of eggs and essence of amber. Internal medicines, to sweeten the blood, and a regularity of diet, should also be observed at the same time; a mixture of crude antimony and flour of brimstone serve well for this purpose, and should be given for some time before the external remedies, here directed, are employed. Heister's Surgery, p. 378.

HEAD, *water in the.* See HYDROCEPHALUS.

HEAD *of fish, caput piscium.* The *head*, in the fish kind, is so very various in its shape and figure, that it makes one of the great articles of their distinction and characters. The *head* is always single, and placed at the anterior extremity of the body; but its proportion or size, as well as figure, is very various in the several kinds. Its differences in figure are five.

1. It is, in some fishes, cathetoplateous; that is, its sides seem squeezed together, and its perpendicular measure for this reason, is greater than its transverse measure. We have instances of this in the pearch, the cyprini, and in several others.

2. In others it is plagioplateous; that is, depressed so that its top and bottom seem to have been squeezed downwards upon one another. Hence its horizontal breadth is greater than its perpendicular, and it is, in all respects, the contrary to the other *head*. The conger, the sturgeon, and the ray-fish, give us evident instances of this sort of *head*.

3. In some fishes the *head* is evidently rounded and cylindric, as in the petromyzon.

4. The *head* is, in some, smooth, as is the case of most fishes; but in others it is rough and aculeated, as in the scorpæna, the cotti, and the legyri.

The differences with respect to proportion are also very great. The *head*, in respect of the rest of the body, is, in some, 1. Narrower than the middle of the body, as in the cyprini, salmons, mackrel, pearch, &c. 2. In some it is broader than the middle of the body, as in the cotti, fishes, &c. And, 3. In others it is about equal to the middle of the body in breadth, as in the clarias.

For the differences of the mouths of fishes, see MOUTH.

The bones of the *head*, in all animals, deserve great attention; and in fish particularly, as they are more numerous in these than in other creatures. They differ much also in the various kinds of fish, in number, figure, and situation. As to number, 1. They are fewer than usual in the cetaceous and cartilaginous kinds. 2. In the spinose fishes, in general, they are very numerous: the bones in the *head* of the perca fluviatilis of Bellonius will serve as an instance of this. The number is not the same in the several kinds that seem nearest allied. In the fish last mentioned there are no less than eighty: there are five in the tongue, one oblong one in the anterior part, and four shorter in the hinder part; there are four in the lower jaw, two on each side; the ossa hypophthalmica are ten on each side, four are small, and of different figures from the rest; the membrana branchiostega contains on each side seven of them; the osseous laminæ behind the eyes, are four on each side; the upper jaw consists of four bones, two on each side; the nostrils have each one bone placed below them; the bones of the palate are four, three of these are small and stand forwards, the other is long and shaped like a pickax-head, and extended all over the palate; the middle of the anterior bone is nicely articulated with this; there is beside this, a cartilaginous bone, of a very singular figure, extended under the bones of the palate, almost to the end of the snout; this has on each side an angular bone fastened to it, and under that end which is nearest the snout there is yet another placed, which is of a very singular figure.

The bones that cover the *head* above are four; the two anterior ones are small; the two posterior ones are long, and so broad, that they cover the greater part of the *head* and cranium. The bones of the cranium are eleven in number; that which is nearest the vertebræ is large, and has several apophyses and cavities: in the lower part of this there are contained two oblong and flat little bones, of almost a stony hardness: all the rest are smaller, and all of very singular and remarkable figures. Artedi, Ichthyolog.

HEAD is also applied in a general sense, by analogy, to the uppermost or principal extremity of any thing; or figuratively, when speaking of communities, to the superior; and, when referred to place or priority, is that station or position which is most honourable.

HEAD, *in Architecture. Heads* are used as an ornament of sculpture or carved work, frequently serving as the key of an arch or flat band, and other occasions.

These *heads* usually represent some of the heathen divinities, virtues, seasons, ages, &c. with their attributes. The *heads* of beasts are also used in places suitable thereto: as a bullock's or sheep's *head*, for a shambles or a market-house; a dog's for a kennel; a deer's or a boar's, for a park or forest; or a horse's, for a stable, &c.

In the metopes of the friezes, and other parts of certain antique Doric temples, we meet with representations of bullocks or rams *heads* flayed, as a symbol of the sacrifices offered there.

In *Heraldry*, the *heads* of men, beasts, birds, &c. are borne in armoury, either full-faced and in front, or side-faced and in profile, which must be distinguished in blazoning.

Among *Medallists*, the different *heads* on ancient coins are distinguished by the different dresses thereof. See MEDAL.

In the imperial medals, where the *head* is quite bare, it is usually a sign the person was not an emperor, but one of the children of one, or the presumptive heir of the empire.

Though we have instances of those who were only Cæsars, and never reigned, being crowned with laurel or adorned with a diadem; as on the contrary, we have some emperors *heads* entirely bare.

The *heads* which are covered, are either covered with a diadem or a crown, or a simple cask, or a veil, or with some other foreign covering; whereof the diadem is the most ancient. The senate first granted it to Julius Cæsar to wear the laurel crown, which his successors took after him.

The *heads* of deities are frequently distinguished by some special symbol thereof.

HEAD is also used for the horns of a deer, as a hart, buck, &c.

Harts *move*, or cast their *heads*, every year, and get new ones.

The old hart or buck casts his *head* sooner than the young; and the time is about the month of February or March. Having cast their *heads*, they instantly withdraw into the thickets, hiding themselves in convenient places near good water, &c. and far from the annoyance of flies.

After they have mewed, they begin to *button* again in March or April, i. e. to shoot out new horns, which at first appear like little branches.

Note, if a hart be gelt before he have a *head*, he will never bear any; and if he be gelt when he has a *head*, he will never after mew or cast it. If only one of his testicles be taken out, it is said he will want a horn on that side; and that if one of the testicles be only tied up, he will want the horn of the opposite side.

The age of a hart or deer is usually reckoned by the number of *heads*. A deer of the first *head*, of the second *head*, &c.

At one year they have nothing but bunches, called *spimsticors*, of horns to come. The second year they appear more perfectly, but straight and simple: this makes the first *head*, properly called *brockets*, and, in a fallow deer, *pricks*. The third year they grow into two *spears*, or four, six, or eight small branches. At the fourth, they bear eight or ten. At the fifth, ten or twelve. At the sixth, fourteen or fifteen. At the seventh year they bear their *heads* beamed, branched, and fourmed, as much as they will bear; never multiplying further, but only growing in magnitude.

The names and diversities of *heads*, in the hunting language, are as follow:

The part that bears the antlers, royals, and tops, is called the *beam*, and the little streaks therein are *gutters*: that which is about the cruft of the beam is termed *pearls*; and that which is about the bur itself, formed like little pearls, is called *pearls bigger than the rest*: the *bur* is next the head, and that which is about the burrs called *pearls*: the first branch is called *antler*, the second *fur-antler*; all the rest which grow afterwards, till you come

come to the crown, palm, or croche, are called *royals*, or *fur-royals*; the little buds or broches, about the tops, are called *antlers*.

The *heads* alſo go by ſeveral names. The firſt *head* is called a *crown top*, becauſe the croches are ranged in form of a crown; the ſecond is called a *raiſed top*, becauſe the croches are formed like a man's hand. In all *heads* which bear not above three or four, the croches being placed aloft, all of one height, in form of a cluſter of nuts, are called *heads of ſix many croches*. All *heads* which bear two on the top, or have their croches doubling, are called *forked heads*. All *heads* which have double barrs, or the antlers, royals, and croches, turned downwards contrary to the other *heads* are called *ſimple heads*. See HUNTING.

HEAD is ſometimes alſo uſed for the whole man.

In this ſenſe we ſay, to aſſeſs a reward for a man's *head*. In proſcriptions, there is a price ſet on a man's *head*.

Capitation denotes a tax laid upon each *head*, called alſo *poll* and *head-money*.

HEAD, in the *Military Art*. *Head of the camp* is the front or foremoſt part of the ground an army is encamped on, or that which advances moſt towards the field or enemy.

The *head* of the camp is always to be the beſt fortified.

In the like ſenſe we ſay, the *head of the trenches*, the *head of the ſap*, *of the works*, &c. meaning the *front*, or thoſe parts next the enemy, and fartheſt from the body of the place. See TRENCH and ATTACK.

The *head of a horn work* is that part contained between the flanked angles of the two demi-baſtions.

HEAD *of a ſhip* or other veſſel, is the *prow*, or that part that goes foremoſt, including the bows on each ſide.

HEAD alſo denotes an ornamental figure erected on the continuation of a ſhip's ſtem, as being expreſſive of her name, and emblematical of war, navigation, commerce, &c. See *Tab. Ship. fig. 2 lit. A. fig. 1. lit. L.*

HEAD, in the *Manage*. The perfections required to the *head* of a horſe are, that it be ſmall, narrow, lean, and dry. Horſes with a big groſs *head*, are apt, by their weight, to reſt and loll upon the bridle, and ſo to incommode the rider's hand. A horſe with a large head can never look ſtately, unleſs he have a long and very well-turned neck, and place his *head* well. Horſes with groſs, fat *heads*, much charged with fleſh, are too often ſubject to infirmities of the eyes.

But the chief thing in a horſe's *head* is a good *reſet*, ſo as he may be able to bring his *head* into its natural ſituation; which is, that all the fore-part, from the brow to the noſe, be perpendicular to the ground; ſo that if a plummet were applied thereto, it would but juſt raze or ſhave it. See HORSE.

The *head* of a horſe is alſo uſed to import the action of his neck, and the effect of the bridle and wriſt.

To give a horſe the *head*, ſee EQUIPPER.

HEAD *in, and likewiſe the hips*, is a phraſe importing that you muſt paſſage your horſe with his *head and croupe in*, i. e. work him ſide-ways upon two parallel lines, at ſtep or trot, ſo that when the horſe makes a ſtep or volt, his ſhoulders make a *pyle* or tread, at the ſame time that his haunches give the tract of another; and the horſe plying or bending his neck, turns his *head* a little within the volt, and ſo looks upon the ground he is to go over.

Moors HEAD is underſtood of a horſe with a black *head* and feet, the body being uſually of a roan colour. It is alſo uſed by engineers, for a kind of boom or grenade ſhot out of a cannon: in *Heraldry*, for a repreſentation, uſually in profile, of a *blackmoor's head*, ſwathed or rolled about with a bandage; frequently borne as a creſt: in *Chemiſtry*, as a cover or capital of an alembic, having a long neck, to convey the vapours raiſed by the fire into a veſſel, which ſerves as a refrigeratory. In *Muſic*, the *head* of a lute, theorbo, or the like, is the place where the pins or pegs are ſcrewed, to ſtretch or ſlacken the ſtrings.

Dragon's HEAD, in *Aſtronomy*, &c. is the aſcending NODE of the moon or other planet.

HEAD-*ach*, in *Medicine*. Phyſicians commonly diſtinguiſh the *head-ach* into two kinds, according to its degree and continuance. The gentleſt kind, and which commonly affects a particular part of the *head* only, they call *cephalalgia*, and the more violent and obſtinate *cephalæa*; when the pain is on one ſide only, it is called HEMICRANIA, and when it is a fixed pain in the forehead, which may be covered with the end of the thumb, it is called the CLAVUS *hyſtericus*.

Cephalalgia is defined to be a pain in the *head*, proceeding from a copious congeſtion of the blood and humours in that part, which do not find any exit or paſſage from thence.

They generally diſtinguiſh it alſo into two kinds, the idiopathic and the ſymptomatic.

The idiopathic is that which ariſes from a plethora, and an immediate congeſtion of blood or humours in the *head*. The ſymptomatic is that which ariſes from a fault in the primæ viæ, communicating with the head by means of the par vagum of nerves, or from a tranſlation of the humours to the *head*, in fevers or other diſeaſes.

The diſtinction of the *cephalalgia* from the *cephalæa* is, that in the latter all the ſymptoms are more violent; the *cephalæa* alſo is uſually chronical and habitual; the *cephalalgia* only returns at times, and has but ſhort periods.

The ſimple *cephalalgia* is alſo diſtinguiſhed from the ſcrofulous *head-ach* by the burning heat and ſenſation of erоſion which attends the latter, which alſo is continual, or, at leaſt, never wholly ceaſes, and is always moſt violent in the night, when the body is at reſt, and at leaſt than in the day.

The *cephalæa* ſometimes ſeizes on the whole *head*, but more uſually the forehead is the ſeat of it; very frequently alſo it is felt about the origin of the noſe, and a weight or preſſure and burning heat are felt in the os cribroſum, and often at the ſame time there is felt a violent weight and preſſure in the bulbs of the eyes; not unfrequently a tooth-ach attends upon the *cephalalgia*, and when this is violent, the other abates in proportion.

A noiſe and ringing in the ears are often alſo an attendant on it, and the eyes are often red and inflamed; the face alſo looks red, and often turgid, but ſometimes it looks as remarkably pale, or has a redneſs irregularly ſpread over it; both theſe caſes are from ſtrictures upon the veſſels. The veſſels of the neck and temples are often turgid. Women are very ſubject to this pain about the time of their menſtrual diſcharges, either before their eruption, or at any time on their diminution; ſometimes the *head-ach* is attended with a vertigo, which gives proof of a very violent congeſtion, and ſometimes a binding of, the bowels, and a ſlight ſuppreſſion of urine attends it.

People of a plethoric habit of body are more ſubject than others to this pain, and, in general, young people more than ſuch as are older, and women more than men; and perſons who live high, and drink much wine, and uſe little exerciſe, ſuffer much more by it than thoſe who live lower, and uſe much labour and exerciſe.

When the *head-ach* proceeds from a hot bilious habit, the pain is very acute and throbbing, with a conſiderable heat of the part affected. When it proceeds from a cold phlegmatic habit, the patient complains of a dull heavy pain, and has a ſenſe of coldneſs in the part: this kind is ſometimes attended with a degree of ſtupidity and folly.

HEAD-*ach*, *cauſes of the*. Among the natural and internal cauſes, the principal are too great a quantity of blood, and a derivation of great quantities of it toward the head, with an intention of nature to relieve herſelf there by a hæmorrhage from the noſe. The external or accidental means that may bring on this pain are very numerous: the natural and habitual evacuations of blood being ſuppreſſed, and of theſe particularly a bleeding at the noſe, the neglect of accuſtomed bleedings, ſweats prevented or repelled, and the omiſſion of purging, cuſtomary before at certain periods of the year; great commotions of the body, or paſſions of the mind, eſpecially anger, drunkenneſs with ſpirituous liquors of any kind, the attracting acrid fumes through the noſe, a ſudden cooling of the legs or feet, hanging down the *head*, looking long obliquely at any object, wearing any thing tight about the neck, a tranſlation of the peccant matter toward the head in fevers, and a peculiar ſenſibility in the organs of ſmelling, whence perfumes give ſome perſons the *head-ach*; and to all theſe are to be added an hereditary diſpoſition, or injuries from blows or concuſſions of the head long before.

Sometimes the *head-ach* proceeds from the repulſion or retrocеſſion of the gout, the eryſipelas, the ſmall-pox, meaſles, itch, or other eruptive diſeaſes.

Prognoſtics from it. The *head ach* is a pain rather troubleſome than dangerous in itſelf, but it too eaſily degenerates into worſe complaints, and not unfrequently preſages defects of the ſight or hearing, or the gout; and in old age, lethargies, apoplexies, and paralytic diſorders.

The *head-ach* often is cured by nature, by plentiful hæmorrhages from the noſe, and ſometimes by inflammatory diſorders of the adjacent parts: it more eaſily leaves young people than old; and, indeed, where long ſettled upon a perſon, and become habitual, rarely gives way to any remedies. The *head-ach* often is ſymptomatic in continual and intermitting fevers, eſpecially quartans: it is likewiſe a very common ſymptom in hyſteric and hypochondriac complaints. When the *head-ach* attends an acute fever, with pale urine, it is an unfavourable ſymptom.

Method of cure. The congeſtions of humours are to be derived from the ſuperior to the inferior parts, and, above

all

all things, the bowels are to be loofened by clyfters and purges, for they are ufually bound up in this diforder. After this, medicines are to be given which will quiet the violent emotions of the blood; fuch are powders of nitre, crabs-eyes, and fome diaphoretics, with a little cinnabar, according to Stahl. When the blood is thick, a fcruple of tartarum vitriolatum may be given every day with great fuccefs. After thefe, the gentle diaphoretics are to be given in fmall doſes, with the diluent decoctions of the common tea-herbs, fuch as baum, fage, and the like. And if the pains are exceſſive, a gentle opiate, fuch as a fmall doſe of the ſtorax-pill, may be added to theſe.

When the *head-ach* is owing to exceſs of blood, or a hot bilious conſtitution, bleeding is neceſſary; which may be performed in the jugular vein, or by cupping, or the application of leeches to the temples or behind the ears. A blifering plaſter may alſo be afterwards applied to the neck, behind the ears, or to any part of the head that is moſt affected. In ſome caſes it will be proper to blifter the whole *head*. In perſons of groſs habit, iſſues or perpetual blifters will be of ſervice; and the belly ſhould likewiſe be kept open by gentle laxation. But when the *head-ach* proceeds from a copious vitiated ſerum ſtagnating in the membranes, and will not yield to bleeding or gentle laxatives, more powerful purgatives are neceſſary, as pills made of aloes, reſin of jalap, &c. the whole *head* ſhould alſo be blifered, and the back part of the neck kept open for a conſiderable time by a perpetual blifter.

External applications ſometimes alſo aſſiſt the uſe of internal medicines; of this kind are ſpirits of wine camphorated, with a ſmall admixture of faffron; this ſometimes almoſt inſtantaneouſly removes the pain. The affected part may be rubbed with Ilate's anodyne balſam, or a cloth dipped in it may be applied to the part; and, in caſe of extreme pain, the patient may, at the ſame time, take twenty drops of laudanum, in a cup of valerian or penny-royal tea, twice or thrice a day: but the uſe of opiates ſhould be always accompanied with proper evacuations. A violent *head-ach* may ſometimes be removed by a little of Ward's eſſence dropped into the palm of the hand, and applied to the forehead; or by æther, applied in the ſame manner. Dr. Percival found by repeated experience, that the uſe of eighteen drops of laudanum and ſtrong coffee removed the *head-ach*, without occaſioning any diſpoſition to ſleep; the narcotic effects of the opium being counteracted by the coffee. Coarſe bread, with juniper-berries, carraway-ſeeds, and ſalt, laid on as an epithem, is alſo ſometimes a preſent help; and bags of aromatic ingredients, reduced to a groſs powder, are, though a ſlower, yet often a very valuable relief. All theſe are only to be uſed in the idiopathic *head-ach*; for in the ſymptomatic, regard is to be had only to the principal diſorder; and when the cauſe is removed, the effect always ceaſes. After the fits of the *head-ach* are over, it is proper, by way of prevention for the future, to bleed in the ſpring and autumn, and frequently to bathe the feet in warm water. The uſe of gentle exerciſe is to be greatly recommended. The fatty or oleaginous remedies, preſcribed by ſome for rubbing on the head, are to be carefully avoided, as they ſtop up the pores and prevent perſpiration. The ſmelling to pungent liquids is not of ſo much benefit as uſually ſuppoſed. The urinous volatiles, ſuch as ſpirit of hartſhorn, ſal volatile, and the like, are ſometimes of a little preſent relief; and theſe, or any thing that will irritate the noſe, may be freely uſed when the *head-ach* is occaſioned by a ſtoppage of a running at the noſe; but the common uſe of ſpirit of lavender and Hungary-water, on theſe occaſions, is often the cauſe of more violent pain, by cauſing a freſh derivation of humours on the parts. Cinnabar has, by many authors, been ſuppoſed a dangerous medicine in all caſes of this kind; but Stahl affirms, on repeated experience, that it has great good effects; and that in theſe, and many other caſes, it ſupplies the place of opiates and anodynes. When the patient cannot bear the loſs of blood, his feet ſhould be frequently bathed in lukewarm water, and rubbed with a coarſe cloth; cataplaſms with muſtard or horſe-radiſh ſhould be alſo applied to them, eſpecially when the pain proceeds from a gouty humour affecting the head.

The diet of perſons afflicted with the *head-ach* ſhould conſiſt of ſuch emollient ſubſtances as will correct the acrimony of the humours and keep the body open, as apples boiled in milk, ſpinach, turnips, &c. The drink ſhould be diluting, as barley-water, infuſions of mild mucilaginous vegetables, decoctions of the ſudorific woods, &c. The feet and legs ſhould be kept warm, and often bathed in warm water, and the head ſhaved and bathed with water and vinegar, and kept, as much as poſſible, in an erect poſture.

Cephalæa is a violent and continual pain in the *head*, occaſioned by a rheumatic congeſtion of humours in the *head*.

Notwithſtanding the *cephalæa* is a continual and unintermitting pain of the head; yet it is ſubject to ſome remiſſions, and is thence diſtinguiſhed by authors into the periodic, the continual, and the vague *cephalæa*. The continual kind is that which is always in the ſame degree, and admits not of the leaſt remiſſions. The periodical is that which has its regular periods of being leſs intenſe; theſe are called its remiſſions. And finally, the vague *cephalæa* is that which has times of being leſs violent; but theſe return at no regular or ſtated periods.

Signs of it. The *cephalæa* ſometimes ſo much reſembles the *cephalalgiæ*, or common *head-ach*, that it only differs from it by its obſtinate continuance and the violence of the pain; and in women it has all the ſame ſymptoms with the clavus hyſtericus, except that it affects indifferently all parts of the head. When this complaint ariſes from a venereal taint in the blood, it is always violent: but moſt ſo, when the perſon is warm in bed. When it ariſes from a ſcorbutic coagulation of the blood, or an inflammation of the meninges of the brain, the pain is remarkably ſharp and piercing, and is attended with a febrile heat and an intolerable thirſt. Theſe generally comes on a vertiginous diſorder of the head after this complaint has head the patient ſome time, and the patient can never beat any motion; and on the leaſt ſhaking or diſturbing the head, the pain becomes violently intenſe, and reſembles the beating of an artery in pulſation. The pain is in general leſs violent while the patient lies down, but as ſoon as the head is raiſed up ever ſo little, it increaſes to a great degree. The leaſt noiſe or motion is terrible to perſons in this ſtate, and the light is frequently offenſive and painful; ſo that the patient loves retirement in darkened and quiet rooms, and avoids company. Liquors of any ſtrength give violence to the pain as ſoon as drank; and in caſes of this kind, where a ſcorbutic habit is the cauſe, frequent and violent bleedings at the noſe happen, which give no laſting relief, but only an abatement of the pain for the time.

Women are generally more ſubject to this terrible pain than men, theſe being rarely afflicted with it, unleſs when there is ſome violent diſorder in regard to the hæmorrhoids, or when there is a venereal taint in the blood. Among women, theſe are moſt ſubject to it who live high and lead ſedentary lives, and who are of a melancholy diſpoſition, or ſubject to obſtructions of the menſes.

Cauſes of it. The general cauſe of this, as well as of all other *head-achs*, is a violent congeſtion of blood directed to the *head*; and the peculiar cauſes which determine the *head-ach* to this terrible kind, are ulcerous or exulcerated diſpoſitions of the body; theſe principally are owing to the ſcurvy, the venereal diſeaſe, or any violent cutaneous eruptions driven in, or to external injuries, as blows and wounds of the head ill-treated. The ancients ſuppoſed this owing to impoſtumes or collections of a vitiated matter in the head, and therefore always preſcribed blifters, fetons, and the like, and ſometimes the piercing the ſkull in the part where the pain was moſt violent.

In the moſt favourable caſes this is a diſtemper that with difficulty admits of a cure. Where there is a ſimple ulceration in the caſe, the cure becomes yet more difficult but not quite to be deſpaired of; but where a venereal taint is the cauſe, a cure is ſcarce to be expected. For though the cauſe be removed, yet in this or any other kind of *cephalæa*, attended with a caries of the bones, the pain will afterwards often return, and that with little leſs violence than before.

Thoſe *cephalæa* which ſometimes are relieved by nature by copious diſcharges of ſerous humours, are more difficult of cure than others; and thoſe which happen to perſons of remarkably plethoric habits, threaten an approaching apoplexy.

Method of cure. The ſame general method is to be obſerved as in the common *head-ach*, which ſee above; but in this there are to be added to the medicines there preſcribed, ſuch as powerfully diſſolve mucous humours; ſuch are the roots of pimpernel, arum, and maſter-wort, with the bitter herbs, ſaſſafras, gum ammoniacum, tartarum vitriolatum, and the like. After theſe, purging is proper; and in caſes where the ſcurvy or any venereal taint is joined, there muſt be always regard had to thoſe complaints in the whole method of cure; and, indeed, the ſcorbutic *cephalæa* ſhould always be treated as the ſcurvy itſelf, and the venereal *cephalæa* as the pox; and the patient, after proper evacuations, ſhould drink freely of the decoction of the woods, or the decoction of ſarſaparilla with raiſins and liquorice; theſe promote perſpiration and ſweeten the humours. When a collection of matter is felt under the ſkin, it muſt be diſcharged by an inciſion, otherwiſe it will render the bone carious;

and where any old ulcers have been dried up, or any other habitual discharge ſtopped, and the complaint is owing to that, the making iſſues or ſetons muſt be premiſed to any other attempt of a cure. Some inveterate complaints of this kind have been happily cured by mercury, whether they had or had not any thing venereal in their foundation; and in general, a ſalivation is a ſort of laſt reſource, be the cauſe what it will. Junker's Conſp. Med. p. 96. 100. 104. 116. and Buchan's Dom. Med. p. 283. edit. 1776.

HEAD-*borow*, or HEAD-*borough*, ſignifies the perſon who is the chief of the FRANK-*pledge*, and had anciently the principal direction of thoſe within his own pledge.

He was alſo called *burrow-head*, *borſholder*, now *borſholder*, *third-borough*, *tything-man*, *chief-pledge*, and *borſowlder*, according to the diverſity of ſpeech in divers places.

This office is now uſually called a *conſtableſhip*.

The *head-borow* was the chief of ten pledges; the other nine were called *hand-borows*, or *plegii manuales*, &c.

By the HEAD, in *Sea-Language*, denotes the ſtate of a ſhip which is ladet deeper at the fore-end than the after-end.

HEAD-*farcin*. See FARCIN.

HEAD-*faſt*, in *Sea-Language*, ſignifies a rope employed to faſten a ſhip to a wharf, chain, or buoy, or to ſome other veſſel along-ſide.

HEAD-*land*, in *Huſbandry*, is the upper part of a ground left for turning the plough, or that part which is ploughed acroſs at the ends of other lands.

HEAD-*land*, in *Sea-Language*. See LAND.

HEAD-*lines*, in a *Ship*, thoſe ropes of all ſails which are next to the yards, and by which the ſails are made faſt to the yards.

HEAD-*moſt*, in *Sea-Language*, denotes the ſituation of any ſhip or ſhips, which are the moſt advanced in a fleet or line of battle.

HEAD-*mould-ſhot*, a diſeaſe in children, wherein the ſutures of the ſkull, generally the coronal, riſes that is have their edges ſhut over one another, and are ſo cloſe locked together, as to compreſs the internal parts, the meninges, or even the brain itſelf.

The diſeaſe uſually occaſions convulſions, and is ſuppoſed to admit of no cure from medicine, unleſs room could be given by manual operation or a diviſion of the ſutures.

The *head-mould-ſhot* is the diſorder oppoſite to the HORSE-*ſhoe-head*.

HEAD-*power*, an exaction of a certain ſum formerly collected by the ſheriff of Northumberland from the inhabitants of that county, without any account to be made to the king. This was aboliſhed by the ſtatute 25 Hen. VI. cap. 7. Blount.

HEADS, a term uſed by builders for that kind of tile which they uſed to lay at the caves of a houſe, being the full breadth of a common tile, and but half a tile in length.

HEAD-*rope*, in a *Ship*, is that part of the BOLT-*rope* which terminates any of the principal ſails on the upper edge, which is accordingly ſewed to it.

HEAD-*ſails*, in a *Ship*, thoſe which belong to the fore-maſt and bowſprit; for it is by theſe that the *head* of the ſhip is governed, and by which it is made to fall off and keep out of the wind; ſuch are the fore-ſail, fore-top-ſail, fore-top-gallant-ſail, jib, fore-ſtay-ſail, and the ſprit-ſail with its top-ſail: and theſe in quarter-winds are the chief drawing-ſails.

HEAD-*ſea* is when a great wave or billow of the ſea comes right a-head of the ſhip as ſhe is in her courſe.

HEAD-*ſtall*, among *Muſicians*. See CAVESON.

HEAD-*ſtall*, among *Ancient Muſicians*. See PHORBEA.

HEAD-*ſtrin*, in *Metallurgy*, is a preparation of tin-ore toward the fitting it for working into metal. When the ore has been pounded and twice waſhed, that part of it which lies uppermoſt, or makes the ſurface of the maſs in the *tub*, is called the *head-ſtrin*; this is ſeparated from the reſt, and, after a little more waſhing, becomes fit for the blowing-houſe.

HEAD-*to-wind*, in *Sea-Language*, denotes the ſituation of a ſhip or boat when her head is turned to windward.

HEAD-*way* ſignifies the motion of advancing at ſea, and is generally uſed when a ſhip firſt begins to advance, or, in calm weather, when it is doubtful whether ſhe be in a ſtate of reſt or motion.

HEALFANG, HEALSFANG, or HALSFANG, in our *Ancient Cuſtoms*, ſignifies *cullifrigium*, or the puniſhment of the PILLORY.

The word is compounded of two Saxon words; *halp*, *neck*, and *fangen*, *to contain*. *Pœna ſcilicet qua aliqui collum ſtringitur*. The *healſfang*, however, cannot ſignify a pillory in the charter of Canutus, D. Foreſtis, cap. xiv. *Si pro culpa ſalvus regi dare ſolidos, quos Doni vocant* halfehang.

HEALFANG is alſo taken for a pecuniary puniſhment or mulct, to commute for ſtanding in the pillory; and is to be paid either to the king or to the chief lord.

Sine ſalfam teſtimonium dedit, vendat regi, vel terræ dominæ healfang. Leg. Hen. I.

HEALING, in its general ſenſe, includes the whole proceſs of curing or removing a diſorder, and recovering health.

In this ſenſe, medicine is defined the art of *healing*.

In its more reſtrained ſenſe, as uſed in ſurgery, *&c. healing* denotes the uniting or conſolidating the lips of a wound or ulcer.

The medicines proper for this intention, are called *incarnantives*, *agglutinatives*, *vulneraries*, &c.

Dr. Beal has a diſcourſe of ſanative or *healing* ſprings and waters, in the Philoſophical Tranſactions, N° 20.

HEALING, in *Architecture*, denotes the covering the roof of a building.

The *healing* is various; as of lead, tiles, ſlate, Horſham-ſtone, ſhingles, or reed and ſtraw.

HEALTH, a due temperament or conſtitution of the ſeveral parts whereof an animal is compoſed, both in reſpect of quantity and quality. Or it is that ſtate of the body wherein it is fitted to diſcharge the natural functions perfectly, eaſily, and durably.

Health is the ſtate or condition oppoſite to *diſeaſe*.

The preſervation and reſtoration of *health* make the objects of the art of medicine.

The continuance of *health* depends, principally, on the ſix non-naturals, viz. air, food, exerciſe, the paſſions, evacuation and retention, and ſleep and waking. See each in its place.

Injuries, affecting a man's *health*, are thoſe in which, by any unwholeſome practices of another, he ſuſtains any apparent damage in his vigour or conſtitution; as by ſelling him bad proviſions or wine, by the exerciſe of a noiſome trade, or by the neglect or unſkilful management of his phyſician, ſurgeon, or apothecary. For thoſe injuries there is a remedy in damages by a ſpecial action of treſpaſs upon the caſe. The ſtat. 51 Hen. III. ſtat. 6. prohibits the ſale of corrupted wine and unwholeſome fleſh, or fleſh bought of a Jew, under pain of amerciament for the firſt offence, pillory for the ſecond, fine and impriſonment for the third, and abjuration of the town for the fourth: and by ſtat. 12 Car. II. cap. 25. any brewing or adulteration of wine is puniſhable with the forfeiture of 100l. if done by the wholeſale merchant, and 40l. if done by the vintner or retailer. See PLAGUE and QUARANTAIN.

The ancients perſonified, and even deified, *health*; or, rather, they erected a goddeſs, to whom they ſuppoſed the care of *health* to belong. The Greeks worſhipped her under the name Υγεια, and the Latins under that of *Salus*. The place of her worſhip at Rome, was on the Mons Quirinalis, where ſhe had a temple, and a ſtatue crowned with medicinal herbs.

We frequently find the goddeſs *Health* on the reverſe of medals. She is repreſented crowned with laurel, with a ſerpent ſtretched on her left arm, and holding a patera to it with the right. Sometimes ſhe has an altar before her, with a ſerpent twiſted round the ſame, and raiſing its head to take ſomething off from it.

The inſcription is SAL. AUG.

HEALTH, *houſe of*, a kind of hoſpital or public building, for the reception and entertainment of perſons infected with the plague, or coming from places infected therewith. See PEST-*houſe*, QUARANTAIN, &c.

In the like ſenſe we ſay, officers of *health*, certificate of *health*, &c.

HEAM, in beaſts, denotes the ſame with *after-birth* in women.

Thyme, penny-royal, winter-ſavory, and common horehound, boiled in white-wine, and given to a mare, are eſteemed good to expel the *heam*. Dittany, applied in a peſſary, expels the *heam*, as well as the dead foal; ſo alſo do fennel, hops, ſavin, angelica, &c.

HEARING, *auditus*, the act or faculty of perceiving ſounds.

Hearing is reckoned among our external ſenſes. Its organ is the *ear*, and particularly the auditory nerve diffuſed through the ſame; and its object, certain motions or vibrations of the air.

Hence *hearing* may be more ſcientifically defined, a ſenſation, whereby, from a due motion impreſſed on the fibrillæ of the auditory nerve, and communicated thence to the ſenſory, the mind perceives and gets the idea of ſounds.

Philoſophers have differed as to the immediate organ of *hearing*. Ariſtotle will have it to be the cochlea and tympanum, and takes the ſenſe of *hearing* to be ſeated therein. Hiſt. Animal. cap. 10. in which he is followed by Galen, lib. viii. De Uſu Part. See TYMPANUM.

The moderns ſpeak of the point on much better ground. The ear, and the ſeveral parts thereof, membranes, ca-

nals, labyrinths, nerves, &c. they say, are the only means and vehicles for the reception, modification, and transmission of the sonorous matter to the brain, which is the seat of the sense.

A sound, in itself, is nothing but a certain rarefaction or modification of the external air, which, being gathered by the external ear, passes through the meatus auditorius, and beats upon the membrana tympani, which moves the four little bones in the tympanum.

In like manner, as this is beat by the external air, these little bones move the internal air which is in the tympanum and vestibulum; which internal air makes an impression upon the auditory nerve in the labyrinth and cochlea, according as it is moved by the little bones in the tympanum: so that, according to the various refractions of the external air, the internal air makes various impressions upon the auditory nerve, the immediate organ of *hearing*; which different impressions represent different sounds. See EAR.

Sir Isaac Newton carries the thing somewhat further, and supposes *hearing*, like seeing, to be performed not immediately by the vibrations of the air, but by those of some other more subtil medium, excited in the auditory nerves by the tremors of the air, and propagated through the solid capillamenta of the nerve to the place of impression.

The curious structure of the labyrinth and cochlea tend to make the weakest sounds audible; for the whole organ of *hearing* being included in a small space, had the auditory nerve run in a strait line, the impression would only have been made on a very small part of it; and the strength of the impression being, *ceteris paribus*, always as the number of parts on which the impression is made, sounds which are now *low* could not have been heard at all. If the auditory nerve had, like the retina, been expanded into a large web, which had covered or lined some wide cavity, the impression of sounds, even in this case, had been much weaker than they are now; for this large cavity had given room for the sounds to dilate, and all sounds grow weaker as they dilate.

Both these inconveniencies are prevented by the present structure of the labyrinth and cochlea, whose canals, by their winding, contain large portions of the auditory nerve, upon every point of which the smallest sound being at once impressed becomes audible, and by their narrowness the sounds are hindered from dilating; and the impressions made upon the nerves by the first dilatations are always the strongest.

The strength of the impression in narrow channels is likewise increased on account of the elasticity of the sides of the bony canal, which, receiving the first and strongest impulses of the air, do reverberate them more strongly upon the auditory nerve.

It may be observed, that though the air be the usual matter of sounds, so that a bell rung in vacuo is not heard at all, yet will most other bodies, properly disposed, do the like office, only some more faintly than others.

Thus may a sound be heard through water, or even through earth; of which we have various instances.

Add, that though the ear be the ordinary organ of *hearing*, yet Hagerup, a Danish physician, maintains that one may hear with the teeth. Thus, if one end of a knife, or the like, be applied to a harpsichord, and the other held between the teeth, the music thereof will be plainly heard, though the ears be ever so closely stopped. But this, perhaps, may more properly be referred to the sense of FEELING.

Such as want the sense of *hearing* are said to be *mute* or *deaf*. See DEAFNESS.

HEARING, *difficulty of*. In common cases, difficult *hearing* suddenly coming on, the following is an excellent remedy: take essence of amber a dram, of castor a scruple, oil of chamomile half a scruple, oil of amber one drop; mix these together, and three or four times a day put into the ear a piece of cotton wetted in them. This is a complaint frequently happening to young women, from a suppression of the menses; and, in that case, there is no more required for a cure than barely to restore that discharge in its natural and proper course. It sometimes also happens to men, from a stoppage of the hæmorrhoidal discharges, and is then to be cured by recalling them, and applying leeches to the part; or, if the patient is averse to that, bleeding or cupping often prove an immediate cure. When this difficulty of *hearing* arises from any obstruction in the auditory passage, the matter that causes the obstruction is to be carefully removed by a surgeon.

Old men often have a difficulty of *hearing* from mere debility and loss of the due strength and tone of the parts. In this case medicine can give no assistance, but all applications usually render the case worse: and the same is to be observed in all cases where the disorder is very inveterate, or is hereditary, or owing to external injuries, by which the tympanum has been broke, or any other of the principal parts are destroyed. The total loss of *hearing*, after having held a person for many years, and not been at all relieved by the common methods of cure, has been sometimes known to go off of itself, and the patient to hear as perfectly as ever; so that we are not to despair of relief, even in the worst cases of this kind, and such as have resisted all remedies. Persons who are subject to returns of this complaint, should use frequent bleeding or cupping, be moderate in diet, and shun all excesses of strong liquors, and use moderate exercise. Heister also affirms, for his own experience, that the drinking the mineral waters in the spring, in the proper and regular manner, is of the utmost service in preserving the patient from returns of this disorder during the year. Heister's Compend. Med. p. 180.

Mr. Le Cat, in his treatise on the organ of sound, proposes an instrument, as of his own invention, to assist dull *hearing*: it consists of a shell or corner of copper, into which a small tunnel-like tube is fixed, so that its narrow end is at the centre of the cornet. See Phil. Trans. N° 460. § 9. See DEAFNESS.

HEARING is particularly used in civil and judicial concerns, for a cause being brought before the judge and jury, and the parties being *heard* as to the merits thereof.

The method of *hearing* causes in the court of Chancery is this: the parties on both sides appearing by their counsel, the plaintiff's bill is first opened or briefly abridged, and also defendant's answer also, by the junior counsel on each side; after which the plaintiff's leading counsel states the case and the matters in issue, and the points of equity arising from them; and then such depositions as are called for by the plaintiff are read by one of the six clerks; and the plaintiff may also read such part of the defendant's answer as he thinks material or convenient: and, after this, the rest of the counsel for the plaintiff make their observations and arguments. Then the defendant's counsel go through the same process for him, except that they may not read any part of his answer; and the counsel for the plaintiff are heard in reply. When all are heard, the court pronounces the decree, adjusting every point in debate according to equity and good conscience; which decree, being usually very long, the minutes of it are taken down, and read openly in court by the registrar. Blackft. Comt. vol. iii. p. 451, 460.

The hearing of ambassadors at the courts of princes, is usually called AUDIENCE.

HEARSE, among *Hunters*, a hind in the second year of her age. See HUNTING.

HEARSE is the name of a well known carriage, used for conveying the dead to the grave.

The word is also used by Shakspeare in his Henry VI. for a monument erected over a grave.

HEART, *cor*, in *Anatomy*, a musculous part of the animal body, situated in the thorax, on the anterior part of the diaphragm, between the two laminæ of the mediastinum, wherein the veins all terminate, and from which all the arteries arise, and which, by its alternate contraction and dilatation, is the chief instrument of the circulation of the blood, and the principle of life. *See Tab. Anat. (Splanch.) fig.* 12. *lit.* cc.

This noble part is included in a capsula or pouch, called the PERICARDIUM, whose structure and office will be explained under that article.

The figure of the *heart* is a cone or pyramid reversed, flatted on the sides; the upper and broader point whereof is called the *base*, and the lower the *cone*, *apex*, or *point*; this is turned a little towards the left side.

The magnitude of the *heart* is indeterminate, and different in several subjects, according to their respective dimensions. Its ordinary length is about six inches, its breadth at the base four or five, and the whole circumference, fourteen. Its place is in the middle of the thorax, between the two soles of the lungs; and it is fastened to the pericardium, and supported by the great blood-vessels, to which alone it is immediately connected, being, for the convenience of its motion, disengaged from any other impediments. It is covered with a thin membrane, which, about the base, is guarded with fat, and which is no other than the common membrane of the muscles.

It has two great cavities called *ventricles*, somewhat unequal, one of which is thick and solid, the other thin and soft; this latter, called the right ventricle, being larger, and capable of containing between two and three ounces of blood. They are divided by a fleshy partition, consisting of the same muscular fibres with the parietes themselves, and called the *septum*: the figure whereof is concave towards the left ventricle, and convex towards the right. There is no immediate communication between

tween the ventricles; but for the blood to pass out of one into the other, it muſt fetch a round through the lungs.

The parietes or ſides of theſe ventricles are of a thickneſs and ſtrength very unequal; the left much exceeding the right becauſe of its office, which is to force the blood through all the parts of the body; whereas the right derives it through the lungs only, and is therein greatly aſſiſted by other parts. The right ventricle, in effect, ſeems only intended with a view to the lungs; whence, in ſuch animals as have no lungs, we only find one ventricle, which is the left.

In the ventricles are little muſcles, called *columnæ carneæ*, or *lacertuli*; theſe are derived from the parietes, and connected by tendinous extremities, to the valves of the *heart* hereafter mentioned.

The ventricles are capped each with an auricle or little muſcle, conſiſting, like the ventricles themſelves, of a double order of fleſhy fibres.

The veſſels, either ariſing from, or terminating in the *heart* and its auricles, are two arteries, viz. the aorta and the pulmonary artery, which have their origin from the two ventricles, viz. the aorta from the left, and the pulmonary from the right: and two veins, which terminate in the auricles, viz. the cava vein in the right, and the pulmonary vein in the left.

At the reſpective orifices of theſe veſſels are placed valves; particularly at the orifice of the arteries, within each of them, are three ſemilunar valves, or membranes of a ſemilunar figure, which cloſe the orifice of the artery, and hinder the reflux of the blood in the *heart* at the time of its dilatation. At the mouth of the right ventricle, juſt at its junCture with the auricle, are three others called *tricuſpides*, from their three points being faſtened by tendinous fibres to the columnæ carneæ; ſo that, upon the contraction or ſyſtole of the *heart*, they cloſe the orifice, and hinder the blood from recurring into the great vein. The ſame office is performed by the two mitral valves, at the exit of the left ventricle, ſtopping the return of the blood into the pulmonary vein.

The ſubſtance of the *heart* is entirely fleſhy or muſculous. The ancients, indeed, generally took it for what they call a parenchyma; but Hippocrates had a juſter ſentiment, and after him Steno and the moderns have evidently found it to conſiſt of a continued ſeries of proper muſculous fibres, variouſly contorted or wound up, and ending at the orifices of the reſpective ventricles, where they form the tendons.

In diſſecting the *heart*, after taking off the proper membrane, there appear, on the outer ſurface of the *right* ventricle, ſome ſlender ſtrait fibres, tending to and ending in the baſis. Immediately under theſe there is a double order of ſpiral fibres, the exterior whereof aſcend obliquely from the ſeptum to the baſis, and form a ſort of helix or cochlea; the interior take a contrary courſe, winding obliquely from the right ſide towards the left, ſo as to compaſs both ventricles, and ending in the baſis on the left ſide, form likewiſe a helix of an inverſe order. Under theſe appear the fibres of the left ventricle; and firſt, a ſpiral ſeries running to the left, under which, as in the other ventricle, lie another order running the contrary way, which not only extend to the outward paries, but encompaſſing the whole ventricle, make the ſeptum more immediately appertain to, and be a part of, the left ventricle. Some of theſe, inſtead of terminating, as the reſt do, in the tendons of the *heart*, run inwards, and form the columnæ carneæ; while others, reaching down to the cone, are wound about it, and form the circle called the *centre of the heart*.

The fibres of the *heart* appear to be the ſame with thoſe of the other muſcles, whence the part now generally paſſes for a real muſcle: though ſome think that inference not very juſt, inaſmuch as the aorta has the ſame claim to be reputed a muſcle.

Some late authors, upon conſidering the ſtructure and diſpoſition of the ſpiral fibres, chuſe rather to make the *heart* a double muſcle, or two muſcles tied together. In effect, the two ventricles, with their reſpective auricles, are found two diſtinct bodies, two veſſels or cavities, which may be ſeparated, and yet remain veſſels; the ſeptum, which was ſuppoſed to belong only to the left, being now found to conſiſt of fibres derived from them both. To ſay no more, the two ventricles, according to Mr. Winſlow, are two ſeveral muſcles united together, not only by the ſeptum, but by ſeveral plans of fibres ariſing from the external baſe of the *heart*, and meeting at the apex, which, entering the left ventricle, lines the parietes, &c.

The *heart* has alſo its proper blood-veſſels, viz. two arteries ſpringing from the entrance of the aorta, and one larger vein, with one or two leſſer; all which, from their encompaſſing the *heart*, are called *coronariæ*.

The nerves of the *heart*, and its auricles, come from a plexus of the par vagum, called by Willis, *plexus cardiacus*. It has alſo lymphæducts, which carry the lymph from the *heart* to the thoracic duct.

The uſe of the ventricles of the *heart*, and its appendant auricles, is to circulate the blood through the whole body; in order to which, they have an alternate motion of contraction and dilatation. The two ventricles may be conſidered as two ſyringes, ſo cloſely joined together as to make but one body, and furniſhed with ſuckers placed in contrary directions to each other, ſo that by drawing out of them a fluid is let in, and forced out again by the other. By the dilatation, called the *diaſtole*, the cavity of the ventricles is opened, and their internal dimenſions enlarged to receive the reſluent blood from the veins, which is forced into them through the tricuſpidal valves, by the contraction of the auricles, where it is lodged; and by the contraction of the ventricles, called the *ſyſtole*, their cavity is ſhrunk, and their dimenſions leſſened, ſo that the blood is forced toward the baſis of the *heart*, and made to paſs the tricuſpidal valves againſt each other, to open the ſemilunares, and toruſh with impetuoſity through the arteries and their ramifications; and from thence it is forced to return by the veins to the auricles which receive and lodge it during the time of a new contraction.

Hence it appears, that theſe alternate motions of the *heart* and auricles are oppoſite, in time, to each other; the auricles being dilated whilſt the *heart* is contracted again, and contracted whilſt it is dilated, to drive the blood into it.

By means of the right ventricle, the blood is driven through the pulmonary artery; from which being received into the pulmonary vein, it is returned to the left ventricle; from which, by the aorta, it is diſtributed all over the reſt of the body, and thence returned to the right ventricle by the vena cava; ſo making an entire circulation through the whole body. *See Circulation of the* BLOOD.

Schenchius gives an account of a man who had no *heart*; but Monnetti denies it; as alſo that there ever were two *hearts* found in any man, though the caſe be common in divers inſects, which have often naturally ſeveral *hearts*: witneſs ſilk-worms, which have a chain of *hearts* running the whole length of their bodies. But we have, in other authors, inſtances of two *hearts*, even in the ſame man. There have been *hearts* found all gnawed and devoured with worms. Marcian opened the *heart* of ſome bardilly, which were all hairy, or of ſtuff reſembling a tomentum or down. And, what is ſtill more extraordinary, we have accounts of perſons in whom the *heart* has been found inverted, or turned upſide down; particularly in a woman hanged ſome time ago in Saxony, and a man hanged at Paris.

Timorous animals have always larger *hearts* than courageous ones, as we ſee in deer, hares, aſſes, &c.

Dr. Hales conjectures, that one reaſon of this may be, that the fibres of the timorous are generally more lax than thoſe of courageous animals; on which account the blood paſſing with leſs reſiſtance through the lax-fibred capillary veſſels, it is requiſite that the heart ſhould at each pulſe throw out a greater quantity of blood, in order to ſupply its more eaſy and plentiful flow through the lax capillary arteries into the veins: and this may alſo be the reaſon why the pulſes of young animals, as of children, are found to beat faſter than thoſe of grown perſons; becauſe the tender fibres of the coats of their blood-veſſels being very lax, give leſs reſiſtance to the flowing blood, whoſe globules are obſerved by M. Lewenhoeck to be all of a ſize, both in great and ſmall animals; whence it was needful to make proviſion for a proportionably greater ſupply of it from the *heart*, by increaſing the velocity of its dilatations and contractions. Hæmaſtatics in Statical Eſſ. vol. ii. p. 29.

There is a bone ſometimes found in the baſis of the *hearts* of certain animals, particularly deer, which ſeems to be no other than the tendons of the fibres of the *heart* indurated and oſſified.

Hiſtorians relate, that pope Urban VIII. being opened after his death, was found to have ſuch a bone in his *heart*. The caſe is very uſual in the trunk of the aorta, which ſprings from the *heart*.

Many amphibious creatures, as frogs, &c. have but one ventricle to the *heart*. The tortoiſe is ſaid, by the French academiſts, to have three ventricles: M. Buffiere charges this on them as a miſtake, and maintains it has but one. The point is ſtance yet aſcertained. Mem. de l'Acad. an. 1703, and Philoſ. Tranſ. N° 238.

HEART, *theory of the motion of the*. The principle of motion in the *heart*, or the power from which its alternate contraction and dilatation ariſes has been greatly controverted among the late phyſicians and anatomiſts. See DIASTOLE and SYSTOLE.

The proportion of the weight of the *heart* to that of the body is greater in the males than in the females of birds, both wild and tame. But this proportion differs leſs in the males and females of wild birds than of tame birds; which may probably be owing to the exercise of the former being more nearly equal than that of the latter.

The proportion of the *heart* to the body is much greater in birds than in fiſh, as a medium about 8 to 1; Dr. Robinſon thinks this great difference is owing to the vaſtly ſuperior heat of birds.

Dr. Bryan Robinſon has given us a table of the mean weights of the bodies, *hearts*, and livers of ſeveral ſpecies of birds and fiſhes, as alſo of the proportions of the *hearts* and livers to the weight of the body, and of the liver to the weight of the *heart*. It appears from theſe tables, that the proportion of the weight of the *heart* to the weight of the body is greater in wild birds than in tame birds: the former uſe more exerciſe, or move their muſcles more than the latter, and it is known that the motions of the *heart* and blood are much increaſed by the motion of the muſcles: on the contrary, when the quantity of motion in the muſcular ſyſtem is greatly diminiſhed by the inactivity of bodies, the force of the *heart* and motion of the blood will likewiſe be diminiſhed in the ſame proportion. But muſcles which are much moved always increaſe in magnitude, weight, and ſtrength; and yet bodies that uſe much muſcular motion are ſeldom obſerved to grow fat, or increaſe in weight; and therefore the weight of the *heart* in proportion to the weight of the body will be greater in wild animals than in tame, and in bodies which uſe much exerciſe than in bodies which are inactive.

The weight of the *heart* in proportion to the weight of the body is greater in ſmall birds than in large ones. It is likewiſe greater in a mouſe than in an ox, in a child than in a man, and probably greater in little men than in large men. Now ſince ſmall animals are generally more active than great animals, we may allow the activity of the body to depend much on the proportion of the weight of the *heart* to the weight of the body. Diſſ. on the Food and Diſeaſes of Hum. Bod. p. 103, 104.

The proportion of the weight of the *heart* to the weight of the body is leſs in fat bodies than in lean. As animals grow fat the weight of their bodies increaſes, and their quantity of blood and weight of *heart* leſſen; for the fat in the membranes compreſſes the blood-veſſels, and leſſens the quantity of blood, and as this leſſens, the weight of the *heart* leſſens; the weight of the *heart* and quantity of blood always increaſing and decreaſing together. Diſſ. on the Food, &c. of Hum. Bod. p. 103, 108.

Various unnatural accidents happen to the *heart*, and are the cauſes of diſorders, which are never underſtood till too late, on the diſſection of the body. Of this kind Mr. Hunauld ſhewed the Paris Academy a remarkable inſtance in the *heart* of a woman of thirty years old; in this the valves of the left auricle were joined and cemented together, and left only a very ſmall aperture formed in the middle of the plane made by their re-union; the blood coming from the lungs into this auricle, could not without a very great and unnatural difficulty, paſs thence into the ventricle; and the auricle, compelled by this to extend itſelf to contain a large quantity of blood, was become much larger than it ought to have been in its natural ſtate. In different parts of the united valves there appeared ſeveral little points where an oſſification was begun; the woman died phthiſical, nor could it be otherwiſe, ſince the lungs could not but be affected by the difficulty with which the blood entered into the left ventricle of the *heart*: and the gentleman who gave the account obſerved, that this was *not* ſingle inſtance of a caſe of this kind, but that he had met with ſeveral ſuch, particularly one in the right auricle of the *heart* of a girl of fourteen. Another inſtance of a remarkable diſtemperature of the *heart* is given by Mr. Du-Fay of the ſame Academy: a man who had lived to thirty-four in very good health, became at this age very ſubject to the vapours, but the complaint increaſed to no particularly violent degree for the ſpace of eighteen years, but at this time he perceived a palpitation of the *heart* to join with the other ſymptoms, and this held him to the time of his death, which was two years afterwards. Mem. Acad. Scienc. Paris, 1735.

Theſe palpitations, which were ſlight at firſt, became afterwards ſo ſtrong, that they communicated their motion to the ſides, and might be ſeen through the patient's cloaths even when he was dreſſed; if the hand were applied to the region of the *heart*, it was perceived to move very forcibly, and the arteries all pannook of the diſorder, while the veins were all conſiderably ſwelled in the upper parts; in the latter part of his life he became dropſical, his legs ſwelling violently. On opening his body, the cavities of the breaſt and belly were found to be full of water, the lungs were found, but conſiderably waſted; the liver and ſpleen ſomewhat larger than ordinary, and the pancreas very large, and very hard and ſcirrhous; the *heart* weighed above two pounds, and was ſo large that it threw the left lobe of the lungs towards the upper part of the breaſt; it meaſured fifteen inches round at the baſe, and the two ventricles were full of blood, the right was nearly of its natural ſize, but the left, which ought to be ſmaller than that, was ſo dilated as to be vaſtly larger, though its ſides had not at all loſt their thickneſs; the pericardium was ſomewhat thicker than ordinary, and was nicely applied to the *heart*, but had on one ſide a tumor of the ſize of an egg, full of blood; the aorta was oſſified at the place where it goes out of the left ventricle. Mr. Du-Fay eſteems this caſe to have been an extraordinary ancuriſm of the left ventricle of the *heart*, a caſe ſeldom heard of. Another ſcarce leſs memorable inſtance there is in the Memoirs of the ſame Academy, which proves that wounds of the *heart* are not always ſo immediately mortal as is generally ſuppoſed: the caſe is this, a ſoldier was brought into one of the hoſpitals with a wound made by a ſword in the upper part of the left breaſt; he ſeemed very well for three days, but on the fourth he was taken with a fever and difficulty of reſpiration, and in fine died on the tenth day. On opening the body it was found that the ſword had pierced the pericardium, traverſed the right ventricle of the *heart* in its lower part, and near the point, and pierced the pericardium on the oppoſite ſide, and gone through the diaphragm, and an inch deep into the liver; there was much blood found in the pericardium, a little clot of congealed blood in the wound in the *heart*, and a quantity of purulent water on each ſide of the breaſt.

We have an account of a child which lived ſeveral days, yet upon diſſection its *heart* was found without a pericardium, and turned aptide down, ſo that its baſis, with all the veſſels, had fallen down as low as the navel, and its apex ſtill on the left ſide lay bid between the two lungs. See Phil. Tranſ. N° 461. ſect. 7.

Mr. Boyle tells us of a kind of fiſh on the coaſt of Ireland, about the ſize of mackrel, the *heart* of which was inverted, the baſis lying towards the tail, with the mucro pointing to the head, and adhering to the aorta.

Some creatures are known to live a conſiderable time after their *hearts* are taken out: Mr. Boyle mentions frogs ſwimming in this condition, and living above an hour; and the *heart* of an animal often gives ſigns of life after exſtection. The ſame author mentions the *heart* of a chicken unhatched, but perfectly formed, which continued to beat above an hour after the head and breaſtbone were clipt off to diſcloſe it; and when the *heart* was dead to appearance, it might be excited to freſh motion by puncture; the motion was alſo again excited by placing the part in the ſteam of warm water, and thus the *heart* was kept beating for two hours and a half. See Boyle's Works abridg. vol. i. p. 28.

The *heart* is a ſolitary muſcle of very great ſtrength, and the intercoſtal muſcles and diaphragm, which likewiſe have no antagoniſts, are a vaſt additional force, which muſt be balanced by the contrary action of ſome equivalent power or other; for though the action of the intercoſtal muſcles be voluntary, it does not exempt them from the condition of all other muſcles ſerving for voluntary motion, which would be in a ſtate of perpetual contraction, notwithſtanding any influence of the will, if it were not for the libration of antagoniſt muſcles. This libration between other muſcles, is anſwered by the weight of the incumbent atmoſphere, which preſſes upon the thorax and other parts of the body; as in all other voluntary motions, the influence of the will only gives a prevalence to one of the two powers before equilibrated; ſo here it ſerves to enable thoſe muſcles to lift a weight too ponderous for their ſtrength not ſo aſſiſted: ſo that as ſoon as that aſſiſtance is withdrawn, the ribs are again depreſſed by the mere gravitation of the atmoſphere, which would otherwiſe remain elevated through the natural tendency of theſe muſcles to contraction: this is evidently proved from the Torricellian experiment, and thoſe made upon animals in *vacuo*, where, as ſoon as the air is withdrawn, and the preſſure thereby taken off, the intercoſtal muſcles and diaphragm are contracted, and the ribs elevated in an inſtant, and cannot by any power of the will be made to ſubſide, till the air is again let in to bear them forcibly down. As in the elevation of the ribs, the blood, by the paſſage opened for it, is in a manner ſolicited into the lungs, ſo in their depreſſion, by the ſubſidence of the lungs, and contraction of the blood-veſſels conſequent thereto, the blood is forcibly driven through the pulmonary vein into the left ventricle of the *heart*; and this, together with the general compreſſion of the body by the weight of the

atmoſphere

atmosphere which surrounds and presses on its whole surface, is that power which causes the blood to mount in the veins, after the force impressed upon it by the *heart* is broken and spent, and which suffices to force the *heart* from its natural state to dilatation.

Upon computing the weight of the column of air equal to the surface of the body, it appears however sufficient for the effects here ascribed to it, and considering that the bodies of animals are compressible machines, it appears that it must of necessity affect them in the manner here laid down; and yet though our bodies be entirely composed of tubuli, or vessels filled with fluids, this pressure how great soever, being equal every way, could not affect them, were it not that the superficial dimensions are equally variable: because, being compressed on all parts with the same degree of force, the contained fluids could not any-where begin to recede, and make way for the rest to follow, but would remain as fixed and immoveable as if they were actually solid.

But, by the dilatation of the thorax, room is made for the fluids to move, and by the coarctation of it, fresh motion is impressed; which is the great spring whereby the circulation is set and kept going.

This reciprocal dilatation and contraction of the superficial dimensions of the body seem so necessary to animal life, that there is not any animal so imperfect as to want them, at least none to which our anatomical inquiries have yet reached; for though most kinds of fish, and insects, want both moveable ribs and lungs, and consequently have no dilatable thorax, yet that defect is supplied by an analogous mechanism, answering sufficiently the necessities of their life. Thus fishes, which have no lungs, have gills to do the office of lungs, receiving and expelling alternately the water, whereby the blood-vessels suffer the same alteration of dimensions as in the lungs of more perfect animals.

Add that the lungs, or air-vessels, of insects are much more different from those of perfect animals, than those of fishes are, and yet in their action and use, they agree perfectly with both; that is, removing and expelling the air, and varying the dimensions and capacities of the blood-vessels; having no thorax, or separate cavity for the *heart* and air-vessels, the latter are distributed through the whole trunk, by which they communicate with the external air through several spiracles or vent-holes, to which are fitted so many little trachææ or wind-pipes, which thence send their branches to all the muscles and viscera, and seem to accompany the blood-vessels all over the body, as they do in the lungs of perfect animals; by this disposition, in every inspiration the whole body is inflated, and in every expiration compressed, and consequently the blood-vessels must suffer a vicissitude of extension and contraction, and a greater motion be thereby impressed on the contained fluids than the *heart*, which in these creatures does not appear to be muscular, would be capable of giving. The only animal excepted from this necessary condition of receiving and expelling alternately some fluid in and out of the body is a FŒTUS; but this, while included in the womb, seems to have little more than a vegetative life, and ought scarce to be reckoned among the number of animals; and were it not for that small share of muscular motion which it exercises in the womb, it might without absurdity, be accounted a graft upon, or branch of, the mother.

One difficulty we must not here conceal, which will lie against the whole doctrine, viz. that the *hearts* of several animals have been found to beat regularly, and strongly, even *in vacuo*, not less so than in the air. Witness the *hearts* of frogs, tried by Mr. Boyle. Phil. Transf. N° 62. Dr. Keill objects to this hypothesis; alledging, that the pressure of the atmosphere on the surface of our bodies cannot supply the place of antagonist muscles, because the air within us is always in equilibrio with the external air, and consequently the pressure of the atmosphere can neither promote nor retard the contraction of the thorax, or the dilatation of the *heart*; and he ascribes their alternate contraction and dilatation to the influx of the blood or animal spirits. Anat. p. 133. edit. 1759.

Albert Haller, M. D. ascribes the motion of the *heart* to a stimulus impressed upon it by the blood; in proof of this he urges, that the right auricle and ventricle do persevere longer in a state of constriction than the left, because they are longer stimulated by the venous blood: the fact is known, and inferred by Boerhaave from the experiments of Galen and Harvey. Dr. Haller made several experiments to prove that this was owing to the afflux of the venous blood: he contrived to exclude the blood from the right ventricle and auricle, and to hinder it from quitting the left ventricle; and thus by retaining the stimulus, he caused the motion of the left ventricle to subsist, and thence inferred that the motion of the *heart* depends upon the stimulus of the blood; for this purpose, after cutting the veins of cats and kids, which were the animals he used, he opened the pulmonary artery, in order perfectly to empty the right ventricle of its blood, keeping the left ventricle full by a strong ligature on the aorta; he then found that the right ventricle was at rest, and that the left and its auricle were in motion; according to this process the part which kept longest alive, which is commonly the right auricle, was now the left ventricle, that being the longest kept stimulated by the blood. Mem. Acad. Sc. Gottingen, vol. i.

HEART, *estimate of the force of the*. The quantity of the force of the *heart* has been variously estimated, and on various principles, by various authors, particularly Borelli, Morland, Keill, Jurin, &c.

The force of the *heart* may be defined by the motion wherewith the *heart* contracts, or by the motion of a weight which being opposed to the blood at its exit out of the *heart*, will just balance and stop the same; this we have no way of coming at *a priori*; the internal structure of the part, and the nature and power of the contracting cause, being but imperfectly known; so that the only means remaining is, to estimate it by the effects.

All the action of the *heart* consists in the contraction of its ventricles; the ventricles contracting, strike or press upon the blood, and communicating part of their motion thereto, drive it out with vehemence where the passage is open: the blood thus protruded into the aorta and pulmonary artery, presses every way, partly against the coats of the arteries, which by the last diastole had been left in a collapsed, flaccid state; and partly against the anterior blood moving on too slowly before it: by such means the coats of the arteries are gradually distended, and the antecedent blood has its motions accelerated. By the way it may be observed, that the more flaccid the arteries are, the less resistance they will make to a dilatation; and the more they are dilated, the more strongly will they resist a farther dilatation: so that the force of the blood, at its egress out of the *heart*, is at first spent in distending the arteries more than in protruding the antecedent blood, but afterwards more in protruding the blood than in distending the arteries.

Borelli, in his Oecon. Animal. makes the obstacle to the motion of the blood through the arteries, equivalent to 180,000 pounds; and the force of the *heart* itself only equal to 3000 pounds, which is only one sixtieth of the opposition it has to overcome: then deducting 45,000 pounds for the adventitious help of the muscular elastic coat of the arteries, he leaves the *heart* with a force of 3000 pounds to overcome a resistance of 135,000 pounds, that is, with 1 to remove 45; which he supposes it enabled to do by virtue of percussion. See DIASTOLE. But if he had proceeded in his calculation to the veins, which he allows to contain quadruple the quantity of blood found in the arteries, and to which this energy of percussion either does not reach at all, or but very languidly, he would readily have seen the system of percussion to be insufficient.

But his calculus itself is also found to be faulty; the force ascribed by him to the *heart* being immensely too great. Dr. Jurin shews, that if he had not made a mistake in the computation, the resistance which the *heart* has to overcome, must have come out, on his own principles, much greater; and, instead of 135,000 pounds, would have been 1,076,000 pounds, which transcends all probability.

The great faults in his solution consist, according to Dr. Jurin, in his estimating the motive force of the *heart* by a pondus at rest, in supposing the whole weight sustained by a muscle, in one of his experiments, to be sustained wholly by the contracting force thereof; in assuming muscles equally heavy to be of equal force, and in supposing the utmost force of the *heart* exerted at every systole.

Dr. Keill, in his Essays on the Anim. Oecon. first ventured to set aside Borelli's calculus, and substituted another, almost infinitely smaller in its stead: his method of estimating the force of the *heart* is as follows: having the velocity wherewith a fluid flows out at an orifice, without meeting any resistance from an anterior fluid; the force which produces that motion is thus determined: Let the line A B be the height from which a falling body will acquire a velocity equal to that wherewith the fluid flows out at the orifice; then is the force, which produces the motion of this fluid, equal to the weight of a cylinder of the same fluid, whose base is equal to the orifice, and weight

A

B

equal 2 A B. Corol. 2 Prop. 36. lib. ii. Newton. Princip.

Now the blood flowing out of the *heart* is resisted, in its motion, by the anterior blood in the arteries and veins, and therefore cannot flow with all the velocity which the force

of the *heart* will give it, part of that force being spent in overcoming the reſiſtance of the maſs of blood; it therefore, we knew how much the velocity of the blood is diminiſhed by this reſiſtance, or what proportion the velocity of the blood reſiſted has to the blood driven out, and not reſiſted, having already determined the velocity of the blood as it is reſiſted, we might eaſily collect the velocity by which the blood would flow were it not reſiſted; and from thence find the abſolute force of the *heart*. To find this, the author made the following experiment: having uncovered the iliac artery and vein in the thigh of a dog, near his body, and paſſed convenient ligatures under them, he opened the whole diameter of the vein, and receiving the blood which runs from it in the ſpace of ten ſeconds; the time was afterwards done by the artery for the ſame ſpace of time, and both the quantities of the blood were exactly weighed: the experiment was repeated for the greater ſecurity, till the quantity of blood from the artery was found, at a medium to that of the vein, in the ſame ſpace of time, nearly as 7 to 3.

Now the velocity of the blood in the iliac artery, ſo near the aorta, muſt be nearly the ſame with that in the aorta itſelf; and conſequently the velocity with which it flows out of the iliac artery cut aſunder, is the ſame with which it would flow out of the *heart* unreſiſted, or the blood runs through a wound in the iliac artery with all the velocity it received from the *heart*: now all the blood which runs along the iliac artery returns again by the iliac vein; and conſequently the quantities of blood which paſs through both in the ſame ſpace of time are equal; the quantity of blood, therefore, which runs out of the iliac vein cut aſunder, is the ſame which ran through the iliac artery before it was cut, in that ſpace of time: having therefore the quantity which runs through the iliac artery when it is cut and when it is not cut, we have their velocities; for the velocity of a fluid running through the ſame canal in equal ſpaces of time, is directly as their quantities; but the velocity of the blood when the artery is cut, is equal to that it receives by the full force of the *heart*, and the velocity when it is not cut, is that velocity with which the blood moves through the aorta, reſiſted by the anterior blood, and therefore theſe two velocities are to one another as 7 to 3.

If now the *heart* throws out two ounces of blood every ſyſtole, which is a probable aſſumption, then the blood moves through the aorta at the rate of 156 feet in a minute; and therefore the abſolute velocity wherewith the blood would be forced into the aorta, if it found no reſiſtance, is ſuch as would make it move 300 feet in a minute, or 65 feet in a ſecond.

We now proceed to enquire, what is the height from which a falling body will acquire this given velocity? for this height doubled, gives the length of the cylinder whoſe baſe is equal to the orifice of the aorta, and weight equal to the abſolute force of the *heart*.

It is known by experiment, that the force of gravity will make a body move 30 feet in a ſecond, which is the velocity it acquires in falling through 15 feet; and therefore this velocity is to the velocity of the blood flowing without reſiſtance into the aorta as 30 to 65: but becauſe the heights from which bodies acquire given velocities, are as the ſquares of the velocities, that is, as 900 to 4225; therefore as 900 to 4225, ſo is 15 to 0.74. This height doubled, gives 1.48, or in inches 17.76, which is the height of a cylinder of blood, whoſe baſe is equal to the aorta, which we have ſuppoſed to be equal to 0.4187, and therefore the ſolid content is 7.436112, the weight of which is equal to the abſolute force of the *heart*.

This weight is five ounces, whence the force of the *heart* is found equal only to the weight of five ounces.

Dr. Keill, in his Anatomy Abridged, p. 137, &c. ſuppoſes that the ventricles of the *heart* throw out at leaſt one ounce of blood in each ſyſtole; and, if the *heart* contracts 4000 times in an hour, there will paſs through the *heart* every hour 4000 ounces, or 250lb. weight of blood: and, ſtating the whole maſs of blood to be 25lb. a quantity equal to this paſſes through the heart 10 times in an hour, or about once in ſix minutes. If the *heart* contracts 80 times in a minute, then 25lb. weight of blood paſſes through its ventricles once in five minutes. According to this eſtimate, the left ventricle of the *heart* throws out in each ſyſtole one ounce, or 1.638 cubic inches of blood, and the area of the orifice of the aorta being = 0.4187; then, *dividing* the former by this, the quotient 3.9 will be the length of the cylinder of blood, which is formed in paſſing through the aorta in each ſyſtole; and, allowing the number of pulſes in a minute to be 75, in 75 pulſes 3 cylinder of 292.5 inches will paſs, or the blood will move at the rate of 1462 feet in an hour: but the ſyſtole of the *heart* being performed in one third of the time of a pulſation, the velocity of the blood in that inſtant will be three as much; viz. at the rate of 4386 feet in an hour, or 73 feet in a minute. The quantity of blood thrown out in 75 pulſes will be equal to 4 lb. 11 oz. and in 34 minutes a quantity equal to a middle-ſized man, viz. 158lb. will paſs through the *heart*. But if, with Dr. Harvey and Dr. Lower, we ſuppoſe two ounces of blood, i. e. 3.276 cubic inches, to be thrown out at each ſyſtole, then the velocity of the blood in entering the orifice of the aorta will be double the former, viz. at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will paſs in half the time, viz. 17 minutes. Hale's Stat. Eſſ. vol. ii. p. 39.

Dr. Keill has farther demonſtrated, that the greateſt velocity of the blood is to the leaſt as 5833 to 1, or that it moves 5833 times ſlower in ſome capillary arteries than it does in the aorta; ſuppoſing that it has a free and unembarraſſed courſe through theſe arteries; which is very far from being the caſe, becauſe the principal obſtruction to the progreſs of the arterial blood is in the capillary arteries, as Dr. Hales has ſhewn, vol. ii. p. 28, &c. and ſince the velocity of the blood at its paſſing from the *heart* to the aorta is at the rate of 146 feet in a minute, taking one third of that for its continued equable velocity, according to Dr. Keill's eſtimate, it would move but 0.1128 inch in a minute, in the evaneſcent arteries in that time.

The number of extreme capillary arteries eſtimated by Dr. Hales, on the ſuppoſition that one ounce of blood be thrown out at each ſyſtole, is 4267723; and, on the ſuppoſition that two ounces of blood are thrown out at each ſyſtole, their number will be 8210446. From the arteries the blood is received into the veins; and, if the number of arteries be to that of the veins as 324 to 441, Dr. Keill concludes, that the blood moves in the veins above 7216 times ſlower than it does in the aorta.

The ſame author, by another method of calculating from the laws of projectiles, finds the force of the *heart* almoſt equal to eight ounces; which, though ſomewhat more than was before determined, yet the difference is of ſmall moment in reſpect of Borelli's account, the great failing of whoſe calculation Dr. Keill takes to ariſe from his not diſtinguiſhing between the blood at reſt and the blood already in motion. The force of the *heart*, it is certain, is not employed in giving motion to any quantity of blood at reſt, but only to continue it in motion: how that motion firſt aroſe, ſeems out of the human capacity to determine. It is demonſtrable, that if the reſiſtance of the blood always bore the ſame proportion to the force of the *heart* it now does, the blood never could be firſt put in motion by the heart, if the blood conſtantly moved forwards, with the motion firſt communicated to it, and did the coats of the veſſels make no reſiſtance, the poſterior blood would not be retarded by the anterior, and the force of the blood would equal the entire force of the mover; but becauſe of the reſiſtance made by the coats of the blood-veſſels, and the force which is ſpent in diſtending them, the blood is continually retarded in its motion as it circulates, and would in a ſhort time ſtop, were not the motion loſt made up again by a freſh impulſe from the *heart*; and, therefore, the force of the *heart* muſt be equal to the reſiſtance the blood meets with in its motion: if it were more, the velocity of the blood would be continually increaſing; if leſs, it would continually decreaſe, and at laſt ſtop. And hence it is evident, that if the circulation of the blood was once ſtopped, all the force of the *heart* could never ſet it moving again.

Thus much for Dr. Keill's ſyſtem. Dr. Jurin charges even this with its defects; and, particularly, in that it ſuppoſes the weight, whereby the motion of water running out of a veſſel may be generated, to be what generates that motion, which this laſt author takes for a miſapprehenſion of ſir Iſaac Newton's corollary, urging, that the water falling by the power of gravity, acquires its motion of itſelf, and that the weight falling the ſame time, only receives a motion equal to that of the water out of the veſſel. There are ſome other points which he objects againſt, and of which the learned author has an expreſs vindication in the Philoſophical Tranſactions; to which his antagoniſt has ſince replied; but the author dying in the mean time, the diſpute ceaſed.

Dr. Jurin, however, proceeds to give another computation, on more unexceptionable principles; though his adverſary has found occaſion therein for recrimination.

He conſiders one of the ventricles of the *heart* impelling the blood, as a given body impelling another at reſt, with a given velocity, and, after communicating part of its motion thereto, proceeding with the ſame common velocity; on which principle, the force of the *heart* will

either be equal to the fuctum of the weight of the ventricle and its initial velocity before it impels the blood, or to the fum of the motions of the ventricle, and the blood flowing out of the fame, and the motion communicated to the coats of the arteries and the antecedent blood.

Now it is demanftrable. 1. That the motion whereby a hollow machine, unequally contractile, does act in contraction, is equal to the fum of the fuctums of the feveral particles of the machine multiplied into their feveral velocities. Whence it follows, that the motion of the machine is equal to the fuctum of its weight into fome mean velocity between the particles moved fwifteft, and thofe moved floweft. 2. That if the water be expreffed out of the orifice of fuch a machine, the motion of the water burfting out of the fame will be equal to the fum of the fucta of any tranfverfe fections of all the threads of water, feverally multiplied into their refpective lengths and velocities: whence it follows, that the motion of the water is equal to the fuctum of the water iffuing out at the orifice into fome mean length between that of the longeft thread and the fhorteft. Hence, alfo, if there be feveral fuch machines full of water, and contracted alike, whether equally, or unequally, the motion of the water burfting out at the orifice of one of them will be in a ratio compounded of the quadruple ratio of any homologous diameter of the machine, and the reciprocal ratio of the time wherein the contraction is effected.

From thefe data is drawn a folution of the problem, *To find the force of the heart.* For, calling the weight of the left ventricle, or the quantity of blood equal to the fame, p; the inner furface of the ventricle, s; the mean length of the filaments, or threads, of blood expelled from the fame, $\frac{1}{2}$; a fection of the aorta, z; the quantity of blood contained in the left ventricle, q; the time wherein the blood would be thrown out of the *heart*, were the refiftance of the arteries and antecedent blood removed, t; the variable velocity wherewith the blood would flow through the aorta, if the refiftance were taken away, v; the variable length of the aorta, paffed over by the blood, x; and the time wherein the length x is run, z. The mean variable velocity of the blood contiguous to the ventricle, or the mean velocity of the ventricle itfelf, will be $= \frac{xv}{s}$; the motion of the ventricle, $= p \times \frac{xv}{s}$; the motion of the blood iffuing out, $= zv \times \sqrt{\frac{2x}{s}}$; and their fum, or force of the ventricle, $= zv \times \frac{p}{s} + \frac{1}{2} + x$.

But, $v = \frac{z}{q}$; whence, by the inverfe method of fluxions, the force of the ventricle is found $= \frac{zv}{z} \times \frac{p}{s} + \frac{1}{2} + l$. But fince $z = t$, $zv = q$. And hence, the force of the ventricle $= \frac{q}{t} \times \frac{p}{s} + \frac{1}{2s} + l$. After the like manner, the force of the right ventricle (noting the fame things by Greek letters, which in the left are denoted by Italic ones) is found $= \frac{\chi}{\tau} \times \frac{\pi}{\Sigma} + \frac{\chi}{2\sigma} + \lambda$. So that the whole force of the *heart* is $= \frac{q}{t} \times \frac{p}{s} + \frac{\pi}{\Sigma} + \frac{\chi}{2\sigma} + l + \lambda$. *Q. E. I.*

If now we fuppofe $p = 8$ ounces, and $\pi = 4$ ounces avoird. $S = 10$ fquare inches, and $\Sigma = 10$ as much; $l = 2$, and $\lambda = 1\frac{1}{2}$ inches; $q = 2$ ounces avoird. $\tau = 0.4185$ fquare inches, $\sigma = 0.5835$; and $\tau = 0.1$; the forces of the ventricles will be equal to the weights under-written; viz.

	lb	oz.
Of the left ventricle - -	9	1
Of the *right* ventricle - -	6	3
Force of the whole *heart* -	15	4

which weights have a velocity, wherewith they would move an inch each fecond of a minute.

Corol. Hence it is inferred, that when the pulfe is quicker than ordinary, either the refiftance is lefs than ordinary, or the force of the *heart* is increafed, or a lefs quantity of blood than ufual is expelled at each contraction of the *heart*; and *vice verfâ*. As alfo, that if the refiftance be either increafed or diminifhed, either the pulfe or the quantity of blood expelled at each contraction, will be either increafed or diminifhed refpectively. And that if the force of the *heart* be increafed, or diminifhed, either the pulfe muft be accelerated, or the refiftance diminifhed.

On thefe principles Dr. Jurin proceeds to demonftrate the three following theorems:

1. That the whole motion of refiftance made to the blood iffuing out of the *heart* in the fyftole, or the whole motion communicated to the antecedent blood, and the coats of the arteries, is equal to the whole force of the *heart*, *quam proxime*.

2. That the motion communicated to the antecedent blood in a fyftole, is to the motion communicated to the coats of the arteries, as the time of the fyftole is to the time of the diaftole.

Whence, if, with Dr. Keill, we fuppofe the fyftole performed in one third of the interval between two pulfes, the motion communicated to the antecedent blood will be one third of the whole motion of the *heart*; and that communicated to the arteries, two thirds.

3. In different animals, the force of the *heart* is in a ratio compounded of the quadruple ratio of the diameter of any homologous veffel, and the inverfe ratio of the time wherein the *heart* is contracted; or a ratio compounded of the ratio of the weight either of the *heart*, or the whole animal, the fubtriplicate ratio of the fame weight, and the reciprocal ratio of the time. Phil. Tranf. abr. vol. v p. 231. 249, &c.

We fhall clofe this article with a table exhibiting the refult of many experiments made by Dr. Hales, with a view of determining the velocity of the blood in different animals, &c. The apparatus for thefe experiments is very fimple; it conffts of a brafs pipe, about one fixth of an inch in diameter, to which, by means of another brafs pipe fitly adapted to it, is fixed a glafs tube of the fame diameter, and about nine feet in length; thefe pipes are properly graduated, and the brafs pipe is inferted into the arteries, &c. of the animals that are the fubjects of the author's experiments.

The feveral animals.	Weight of each.	Height of the blood in the arteries from level.	Height of the blood in tubes fixed to arteries.	Capacity of the left ventricle of the heart.	Area of the orifice of the aorta.	Velocity of the blood in the aorta in a minute.	Quantities of blood = to the weight of the animal in what time	How much is thrown out by the left ventricle contracting.	Weight of the blood iffuiued by the left ventricle contracting.	Number of pulfes in a minute.	Area of the tranfverfe fections of defcending aorta.	Area of the tranfverfe fection of afcending aorta.

It does not appear, that, by comparing the weights of theſe animals, and the ſeveral quantities of blood which paſs through their *hearts* in a given time, any fixed rule can be thence formed for proportioning the quantities of flowing blood to their different ſizes. Theſe quantities in larger animals are very diſproportionate to the bulk of their bodies, in compariſon with thoſe in leſſer animals. But as the blood has a longer courſe, and conſequently a greater reſiſtance in the former, it appears by the table, by comparing the perpendicular heights of the blood in the tubes affixed to the arteries, that the force of it in the arteries, is in the main, greateſt in the largeſt animals. And if the blood-veſſels in the man and horſe are equally diſtributed in all their homologous parts, or if they are proportionable to their reſpective weights, then the blood muſt move in them reciprocally as the times, in which quantities of blood equal to their reſpective weights paſs through their *hearts*, viz. as 60 to 17 minutes; and, therefore, though the arterial blood of a horſe is propelled with a greater force than that of a man, yet it moves ſlower in the horſe, on account of a greater number of ramifications, and a greater length of veſſels in the larger animals. See a variety of curious experiments and obſervations on this ſubject, in Hales's Statical Eſſays, vol. ii.

HEART *of fiſh*. The *heart* in *fiſhes* is ſituated a little below the gills. It is uſually contained in an extremely thin membrane by way of pericardium, and placed in a large cavity. The *heart*, in the ſeveral kinds of fiſhes is of many different figures. 1. In ſome it is quadrilateral; of this we ſee inſtances in moſt of the common fiſh. 2. In ſome it is of a triangular figure, but a little flatted, as in the cyprini. 3. Its ſituation is generally tranſverſe with reſpect to the head, but not always ſo. In the cartilaginous fiſhes the *heart* has two ventricles, as in land animals, but in all other fiſhes, that is, in all that have gills and not lungs, it has but one cavity. The *heart* in all fiſh has only one auricle; this is very large, and is always placed on the left ſide of the *heart*; at the place of the inſertion of this auricle, there are two valves, the one an upper, the other a lower one. The auricle in its lower part contains the receptacle of the veins, and this has alſo, at its inſertion into the auricle, two valves.

The aorta, or great artery in fiſhes, adheres to the upper part or back of the *heart* by a ginglymus. Its firſt part, or that next the *heart*, is ſmall, and contains two ſigmoide valves. Soon after this it is dilated into a large cavity, which is whiſh on the outſide, and within is ſupported by ſeveral carneous fibres, forming a ſort of columns. From this part the artery is formed into a ſort of caſe, and thence is carried to the gills; it gives one great branch to the hollow of each gill, that is, four to each ſide; and each of theſe large branches is again, a little beyond its inſertion into the hollow part of the bow of each gill, divided into four other branches, which running along the baſe of the lamellæ, are divided finally into as many branches as there are lamellæ, each receiving one; theſe are carried to the extremity of the lamellæ, and there loſt; but the blood returns by as many veins, and is thence diſtributed throughout the whole body. In the margin of every lamina in the leaves of the branchiæ, or gills, there is a vein which diſcharges the blood it receives from the arteries of theſe parts into a trunk, which runs over the ſurface of every arch or bow of the gills; and in fine, every vein coming from all the bony circles of the gills, is by degrees, ſome higher and ſome lower, inſerted into one common trunk. This grand trunk of the vein runs along the ſpine, and performs the office of the deſcending trunk of the aorta in land animals, and diſtributes the blood to every part of the body of the fiſh. The trunks of the lower part of each bony circle take this courſe; but thoſe of the upper part are carried up to the brain and organs of ſenſation, and are returned thence by other branches, which join thoſe lower trunks. Theſe veins when thus joined, are carried to the origin of the gills, and there are diſcharged into another trunk lying upon the aorta, which is opened into the receptacle of Du Verney. This receptacle is no other than a venoſe trunk formed by the meeting of ſeveral veins coming from the ſpine, from the liver, and other parts, and terminating in the auricle. Thus is the circulation in fiſh carried on in a very different manner from that in land animals; and the gills ſerve to fiſhes little thought of by many authors. Artedi's Ichthyology.

HEART *of inſects*. It is eaſy to diſcover that many inſects have a true and regular *heart*; nor is this any where more beautifully diſtinguiſhable than in the claſs of flies; the ſmall ones, and thoſe of tranſparent bodies, are to be choſen indeed for this examination, the larger and more opake being wholly improper for it. None is more eligible on this occaſion than the little fly produced of the puceron eater; this is a very pale yellowiſh fly of a flat body, and ſo perfectly tranſparent, that examined in a proper manner, its internal parts are ſeen as clearly as if they were in a white glaſs veſſel.

One of theſe little flies is to be taken faſtly by the head between the fingers; the wings are to be bent backward, and held with the head, the body inverted and held up againſt a ſtrong light, and the belly then examined with the help of a magnifying glaſs. This examination will convince any one that flies have a real *heart*; they have not a long veſſel only, in the place of one running lengthway down the back, as Malpighi thinks is the caſe in caterpillars and butterflies, but towards the middle of the ſecond ring, and ſometimes in the third, counting from the corſelet, one plainly diſcovers a part which can be taken for no other than a real *heart*. The figure of the *heart* in theſe animals varies, however, much more than in any others that we are acquainted with. Sometimes this *heart* is of the figure of a kidney, placed tranſverſely, and with its hollowed part toward the corſelet, with a long veſſel running ſtraight from this hollowed part up the corſelet. At other times the hollow of the *heart* diſappears, it lengthens itſelf, and acquires the figure of a bottle, with the veſſel before deſcribed placed as its neck. Sometimes it is more, and ſometimes leſs inflated and diſtended; ſometimes the tranſverſe diameter ſurpaſſes the longitudinal, and at others the longitudinal diameter exceeds the other. At all times, however, one may ſee a regular alternative contraction and dilatation of the *heart*; and to the contraction there conſtantly ſucceeds a jet of liquor thrown into the long veſſel as if by a ſyringe; but what is very ſingular is, that after four or five of theſe jets, one always ſees the liquor before thrown up, deſcending into the *heart* again out of the corſelet, by the ſame veſſel by which it was received from the *heart*. Reaumur's Hiſt. Inſ. vol. iv. p. 261.

HEART-*burn*, a diſeaſe, among *Phyſicians*, uſually called CARDIALGIA.

In furfeits, or upon ſwallowing without due maſtication; when meats are eat tough and fat, or with farinaceous ſubſtances unfermented; or when by any accident the ſaliva is vitiated, too ſcanty, or not intimately mixed with the food, the fermentation becomes tumultuous, the ſtomach ſwells with air, and this extraordinary commotion being attended with an unuſual heat, brings on the uneaſineſs called the *heart-burn*; which is remedied by whatever promotes a greater ſecretion of ſaliva, or helps to mix it with our aliments. Pringle's Obſerv. on the Diſeaſes of the Army, p. 168. See DIGESTION.

The teſtaceous powders, as caſſer-ſhells, crabs-eyes, chalk, &c. are the uſual remedies for the *heart-burn*.

HEART *of a tree*, the middle part thereof, taken longitudinally, is called ſo.

HEART, in the *Manege*. A horſe that works in the manege with conſtraint and reſolution, and cannot be brought to conſent to it, is ſaid to be a horſe of *two hearts*.

HEART, in *Sea Language*, is a peculiar ſort of DEAD-*eye*, ſomewhat reſembling the ſhape of a *heart*, but differing from the common dead-eyes, inaſmuch as it is only furniſhed with one large hole in the middle, whereas the common dead-eyes have always three holes. They are principally uſed to contain the lanirards, by which the ſtays are extended.

HEART'S *eaſe*, in *Botany*, the name of a ſpecies of VIOLET.

It is ſaid to be good for ruptures, and the falling ſickneſs. Dict. Ruſt.

HEART-*ſhell*, *cordiformis*, in *Natural Hiſtory*, the name of a genus of ſhells, by ſome authors referred to the peſtinculus or cockle kind, but by later writers juſtly diſtinguiſhed into a ſeparate genus. The characters are theſe: it is a bivalve ſhell-fiſh of the globoſe-elated form, furrowed in deep lines, and in ſome ſpecies imbricated, in others prickly, never auriculated, and always expreſſing what we call the figure of a *heart*.

There are ſeveral very remarkable ſpecies of this genus. The imbricated *heart-ſhell*, called by the French authors *faitage*, or roof-ſhell, from its reſembling the rafters on the top of a houſe, is a very elegant one. Another ſpecies is called the cabbage-ſhell, from the undulations in it reſembling ſome of the garden-curled cabbages. To this genus alſo belong the Noah's ark ſhell. Some of theſe ſpecies of *heart-ſhells* are of a globular figure; others of a triangular ſhape; others more nearly of the ſhape of a human heart; and others again of an imbricated kind. Hiſt. Nat. Eclaire p. 330.

HEARTH, *ſtone*. See FIRE, CHIMNEY, &c.

HEARTH-*money*. See CHIMNEY-*money*.

HEARTH-*ſtone*. See FIRE-*ſtone*.

HEAT, *color*, one of the primary qualities of bodies; oppoſed to *cold*.

Heat may be defined a phyſical being, whoſe preſence is known, and its degree meaſured by the expanſion of the air, or ſpirit, or mercury, in the thermometer.

Heat in us is properly a ſenſation, excited by the action of fire: or it is the effect of fire on our organs of feeling. Hence it follows, that what we call *heat* is a particular idea, or modification of our own mind; and not any thing exiſting in that form in the body that occaſions it.

Heat is no more in the fire that burns the finger, than pain in the needle that pricks it. In effect, *heat*, in the body that gives it, is only motion; and in the mind only a particular idea or diſpoſition of the ſoul.

Heat, with reſpect to our ſenſation, or the effect produced on us by a hot body is eſtimated by its relation to the organ of feeling; no object appearing to be hot, unleſs its *heat* exceeds that of our body: whence the ſame thing to different perſons, or at different times to the ſame perſon, ſhall appear both hot and cold.

Heat, as it exiſts in the hot body, or that which conſtitutes and denominates a body hot, and enables it to produce ſuch effects on our organ, is variouſly conſidered by the philoſophers. Some will have it a quality, others a ſubſtance, and others only a mechanical affection, viz. motion.

Ariſtotle and the Peripatetics, define *heat* a quality or accident whereby homogeneous things, i. e. things of the ſame nature and kind, are collected and gathered together; and heterogeneous ones, or things of different natures, are ſevered or diſunited. Thus, ſays he, the ſame *heat* which aſſociates and brings into a maſs ſeveral particles of gold before ſeparate, ſeparates the particles of two metals before mixed together. But not only the doctrine, but the very inſtance he produces, is faulty; for *heat* though continued to eternity, will never ſeparate a maſs, e. g. of gold, ſilver, and copper: and on the contrary, if bodies of different qualities, as gold, ſilver, and copper, be put ſeparately in a veſſel over a fire; notwithſtanding all their heterogeneity, they will be mixed and congregated into a maſs thereby.

In effect, *heat* cannot be ſaid to do either this thing or that univerſally; but all its effects depend on the circumſtances of its application. Thus, to do the ſame thing in different bodies, different degrees of *heat* are required; as, to mix gold and ſilver, the heat muſt be in one degree, and to mix mercury and ſulphur, in another.

Add, that the ſame degree of *heat* ſhall have oppoſite effects. Thus a vehement fire ſhall render water, oils, ſalts, &c. volatile; and yet the ſame fire ſhall embody ſand, and fixed alkaline ſalt, into glaſs.

The Epicureans, and other corpuſcularians, define *heat* not as an accident of fire, but as an eſſential power or property thereof, the ſame in reality with it, and only diſtinguiſhed from it in the manner of our conception.

Heat, then, on their principles, is no other than the volatile ſubſtance of fire itſelf, reduced into atoms, and emitted in a continual ſtream from ignited bodies; ſo as not only to *warm* the objects within its reach, but alſo, if they be inflammable, to kindle them, turn them into fire, and conſpire with them to make flame.

In effect, theſe corpuſcles, fay they, flying off from the ignited body, while yet contained within the ſphere of its flame, by their motion conſtitute fire; but when fled, or got beyond the ſame, and diſperſed every way, ſo as to eſcape the apprehenſion of the eye, and only to be perceivable by the feeling, they take the denomination of *heat*, inaſmuch as they ſtill excite in us that ſenſation. The Carteſians, improving on this doctrine, aſſert *heat* to conſiſt in a certain motion of the inſenſible particles of a body, reſembling the motion whereby the ſeveral parts of our body are agitated by the motion of the heart and blood.

Our lateſt and beſt writers of mechanical, experimental, and chemical philoſophy, differ very conſiderably about *heat*. The fundamental difference is, whether it be a peculiar property of one certain immutable body, called *fire*; or whether it may be produced mechanically in other bodies, by inducing an alteration in the particles thereof. The former tenet, which is as ancient as Democritus, and the ſyſtem of atoms, had given way to that of the Carteſians, and other mechaniſts; but is now with great addreſs retrieved, and improved on, by ſome of the lateſt writers, particularly Homberg, the younger Lemery, 'sGravеſande, and, above all, by the learned and induſtrious Boerhaave, in a courſe of lectures expreſly on *fire*; the reſult whereof we have already laid down under the article FIRE.

The thing we call *fire*, according to this author, is a body ſui generis, created ſuch ab origine, unalterable in its nature and properties, and not either producible de novo, from any other body, nor capable of being reduced into any other body, or of ceaſing to be fire.

This fire, he contends, is diffuſed equably every where, and exiſts alike, or in equal quantity, in all parts of ſpace, whether void or poſſeſſed by bodies; but that naturally, and in itſelf, it is perfectly latent and imperceptible; and is only diſcovered by certain effects which it produces, and which are cognizable by our ſenſes.

Theſe effects are *heat*, light, colour, rarefaction, and burning, which are all indications of fire, as being none of them producible by any other cauſe: ſo that wherever we obſerve any of theſe, we may fafely infer the action and preſence of fire. But, though the effect cannot be without the cauſe, yet the fire may remain without any of theſe effects; any, we mean, groſs enough to affect our ſenſes, or become objects thereof: and this he adds, is the ordinary caſe; there being a concurrence of other circumſtances, which are often wanting, neceſſary to the production of ſuch ſenſible effects.

Hence, particularly, it is, that we ſometimes find ſeveral, and ſometimes all, of theſe effects of fire together, and ſometimes one unaccompanied with any others; according as the circumſtances favour or diſpoſe things for the ſame. Thus we find light without *heat*; as in rotten wood, putrid fiſhes, or the mercurial phoſphorus: nay, and one of them may be in the higheſt degree, and the other not ſenſible; as in the focus of a large burning-glaſs expoſed to the moon; where, though the light, as Dr. Hooke found, was ſufficient to have inſtantly blinded the beſt eye, yet no *heat* was perceivable, nor was there the leaſt rarefaction occaſioned in an exquiſite thermometer. See MOON and LIGHT.

On the other hand, there may be *heat* without light, as we find in fluids, which emit no light even when they boil, and not only *heat* and rarefy, but alſo burn or conſume the parts; and in metals, ſtones, &c. which contract a vehement *heat* before they ſhine, or become ignited. Nay, and there may be the moſt intenſe *heat* in nature without any light: thus in the focus of a large burning concave, where metals melt, and the hardeſt gems vitrify, the eyes perceive no light; ſo that ſhould the hand happen to be put there, it would inſtantly be turned into a coal, or even a calx. So alſo rarefactions are frequently obſerved by the thermometer, in the night-time, without either *heat* or light, &c.

But as *heat*, when accumulated in a ſufficient quantity, is conſtantly accompanied with light, or, in other words as fire is always produced by the increaſe of *heat*, philoſophers have generally conſidered theſe phenomena as proceeding from the ſame cauſe; and have, therefore, uſed the word FIRE to expreſs that unknown principle, which, when it is preſent to a certain degree, excites the ſenſation of *heat* alone, but when accumulated to a greater degree, renders itſelf obvious, both to the ſight and touch, or produces *heat*, accompanied with light; and in this ſenſe, the element of fire ſignifies the ſame thing with abſolute *heat*. See the ſequel of this article.

Thus it appears, that the effects of fire have a dependence on other concurring circumſtances; ſome more, and others leſs. One thing ſeems to be required in common to them all, *viz.* that the fire be collected or brought into leſs compaſs; without this, as fire is every where equably diffuſed, it could have no more effect in one place than another, but muſt either be diſpoſed to warm, burn, and ſhine, every where, or no where. Indeed, ſuch every where does amount to no where; for to have the ſame *heat*, &c. in every place, would be to have no *heat* at all; it is only the changes that we perceive; thoſe alone make the mind diſtinguiſh its ſtate, and become conſcious of the things that diverſify it. So our bodies being equally preſſed on all ſides by the ambient air, we feel no preſſure at all; but if the preſſure be only taken off in any one part, as by laying the hand over an exhauſted receiver, we ſoon become ſenſible of the load.

This collection is performed two ways: the firſt, by directing and determining the fluctuating corpuſcles of fire into lines, or trains, called *rays*; and thus driving infinite ſucceſſions of the fiery atoms upon the ſame place or body, each to produce its ſeveral effect, and ſecond that of the preceding ones, till by a ſeries of augmentations, the effect is ſenſible. This is the office of thoſe bodies which we call *luminaries*; ſuch as the ſun, and other heavenly bodies; and alſo of our culinary fires, lamps, &c. on earth, which do not emit the fire from their own ſubſtance, as is commonly conceived, but only by their rotatory mutation direct the undetermined corpuſcles into parallel rays. And the effect may ſtill be farther increaſed by a ſecond collection of theſe parallel into converging rays, by means of a concave ſpeculum, or a convex glaſs, which at length brings them all into a point: whence thoſe aſtoniſhing effects of our large burning-glaſſes.

The ſecond way wherein the collection is made, is not by determining the vague fire, or giving it any new direction, but merely by aſſembling it; which is done by the

attrition or rubbing of two bodies ſwiftly againſt each other; or ſwiftly, in effect, as that nothing in the air, except the floating fire, has activity enough to move an equal pace, or ſucceed faſt enough into the places continually relinquiſhed by it: by which means fire, the moſt agile body in nature, ſlipping in, becomes collected in the path of the moving body; ſo that the moveable has, as it were, a fiery atmoſphere around it. Thus it is, that the axes of chariot-wheels, mill-ſtones, the ropes of ſhips, cannon-balls, &c. conceive *heat*, and ſome of them kindle into flame.

Thus much for the circumſtance in *heat*, common to all the effects of fire, viz. collection. The particular circumſtances are various: thus, for it to warm, or to *heat*, i. e. to give the ſenſation of it, it is neceſſary that there be more *fire* in the *hot* body or thing, than in the organ whereby it is to be felt; otherwiſe the mind will not be put into any new ſtate upon its approach, nor have any new idea. Whence, alſo, if the contrary to this obtains, v. g. if there be leſs fire in the external object than in the organ, it will raiſe an idea of cold, or chillneſs.

Thus it is, that a man coming out of a hot bath into a moderately warm air, ſeems as if he were got into an exceſſive cold place; and another entering a room ſcarcely warm, in a very pinching day, will at firſt fancy himſelf in a ſtove. Whence it appears, that the ſenſe of *heat* does by no means determine the degree of fire; the *heat* being only the ratio or difference between the internal and external fire. As to the circumſtances neceſſary to the fire's producing LIGHT, BURNING, RAREFACTION, &c. ſee LIGHT, &c.

The mechanical philoſophers, particularly lord Bacon, Mr. Boyle, and ſir Iſaac Newton, look on *heat* in another light. They do not conceive it as an original inherent property of any particular ſort of body; but as mechanically producible in any body.

Lord Bacon, in an expreſs treatiſe De Forma Calidi, deduces, from a particular enumeration of the ſeveral phenomena and effects of heat,

1. That *heat* is motion: not that motion generates *heat*, or *heat* motion; though, in many caſes, this be true: but that the very thing *heat* is motion and nothing elſe. But this motion, he ſhews, has ſeveral peculiar circumſtances, which conſtitute it *heat*.

As, 2. That it is an expanſive motion, whereby a body endeavours to dilate or ſtretch into a larger dimenſion than it had before.

3. That this expanſive motion is directed towards the circumference, and at the ſame time upwards; which appears hence, that an iron rod, being erected in the fire, will burn the hand that holds it, much ſooner than if put in laterally.

4. That this expanſive motion is not equable, and of the whole, but only of the ſmaller particles of the body; as appears from the alternate trepidation of the particles of *hot* liquors, ignited iron, &c. And laſtly, that this motion is very rapid.

Hence he defines *heat* an expanſive undulatory motion in the minute particles of the body; whereby they tend, with ſome rapidity, towards the circumference, and at the ſame time incline a little upwards.

Hence, again, he adds, that if, in any natural body you can excite a motion whereby it ſhall expand or dilate itſelf, and can ſo repreſs and direct this motion upon itſelf, as that the dilatation ſhall not proceed uniformly, but obtain in ſome parts, and be checked in others, you will generate *heat*. This doctrine, Deſcartes and his ſect adhere to with ſome little variation. According to them, *heat* conſiſts in a certain motion or agitation of the parts of a body, like to that wherewith the ſeveral parts of our body are agitated by the motion of the heart and blood.

Mr. Boyle, in a treatiſe of the Mechanical Origin of *Heat* and Cold, ſtrenuouſly ſupports the doctrine of the producibility of *heat*, with new obſervations and experiments: as a ſpecimen, we ſhall here give one or two.

In the production, ſays he, of *heat*, there appears nothing, on the part either of the agent or patient, but motion, and its natural effects. When a ſmith briſkly hammers a ſmall piece of iron, the metal thereby becomes exceedingly *hot*; yet there is nothing to make it ſo, except the forcible motion of the hammer impreſſing a vehement and variouſly determined agitation on the ſmall parts of the iron, which, being a cold body before, grows, by that ſuperinduced commotion of its ſmall parts, *hot*: firſt in a more looſe acception of the word, with regard to ſome other bodies, compared with which it was cold before; and then ſenſibly *hot*, becauſe this agitation ſurpaſſes that of the parts of our fingers; and in this inſtance oftentimes, the hammer and the anvil continue cold after the operation; which ſhews, that the *heat* acquired by the iron, was not communicated by either of thoſe inſtruments as *heat*, but produced in it by motion great enough ſtrongly to agitate the parts of ſo ſmall a body as the piece of iron, without being able to have the like effect upon ſo much greater maſſes of metal, as the hammer and the anvil; though, if the percuſſions were often and briſkly renewed, and the hammer were ſmall, this alſo might be *heated*. Whence it is not neceſſary, that a body itſelf ſhould be *hot* to give *heat*.

If a large nail be driven by a hammer into a plank of wood, it will receive ſeveral ſtrokes on its head, before it grow *hot*; but when it is once driven to the head, a few ſtrokes ſuffice to give it a conſiderable heat: for while at every blow of the hammer, the nail enters farther into the wood, the motion produced is chiefly progreſſive, and is of the whole nail tending one way; but when the motion ceaſes, the impulſe given by the ſtroke being unable to drive the nail farther on, or to break it, muſt be ſpent in making various, vehement, and inteſtine commotions of the parts among themſelves, wherein the nature of *heat* conſiſts.

That *heat*, ſay the ſame authors, is mechanically producible, appears probable from a conſideration of its nature, which ſeems principally to conſiſt in that mechanical property of matter, called *motion*; but which is here ſubject to three conditions, or modifications.

Firſt, the agitation of the parts of the body muſt be vehement: for this diſtinguiſhes the bodies faid to be *hot*, from thoſe which are barely fluid. Thus, the particles of water, in its natural ſtate, move ſo calmly, that we do not feel it at all warm, though it could not be a liquor, unleſs they were in a reſtleſs motion; but when water becomes actually *hot*, the motion manifeſtly and proportionably appears vehement, ſince it does not only ſtrike our organs of feeling briſkly, but ordinarily produces numerous very ſmall bubbles, melts coagulated oil caſt upon it, and affords vapours, which by their agitation aſcend into the air. And if the degree of *heat* be ſuch as to make the water boil, the agitation becomes more manifeſt by the confuſed motions, waves, noiſe, bubbles, and other obvious effects, excited therein. Thus in a *heated* iron, the vehement agitation of its parts may be eaſily inferred from the motion, and the hiſſing noiſe, it makes with the drops of water that fall from it. But though the agitation be various, as well as vehement, yet there is a third condition required to make a body *hot*; which is, that the agitated particles, or at leaſt the greateſt number of them, be ſo minute, as to be ſingly inſenſible. Were a heap of ſand to be vehemently agitated by a whirlwind, the bulk of the corpuſcles would keep their agitation from being properly *heated*, though by their numerous ſtrokes upon any man's face, and the briſk commotion of the ſpirits, which would thence enſue, they might perhaps produce that quality.

The ſecond condition is, that the determination be very various, and tend all manner of ways. This variety of determinations appears to be in hot bodies, both by ſome of the inſtances already mentioned, and eſpecially that of flame, which is a body: by the dilatation of metals when melted; and by the operations of *heat*, exerciſed by hot bodies upon others, in what poſture or ſituation ſoever the body, to be heated thereby, be applied to them: thus a coal, thoroughly kindled, will appear on all ſides red, and melt wax and kindle brimſtone, whether the body be applied to the upper, the lower, or any other part of it. Hence, if we duly attend to this notion of the nature of *heat*, it is eaſy to diſcern how it may be mechanically produced ſeveral ways: for, except in ſome few anomalous caſes, by whatever means the inſenſible parts of a body can be put into a very confuſed and vehement agitation, *heat* will be introduced into that body; and as there are ſeveral agents and operations, by which the heating motion may be excited, ſo there muſt be ſeveral mechanical ways of producing *heat*: various experiments may be reduced to almoſt each of theſe heads; chance itſelf having, in the laboratories of chemiſts, afforded ſeveral phenomena referable thereto.

This ſyſtem is farther ſupported alſo by ſir Iſaac Newton, who does not conceive fire as any particular ſpecies of body, originally endued with ſuch and ſuch properties. Fire, according to him, is only a body much ignited, i. e. heated hot, ſo as to emit light copiouſly: what elſe, ſays he, is red-hot-iron than fire? and what elſe is a burning coal than red-hot wood? or flame itſelf than red-hot ſmoke? It is certain, that flame is only the volatile part of the fuel heated red-hot, i. e. ſo hot as to ſhine; and hence only ſuch bodies as are volatile, i. e. ſuch as emit a copious fume, will flame; nor will they flame longer than they have fume to burn. In diſtilling hot ſpirits, if the head of the ſtill be taken off, the aſcending vapours will catch fire from a candle, and turn into a flame. And in the ſame manner ſeveral bodies, much heated by motion, attrition, fermentation, or the like,

like, will emit lucid fumes, which if they be copious enough, and the *heat* sufficiently great, will be flame: and the reason why fused metals do not flame, is the smallneſs of their fume; this is evident, becauſe ſpelter, which fumes moſt copiouſly, does likewiſe flame. Add, that all flaming bodies, as oil, tallow, wax, and pitch, ſulphur, &c. by flaming, waſte, and vaniſh into burning ſmoke.

And do not all fixed bodies, when heated beyond a certain degree, emit light, and ſhine? and is not this emiſſion performed by the vibrating motion of their parts? and do not all bodies, which abound with terreſtrial and ſulphureous parts, emit light as often as thoſe parts are ſufficiently agitated, whether that agitation be made by external fire, or by friction, or percuſſion, or putrefaction, or by any other cauſe? Thus ſea-water, in a ſtorm; quickſilver agitated in vacuo; the back of a cat, or the neck of a horſe, obliquely rubbed in a dark place; wood, fleſh, and fiſh, while they putrefy; vapours from putrefying waters, uſually called *ignes fatui*; ſtacks of moiſt hay or corn; glow-worms; amber and diamonds by rubbing; fragments of fleel ſtruck off with a ſtone, &c. all emit light. Are not groſs bodies and light convertible into one another? and may not bodies receive much of their activity from the particles of light which enter their compoſition? I know no body leſs apt to ſhine than water; and yet water, by frequent diſtillations, changes into fixed earth, which, by a ſufficient *heat*, may be brought to ſhine like other bodies.

Add, that the ſun and ſtars, according to ſir Iſaac Newton's conjecture, are no other than great earths vehemently heated: for large bodies, he obſerves, preſerve their *heat* the longeſt, their parts heating one another; and why may not great, denſe, and fixed bodies, when heated beyond a certain degree, emit light ſo copiouſly, as by the emiſſion and reaction thereof, and the reflections and refractions of the rays within the pores, to grow ſtill hotter, till they arrive at ſuch a period of *heat* as is that of the ſun? Their parts alſo may be farther preſerved from fuming away, not only by their fixity, but by the vaſt weight and denſity of their atmoſpheres incumbent on them, and ſtrongly compreſſing them, and condenſing the vapours and exhalations ariſing from them. Thus we ſee, warm water, in an exhauſted receiver, ſhall boil as vehemently as the hotteſt water open to the air; the weight of the incumbent atmoſphere, in this latter caſe, keeping down the vapours, and hindering the ebullition, till it has conceived its utmoſt degree of *heat*. So, alſo, a mixture of tin and lead, put on a red-hot iron in vacuo, emits a fume and flame; but the ſame mixture in the open air, by reaſon of the incumbent atmoſphere, does not emit the leaſt ſenſible flame. Thus much for the *ſyſtem of the producibility of heat*.

On the other hand, Mr. Homberg, in his Eſſai du Souffre Principe, holds, that the chemical principle or element SULPHUR, which is ſuppoſed one of the ſimple, primary, pre-exiſtent ingredients of all natural bodies, is real fire, and conſequently, that fire is coeval with body. Mem. de l'Acad. an. 1705.

Dr. s'Graveſande goes on much on the ſame principle: fire, according to him, enters the compoſition of all bodies, is contained in all bodies, and may be ſeparated or procured from all bodies, by rubbing them againſt each other, and thus putting their fire in motion. But fire, he adds, is by no means generated by ſuch motion. Elem. Phyſ. tom. ii. cap. 1.

A body is then only ſenſibly hot, when the degree of its *heat* exceeds that of our organs of ſenſe; ſo that there may be a lucid body, without any ſenſible *heat*; and conſequently, as *heat* is only a ſenſible quality, without any *heat* at all.

Heat, in the hot body, ſays the ſame author, is an agitation of the parts of the body, made by means of the fire contained in it; by ſuch agitation a motion is produced in our bodies, which excites the idea of *heat* in our minds: ſo that *heat*, in reſpect of us, is nothing but that idea, and in the hot body nothing but motion. If ſuch motion expel the fire in right lines, it may give us the idea of light; if in a various and irregular motion, only of *heat*.

Mr. Lemery, the younger, agrees with theſe two authors in aſſerting this abſolute and ingenerable nature of fire; but he extends it farther. Not contented to confine it as an element to bodies, he endeavours to ſhew, that it is equably diffuſed through all ſpace; that it is preſent in all places, even in the void ſpaces between the bodies, as well as in the inſenſible interſtices between their parts. Mem. de l'Acad. an. 1713. See ÆTHER.

This laſt ſentiment falls in with that of Boerhaave above delivered. It ſeems extravagant to talk of heating cold liquors with ice; yet Mr. Boyle aſſures us he has eaſily done it, by taking out of a baſon of cold water, wherein ſeveral fragments of ice were ſwimming, one piece or two which he perceived very well drenched with the liquor, and ſuddenly immerging them into a wide-mouthed glaſs of ſtrong oil of vitriol; for the menſtruum preſently mixing with the water which adhered to the ice, produced in it a briſk *heat*, ſometimes with a manifeſt ſmoke, and that ſuddenly diſſolving the contiguous parts of the ice, and thoſe the next, the whole ice was ſoon reduced to water; and the corroſive menſtruum being, by two or three ſhakes, well diſperſed through it, the whole mixture would immediately grow ſo hot, that ſometimes the containing phial could not be endured in one's hand. Philoſophers have lately diſtinguiſhed *heat* into *abſolute* and *ſenſible*. By *abſolute heat*, which is ſynonymous with what other writers have called FIRE, they mean that power or element, which, when it is preſent to a certain degree, excites in animals the ſenſation of *heat*; and by *ſenſible heat*, the ſame power conſidered in its reaction to the effects which it produces: e. gr. two bodies are ſaid to have equal quantities of ſenſible *heat*, when they produce equal effects upon the mercury in the thermometer; but as bodies of different kinds have different capacities for containing *heat*, the abſolute *heat* in ſuch bodies will be different, though the ſenſible *heat* be the ſame. Thus, a pound of water and a pound of antimony of the ſame temperature have equal ſenſible *heat*; but the former contains a much greater quantity of abſolute *heat* than the latter. It is a well known fact, that *heat* is contained in great quantities in all bodies, when at the common temperature of the atmoſphere; and it is no leſs certain, that *heat* has a conſtant tendency to diffuſe itſelf over all bodies, till they are brought to the ſame degree of abſolute *heat*: it is alſo generally acknowledged, that, when the parts of the ſame homogeneous body have the ſame degree of ſenſible *heat*, the quantities of abſolute *heat* will be proportionable to the bulk or quantity of matter: it alſo appears, that in the ſame homogeneous bodies, if the temperatures be different, but the quantities of matter the ſame, the quantities of abſolute *heat* will be in proportion to the temperatures; and, therefore, the mercurial thermometer is an accurate meaſure of the comparative quantities of abſolute *heat*, which are communicated to the ſame homogeneous bodies, or ſeparated from them, as long as ſuch bodies continue in the ſame form.

M. De Luc has evinced by a variety of experiments, that the expanſions of mercury between the freezing and boiling points of water correſpond preciſely to the quantities of abſolute *heat* applied, and that its contractions are proportionable to the diminution of this element within theſe limits: from hence it may alſo be inferred, that, if the mercury were to retain its fluid form, its contractions would be proportionable to the decrements of the abſolute *heat*, though the diminution were continued to the point of total privation. But the comparative quantities of abſolute *heat*, which are communicated to different bodies, or ſeparated from them, cannot be determined in a direct manner by the thermometer.

Some philoſophers have apprehended that the quantities of abſolute *heat* in bodies are in proportion to their denſities. The celebrated Boerhaave imagined that *heat* is equally diffuſed through all bodies, the denſeſt as well as the rareſt, and, therefore, that the quantities of *heat* in bodies, are in proportion to their bulk: and at his deſire, Fahrenheit attempted to determine the fact by experiment. For this purpoſe, he took equal quantities of the ſame fluid, and gave them different degrees of *heat*, and, having mixed them intimately together, found, that the temperature of the mixture was half the exceſs of the hotter above the colder. But if this experiment be made with water and mercury, in the ſame circumſtances, the reſult will be different. Thus, if you take equal bulks of mercury and water, and give the water a greater degree of *heat* than the mercury, the *heat* of the mixture will always be greater than half the exceſs of the *heat* of the water above that of the mercury. If, on the other hand, the mercury be hotter than the water, the temperature of the mixture will always be leſs than half the exceſs of the *heat* of the mercury above that of the water. And, in general, if equal bulks of water and mercury, at different temperatures, be mixed together, the change, produced in the *heat* of the mercury, will be to that produced in the *heat* of the water as three to two; from whence it has been inferred, that the comparative quantities of the abſolute *heats* of theſe fluids are reciprocally proportionable to the changes which are produced in their ſenſible *heats*, when they are mixed together at different temperatures: this is a fact, which has been publicly taught, for ſeveral years, by Dr. Black and Dr. Irvine, in the univerſities of Edinburgh and Glaſgow. This rule, however, does not apply to thoſe ſubſtances

substances which, in mixture, excite sensible *heat* by chemical action.

From the experiments and reasoning employed by Dr. Crawford, a late ingenious and much-approved writer on this subject, it follows, that equal weights of heterogeneous substances, as air and water, having the same temperature, may contain unequal quantities of absolute *heat*; and, therefore, there must be certain essential differences in the nature of bodies, in consequence of which some have greater powers or capacities of collecting and containing *heat* than others. On these principles Dr. Crawford proceeds, with great caution, guarding as he apprehends, against every possible cause of error, to estimate the absolute *heat* of a variety of substances: the general conclusions deduced from his experiments, the reader will find in this and some of the following articles.

We shall now observe, that he has shewn, by several well-conducted experiments, that the capacities of bodies for containing *heat* are diminished by the addition of phlogiston, and increased by the separation of this principle.

It has been an opinion generally received among philosophers, that phlogiston is either fire itself, or intimately connected with the production of fire. But if this were true, says Dr. Crawford, bodies when united with phlogiston, would contain a greater quantity of fire, or of absolute *heat*, than when separated from it: thus metals would contain more absolute *heat* than their calces, and sulphur more than the vitriolic acid. But the contrary is evinced to be the fact: e. gr. the absolute *heat* of the calx of tin is to that of tin as 14.7 to 10.4; the absolute *heat* of the calx of iron is to that of the metal as 8 to 3.1; the absolute *heat* of the calx of lead is to that of lead as 19.9 to 14.7; and the absolute *heat* of the calx of antimony is to that of the regulus as 11.6 to 4.5. Hence it follows, that if phlogiston be added to a body, a quantity of the absolute *heat* of that body will be extricated; and if the phlogiston be separated again, an equal quantity of *heat* will be absorbed: in the former case, the capacity of the body for containing *heat* is diminished, and in the latter increased. *Heat*, therefore, and phlogiston appear to be two opposite principles in nature: by the action of *heat* on bodies, the force of their attraction to phlogiston is diminished; and by the action of phlogiston, a part of the absolute *heat*, which exists in all bodies as an elementary principle, is expelled. It appears, however, from the facts above recited, that, though all bodies have their capacities for containing *heat* changed in consequence of the addition or separation of phlogiston, yet the degree of this change is very different in different bodies. It is also evident from this ingenious author's experiments, that different quantities of phlogiston are required to saturate different bodies; and that when phlogiston passes from one body to another, the changes in the capacities of the bodies for containing *heat* will be different, and unequal quantities of matter will be changed in a given time: and if two contiguous bodies, at the same moment, have their capacities for containing *heat* respectively increased and diminished, and the changes be such that the whole *heat* separated from the one is absorbed by the other, no sensible *heat* or cold will be produced. Dr. Crawford has demonstrated by an analytical process, that in the case when this happens, the differences of the capacities are reciprocally as the quantities of matter changed in a given time: but if the diminution in the capacity of one body be to the increase in another, in a greater proportion than the quantity of matter in this body to that in the former, the whole of the *heat* which is separated from the former will not be absorbed by the latter: a part of it becoming redundant, or being converted into moving and sensible *heat*. He observes, that the capacity for containing *heat* may continue unchanged, while the absolute heat is varied without end; that the alterations which are produced in the sensible *heats* in different bodies, by given quantities of absolute *heat*, are greater or less, as the body to which the *heat* is applied has a less or greater capacity for containing *heat*; and, therefore, the sensible *heat* of a body depends partly upon the quantity of its absolute *heat*, and partly upon the nature of the body in which this *heat* is contained; and therefore in the same body, the sensible *heat* may vary, though the absolute *heat* continues the same. The curious reader will find a variety of other proportions, that obtain with respect to the capacities, the sensible *heats*, and the quantities of absolute *heat*, deduced from experiment and analysis, in the work cited at the close of this article.

This ingenious writer has not presumed absolutely to decide the question that has been long agitated, whether *heat* be a substance or a quality. He observes, however, that if we adopt the opinion, that *heat* is a distinct substance, an element *sui generis*, the phenomena will be found to admit of a simple and obvious interpretation; and to be perfectly agreeable to the analogy of nature. Fire, he says, on this hypothesis, will be considered as an elementary principle, which enters into the composition of all known bodies: in consequence of the addition of phlogiston, a portion of the fire will be detached, in the same manner as the nitrous acid is detached, by the vitriolic, from an earth or alkali; and therefore respiration and combustion will be truly chemical processes, in which, by the exchange of fire and phlogiston, a double decomposition will take place, and two new compounds will be formed; the blood, or the inflammable body, parting with phlogiston and receiving fire, and the atmospherical air parting with fire and receiving phlogiston. See *Animal* HEAT, and HEAT *of inflammable bodies*.

He adds, that a table may be formed on this supposition, exhibiting the respective attractions of phlogiston and fire. As phlogiston separates from bodies a part of their absolute *heat*, this should be placed at the head of the first column; the earths of the perfect metals, which attract this principle with the greatest force, should stand immediately under phlogiston; and next to these should be classed in order, dephlogisticated and atmospherical air, the bases of all the inflammable bodies, according to the degrees of *heat* which are necessary to their inflammation, when combined with phlogiston, and last of all nitrous air. Fire should be placed at the head of the second column; and if the attractions of bodies to this principle be proportionable to the quantities of it contained in them, when the quantities of matter are equal, under fire should stand dephlogisticated and atmospherical air, the vapour of the nitrous acid, and probably of some other fluid, arterial blood, water, &c. But many experiments are wanting for forming an accurate table of this kind. See Crawford's Experiments and Observations on Animal *Heat* and the Inflammation of combustible Bodies, &c. 8vo. 1779. See also Ellice's Philosophical Observations, &c. 8vo. 1780.

There is a great variety in the *heat* of different places and seasons. Naturalists commonly lay it down, that the nearer any place is to the centre of the earth, the hotter it is found; but this does not hold strictly true. In digging mines, wells, &c. they find, that at a little depth below the surface it feels cool; a little lower, and it is yet colder, as being now beyond any reach or influence of the sun's rays, insomuch that water will freeze almost instantaneously; and hence the use of ice-houses, &c. but when a little lower, viz. about forty or fifty feet deep, it begins to grow warmer, so that no ice can bear it; thus, in the cave of the observatory at Paris, about ninety feet under ground, the *heat* keeps the thermometer at 53°; and then the deeper they go, still the greater is the *heat*, till, at length, respiration grows difficult, and the candles go out. Hence some have recourse to the notion of a fund of fire lodged in the centre of the earth, which they consider as a central sun, and the great principle of the generation, vegetation, nutrition, &c. of fossil and vegetable bodies.

But Mr. Boyle, who had been at the bottom of some mines himself, suspects that this degree of *heat*, at least in some of them, may arise from the peculiar nature of the minerals generated therein. To confirm this he instances a mineral of the vitriolic kind, dug up in large quantities, in several parts of England, which, by the bare effusion of common water, will grow so hot as almost to take fire.

On the other hand, as you ascend high mountains, the air grows more and more piercing and cold: thus the tops of the Pico de Theide in Bohemia, the pike of Teneriff, and several others, even in the most sultry countries, are found always invested with snow and ice, the *heat* never being sufficient to thaw the same.

In some of the mountains of Peru there is no such thing as running water, but all ice: plants make a shift to grow about the feet of the mountains, but near the top no vegetable can live; and this is not for want of food, but through the intenseness of the cold. This effect is attributed to the thinness of the air, and the little surface of earth there is to reflect the rays. The rays here are only determined into a parallelism; but the effect of direct parallel rays is found, by computation, to be very inconsiderable, this effect being really greater in winter than summer.

HEAT, in *Geography*. The diversity of the heat of climes and seasons arises from the different angles under which the sun's rays strike upon the earth's surface.

It is shewn in mechanics, that a moving body, striking perpendicularly on another, acts on it with all its force; and that a body striking obliquely, acts with the less force, the more it deviates from the perpendicular. Now fire moving in right lines, must observe the same mechanical

law as other bodies; and consequently its action must be measured by the sine of the angle of incidence: and hence fire, striking on any obstacle in a direction parallel thereto, has no sensible effect, because the ratio is almost infinite, i. e. it is nothing. Accordingly, the sun, radiating on the earth in the morning, scarce produces any warmth at all.

Hence Dr. Halley gives a mathematical computation of the effect of the sun under different seasons and climates; proceeding on this principle, that the simple action of the sun, as all other impulses or strokes, is more or less forcible, according to the sines of the angles of incidence, or to the perpendiculars let fall on the plane; whence, the vertical ray (which is of the greatest *heat*) being put for radius, the force of the sun on the horizontal surface of the earth will be to that, as the sines of the sun's altitude at any other time.

Hence it follows, that the time of the continuance of the sun's shining being taken for a base, and the sines of the sun's altitude erected thereon as perpendiculars, and a curve drawn through the extremities of those perpendiculars, the area comprehended will be proportionate to the collection of the *heat* of all the sun's beams in that space of time.

Hence it will follow likewise, that under the pole the collection of all the *heat* of a tropical day is proportionate to a rectangle of the sine of 23 degrees and a half into 24 hours, or the circumference of a circle; that is, the sine of 23 degrees and a half being nearly $\frac{4}{7}$ of radius, as $\frac{4}{7}$ into 12 hours. Or, the polar *heat* is equal to that of the sun continuing 12 hours above the horizon at 53 degrees height; than which the sun is not five hours more elevated under the equinoctial.

But whereas the nature of *heat* is to remain in the subject, after the luminary that occasioned its being heated is removed, and particularly in the air, under the equinoctial the twelve hours absence of the sun does but little diminish the motion impressed by the past action of his ray, wherein *heat* consists, before he rises again; but under the pole, the long absence of the sun for six months, wherein the extremity of cold does obtain, hath so chilled the air, that it is, as it were, frozen, and cannot, before the sun has got far towards it, be any ways sensible of his presence, his beams being obstructed by thick clouds, and perpetual fogs and mists.

That *heat* and cold very much depend on the clearness or opacity of the sky, is testified by fact; for the winter cold in South America is very sharp, because the atmosphere is loaded with clouds and icy particles, which intercept the solar rays. At Lima, in lat 12° south, where the sky is never free from vapours, the *heat* is moderate, but at the distance of a few miles the sky is more serene, and there the *heat* is greater; and at Carthagena, in lat. 11° north, the *heat* is, principally on this account, intolerable. Add, that the different degrees of *heat* and cold, in different places, depend, in a very great measure, upon the accidents of situation, with regard to mountains or valleys, rivers, seas, and woods, and the nature and colour of the soil, &c. The first, especially when they are lofty and covered with snow, greatly help to chill the air by the winds which come over them, and which blow in eddies through the levels beyond.

Mountains, sometimes, turning a concave side towards the sun, have the effect of a burning mirror on the subject plain; and the like effect is sometimes had from the concave or convex parts of clouds, either by refraction or reflection. And some even take these to be sufficient to kindle the exhalations lodged in the air, and to produce thunder and lightning, &c.

As to soils; a stony, sandy, or chalky earth, it is known, reflects most of the rays into the air again, and retains but few; by which means a considerable accession of *heat* is derived to the air; as, on the contrary, black loose soils absorb most of the rays, and return few into the air, so that the ground is much the hotter.

This the peasants, who inhabit the morass de Veenen, where turf is dug, are very sensible of; walking there but a little while, the feet grow extremely hot, but the face not at all; on the contrary, in a sandy place, the feet are scarce warm, when the face is scorched by the great reflection.

It is certain, that *heat* communicated by the sun to bodies on this earth, depends much upon other circumstances beside the direct force of its rays. These must be modified by our atmosphere, and variously reflected and combined by the action of the surface of the earth itself, to produce any remarkable effects of *heat*; so that if it were not for these additional circumstances, it is much to be questioned whether the naked *heat* of the sun would be very sensible.

To this purpose, it is observed by Ulloa, in his Voyage to Peru, that on the western shore of that kingdom, from Santa Maria de la Parilla to Lima, it is winter on the mountains from January or February to June, whilst it is summer in the vallies; but from June to November or December, it is winter in the vallies, and summer in the mountains.

The following table gives the *heat* to every tenth degree of latitude to the equinoctial and tropical sun, by which an estimate may be made of the intermediate degrees.

Lat.	Sun in ♈ ♎	Sun in ♋ ♑	Sun in ♑
0	20000	18341	18341
10	19696	20290	15834
20	18795	21737	13166
30	17321	22651	10124
40	15321	23048	6944
50	12855	22991	3708
60	10000	22773	1075
70	6840	23543	000
80	3473	24673	000
90	0000	25055	000

For an account of the general principles and problem, by which this table is calculated, see Phil. Transf. abr. vol. ii. p. 167, &c.

From this table are deducible the following corollaries:

1. That the equinoctial *heat*, when the sun becomes vertical, is as twice the square of the radius; which may be proposed as a standard to be compared with in all other cases.

2. That under the equinoctial the *heat* is as the sine of the sun's declination.

3. That in the frigid zones, when the sun sets not, the *heat* is as the circumference of a circle into the sine of the altitude at 6. And, consequently, that in the same latitude, these aggregates of warmth are as the sines of the sun's declination; and, at the same declination of the sun, they are as the sines of the latitudes, and generally they are as the sines of the latitudes into the sines of declination.

4. That the equinoctial day's heat is every-where as the cosine of the latitude.

5. In all places where the sun sets, the difference between the summer and winter *heats*, when the declinations are contrary, is equal to a circle into the sine of the altitude at 6, in the summer parallel; and, consequently, those differences are as the sines of the latitude into, or multiplied by, the sines of declination.

6. From the foregoing table it appears, that the tropical sun, under the equinoctial, has of all others the least force; under the pole it is greater than any day's *heat* whatever, being to that of the equinoctial as 5 to 4.

From the table, and these corollaries, a general idea may be conceived of the sum of all the actions of the sun in the whole year; and thus that part of *heat* which ariseth simply from the presence of the sun, may be brought to a geometrical certainty. The *heat* of the sun, for any small portion of time, is always as a rectangle, contained under the sine of the angle of incidence of the ray producing *heat* at that time.

Many objections have been urged against the preceding theory of Dr. Halley: some have urged, that the *effect* of the sun's *heat* is not in the simple ratio of the sines of the angles of incidence, but in the duplicate ratio of these sines; alledging, that this is the law of the impulse of fluids. See FORCE. Dr. Halley himself was well apprised, that many other circumstances, besides the direct force of the sun's rays, contributed to augment or diminish the effect of this and the *heat* resulting from it in different climates; and, therefore, no calculation, formed on the preceding theory, can be supposed to correspond exactly with observation and experiment. It has also been objected, that, according to the preceding theory, the greatest *heat* in the same place should be at the summer solstice, and the most extreme cold at the winter solstice; which is contrary to experience. To this objection it may be replied, that *heat* is not produced in bodies by the sun instantaneously, nor do the effects of his *heat* cease immediately when his rays are withdrawn; and, therefore, those parts which are once heated, retain the heat for some time, which, with the additional heat daily imparted, makes it continue, to increase, though the sun declines towards the south; and this is the reason why July is hotter than June, although the sun has withdrawn from the summer tropic; as we find it is generally hotter at three in the afternoon, when the sun has declined towards the west, than at noon, when he is on the meridian. As long as the heating particles, which are constantly received, are more numerous than those which fly away or lose their force, the *heat* of bodies must continually increase. After the sun has left the tropic, the number of particles, which *heat* our atmo-

moſphere and earth, conſtantly *increaſes*, becauſe we receive more in the day than we loſe at night, and therefore our *heat* muſt alſo increaſe. E. gr. Let us ſuppoſe that there are 100 heating particles received in the day, whilſt the ſun is above our horizon, and that, as the night is much ſhorter, 50 of them fly off; the other 50 ſtill remaining to excite *heat*: the next day, the ſun acting with almoſt the ſame force, will impart 100 particles more, of which one half will eſcape in the night; ſo that, on the beginning of the third day, the number of particles exciting *heat* will be increaſed by 100: and thus while there are more particles that excite *heat* received in the day-time than thoſe that fly off in the night, the *heat* muſt increaſe. But as the days decreaſe, and the action of the ſun becomes weaker, more particles will fly off in the night-time than thoſe we receive in the day, by which means the earth and air will gradually cool. Farther, thoſe places which are well cooled require time to be heated again; and, therefore, we find January for the moſt part colder than December, although the ſun has withdrawn from the winter tropic, and begins to emit his rays more perpendicularly upon us.

It is well known, that the ſun is farther from the earth in ſummer than in winter, becauſe his apparent motion is ſlower, and his apparent DIAMETER leſs in June than in December: but, as the EXCENTRICITY of the earth's orbit bears no greater proportion to the earth's mean diſtance from the ſun than 17 does to 1000, this ſmall difference of diſtance cannot occaſion any great difference of *heat* or cold. But the principal cauſe of the difference between the *heat* of ſummer and that of winter is, that in ſummer the rays fall more perpendicularly, and paſs through a leſs denſe part of the atmoſphere; and, therefore, with greater force, and in greater number on the ſame place: and, beſides, by their long continuance, a much greater degree of *heat* is imparted by day than can fly off by night. The effect of rays, according to their various degrees of obliquity, has been already ſtated; and it will appear (*by Tab.* III. *Aſtronomy, fig.* 79) that a greater number of rays fall on the ſame place, when they come perpendicularly, than when they come obliquely upon it: for, let AB repreſent a certain number of the ſun's rays falling on CD, e. gr. London, on the 21ſt of June; but on the 22d of December, the line CD or London has the oblique poſition C*d* to the ſame rays; and, therefore, ſcarce a third part of them falls upon it, or only thoſe between A and *e*; all the reſt being expended on the ſpace *d*P, which is more than double the length of CD or C*d*.

Dr. Long, eſtimating the degree of *heat* by the ſines of the angles of incidence of the ſun's rays, computes the *ſun's heat* at noon at the ſummer ſolſtice to be in proportion to his *heat* at noon at the winter ſolſtice, in Cambridge, nearly as 100 to 28; for, the meridian height of the ſun, at the ſummer ſolſtice, being there 61° 19', and his height at the winter ſolſtice 14° 21', the ſines of theſe angles are 8772858 and 2478445 reſpectively.

Monſ. De Mairan, allowing for the principal cauſes of the ſummer *heat*, ſtates the proportion of ſummer *heat* to that of winter as 66 to 1. The method he purſues in forming his calculation is briefly as follows: he aſſigns the proportion of the ſines of the meridional heights of the ſun at the ſummer and winter ſolſtices to be as 3 to 1, and the ratio of the *heat*, which he ſuppoſes to be as the ſquares of the ſines, that of 9 to 1; and as the rays of the ſun proceed through a leſs ſpace of air in ſummer than in winter, he ſtates the increaſe of ſummer *heat* on this account to be in the proportion of 2 to 1, and that ariſing from the greater length of days as 4 to 1; and, therefore, the *heat* of ſummer is to that of winter as 72 to 1. But there are ſome other circumſtances, particularly the greater diſtance of the ſun in ſummer than in winter, which induce him to reduce this proportion of 72 to 1 to that of 66 to 1.

However, M. Amontons has, from obſervation, made the proportion of ſummer *heat* to that of winter as 60 to 51$\frac{1}{3}$; and M. De Mairan, in order to reduce his calculation to fact, ſuppoſes that in the earth and air there is a conſtant fund of *heat*, equal to 393 degrees, to which 66 degrees muſt be added in ſummer, and 1 in winter, and thus he adjuſts his own proportion of 66 to 1 to that of M. Amontons, or 60 to 51$\frac{1}{3}$. Keil's Aſt. Lect. viii. Ferguſon's Aſt. chap. x. Long's Aſt. § 777. Mem. Acad. Scienc. 1719.

With regard to the temperature or *heat* of our atmoſphere, we may obſerve that the mercury ſeldom falls under 16° in Fahrenheit's thermometer; but we are apt to reckon it very cold at 24°, and it continues coldiſh to 40° and a little above. However, ſuch colds have been often known as to bring it down to 0°, the beginning of the ſcale, or nearly the cold produced by a mixture of ſnow and ſalt. This, as Dr. Boerhaave ſeems to think, is the greateſt degree of cold which nature has ever been obſerved to produce on our earth; but the fallacy of this opinion has been evinced by a variety of obſervations in climates that may be reckoned ordinarily temperate. In Penſylvania, in lat. 40°, the cold brought the mercury to 5° in 1732; at Paris, in 1709 and 1710, the mercury ſunk to 8°; at Leyden, in 1729, to 5°, and at Utrecht to 4°; at London, in 1709 and 1710, the cold ſunk the ſpirits almoſt down to the artificial cold of an ice and ſalt mixture; and, in 1709, the mercury ſunk to 0° at Copenhagen, lat. 55° 43'. At Upſal, in 1732, the cold was ſo great as to be ſufficient to make the mercury fall one degree below 0°; and at Peterſburgh, lat. 59° 56', much the ſame with that of Upſal, the cold was ſevere enough to depreſs the mercury to 28° below 0.

We learn from Dr. King's Obſervations on the Climate of Ruſſia, that the cold at St. Peterſburgh, during the months of December, January, and February, is uſually from 8 to 15 or 20 degrees below 0; and that commonly, in the courſe of the winter, it is for a week or ten days ſome degrees lower. In this ſeaſon, the water iſſuing from the eyes hangs in little icicles on the eye-lathes, and icicles appear ſuſpended to the beards of the peaſants in form of ſolid lumps of ice. But in ſtill more northern latitudes the cold is much more extreme. Maupertuis, who wintered at the north polar circle in 1736-7, found the degree of cold at Torneo, lat. 65° 51', ſufficient to have made the mercury ſink to 33 diviſions below 0. By Mr. Hutchins's obſervations at Albany Fort, lat. 52° 24', the thermometer was at eight o'clock in the morning of the 19th of January, 1775, at 37° below 0. And yet this degree of cold is inconſiderable, compared with that which may be produced by art. See FREEZING.

The middle temperature of our atmoſphere is about 48°, which is, as it were, the medium of all the ſeaſons, coinciding nearly with the middle vernal and autumnal *heat*, as obſerved in England by Sir Iſaac Newton and Dr. Hales, and by Mr. Cruquius in Holland. The French make it ſomewhat higher, reckoning it equal to the *heat* of the cave of their royal obſervatory, or 53°. In cold countries the air will be found agreeable enough to the inhabitants while it is betwixt 40° and 50°. In our climate we are beſt pleaſed with the *heat* of the air from about 50 to 60°, while in the hot countries, the air is generally a little above or below 70°. With us the air is not reckoned warm till it arrives at about 64°, and it is very warm and ſultry at 80°; and Dr. Boerhaave thought, that in its natural ſtate it ſcarce ever exceeded 80 or 90°, apprehending that ſuch hot air would ſoon be deſtructive of the life of animals: but in theſe temperate climates it has been found much hotter; and at Utrecht, Paris, Padua, &c. the mercury would have riſen in our thermometer to above 90°. In Penſylvania, the ſummer *heat* in 1732 was once 96 or 97°; and at Aſtracan, in July 1746, the *heat* was ſo great as to raiſe the mercury in M. De L'Iſle's thermometer in the ſhade to 89°, which correſponds to 103$\frac{1}{3}$ of Fahrenheit's; and during the whole month of July, and for ſeveral days in Auguſt, it was higher than 96°, which in Fahrenheit's denotes the natural *heat* of the blood. Mem. de l'Acad. de Berlin, 1746. See *Animal* HEAT.

The preceding obſervations are applicable to the ſtate of the air, influenced by the ſun, but ſhaded from its immediate burning operation; for, in the open air, expoſed to its direct beams ſhining with greateſt advantage, the *heat* is found much higher. Many have had occaſion to obſerve how much metals are heated in the ſun: Dr. Martine found dry earth heated to above 120°; and Dr. Hales found a very hot ſun-ſhine *heat* in 1727 to be about 140°; but Dr. Muſchenbrock once obſerved it ſo high as 150°; and if we reckon from the freezing point at 32°, theſe ſtrong ſun-ſhine *heats* were much greater than $\frac{1}{3}$, or even the half of the *heat* of boiling water. At Montpelier the ſun was ſo very hot, on one day in the year 1705, as to raiſe the quickſilver in M. Amontons' thermometer to the mark of boiling water itſelf, which is our 212°. But the moſt common noon-tide *heat* of the ſun in our climate has been found to raiſe the mercury in the thermometer to about 60 or 70 diviſions above the freezing point at 32°; and the afternoon *heat* in the ſhade about the half of that; and, therefore, the ordinary ſummer *ſun heat* with us does nearly coincide with the *heat* of our body, and boiling water is between two and three times hotter than our common ſhaded, warm air at Midſummer.

Sir Iſaac Newton informs us, that he found the *heat* of boiling water only about three times greater than the *heat* communicated to dry earth by the ſummer ſun, or about 92°, with which the obſervations of Muſchenbrock agree; and in Italy, Boreli and Malpighi found this *heat* at Midſummer equal to the *heat* of the viſcera

of hot animals, or about 102°. In another place (viz. Princip. lib. iii. prop. 8. cor. 4.) Sir Isaac Newton estimates the *heat* of boiling water to be seven times greater than the *heat* of the summer sun, which in this reckoning should be only at (32 + 12 =) 58° : by which, as Dr. Martine remarks, he must have meant solely the number of degrees above freezing water; and by summer sun, the ordinary shaded air in summer, or the summer *heat* of the air. Martine's Ess. Med. and Phil. 1740. Ess. vi.

It appears, from a register of the thermometer kept at London by Dr. Heberden for nine years, viz. from the end of 1763 to the end of 1772, that the mean *heat* at eight in the morning was 47°.45 and by another register kept at Hawkhill, near Edinburgh, that the mean *heat* in that place, during the same period of time, was 46°. By registers kept in London and at Hawkhill, for the years 1772, 1773, 1774, it appears, that the mean *heat* of these three years in London, at eight in the morning, was 48°.5, and at two in the afternoon 56°, and the mean *heat* of three years, both morning and afternoon, 52°.2 ; and the mean *heat* at Hawkhill for the same time, at eight in the morning, was 45°.4, and at two in the afternoon 50°.1, and the mean *heat* of morning and afternoon for the whole time 47°.7 The mean *heat* of springs near Edinburgh seems to be 47°, and at London 51°. Phil. Trans. vol. lxv. part ii. art. 44.

From the Meteorological Journals of the Royal Society, published in the Philosophical Transactions, it appears, that the mean heights of the thermometer, kept without and within the house, are as below :

	Therm. without.	Therm. within.
For 1775 - -	51.5	52.7
1776 - -	51.1	52.9
1777 - -	51.0	53.0
1778 - -	52.0	53.1

And, therefore, according to these observations, the mean *heat* of four years, estimated by the external thermometer, is 51°.4. The least height during this period was on 31st January, 1776, at eight in the morning, when it was 13°.5 ; and the greatest height, which was on the 13th and 14th of July, 1778, at two in the afternoon, was 86°.

HEAT, *animal*. The *heat* of animals is very various, both according to the variety of their kinds and the difference of the seasons : accordingly, zoologists have divided them into hot and cold, reckoning those to be hot which are near our own temperature, and all others cold whose *heat* is much below our's, and, consequently, affects us with the sense of cold ; though, by their *vis vitæ*, they are kept somewhat warmer than the medium in which they live. To this latter class writers have commonly referred the whole insect tribe ; though Dr. Martine observes with respect to bees, that the heat of a swarm raised a thermometer buried among them above 97°, indicating a degree of *heat* scarce, if at all, inferior to our own. To this class also belong muscles and oysters, the branchial fishes, snails, frogs, land and sea tortoises, toads, vipers, and all the serpent kind.

The human kind forms the lowest gradation in the class of hot animals : the *heat* of the human body, in its natural state, according to Dr. Boerhaave, is such as to raise the mercury in the thermometer to 92°, agreeing with Dr. Pitcairn's observation of the *heat* of the human skin, or at most to 94°. M. Amontons, by several trials, found the *heat* communicated by the human body to be 91°, 92°, and 93°. Sir Isaac Newton makes the external *heat* of the human body, of the same temperature with that of a bird hatching eggs, to be 95°.5. Fahrenheit states the *heat* of the human body and blood at 96°, which Muschenbroek alligns to be the degree of *heat* communicated to the thermometer when immerged in the blood flowing from an animal. Dr. Martine infers, from a great number of trials that the mean *heat* of the human skin is about 97° or 98° ; being a little higher in some subjects, and a little lower in others : and the *heat* of the human urine, by which we may judge of that of the neighbouring viscera, he says, is scarcely a degree hotter than the skin. Dr. Hales found the *heat* of his skin to be about 97°, and the *heat* of urine newly made about 103°. Mr. Hunter found, by sinking the ball of the thermometer under his tongue, and keeping it there for some minutes, that the mercury rose to 97° : in another experiment, he introduced the ball of the thermometer into the urethra about an inch, and when it had remained there a minute, the quicksilver rose only to 92° ; at two inches it rose to 93° ; at four inches to 94° ; and when the ball had got as far as the bulb of the urethra, the quicksilver rose to 97°. The *heat* of the rectum was 98°½ exactly.

With respect to ordinary quadrupeds, such as dogs, cats, sheep, oxen, swine, &c. the *heat* of their skin raises the thermometer four or five divisions higher than that of the human kind, viz. to 120°, 121°, 104°, and some to 103° and a little more. The cetaceous fishes are as hot as these ; and the bird kind, as lord Bacon has long since observed, are warmer by three or four degrees than quadrupeds : for Dr. Martine has found, by lodging the bulb of the thermometer in the groin of ducks, geese, hens, &c. that the mercury was raised to 103°, 104°, 105°, 106°, and 107°, and in a hen hatching eggs, he once found the height to be 108°. Dr. Crawford has collected the following observations relating to this subject : that those animals which are furnished with lungs, and which continually respire the fresh air in great quantities, have the power of keeping themselves at a temperature considerably higher than the surrounding atmosphere ; but animals that are not furnished with respiratory organs, are very nearly of the same temperature with the medium in which they live ; the former, according to his theory, which we shall explain in the sequel of this article, continually abstohing *heat* from the air, for which purpose they are provided with a pulmonary system and double circulation. Farther, among the hot animals, those are the warmest which have the largest respiratory organs, and which, consequently, breathe the greatest quantity of air in proportion to their bulk : thus, the respiratory organs of birds, compared with their size, are more extensive than those of any other animal ; and birds are known to have the greatest degree of animal *heat*. This fact is likewise explained by the same theory, and affords a confirmation of it ; for, if animal *heat* depends upon a change which the air undergoes in the lungs, it is evident that, all other circumstances being equal, the greater the quantity of air which is changed in a given time, the greater must be the *heat* produced. Moreover, in the same animal, the degree of *heat* is in some measure proportionable to the quantity of air inspired in a given time : thus, we find, that animal *heat* is increased by exercise and by whatever accelerates respiration.

But it is observed, that the *heat* of animals varies in different individuals, and likewise in the same animal at different times ; for, though in a healthful state, the variations are not great, yet by accidents and diseases they may be much altered, and brought considerably above and below the natural standard. Dr. Hales supposes the *heat* of the human blood in high fevers to be about 136°.5 ; and Dr. Boerhaave relates certain experiments of Fahrenheit and others, from which it appears, that animals were very soon destroyed in a *heat* of 146° ; a sparrow having died in less than seven minutes, a cat in about fifteen, and a dog in twenty-eight : and he concludes in general, that the serum of the blood may be coagulated by a degree of *heat* not much above 100° ; whence Dr. Hales and Dr. Arbuthnot have been led to affirm, that the natural *heat* of the blood of a human creature approaches very near the degree of coagulation. But Dr. Martine observes, that he has found the blood to be heated five or six degrees above 100°, without any such pernicious effects ; and that the serum of blood and the white of an egg have continued thin and liquid, till the thermometer had indicated a degree of *heat* equal to 136°, which he supposes to extend beyond any thing that can ever be experienced by a living animal. The late ingenious Mr. Hewson infers, from several experiments, that the lymph of the human blood coagulates at a degree of *heat* between 114° and 120°, and that the serum does not coagulate without 160° of *heat* ; there is, therefore, no ground for the apprehension of Boerhaave and others, that the blood should be coagulated by the animal *heat*, even whilst it is circulating in the blood-vessels ; since the animal *heat* is naturally only 98° or 100°, and in the most ardent fever it is not raised above 112°. Phil. Trans. vol. lx. art. 33.

From some experiments made by Dr. Dobson in a heated room it appears, that the white of an egg, inclosed in its own film, remained fluid in a *heat* of 224°, but coagulated in the same *heat* when contained in a tin vessel or its own shell : he offers several conjectures for the explication of this phenomenon, the most probable of which seems to be, that tin is a more powerful conductor of fire from air, and robs this medium of its *heat* more readily than the film can do.

Philosophers, unified by the opinion of Boerhaave and the experiments above recited, have very generally imagined, that animals were incapable of enduring, without danger, any very considerable degree of *heat* : however, governor Ellis had observed, as long ago as the year 1758, that a man can live in air of a greater *heat* than that of his own body, and that in this situation continues its own cold. Phil. Trans. vol. l. p. 755.

Nevertheless, it was scarce conceivable, by reasoning *a priori*

priori and in oppoſition to a ſuppoſed fact, that the human body could be ſafely expoſed to a *heat* only of the degree which proved fatal to the animals in the experiments related by Boerhaave. Accident, we may ſay, firſt led to the diſcovery of the fallacy of the general opinion on this ſubject. Meſſrs. Du Hamel and Tillet being employed in the years 1760 and 1761, in deſtroying an inſect which conſumed the grain of the province of Angoumois, contrived, for this purpoſe, to expoſe the affected corn, with the inſects included in it, in an oven, the *heat* of which was ſufficient to kill them without injuring the grain. With a view of aſcertaining the *heat* of this oven, they conveyed into it a thermometer; and being deſirous of knowing the preciſe heat of the mercury whilſt the thermometer remained in the oven, a girl, one of the attendants on the oven, entered it, and marked the thermometer with a pencil, after ſtaying two or three minutes, and the *heat* was found to be near 260° of Fahrenheit's ſcale: ſhe afterwards remained there ten minutes longer, the mercury in the thermometer ſtanding at 288°, or 76° above that of boiling water; and when ſhe came out of the oven her complexion was conſiderably heightened, but her reſpiration was by no means quick and laborious. Theſe experiments were afterwards repeated, when another girl remained in the oven without much inconvenience, and under the ſame degree of *heat*, as long as the former, and even breathed in air heated to about 325° for the ſpace of five minutes. Theſe girls, ſays M. Tillet, were protected from the external action of the *heat* by their cloaths, which are bad conductors of *heat*, and enabled to breathe the air, thus violently heated, for a long time, without great inconvenience: to which we may add, ſays an ingenious anonymous remarker on this experiment, that the bulk of their bodies might alſo contribute to their ſecurity; and, as in common reſpiration, the blood in its paſſage through the lungs is cooled by being brought into contact with the external inſpired air: in the preſent caſe, on the contrary, the veſicles and veſſels of the lungs, receiving at each inſpiration an air heated to 300°, muſt have been continually cooled and refreſhed, as well as the ſubcutaneous veſſels, by the ſucceſſive arrival of the whole maſs of blood contained in the interior parts of the body, whoſe *heat* might be ſuppoſed, at the beginning of the experiment, not to exceed 100°. Hiſt. Acad. Scienc. 1764. mem. ii. Month. Rev. vol. xxxviii. p. 582.

Theſe extraordinary facts might poſſibly lead philoſophers into a new train of reaſoning and experiment on the ſubject of *heat*: accordingly we find, that Dr. Cullen has long ago ſuggeſted many arguments to ſhew, that living animals have a power of generating *heat*, independently of any common chemical or mechanical means either of friction or fermentation, and alſo of generating cold or deſtroying *heat*, when the *heat* of the atmoſphere exceeded the proper temperature of their bodies. In order to examine and aſcertain this theory, Dr. George Fordyce prepared a ſuit of three rooms heated by flues in the floor; in one of which the air was in a dry ſtate, and in another loaded with moiſture, by pouring boiling water on the floor. In the firſt room the higheſt thermometer ſtood at 120°, and the loweſt at 110°; in the ſecond the *heat* was from 90° to 85°; and the third room felt moderately warm, whilſt the external air was below the freezing point. Dr. Fordyce, having undreſſed himſelf to his ſhirt in the third room, entered the ſecond room, and ſtaid five minutes in a *heat* of 90°; he then entered the firſt room, and, having remained in the part heated to 110° for ten minutes, the water running down in ſtreams over his whole body, he removed to the part of the room heated to 120°, and after ſtaying there twenty minutes, he found that the thermometer, placed under his tongue and held in his hand, ſtood juſt at 100°, and that his urine was of the ſame temperature: his pulſe had gradually riſen till it made 145 pulſations in a minute; the external circulation was greatly increaſed, but his reſpiration little affected. The moiſture of his ſkin, he apprehended, was chiefly owing to the condenſation of the vapour in the room upon his body. In the ſecond experiment, the higheſt thermometer in the firſt room varied from 132° to 130°, and the loweſt ſtood at 119°. Having undreſſed in an adjoining chamber, he went firſt into the *heat* of 119°, and in half a minute the water flowed down over his whole body, in ſtreams; having remained here fifteen minutes, he went into the *heat* of 130°; at this time the *heat* of his body was 100°, and his pulſe beat 126 times in a minute: in this ſituation a Florence flaſk, filled with water heated to 100°, and wiped dry, became wet, and ſtreams of water continued to run down its ſides, till the *heat* of the water within had riſen to 122°. In this *heat* he remained fifteen minutes, and juſt before he left the room his pulſe made 139 beats in a minute, but the *heat* under his tongue, in his ſtand, and of his urine, did not exceed 100°.

Dr. Fordyce obſerves, on this experiment, that there was no evaporation, but conſtantly a condenſion of vapours on his body, and no cold was generated but by the animal powers. Having continued much longer in a much greater dry *heat* without being ſo much affected, he takes occaſion to infer, from this circumſtance, that dry air does not communicate its *heat* like air ſaturated with moiſture; and that the evaporation from the body which takes place when the air is dry, aſſiſts its living powers in producing cold.

In another experiment, Dr. Fordyce, accompanied with four other gentlemen, went into the heated chamber where the air was dry, without taking off their cloaths. When they firſt entered the room, the quickſilver ſtood above 150°, and they continued in it more than twenty minutes, in which time the *heat* had riſen about 12°. In another period of this experiment, the quickſilver ſtood at 198°, and they continued in this *heat* about ten minutes; but finding that the thermometer ſunk very faſt when they went together, they agreed to go in ſeparately. Dr. Solander ſtood in the room heated to 210° for three minutes, during which time the quickſilver ſunk to 196°; and Mr. Banks remained ſeven minutes in the *heat* of 211°, in which time the quickſilver had ſunk to 198°. The *heat* of their bodies in theſe ſeveral experiments roſe very little above its uſual ſtate; and many ſtriking effects proceeded from their power of preſerving their natural temperature. Whenever they breathed on the thermometer, the mercury ſunk ſeveral degrees; every expiration afforded a pleaſant cooling impreſſion to the noſtrils, and their cold breath cooled their fingers. Dr. Blagden, on touching his ſide, found that it felt like a corpſe, though the actual heat of his body was 98°. When the *heat* of the air began to approach the higheſt degree which the apparatus made uſe of was capable of producing, their bodies in the room prevented it from riſing any higher; and when it had been previouſly raiſed above that point, immediately ſunk it. Theſe, and other circumſtances attending the experiments, clearly prove, that the body has a power of deſtroying *heat*; but, in eſtimating this *heat* which we are capable of reſiſting, it is neceſſary to conſider not only what degree of *heat* would be communicated to our bodies, if they poſſeſſed no reſiſting power, by the heated body, before the equilibrium of *heat* was effected, but alſo what time that *heat* would take in paſſing from the heated body into our bodies. On this principle, we bear very different degrees of *heat* in different mediums; and it appears, by other experiments, that the ſame perſon, who felt no inconvenience from air heated to 211°, could not bear quickſilver at 120°, and could juſt bear rectified ſpirit of wine at 130°, i. e. quickſilver heated to 120° tranſmitted, in a given time, more *heat* for the living powers to deſtroy than ſpirits heated to 130°, or air to 211°. Accordingly, when they were in the heated rooms, their watch-chains and other pieces of metal felt ſo hot, that they could ſcarce touch them; whilſt the air, from which the metal derived all its *heat*, was only unpleaſant. From theſe experiments, it is concluded that no attrition, fermentation, or whatever elſe the mechanical and chemical phyſicians have deviſed, can explain a power capable of producing or deſtroying *heat*, juſt as the circumſtances of the ſituation require: this power muſt be referred to the principle of life itſelf; and yet this is only giving a name to a ſtill unknown cauſe. This power, however it acts, ſeems to attend life very univerſally: Mr. Hunter found a carp preſerve a coat of fluid water round him long after all the other water in the veſſel had been congealed by a freezing mixture; and he has alſo ſhewn, that vegetables poſſeſs ſome degree of this property of generating *heat*. The ſudden melting of ſnow on *graſs*, whilſt that on the gravel walks continues unthawed, and many other ſimilar phenomena, can be adequately explained only on this principle.

In ſubſequent experiments, the *heat* of the room was raiſed to 240°, and ſometimes to 260°: theſe exceſſive *heats* were borne for a conſiderable time with little inconvenience by the gentlemen, who expoſed themſelves to them, both naked and with their cloaths on; nor was the *heat* of Dr. Blagden's body at all increaſed, though the velocity of his pulſe was, in one inſtance, more than doubled. A blaſt of the heated air from a pair of bellows was ſcarcely to be endured for the following obvious reaſon: when the ſame air remained for any time in contact with the body, part of its *heat* was deſtroyed, and, conſequently, the body was ſurrounded with a colder medium than the air of the room; whereas, when freſh portions of the air were applied to the body in ſuch a quick ſucceſſion, that no part of it could remain in contact a ſufficient time to be cooled, the *heat* muſt be ſenſibly

ſenſibly greater. On this occaſion the gentlemen evinced the fallacy of the experiment related by Boerhaave, and which has been already mentioned: they ſhut up a bitch in the heated room, when the thermometer had riſen to 220°; in this ſituation ſhe was ſuffered to remain, without being immoderately affected, for 32′, and when ſhe was releaſed, and brought again into the cold air, ſhe appeared not to have received the leaſt injury. In the ſame heated air, which they breathed, eggs were roaſted quite hard in 20′, and beef-ſteaks were dreſſed in 33′; and by blowing the air upon ſome of them, in 13′.

The effect of EVAPORATION, in preventing certain bodies, and particularly fluids, from receiving a degree of heat equal to that of the air, is ſhewn by ſome of theſe experiments to be very conſiderable. In the great *heat* juſt mentioned, pure water expoſed in an earthen veſſel, during an hour and a half, acquired only a *heat* of 140°, and afterwards continued ſtationary above an hour, at a degree much below the boiling point; but when its power of evaporating was checked, by dropping a ſmall quantity of oil on its ſurface, it boiled very briſkly. A ſaturated ſolution of ſea-ſalt acquired a *heat* of 230°, and was, conſequently, brought into a briſk ebullition, on covering its ſurface with a layer of oil.

Dr. Dobſon has alſo publiſhed an account of ſimilar experiments made by him in the ſweating-room of the hoſpital at Liverpool; the reſults of which are conformable to thoſe that have been already recited. It appears from theſe, as well as from the former experiments, that the pulſe is conſiderably accelerated by heated air, whilſt the animal *heat* varies little from its natural ſtandard; a fact, which, as Dr. Dobſon obſerves, contradicts the opinion that has been generally received with regard to the cauſe of animal *heat*, viz. that it is produced by the attrition of the globules of the circulating fluids againſt the ſides of the containing veſſels; whereas it is ſeen, that the circulation may be amazingly quickened, whilſt there is little increaſe of the animal *heat*.

We may conclude in general, from the experiments and obſervations already recited, that man is ſo framed as to poſſeſs a power of keeping nearly the ſame tenor of *heat* in all the variations of the temperature of the air in ſummer and winter, in hot and cold climates; and, conſequently, changes his ſituation on the ſurface of the globe with much leſs inconvenience or injury than he could otherwiſe have done. The ſame power likewiſe happily adapts different animals to their reſpective deſtinations: the lizard and the cameleon remain cool under the equator, whilſt the whale and porpoiſe retain a degree of *heat* above that of the human body, though ſurrounded with the waters of the coldeſt northern ſeas, and amidſt mountains of ice, in the neighbourhood of the pole.

Dr. Crawford obſerves, with regard to the power above illuſtrated, which animals poſſeſs, of producing cold, that, by the heat of the ſurrounding medium, the evaporation from the lungs is increaſed; and that if this increaſe to ſuch a degree as to carry off the whole of the *heat* which is detached from the air, the arterial blood, when it returns by the pulmonary vein, will have its ſenſible *heat* greatly diminiſhed, and will, conſequently, abſorb *heat* from the veſſels which are in contact with it, and from the parts adjacent. And thus the ſame proceſs, which in one caſe ſupplies the animal with *heat*, according to Dr. Crawford's theory, explained in the ſequel of this article, will now become the inſtrument of producing cold; and the quantity of cold produced will be in proportion to the velocity of the blood through the lungs, and the fulneſs and frequency of the reſpiration. Thus, in winter ſeaſons, and cold climates, the veſſels on the ſurface of the body are conſtricted, the blood is determined to the lungs, and the pulſe and reſpiration are rendered full and frequent; ſo that the quantity of *heat* abſorbed from the air is proportionably increaſed. But in ſummer, the blood is determined to the ſurface, the velocity of the circulation through the lungs is diminiſhed, and the quantity of *heat* abſorbed is diminiſhed: beſides, if the quantity of *heat* abſorbed by the vapour exhaled in reſpiration be ſo great, as that the remaining portion of the *heat* depoſited by the air is not ſufficient to ſupport the temperature of the arterial blood, ſome degree of cold will be produced in conſequence of the change which the blood undergoes in the lungs. Martine's Eſſays, Eſſ. vi. Phil. Tranſ. vol. lxv. part i. art. 12. Id. ibid. part ii. art. 43. art. 45. art. 47. Id. vol. lxviii. part i. art. 2. Crawford on *Heat*, &c. p. 31. Boy &c.

There is hardly any ſubject of philoſophical inveſtigation that has afforded a greater variety of hypotheſes and conjectures, and experiments, than the origin of animal *heat*. The reader will find the principal of them enumerated, and briefly illuſtrated, in this article. The firſt opinion which has very generally obtained is, that the *heat* of animal bodies is owing to the attrition betwixt the arteries and the blood.

The arguments in favour of this opinion are, that if an artery is tied or cut, the part to which it goes turns cold; on the ceaſing of the pulſation of the arteries, cold and death follow. An increaſe of *heat* attends a briſk circulation, and a languid circulation is accompanied with a ſmall *heat*; but it has been already ſhewn, that this is not univerſally the caſe. One who burns in a fever, or is hot with exerciſe, has a full and frequent pulſe; in cold faintings, chlorоſis, &c. the pulſe is ſmall and ſlow; and laſtly, that the thermometer ſhews the arterial blood to be a little hotter than that of the veins. This is accounted for from the conical figure of the arteries, from their flexures and branchings into exquiſitely ſmall capillaries; whence the reſiſtance and conſequent attrition muſt be great; from the number, ſtrength, and elaſticity of their coats; from the propelling power of the heart, and their ſtrong reſiſtance. From all theſe the particles of the blood perpetually getting new motions, directions, and rotations, are attenuated, condenſed, have their angles ground off, and are made homogeneous: hence the fluidity, red colour, and *heat* of the maſs, which is here perfected. But this theory is doubtful; for what is ſaid of arteries, may be ſaid of any other parts, whoſe functions are neceſſary to life. The *heat* and pulſation of the arteries do not keep together in any regular proportion; in ſome morbid caſes there is a great ſenſible *heat*, and a ſmall pulſe; and in others a full pulſe, and great coldneſs. Beſides, all the length this demonſtration goes, is to ſhew, that the motion of the arteries and *heat* are generally in proportion, which, however, does not ſhew which is the cauſe, and which the effect; nor indeed that either is the cauſe or effect of the other, ſince both may be the effects of ſome other cauſe. As to the proof by the thermometer, it ſeems doubtful; and what adds to the doubt is, that the venal blood does not coagulate ſo ſoon as the arterial. In ſhort, this theory is not eſtabliſhed by any ſatisfactory and convincing proof.

Dr. Douglas, in his Eſſay on the Generation of *Heat* in Animals, aſcribes it ſolely to the friction of the globules of blood in their circulation through the capillary veſſels.

The ſecond opinion is, that the lungs are the fountain of *heat* in the human body. All that has been ſaid for the blood's being heated in the arteries, is advanced to prove this hypotheſis, with conſiderable addition, viz. that in the lungs the blood-veſſels every where attend, divide, and ſubdivide, along with the ramifications of the windpipe; and as theſe are perpetually changing their ſituation and form, becoming longer or ſhorter, making more acute or more obtuſe angles, ſo muſt the concomitant blood-veſſels every moment make new angles, and give the blood new directions; that at laſt the blood enters into an exquiſitely fine net-work, ſpread every where on the vaſtly thin air veſicles, where theſe air-bladders are perpetually changing their angles, points of contact, their form, volume, interſtices, and ſo forth. From theſe, and the elaſticity of the air, and weight of the atmoſphere, the blood is ſaid to be churned, preſſed backward and forward, broken and kneaded together, diſſolved and condenſed, made red and hot in reſpiration. This theory, however plauſible, is not ſatisfactory. For, 1. What was ſaid before of the improbability of *heat* being generated by the ſole attrition of fluids, takes place here. 2. Though the lungs be regularly ſupplied with plenty of air, which has weight and elaſticity enough to carry on the alternate ſwelling and ſubſiding of the veſicles; yet life and *heat* ſoon fail, if that air has, by paſſing through the fire, or any other way, been robbed of, or if it has acquired ſome particles or quality different from its weight and elaſticity. 3. The argument from the additional action of the ſolids of the lungs on the blood, more than what is found in the arteries, from their greater and conſtantly varying motion, ſeems to be fully taken off by one part of Hook's experiment, exhibited before the Royal Society, in which the lungs of a dog being kept conſtantly diſtended by a freſh blaſt of air, the dog lived, and his heart beat regularly; ſo that there is no need of that frequent and great variation of angles, and points of contact, upon which the additional attrition is built. 4. That the cold air ruſhing into the ſpongy lungs, on the numberleſs air-bladders, on which the blood is almoſt ſuperficially ſpread, ſhould make the blood hot, is an improbable opinion, and ſupported by no proof. And as the cauſe appears not at all promiſing *à priori*, ſo the effect ſeems to demonſtrate this not to be the cauſe. For, 5. That the blood is rather cooled than *heated* in the lungs, may be inferred from the benefit received by the inſpiration of cool air in many inflammatory diſeaſes, eſpecially thoſe of the lungs. In burning fevers, with a full quick pulſe, red ſkin, and a large and

quick respiration, relief has often been given by opening a window, and admitting a ſtream of cool air to breathe in; the effects of which have been obſerved to be, that though the body was cloſe covered, yet in one minute the reſpiration became ſlower, and very ſoon after the pulſe abated of its fullneſs; and not only the face, but the whole body, of its fiery *heat* and colour. 6. If the blood were *heated* in the lungs, we ſhould need leſs of their functions, when we are warm, or in a warm place, the *heat* of our bodies, or of the atmoſphere, doing ſo much of the office of the lungs; and we ſhould want more of it, when cool, or in cool air. But when we are hot, and want to be cooled, we breathe ſtill and quick; and when we are cold, and want to be warmed, our reſpiration is ſlow and ſmall; contrary to what one would expect, if the action of the air on the blood in the lungs were to *heat* it. 7. The blood which comes from the ſmall veſſels of the lungs, is not more expanded than before, as has been aſſerted, but not proved by any experiment, which it would certainly be, if it was hotter; for liquors rarefy by *heat*, and few more than blood. 8. If the blood owes its *heat* to the action of the lungs, we muſt look out for another ſource of *heat* in the eggs and fœtus. To the objection, that the *heat* of the mother is ſufficient for the purpoſe, till this new function comes into action, two obſervations may be oppoſed: the firſt is, that toward the end of incubation, an egg may be left by the dam, in a cold ſeaſon, for a little longer time than would be ſafe for the chick, if all its *heat* depended upon her; yea long enough for an egg, that contains no warm principle to become of the temperature of the ambient air; yet upon opening it, the chick has been found neither quite ſo cold, nor dead. The ſecond is, that a ripe fœtus taken away from the mother, but continuing within the membranes, can live ſeveral hours by its own *heat*, without any aſſiſtance from the lungs. What is the cauſe of this *heat* before the lungs act? How comes it to fail as ſoon as the lungs play? Med. Eſſ. Edinb. abr. vol. i. p. 228.

The third opinion is, that the cauſe of animal *heat* is owing to the action of the ſolid parts upon one another. The heart and arteries move moſt; and it is natural to expect, that the *heat* ſhould be owing to this motion. But even this does not ſeem very plauſible, from the following conſiderations: 1. The moving parts, however we term them ſolid, are neither hard nor dry; which two conditions are abſolutely requiſite to make them fit to generate *heat* by attrition. 2. None of their motions are ſwift enough to promiſe *heat* in this way. 3. They have no great change of ſurface in their attrition. 4. The moveable fibres have fat, mucilage, or liquors every way ſurrounding them, to prevent their being deſtroyed, or *heated* by attrition.

A fourth cauſe aſſigned for the *heat* of our bodies, is that proceſs by which our aliment and fluids are perpetually undergoing ſome alteration.

This proceſs, according to Dr. Stevenſon, may be one *ſui generis*, ſomewhat of a middle nature, betwixt fermentation and putrefaction; and he thinks it to come ſo near to the latter, that he chooſes to call it by that name. In putrefaction, which is a moſt powerful diſſolvent of bodies, the inteſtine action of their minute particles creates, collects, or ſome way or other is the cauſe or means of *heat*. The doctor thinks it probable, that this proceſs is conſtantly carried on in all our juices, eſpecially where there is blood, and this chiefly in the veins; ſo that the blood is both the fountain of *heat*, and the firſt ſpring of motion. He obſerves, that it is agreeable to the laws of natural philoſophy to reaſon on the chemiſtry of the animal body, as well as on its mechanics; the minute component parts of ſolids having a ſet of laws peculiar to them; and their intimate changes and actions on one another are not to be accounted for by the coarſe mechanical laws. He obſerves laſtly, that ſince it has never been demonſtrated, that any fluid acquired *heat* in the coarſe mechanic way, by friction with a ſolid body; or that ſo conſiderable a change was made on the ſtructure of the minute parts of bodies, as is made in this proceſs, without producing *heat* at the ſame time; and ſince in fermentation, putrefaction, &c. the *heat* is not pretended to be owing to the veſſels containing the changed ſubject, but to what happens to its minute parts, in undergoing the change, it ſeems, on the whole, an unphiloſophic partiality for mechanics to maintain, that our juices have all their *heat* communicated to them from the ſolids, and that they acquire it by rubbing with the veſſels. See Medic. Eſſ. Edinb. vol. v. art. 77. Abrid. vol. i. p. 222, ſeq.

The ingenious Dr. Franklin inclines to this hypotheſis, when he ſays, that the fluid fire, as well as the fluid air, is attracted by plants in their growth, and becomes conſolidated with the other materials of which they are formed, and makes a great part of their ſubſtance; that, when they come to be digeſted, and to ſuffer in the veſſels a kind of fermentation, part of the fire, as well as part of the air, recovers its fluid active ſtate again, and diffuſes itſelf on the body digeſting and ſeparating it; that the fire ſo reproduced, by digeſtion and ſeparation, continually leaving the body, its place is ſupplied by freſh quantities, ariſing from the continual ſeparation; that whatever quickens the motion of the fluids in an animal, quickens the ſeparation, and reproduces more of the fire, as exerciſe, &c. Hence he conceives, that *animal heat* ariſes by or from a kind of fermentation in the juices of the body, juſt as *heat* ariſes in the liquors preparing for diſtillation; and he adds, it is remarkable that the liquor in a diſtiller's vat, when in its higheſt and beſt ſtate of fermentation, has the ſame degree of *heat* with the human body, i. e. about 94 or 96°.

But to this hypotheſis it may be objected, that the putrefactive fermentation, which is the only ſpecies that can, with probability, be ſuppoſed to take place in the body, has been found by accurate experiments to produce no *heat* at all; as is apparent in a dead body, which continues cold, though tending ever ſo faſt towards putridity. Beſides, it may be aſked, what fermentative or putrefactive proceſs can poſſibly be carried on in the bodies of men or animals in ſuch a climate as that of Siberia, where the thermometer frequently ſtanding at 90° or 100° below 0, a *heat* is nevertheleſs generated, in the body of a man using a proper degree of exerciſe, equal at leaſt to 96° above that mark? And whether there be any ſuch proceſs, that generates greater quantities of *heat* in proportion to the increaſing degrees of cold in the medium in which the proceſs is carried on? Thus, let the *heat* of the body at a medium be 95°; and, conſequently, when the thermometer ſtands at temperate, or 50°, a *heat* is generated within the body equal to 45°, which may be conſidered as additional to the 50°, which the body would poſſeſs in a ſtate of death. When the thermometer ſtands at 32°, the body, with proper exerciſe, is ſtill 95°, and produces no leſs than 63 additional degrees of *heat*; and in the cold above ſtated of 90° below 0, the body of a living man muſt produce 185 degrees of *heat* above that of a dead man expoſed in the ſame ſituation. Franklin's Exp. and Obſ. &c. on Electricity, p. 346, &c. Month. Rev. vol. xlii. p. 302.

A late author thinks the *heat* of animals explicable from the phoſphorus and air they contain. Phoſphorus exiſts, at leaſt in a dormant ſtate, in animal fluids; and it is alſo known that they all contain air; it is therefore only neceſſary to bring the phoſphoreal and aereal particles into contact, and *heat* muſt of conſequence be generated; and were it not for the quantity of aqueous humours in animals, fatal accenſions would frequently happen. Dr. Mortimer, ap. Phil. Tranſ. N° 476. § 20. See PHOSPHORUS.

Dr. Cullen, as we have already obſerved, maintains that the vital principle may have ſuch a peculiar power, that, where it is different, different degrees of *heat* may be generated, though the velocity of the blood be the ſame. But this appears to be only an occult principle in the animal œconomy, producing effects in a manner not yet ſatisfactorily explained. And it ſeems contrary to experience, and abſurd, to aſſert, that the principle of life can generate *heat* or cold, independently of chemical or mechanical means.

Dr. Black ſuppoſes, that animal *heat* is generated altogether in the lungs, by the action of the air on the principle of inflammability, and is thence diffuſed over the reſt of the body by means of the circulation; but a late ingenious writer, Dr. Leſſie, hath urged ſeveral arguments againſt this hypotheſis, tending to ſhew that it is repugnant to the known laws of the animal machine.

Dr. Leſſie advances another hypotheſis of his own, viz. that the ſubtle principle by chemiſts termed phlogiſton, which enters into the compoſition of natural bodies, is in conſequence of the action of the vaſcular ſyſtem gradually evolved through every part of the animal machine, and that, during this evolution, *heat* is generated. This opinion, he candidly acknowledges, was firſt delivered by Dr. Duncan of Edinburgh, and ſomewhat ſimilar to it is to be found in Dr. Franklin's Works, and in a paper of Dr. Mortimer's, in the Philoſophical Tranſactions. He endeavours to eſtabliſh this hypotheſis by the following arguments: 1. That the blood contains phlogiſton. 2. That the action of the blood-veſſels evolves phlogiſton. 3. That the evolution of phlogiſton is attended with *heat*. 4. That the *heat* thus generated is ſufficient to account for the *heat* of living animals. 5. That the moſt ſtriking phenomena of animal *heat* evince the truth of theſe propoſitions. Philoſ. Inquiry into the Cauſe of Animal *Heat*, &c. 8vo. 1778.

With reſpect to this hypotheſis, it may be obſerved, that it is altogether inconſiſtent with thoſe experiments of Dr. Prieſtley, from which it appears, that arterial blood has ſo

so ſtrong an attraction to phlogiſton, as to be capable of ſeparating it from fixed and phlogiſticated air. See BLOOD. The laſt hypotheſis we ſhall mention, is the very plauſible one of the ingenious Dr. Crawford, lately publiſhed in his Experiments and Obſervations on Animal *Heat*. It has been already obſerved, that Dr. Crawford has inferred from a variety of experiments, that *heat* and phlogiſton, ſo far from being connected, as moſt philoſophers have imagined, act in ſome meaſure in oppoſition to each other. By the action of *heat* on bodies, the force of their attraction of phlogiſton is diminiſhed, and by the action of phlogiſton, a part of their abſolute *heat* is expelled. He has alſo demonſtrated, that atmoſpherical air contains a greater quantity of abſolute *heat* than the air which is expired from the lungs of animals: he makes the proportion of the abſolute *heat* of atmoſpherical air to that of fixed air as 67 to 13; and the *heat* of dephlogiſticated air to that of atmoſpherical air as 4.6 to 1; and obſerving, that Dr. Prieſtley has proved, that the power of this dephlogiſticated air in ſupporting animal life is five times as great as that of atmoſpherical air, he concludes, that the quantity of abſolute *heat* contained in any kind of air fit for reſpiration, is very nearly in proportion to its purity, or to its power of ſupporting animal life; and ſince the air exhaled by reſpiration is found to contain only the $\frac{1}{10}$th part of the *heat* which was contained in the atmoſpherical air, previous to inſpiration, it is very reaſonably inferred, that the latter muſt neceſſarily depoſit a very great proportion of its abſolute *heat* in the lungs. It is natural to wiſh, that Dr. Crawford had made a greater variety of deciſive experiments on phlogiſticated air, which is not the ſame with fixed air, and experiments conducted on a larger ſcale than thoſe from which ſome of theſe latter concluſions are deduced, in order to confirm his general theory. An ingenious friend of the editor informs him, that, in repeating Dr. Crawford's experiments with the utmoſt attention and exactneſs, he has obtained very different reſults; and expreſſes an apprehenſion, that his ſyſtem is not ſufficiently eſtabliſhed by the experiments already publiſhed. Dr. Crawford has alſo demonſtrated, that the blood which paſſes from the lungs to the heart, by the pulmonary vein, contains more abſolute *heat* than that which paſſes from the heart to the lungs, by the pulmonary artery; the abſolute *heat* of florid arterial blood being to that of venous blood as 11$\frac{1}{2}$ to 10: therefore, ſince the blood which is returned by the pulmonary vein to the heart has the quantity of its abſolute *heat* increaſed, it muſt have acquired this *heat* in its paſſage through the lungs; ſo that in the proceſs of reſpiration, a quantity of abſolute *heat* is ſeparated from the air, and abſorbed by the blood. Dr. Prieſtley has alſo proved, that in reſpiration phlogiſton is ſeparated from the blood, and combined with air. From theſe general principles, the ingenious author infers, that animal *heat* is diſengaged from the atmoſpherical air, during the proceſs of reſpiration, by the action of the phlogiſton contained in the blood; the blood at the ſame moment being left at liberty to unite with that portion of *heat* which the air had depoſited; ſo that a proceſs is carried on ſimilar to a chemical elective attraction. Thus, the air is received into the lungs, containing a great quantity of abſolute *heat*, the blood is returned from the extremities, highly impregnated with phlogiſton; the attraction of the air to the phlogiſton is greater than that of the blood: this principle, therefore, will leave the blood to combine with the air. By the addition of phlogiſton, the air is obliged to depoſit a part of its abſolute *heat*; and as the capacity of the blood for retaining *heat* is increaſed by the ſeparation of the phlogiſton, it will inſtantly unite with that portion of *heat* which had been detached from the air. Since arterial blood, as Dr. Prieſtley has proved, has a ſtrong attraction to phlogiſton, it will, conſequently, during the circulation, imbibe this principle from thoſe parts which retain it with leaſt force; and hence the venous blood, when it returns to the lungs, is found to be highly impregnated with phlogiſton. By this impregnation, its capacity for containing *heat* is diminiſhed. In proportion, therefore, as the blood, which had been dephlogiſticated by the proceſs of reſpiration, becomes again combined with phlogiſton in the courſe of the circulation, it will gradually give out that *heat* which it had received in the lungs, and diffuſe it over the whole ſyſtem. Conſequently, in reſpiration the blood is continually diſcharging phlogiſton, and abſorbing *heat*; and in the courſe of the circulation, it is continually imbibing phlogiſton, and emitting *heat*. But this *heat* being more than can be abſorbed by thoſe parts of the animal ſyſtem, which communicate the phlogiſton to the blood, the ſurplus becomes redundant, or is converted into moving or ſenſible *heat*, or that *heat* which is the object of our ſenſes.

The author applies theſe principles to the explication of a variety of phenomena accompanying *animal heat*. He ſhews, that the cauſes, which prevent the accumulation of *heat* in the animal body, in conſequence of its continually abſorbing it from the air, are the evaporation from the ſurface, and the cooling power of the air. Theſe, he obſerves, are alternately increaſed and diminiſhed in ſuch a manner, as to produce an equal effect. When the cooler power of the air is diminiſhed by the ſummer *heats*, the evaporation from the ſurface is increaſed; and when, on the contrary, the cooling power of the air is increaſed by the winter colds, the evaporation from the ſurface is proportionably diminiſhed. Exerciſe contributes to accelerate the reſpiration, and to increaſe the velocity of the circulation, and, therefore, to increaſe the quantity of phlogiſton diſcharged, and the quantity of *heat* abſorbed. In the cold ſtage of fevers, preceded by languor, a ſenſe of debility, and a diminution in the action of the heart and arteries, the reſpiration is ſmall, the pulſe is weaker than its natural ſtate, and the quantity of blood which paſſes through the *heart* in a given time, is diminiſhed; and hence leſs phlogiſton will be diſcharged from the body, and, conſequently, leſs *heat* ſeparated from the air. But in the progreſs of this cold ſtage, the veſſels on the ſurface of the body will be conſtricted, and the blood determined to the heart; and, therefore, its velocity through the lungs will be increaſed, and a greater quantity of *heat* will be abſorbed. In the hot ſtage of fevers, there is a very great evaporation from the ſurface, which is one of the means employed by nature for moderating the *heat*, and reſtraining the violence of the diſeaſe.

In putrid fevers, as the ſolid and fluid parts of the ſyſtem are in a putreſcent ſtate, and, conſequently, retain their phlogiſton with leſs force, a greater quantity of this principle will be diſcharged from the lungs, and the air more copiouſly ſupplied with it, will impart to the blood a greater proportion of its abſolute *heat*; and to theſe cauſes it is probably owing, that the *heat* of the human body never riſes ſo high as in puttid fevers. In topical inflammations, the *heat* is accumulated by the increaſed velocity of the blood through the part inflamed, in the ſame manner as it is accumulated upon fuel, in combuſtion, by directing a ſtream of freſh air into the fire.

HEAT *of inflammable and combuſtible bodies*. Dr. Crawford's theory with reſpect to the inflammation of combuſtible bodies, is founded on the ſame principles as his doctrine concerning the *heat* of animals. According to him, the *heat* which is produced by combuſtion is derived from the air, and not from the inflammable body. Inflammable bodies, he ſays, abound with phlogiſton, and contain little abſolute *heat*: the atmoſphere, on the contrary, abounds with abſolute *heat*, and contains little phlogiſton. In the proceſs of inflammation, the phlogiſton is ſeparated from the inflammable body, and combined with the air; the air is phlogiſticated, and gives off a great proportion of its abſolute *heat*, which, when exiricated ſuddenly, burſts forth into flame, and produces an intenſe degree of ſenſible *heat*. And ſince it appears by calculation, that the *heat* produced by converting atmoſpherical into fixed air, is ſuch, if it were not diſſipated, as would be ſufficient to raiſe the air ſo changed, to more than twelve times the *heat* of red-hot iron, it follows, that in the proceſs of inflammation a very great quantity of *heat* is derived from the air. But, on the contrary, no part of the *heat* can be derived from the combuſtible body; becauſe the combuſtible body, during the inflammation, being deprived of its phlogiſton, undergoes a change ſimilar to that of the blood by the proceſs of reſpiration, in conſequence of which its capacity of containing *heat* is increaſed; and, therefore, it will not give off any part of its abſolute *heat*, but, like the blood in its paſſage through the lungs, it will abſorb *heat*. E. gr. the calx of iron contains more than twice as much abſolute *heat* as the iron in its metallic form; ſo that, in the proceſs of inflammation, the former muſt neceſſarily abſorb a quantity of *heat* equal to the exceſs of its *heat* above that of the latter. This *heat* cannot be conveyed from the iron; becauſe the *heat* of the calx is more than double of that which was contained in the iron, previous to the calcination. But in the burning of iron, the phlogiſton is ſeparated from the metal, and combined with the air; and by the combination of phlogiſton with air, a very intenſe *heat* is produced; and therefore, in the inflammation of iron, the atmoſpherical air is decompoſed, a very great proportion of its abſolute *heat* is ſeparated, part of which is abſorbed by the calx, and the reſt appears in the form of flame, or becomes moving and ſenſible *heat*. This ſenſible *heat* excited in combuſtion muſt conſequently depend upon the ſeparation of abſolute *heat* from the air, by the action of phlogiſton. From this reaſoning it appears, that, when the air, in which an inflamed body is confined, is ſaturated with phlogiſton, and deprived of the greater part of its abſolute *heat*, the ſource of inflammation will be exhauſted,

and

and the flame will be neceſſarily extinguiſhed. Hence we ſee the reaſon, why a conſtant ſucceſſion of freſh air is neceſſary to inflammation, as well as to the ſupport of animal life. Moreover, it is manifeſt, that the leſs phlogiſton, and conſequently the more abſolute *heat* any ſpecies of air contains, the longer it muſt contribute to the ſupport of flame as well as to the preſervation of life; and this agrees both with the author's experiments, and with thoſe of Dr. Prieſtley: for Dr. Crawford has found, that *dephlogiſticated* AIR contains nearly five times as much abſolute *heat* as common air; and Dr. Prieſtley has ſhewn, that five times as much ſenſible *heat* is produced by the converſion of it into fixed and phlogiſticated air, as by that of common air; for a candle will continue to burn five times as long in the former as in the latter ſpecies of air. It is evident, likewiſe, that the intenſity of the *heat*, all other circumſtances being alike, muſt be in proportion to the quantity of air which is changed in a given time; and, therefore, the *heat* may be increaſed to a very great degree, if a ſtream of freſh air be directed upon the fuel, by the bellows, or the blow-pipe.

It is obſerved by Dr. Prieſtley, that the air which was tainted by combuſtion and reſpiration, is again purified by the growth of vegetables (ſee AIR, *phlogiſticated*); and if this effect be produced by the ſeparation of phlogiſton, it follows, that vegetation will reſtore to the air that *heat* which had been detached from it in the proceſſes of reſpiration and combuſtion; and thus the principles of phlogiſton and fire, by the medium of atmoſpherical air, will be continually circulating through the animal and vegetable kingdome.

A ſimilar theory of *heat* has lately been publiſhed by Mr. Elliott. See his Philoſophical Obſervations on the Senſes of Viſion and Hearing; to which are added an Eſſay on Combuſtion and *Animal Heat*, &c. 8vo. 1780.

HEAT is uſually divided, by the ſchool philoſophers, into *actual* and *potential*.

HEAT, *actual*, is that which we have been hitherto ſpeaking of, and which is an effect of real, elementary fire.

HEAT, *potential*, is that which we find in pepper, wine, and certain chemical preparations, as oil of turpentine, brandy, quick-lime, &c.

The Peripatetics account for the *heat* of quick-lime from an antiperiſtaſis.

The Epicureans, and other corpuſcularians, attribute even *potential heat* to atoms of particles of fire detained and locked up in the pores of thoſe bodies, and remaining at reſt therein; which being excited to action again by the *heat* and moiſture of the mouth, or by the effuſion of cold water, or the like cauſe, then break their incloſures, and diſcover what they are.

This doctrine is illuſtrated by Mr. Lemery the younger, in the inſtances of quick-lime, regulus of antimony, tin, &c. in the calcination whereof he obſerves, 1. That the fire, which they imbibe in the operation, makes a ſenſible addition to the weight of the body, amounting ſometimes to one tenth of the whole; and that, during this impriſonment, it ſtill retains all the particular properties or characters of fire, as appears hence, that when once ſet at liberty again, it has all the effects of other fire.

Thus a ſtony or ſaline body being calcined, and water poured thereon, that fluid is found ſufficient, by its external impreſſion, to break up the cells, and let the fire out; and upon this the water is rendered more or leſs warm, according to the quantity of fire lodged therein. Hence alſo it is, that ſome of theſe bodies viſibly contain a great deal of actual fire; and the ſlighteſt occaſion is capable of diſengaging it; and upon applying them to the ſkin, they burn, and raiſe an eſchar, not unlike the top of a live coal.

To this it is objected, that the particles of fire are only ſuch in virtue of the rapid motion wherewith they are agitated; ſo that to ſuppoſe them fixed in the pores of a body, is to diveſt them at once of that which conſtituted them fire, and, conſequently, to diſqualify them from producing the effects aſcribed to them. To which M. Lemery anſwers, that though the rapid motion of fire doth contribute very greatly to its effects, yet the particular figure of its particles is alſo to be conſidered. And though fire ſhould be detained, and fixed in the ſubſtance of bodies, yet why ſhould it fare worſe than other fluids under the ſame circumſtances? Water, for inſtance, is a fluid, whoſe fluidity depends, as already obſerved, on fire; and conſequently, it is leſs fluid than fire; and yet, every day, water is incloſed in bodies of all ſorts, without loſing its fluidity, or any of the properties that characterize it as water.

Add, that when water is frozen, the motion of its parts is, doubtleſs, diſcontinued; and yet, the figure of the particles remaining the ſame, it is ready to commence a fluid, as before, upon the leaſt warmth.

Laſtly, though ſalt be allowed to be the matter of taſtes, and that it has certain properties, ariſing chiefly from the figure of its parts; yet it only acts when diſſolved, or, which amounts to the ſame, when it ſwims in a fluid proper to keep its parts in motion: yet it is not leſs ſalt, or leſs the matter of taſte, when not in a ſtate of diſſolution: to deſpoil it of that quality, the figure of its parts muſt be altered.

As to what may be farther objected, of the impoſſibility of fixing ſo ſine, ſubtil, penetrative, and active a matter, as fire, within the ſpongeous ſubſtance of a groſs, porous body, it will be of no great weight, unleſs it can be proved, that the pores of the cells are bigger than the ſame. If it be inſiſted, again, that a body which could find its way into a ſolid body, might get out again the ſame way; and that as it only penetrated the body, becauſe its own corpuſcles were ſmaller than the pores, the ſame conſideration muſt let it out again; it is anſwered, that the pores are not now in the ſame condition as before; the fire, in calcining, opened and diſtated the pores; which, upon the fire's ceaſing, muſt naturally cloſe and contract again. Mem. de l'Acad. an. 1713.

Mr. Boyle endeavours to ſet aſide this account, and ſubſtitute a mechanical property; viz. a peculiar texture of parts in theſe caſes, in lieu of fire. Though a great likeneſs might be expected between the particles of fire adhering to the quick-lime, and thoſe of highly rectified ſpirit of wine; yet he has not found, that the effuſion of the ſpirit upon quick-lime produced any ſenſible *heat*, or viſible diſſolution of the lime, though it ſeemed to be as greedily ſucked in, as common water would have been. And farther, he found, that if cold water were poured upon the ſame lime, ſo drenched, there would enſue no manifeſt *heat*; nor did the lump appear ſwelled or broken till ſome hours after; which ſeems to argue, that the texture of the lime admitted ſome particles of the ſpirit of wine into ſome of its pores, which were either larger or more fit for it, without admitting it into the moſt numerous, whereinto the liquor muſt be received, to be able ſuddenly to diſſipate the corpuſcles of lime into their minuter particles.

Theſe phenomena, according to Mr. Boyle, ſeem to ſhew, that the diſpoſition which lime has to grow hot with water, greatly depends on ſome peculiar texture; ſince the aqueous parts, which one would think capable of quenching moſt of the fiery atoms ſuppoſed to adhere to quick-lime, did not near ſo much weaken the diſpoſition of it to *heat*, as that exceſs of the ſpirituous corpuſcles, and their contexture with thoſe of the lime, increaſed it.

Yet, in other places, this author appears rather to give into the corpuſcular ſcheme; urging, that if, inſtead of cold water, you quench the lime with hot water, the ebullition will be, oftentimes, far greater than if the liquor were cold; which, indeed, might well be expected, hot water being much fitter than cold ſuddenly to pervade the body of the lime, and haſtily to diſſolve, and ſet at liberty, the fiery and ſaline parts wherewith it abounds. And what a greater intereſt ſalts may have in producing ſuch *heats*, than cold water, he has alſo tried, by pouring acid ſpirits, and particularly ſpirit of ſalt, upon good quick-lime; for, by this means, there was always a far greater degree of *heat* excited, than if he had uſed common water; and this, whether he employed the ſpirit cold or hot.

It is not eaſy, ſays the ſame author, to apprehend how ſuch light and minute bodies ſhould be ſo long detained, as muſt by this hypotheſis be allowed, in quick-lime eſpecially; ſince no great *heat* enſues the pouring of water upon minium, or *crocus martis per ſe*, though they have been calcined by a violent fire, the effluvia whereof ſeem to adhere to them, by the increaſe of the weight the lead and iron manifeſtly receive from the operation of it.

The true cauſe of the phenomenon, which is the ſubject of this article, or of the increaſe of weight which certain ſubſtances acquire in calcination, was not generally known, previous to the modern diſcoveries relating to air. From theſe it appears, that the additional weight of calcined ſubſtances, is not owing, as Mr. Boyle and others imagined, to the particles of fire that fix themſelves in the metal, but to the air abſorbed by theſe ſubſtances, and adhering to their conſtituent parts, in the proceſs of CALCINATION. See alſo *Fixed* AIR.

This curious diſcovery was ſuggeſted by Jean Rey, a phyſician at Perigord, in a very ſcarce book written at the beginning of the laſt century. Eſſais de J. Rey, &c. à Buza, 1630.

Mr. Brun, apothecary at Bergerac, had informed him, that having put two pounds ſix ounces of fine tin into an iron veſſel, expoſed to a violent heat, during ſix hours, he found that it was converted into a calx, which weighed ſeven ounces more than the tin originally employed. This increaſe of weight, ſays Jean Rey, proceeds from the air, which has been thickened, rendered heavy, and in ſome degree adheſive,

by the vehement and long continued *heat* of the furnace; which air mixes with the calx, and attaches itself to its minuteſt particles, in the ſame manner as water adheres and adds weight to thoſe of ſand. This air, he adds, is no otherwiſe changed than in being deprived of its fluidity, which rendered it incapable of adhering to any ſubſtance; and in the preſent caſe is made more groſs, heavy, and adhezive. Abbé Rozier's Obſerv. ſur la Phyſique, vol. v. or Monthly Rev. vol. liv. p. 124. See FIRE.

HEAT, *method of eſtimating its effects on ſolids and fluids.* See PYROMETER and THERMOMETER.

HEAT, in *Chemiſtry.* See FIRE.

HEAT, in *Medicine.* Great *heats* are not ſo much the immediate, as the remote cauſe of a general ſickneſs, by relaxing the fibres, and diſpoſing the humours to putrefaction; eſpecially among ſoldiers, and perſons expoſed the whole day to the ſun; for the greateſt *heats* are ſeldom found to produce epidemic diſeaſes, till the perſpiration is ſtopped by wet cloaths, fogs, dews, damps, &c. and then ſome bilious or putrid diſtemper is the certain conſequence, as fluxes, and ardent intermitting fevers. Nevertheleſs, it muſt be allowed, that *heats* have ſometimes been ſo great, as to prove the more immediate cauſe of particular diſorders. As when centinels have been placed without cover, or frequent feaſts, in ſcorching *heats*; or when troops march, or are exerciſed in the *heat* of the day; or when people imprudently lie down and ſleep in the ſun; all theſe circumſtances are apt to bring on diſtempers, varying according to the ſeaſon of the year. In the beginning of ſummer, theſe errors produce inflammatory fevers; and, in the end of it, or in the beginning of autumn, a remitting fever, or dyſentery.

To prevent, therefore, the effects of intemperate *heat*, commanders have found it expedient ſo to order the marches, that the men come to the ground before the *heat* of the day; and to give ſtrict orders, that none of them ſleep out of their tents; which in fixed encampments may be covered with boughs, to ſhade them from the ſun. It is likewiſe a rule of great importance to have the ſoldiers exerciſed before the cool of the morning is over; for, by that means, not only the ſultry *heats* are avoided, but the blood being cooled, and the fibres braced, the body will be better prepared to bear the *heat* of the day. Laſtly, in very hot weather, it has been found proper to ſhorten the centinele duty, when obliged to ſtand in the ſun. Pringle's Obſ. on the Diſeaſes of the Army, p. 79—95.

HEAT, in *Smithery*, &c. See IRON.

HEAT is alſo uſed, in reſpect of race horſes, for the exerciſes to be given them by the way of preparation, &c. Two *heats* in a week are reckoned a juſt meaſure for any horſe, of what ſtate or conſtitution ſoever. The jockeys lay it down as a rule, that one of the *heats* be given on the ſame day of the week whereon the horſe is to run his match; and this is to be the ſharpeſt *heat*.

HEATH, *Erica*, in *Botany*, a genus of the *octandria monogynia* claſs. Its characters are theſe: the flower hath a coloured empalement of four leaves, and one ſwollen petal, which is quadrifid, with eight ſtamina fixed to the receptacle; in the bottom is ſituated a germen, which afterward becomes a round capſule, having four cells, which are filled with ſmall ſeeds. Miller enumerates four ſpecies, which grow wild upon barren uncultivated places in divers parts of England; but notwithſtanding their being ſo common, they deſerve a place in ſmall quarters of humble flowering ſhrubs, where the beauty and long continuance of the flowers, and diverſity of the leaves, make an agreeable variety. Linnæus attributes forty-two different ſpecies to this genus.

The decoction of *heath* is diuretic; Chuſius affirms that Rondeletius, the famous profeſſor of phyſic at Montpelier, uſed the oil of its flowers for fetters with ſucceſs. Tabernæmontanus ſays, that it is a ſpecific for theſe ſorts of diſeaſes; and that a fomentation with the flowers of *heath*, eaſes the pain of the gout. For the ſame diſeaſe they prepare a vapour-bath with its leaves and flowers. Martyn's Tournefort.

The juice, or the diſtilled water of the flowers, cures redneſs of the eyes, and mitigates pain in them. A decoction of the leaves taken warm, to the weight of five ounces, morning and evening, three hours before meat, for thirty days ſucceſſively, is effectual for breaking and expelling the ſtone in the bladder, as Matthiolus experienced. He adds, that he knew ſome, who, by obſerving an accurate regimen of diet, by only drinking this liquor, voided the ſtones from the bladder, crumbled into ſmall particles.

Hence is derived its name *erica*, from *εαγνυμι, I break.*

HEATH, *berry-bearing*, or *Blackberry* HEATH, *Empetrum*, in *Botany*, a genus of the *dioecia triandria* claſs. Its characters are theſe: it hath male and female flowers on different plants; the male flowers have a three-pointed empalement, and three petals, which are narrow at their baſe, and three long hanging ſtamina: the female flowers have the ſame empalement and petals as the male; and in the centre is ſituated a depreſſed germen, with nine reflexed ſpreading ſtigmas; the germen becomes a depreſſed round berry of one cell, including nine ſeeds, placed circularly. We have but one ſpecies in England, which grows wild on the mountains in Staffordſhire, Derbyſhire, and Yorkſhire, where the ſoil is boggy; the heathcocks feed much upon the berries, which are called heath berries, or crack berries; and where theſe ſhrubs are, there is generally plenty of theſe fowls. Miller.

HEATH, *low-pine.* See CORIS.

HEATH, *ſea.* See ERICA *marina.*

HEATH, *proſe.* See *Aſter* VETCH.

HEATH-*cock.* See GROUSE.

HEATH, *mountain.* See SAXIFRAGE.

HEATHEN. See PAGAN.

HEATOTOTL, in *Ornithology*, the name of an American bird, deſcribed by Nieremberg, and called alſo *avis venti.* It is remarkable for a very large and round creſt of whitiſh feathers on its head. Its breaſt is of a brownith grey; its belly white, and its feet yellow; its tail is round when expanded, and is variegated with black and white; its back and wings are black.

HEAVE, at *Sea*, ſignifies to throw away, or fling any thing over-board.

When a ſhip, being at anchor, riſes and falls by the force of the waves, ſhe is alſo ſaid to *heave and ſet.*

To HEAVE *a peak.* See PEEK.

To HEAVE *at the capſtan*, ſignifies to turn it about. See CAPSTAN.

To HEAVE *down.* See CAREENING.

To HEAVE *a ſhip abroad*, is to hang it out. See FLAG, and SIGNAL.

To HEAVE *a-head*, is to make the ſhip advance by heaving in the cable, or other rope, which is faſtened to an anchor at ſome diſtance before her. *To heave a-ſtern*, is to draw the ſhip backwards by the ſame operation.

To HEAVE *the lead.* See SOUNDING.

To HEAVE *out*, is to unfurl and throw looſe a ſail from the place where it had been rolled and faſtened. The phraſe is more particularly applied to the ſtay-ſails: as, *looſe the top-ſails*, and *heave out the ſtay-ſails*, which is done, in order to ſet or dry them.

To HEAVE *ſhort*, is to draw ſo much of the cable into the ſhip, by means of the capſtan or windlaſs, as that by advancing ſhe will be almoſt perpendicularly above the anchor, and in a proper ſituation to ſet ſail: and to *heave taught*, is to turn about the capſtan, till the rope applied to it becomes ſtruit, and ready for action.

HEAVE-*offerings*, under the *Jewiſh Law*, were things offered up to God, by lifting them up on high.

HEAVEN, *Cœlum*, an azure, tranſparent orb, inveſting our earth; wherein the celeſtial bodies perform their motions.

The popular notion of *heaven*, it muſt be obſerved, has various ideas, in the language of philoſophers, divines, and aſtronomers: agreeable to which, we may lay down divers *heavens*; as the *higheſt*, or *empyrean heaven*; the *ætherial*, or *ſtarry heaven*; the *planetary heaven*, &c.

HEAVEN, among *Divines*, called alſo the *empyrean heaven*, is the abode of God, and bleſſed ſpirits; as angels, and the ſouls of the righteous deceaſed.

In this ſenſe, *heaven* ſtands oppoſite to *hell.*

This is alſo frequently called, in Scripture, the *kingdom of heaven*, the *heaven of heavens*, and by St. Paul the *third heaven*; ſometimes *Paradiſe*, the *New Jeruſalem*, &c.

This *heaven* is conceived as a place in ſome remote part of infinite ſpace, wherein the Deity is pleaſed to afford a nearer and more immediate view of himſelf, and a more ſenſible manifeſtation of his glory; and a more adequate perception of his attributes, than in the other parts of the univerſe, where he is likewiſe preſent.

This makes what the divines alſo call the *beatific viſion.* Authors are much divided as to the reality of ſuch *local heaven.*

The inſpired writers give us very magnificent deſcriptions of *heaven*, the ſtructure, apparatus, and attendance thereof; particularly Iſaiah, and St. John the Divine. Plato, in his Dial. de Anim. ſpeaks of *heaven* in terms that bear ſo near a reſemblance to thoſe of Scripture, that Euſebius charges him with borrowing his account thence. De Præpar. Evangel. lib. xi. cap. 37.

The ancient Romans had a kind of *heaven* in their ſyſtem of theology, which they called ELYSIUM, or the *elyſian fields.*

The Mahometan *heaven*, or *paradiſe*, is very groſs, agreeable to the genius of their religion.

HEAVEN, among *Astronomers*, called also the *ætherial* and *starry heaven*, is that immense region wherein the stars, planets and comets, are disposed.

This is what Moses calls the *firmament*, speaking of it as the work of the second day's creation; at least it is thus the word רקיע is usually rendered by his interpreters; though somewhat abusively, to countenance their own notion of the *heavens* being firm, or solid. The word, it is certain, properly signifies no more than *expanse*, or *extension*; a term very well adapted by the prophet to the impression which the *heavens* make on our senses; whence, in other parts of Scripture, the *heaven* is compared to a curtain, or a tent stretched out to dwell in. The LXX. first added to this idea of expansion, that of *firm* or *solid*; rendering it by στερεωμα, according to the philosophy of those times; in which they have been followed by the modern translators.

The later philosophers, as Des Cartes, Kircher, &c. have easily demonstrated this *heaven* not to be solid, but fluid; but they still suppose it full, or perfectly dense, without any vacuity, and carnoned out into many vortices.

But others carry the thing much farther, and overturn not only the solidity, but the supposed plenitude, of the *heavens*. Sir Isaac Newton has abundantly shewn the *heavens* void of almost all resistance, and, consequently, of almost all matter: this he proves from the phenomena of the celestial bodies; from the planets persisting in their motions without any sensible diminution of their velocity; and the comets freely passing in all directions towards all parts of the *heavens*.

Heaven, taken in this general sense, for the whole expanse between our earth and the remotest regions of the fixed stars, may be divided into two very unequal parts, according to the matter found therein; viz. the atmosphere, or *aereal heaven*, possessed by air; and the *ætherial heaven*, possessed by a thin, unresisting medium, called *æther*.

HEAVEN is more particularly used, in *Astronomy*, for an orb, or circular region, of the ætherial *heaven*.

The ancient aftronomers assumed as many different *heavens* as they observed different motions therein. These they supposed all to be solid, as thinking they could not otherwise sustain the bodies fixed in them; and spherical, that being the most proper form for motion.

Thus we had seven *heavens* for the seven planets; viz. the *heavens* of the Moon, Mercury, Venus, the Sun, Mars, Jupiter, and Saturn.

The eighth was for the fixed stars, which they particularly called the *firmament*.

Ptolemy adds a ninth *heaven*, which he called the *primum mobile*.

After him two CRYSTALLINE *heavens* were added, by king Alphonsus, &c. to account for some irregularities in the motions of the other *heavens*: and lastly, an *empyrean heaven* was drawn over the whole, for the residence of the Deity; which made the number twelve.

But others admitted many more *heavens*, according as their different views and hypotheses required. Eudoxus supposed twenty-three, Calippus thirty, Regiomontanus thirty-three, Aristotle forty-seven, and Fracastor no less than seventy.

We may add, that the astronomers did not much concern themselves whether the *heavens*, they thus allow of, were real or not, provided they served a purpose in accounting for any of the celestial motions, and agreed with the phenomena.

Among the other reveries of the rabbins, contained in the Talmud, we find it asserted, that there is a place where the *heavens* and the earth join together; that rabbi Barchana, going thither, laid his hat on the window of *heaven*; and that, going to take it again immediately after, it was gone, the *heavens* having carried it off; so that he must wait for a revolution of the orbs to bring it to its place again.

HEAVER, in *Sea Language*, is a name given by seamen to a wooden staff, which they employ as a lever on many occasions; particularly in setting up the top-mast shrouds, frapping the top-masts, stropping the larger blocks, seizing the standing rigging, &c.

HEAVINESS. See GRAVITY.

For the laws of the descent of *heavy* bodies, see DESCENT.

Heavy bodies do not tend precisely to the very centre of the earth, except at the poles, and the equator, on account of the spheroidal figure of the earth. Their direction is every where perpendicular to the surface of the spheroid.

HEAULME, or HEAUME, in *Heraldry*, a HELMET, or head-piece.

HEAVY, in the *Manage*. A horse is said to reft *heavy* upon the hand, who, through the softness of his neck, the weakness of his back, the weight of his fore-quarters, or through weariness, throws himself upon the bridle; but without making any resistance, or any effort, to force the horseman's hand. This fault is remedied, and the horse made light upon the hand, by stopping, and making him go back frequently, if it proceeds only from laziness and stiffness; but if caused by any defect in the back, there is no remedy for it.

HEBBING-*water*, in our *Statutes*, is used for wears or engines made or laid at ebbing water, 23 Hen. VIII. cap. 5.

HEBDOME, Ἑβδόμη, among the Athenians, a festival or holy day kept always on the seventh day of the moon in honour of Apollo; that being supposed to have been his birth-day.

HEBE, in *Ancient Mythology*, a goddess, the idea of whom, among the Romans, seems to have been much the same with that of eternal youth, or an immortality of bliss; agreeable to which, she is represented on a gem, in the great-duke's collection at Florence, with a young airy look, and drinking out of a little bowl; or, according to Milton's expression, "Quaffing immortality and joy." Spence's Polymetis, p. 189.

HEBENSTRETIA, in *Botany*, the name of a genus of plants, of the *didynamia angiospermia* class; the characters of which are these: the perianthium is of a tubular form; it consists of one leaf, lightly divided at the verge into two lips; the upper lip is short, straight, and narrow; the under is lanceolated, long, and bent downwards; the flower consists of one irregular petal; the tube is cylindric, and shorter than the cup; the lip is only one, not two, as in other labiated flowers; it is broad, and divided into four segments at the end, and is of the length of the under lip of the cup; the stamina are four filaments, two arising from each side of the lower part of the lip of the flower; the pointed of the pistil is oblong, the style is slender, and of the length of the flower, and the stigma is very thin; the fruit is an oblong capsule opening into two parts; the seeds are two in number, and are oblong, convex, and trifulcated on one side, and flat on the other.

HEBERMAN, in *Ancient Law Books*, a poacher, or a fisherman below London bridge: thus called, because he commonly fishes at ebb-water.

HEBERTHEFT, in *Ancient Customs*, a privilege of having the goods of a thief, and the trial of him, within a particular district.

HEBDOMADARY, HEBDOMADARIUS, or HEBDOMADIUS, a member of a chapter, or convent, whose week it is to officiate in the choir, to rehearse the anthems and prayers, and to perform the usual functions which the superiors perform at solemn feasts, and other extraordinary occasions.

The word is formed of the Greek ἑβδομας, which signifies the number *seven*; of ἑπτα, *seven*.

The *hebdomadary* generally collates to the benefices which become vacant during his week; though it is usually looked on as an abuse.

In cathedrals, the *hebdomadary* was a canon or prebendary, who had the peculiar care of the choir, and the inspection of the officers of his week.

In monasteries, the *hebdomadary* is he who waits at table for a week, or other stated period; directs and assists the cook, &c.

In church-antiquity, we meet with accounts of nine different sorts of *hebdomadaries*; viz. the *hebdomadarius cantor*, or *hebdomadary cantor*; *hebdomadarius chori*, *hebdomadary of the choir*; which two were really the same; viz. he who led or conducted the public service: *hebdomadary* of the kitchen, *hebdomadarius coquinæ*; *hebdomadary* of the deffuncti, or the dead, *hebdomadarius defunctorum*, he who took care of the office and service of the dead; *hebdomadarius invitatorii*, he who sung the invitatory; *hebdomadarius lectur ad mensam*, he who read at meal time; *hebdomadarius majoris missæ*, he who read mass; *hebdomadarius psalterii*, who probably was the same with the *hebdomadarius chori*; and *hebdomadarius sacri altaris*, who might be the same with the *hebdomadary* of the high mass.

HEBRAICA *concha*, in *Natural History*, a name given by authors to a very beautiful sea-shell of the VOLUTA kind, from a number of black marks which seem to resemble the Hebrew characters.

HEBRAISM, an idiotism, or manner of speaking, peculiar to the Hebrew tongue.

There is no understanding even the versions of the Old Testament, without some acquaintance with the Hebrew; they are so full of *Hebraisms*.

We have abundance of *Hebraisms* borrowed from Scripture, and naturalized in our own language: as, *Son of perdition*; to *sleep in the Lord*, &c.

HEBREW, something relating to the people of the Jews, i. e. the twelve tribes, descending from the twelve patriarchs, sons of Jacob. See JEWS. Thus we say,

HEBREW *Bible*. See BIBLE.

HEBREW *character*. There are two kinds of *Hebrew* characters: the *ancient*, called also the *square*; and the *modern*, or *rabbinical* characters. The *square Hebrew* takes its denomination from the figure of its characters, which ſtand more ſquare, and have their angles more exact and preciſe than the other.

This character is uſed in the text of holy Scripture, and their other principal and moſt important writings. When both this and the rabbinical character are uſed in the ſame work, the former is for the text, or the fundamental part; and the latter for the neceſſary part; as the gloſs, notes, commentaries, &c.

The beſt and moſt beautiful characters of this kind, are thoſe copied from the characters in the Spaniſh manuſcripts; next, thoſe from the Italian manuſcripts; then thoſe from the Pruſſich; and laſtly, thoſe of the Germans, whoſe characters are much the ſame, with reſpect to the other genuine *ſquare Hebrew* characters, that the Gothic, or Dutch characters, are with reſpect to the Roman.

Several authors contend, that the *ſquare* character is not the real ancient *Hebrew* character, written from the beginning of the language to the time of the Babyloniſh captivity; but that it is the *Aſſyrian*, or Chaldee character, which the Jews aſſumed, and accuſtomed themſelves to, during the captivity, and retained afterwards. They ſay, that the Jews, during the captivity, had quite diſuſed their ancient character; ſo that Ezra found it neceſſary to have the ſacred books tranſcribed into the Chaldean ſquare character. Theſe authors add, that what we call the *Samaritan* character, is the genuine ancient *Hebrew*.

Of this opinion are Scaliger, Bochart, Cafaubon, Voſſius, Grotius, Walton, Capellus, &c. and among the ancients Jerome and Euſebius. On this ſide it is urged, that the preſent characters are called Aſſyrian by the ancient Jewiſh writers of the Talmud, and, therefore, muſt have been brought from Aſſyria; but to this argument it is replied, that there were two ſorts of characters anciently in uſe, viz. the ſacred, or preſent ſquare character, and the prophane or civil, which we call Samaritan; and that the ſacred is called Aſſyrian, becauſe it firſt began in Aſſyria to come into common uſe. It is farther alleged, that the Chaldee letters, which the Jews now uſe, were unknown to the ancient Jews before the captivity, from Dan. i. 4. Moreover, it is inferred from 2 Kings, xvii. 28. whence we learn that a Jewiſh prieſt was ſent to teach the Samaritans the worſhip of Jehovah; on which occaſion he muſt have taught them the law; and yet no mention occurs of his teaching them the language or character, that the law was then written in the character which the Samaritans uſed. But the chief argument is taken from ſome ancient Jewiſh ſhekels, with a legend on one ſide, "The ſhekel of Iſrael," and on the other "Jeruſalem the holy," both in Samaritan characters. Theſe ſhekels, it is ſaid, muſt have been coined before the diviſion of the two kingdoms of Judah and Iſrael, or, at leaſt, before the Aſſyrian captivity, becauſe the Samaritans never afterwards reckoned Jeruſalem holy. On the other ſide, or for the primitive antiquity of the ſquare character, are the two Buxtorfs, Leuſden, Calovius, Hottinger, Spanheim, Lightfoot, &c. They urge, from Matthew v. 18. that *jod* is really the leaſt of the conſonants in the preſent *Hebrew*, whereas it is one of the largeſt characters in the Samaritan alphabet: but Walton replies, that if our Saviour here ſpeaks of the leaſt letter of the alphabet, we can only infer, that the Chaldee character was uſed in our Saviour's time, which is not denied by thoſe who maintain the Samaritan to be the original. They alſo alledge, that the Jews were too obſtinate and ſuperſtitious to allow their ſacred character to be altered; but if this was done under the direction and authority of Ezra, the argument will be much invalidated. Farther they ſay, that Ezra could not alter the ancient character, becauſe it was impoſſible to make the alterations in all their copies. This argument, however, is contradicted by fact; ſince the old Engliſh black letter is actually changed for the Roman. They ſay, likewiſe, that Ezra was not diſpoſed to prophane the ſacred writings with a heathen character: but this ſuppoſes that Ezra was ſo ſuperſtitious as to imagine, that there was ſome peculiar ſanctity in the ſhape of the letters. Moreover, the advocates for this opinion appeal to ancient coins found in Judea, with a legend in the Chaldee or Aſſyrian character. But the genuineneſs of theſe coins is much ſuſpected.

The learned Jeſuit Souciet maintains, with great addreſs, that the ancient *Hebrew* character is that found on the medals of Simon, and others, commonly called *Samaritan medals*; but which, he aſſerts, were really *Hebrew* medals, ſtruck by the Jews, and not the Samaritans.

Buxtorf endeavours to reconcile theſe two opinions, by producing a variety of paſſages from the rabbies to prove, that both theſe characters were anciently uſed; the preſent ſquare character being that in which the tables of the law, and the copy depoſited in the ark, were written; and the other character being uſed in the copies of the law, which were written for private and common uſe, and in civil affairs in general; and that after the captivity, Ezra enjoined the former to be uſed by the Jews on all occaſions, leaving the latter to the Samaritans and apoſtates. But it can hardly be allowed by any who conſider the difference between the Chaldee and Samaritan characters, with reſpect to convenience and beauty, that they were ever uſed at the ſame time. After all, it is of no great moment which of theſe, or whether either of them, were the original characters; ſince it appears, that no change of the words has ariſen from the manner of writing them, becauſe the Samaritan and Jewiſh Pentateuch almoſt always agree after ſo many ages. It is moſt probable that the form of theſe characters has varied in different periods: this appears from the teſtimony of Montfaucon, in his Hexapla Origenis, vol. ii. p. 10. &c. and is implied in Dr. Kennicott's making the characters in which manuſcripts are written, one teſt of their age. See Jenning's Ant. vol. ii. p. 336, and the authors there cited. Kennicott's Diſſ. on the *Hebrew* Text, vol. i. and ii.

HEBREW *character, modern*, or *rabbinical*, is a good neat character, formed of the *ſquare Hebrew*, by rounding it, and retrenching moſt of the angles, or corners of the letters, to make it the more eaſy and flowing. The letters uſed by the Germans are very different from the *rabbinical* character uſed every where elſe, though all formed alike from the ſquare character; but the German in a more ſlovenly manner than the reſt.

The rabbins frequently make uſe either of their own, or the *ſquare Hebrew* character, to write the modern languages in. There are even books in the vulgar tongues, printed in *Hebrew* characters; inſtances whereof are ſeen in the French king's library.

HEBREW *language*, called alſo abſolutely HEBREW, is the language ſpoke by the *Hebrews*, who were ſo called, as is moſt probable, from Heber the ſon of Shem, wherein all the books of the Old Teſtament are written; whence it is alſo called the *holy* or *ſacred language*.

There is no piece in all antiquity, written in pure *Hebrew*, beſide the books of the Old Teſtament; and even ſome parts of thoſe are in CHALDEE.

The *Hebrew*, then, appears to be the moſt ancient of all the languages in the world; at leaſt it is ſo with regard to us, who know of no older. Some learned men will have it the language ſpoken by Adam in paradiſe; and that the ſaints will ſpeak it in heaven; alledging, that it is ſo conciſe and yet ſo ſignificant, ſo pathetic and yet ſo free from levity, or bombaſt, as of all languages to approach neareſt to that of ſpirits, who need no words for conveying their ideas to each other. Dr. Sharpe adopts the opinion, that the *Hebrew* was the original language; not indeed that the *Hebrew* is the unvaried language of our firſt parents, but that it was the general language of men at the diſperſion: and however it might have been improved and altered from the firſt ſpeech of our firſt parents, it was the original of all the languages, or almoſt all the languages, or rather dialects, that have ſince ariſen in the world. Origin, &c. of Languages, p. 22, &c. See LANGUAGE.

The *Hebrew*, ſuch as we have it in the holy Scripture, is a very regular, analogical language, and is particularly ſo in its conjugations. Properly ſpeaking, there is but one ſimple conjugation; but this is varied in each verb ſeven or eight different ways, which has the effect of ſo many different conjugations, and affords a great number of expreſſions, whereby to repreſent, under one ſingle word, all the different modifications of a verb, and ſeveral ideas at once; which in the modern, and moſt of the ancient and learned languages, are expreſſible only by phraſes.

The original or primitive words in their language, which they call *radices*, *roots*, rarely conſiſt of more than three letters, or of two ſyllables, which are expreſſed by two ſounds, or by the ſame ſound redoubled, which is indicated by a point.

There are twenty-two letters in the *Hebrew* language, which grammarians divide into *guttural*, *palatal*, *dental*, *labial*, and *lingual*. This diviſion is taken from the ſeveral organs of ſpeech; ſome whereof contribute more than others to the pronunciation of certain letters.

Uſually, they only reckon five vowels in the *Hebrew*, which are the ſame with ours, viz. *a*, *e*, *i*, *o*, *u*; but then each vowel is divided into two, a long, and a breve, or ſhort: the ſound of the former is ſomewhat graver, and longer; and that of the latter ſhorter, and more acute. It muſt be added, that the two laſt vowels have quite

different

different sounds; different, we mean, in other respects besides quantity and degree of elevation.

To these ten or twelve vowels must be added some others, called *semi-vowels*, which are only slight motions serving to connect the consonants, and make the easier transitions from one to another.

The number of accents is prodigious in the *Hebrew*. Some reckon near forty different ones; and others reduce their number to thirty, and even lower; and of these there are several whose use is not well ascertained, notwithstanding all the inquiries of the learned into that matter.

In the general, we know these three things: 1. That they serve to distinguish the sentences, and the members thereof, like the points and commas, &c. in English. 2. To determine the quantity of the syllables; and, 3. To mark the tone wherewith they are to be spoke or sung.

It is no wonder, then, that there should be more accents in the *Hebrew* than in other languages; as they do the office of three different things, which, in other languages, are called by different names. See ACCENTS.

As we have no *Hebrew* but what is contained in the Scripture, that language to us wants a great many words; not only because in those primitive times the languages were not so copious as at present; but also on this account, that the inspired writers had no occasion to mention many of the terms that might be in the language.

The Chaldee, Syriac, Ethiopic, &c. languages, are by some held to be only dialects of the *Hebrew*, as the French, Italian, Spanish, &c. are dialects of the Latin. It has been supposed by many very learned men, that the *Hebrew* characters or letters were often used hieroglyphically, and that each had its several distinct sense understood as a hieroglyphic. Neuman, who seems to have taken infinite pains to find out this secret meaning of these letters, gives the following explication: א *aleph*, he says, is a character denoting motion, readiness, and activity; ב *beth*, signifies, 1. matter, body, substance, thing. 2. Place, space, or capacity. And, 3. In, within, or contained; ג *gimel*, stands for flexon, bending, or obliquity of any kind; ד *daleth*, signifies any protrusion made from without, or any promotion of any kind; ה *he*, stands for presence, or demonstrative essence of any thing; ו *vau*, stands for copulation or growing together of things; ז *zain*, expresses vehement protrusion and violent compression, such as is occasioned by at once violently discharging and constringing a thing together; it also signifies, sometimes, the straitening of any figure into a narrow point at the end; ח *cheth*, expresses association, society, or any kind of composition, or combination of things together; ט *teth*, stands for the withdrawing, drawing back, or recess of any thing; י *jod*, signifies extension and length, whether in matter or in time; כ *caph*, expresses a turning, curvedness, or concavity; ל *lamech*, stands for an addition, access, impulse, or adversation, and sometimes for pressure; מ *mem*, expresses amplitude, or the amplifying any thing in whatever sense; in regard to continuous qualities, it signifies the adding length, breadth, and circumference; and in disjunct qualities it signifies multitude; נ *nun*, signifies the propagation of one thing from another, or of the same thing from one person to another; ס *samech*, expresses cincture and coarctation; ע *ain*, stands for observation, objection, or obviation; פ *pe*, stands for a crookedness or an angle of any figure; צ *tsade*, expresses contiguity and close succession; ק *koph*, expresses a circuit or ambit; ר *reih*, expresses the egress of any thing, as also the exterior part of a thing, and the extremity or end of any thing; ש *shin*, signifies the number three, or the third degree, or the utmost perfection of any thing; ת *tau*, expresses a sequel, continuation, or succession of any thing.

According to this explication, as the several particular letters of the *Hebrew* alphabet separately signify the ideas of motion, matter, space, and the several modifications of matter, space, and motion, it follows, that a language, the words of which are composed of such expressive characters, must necessarily be of all languages the most perfect and expressive; as the words formed of such letters, according to their determinate separate significations, must convey the idea of all the matters contained in the sense of the several characters, and be at once a name and a definition, or succinct description of the subject, and all things material as well as spiritual, all objects in the natural and moral world, must be known as soon as their names are known, and their separate letters considered.

The words URIM and THUMMIM are thus easily explained, and found, perhaps, the most appolite and expressive words that were ever formed.

HEBREW, *rabbinical*, or *modern* HEBREW, is the language used by the rabbins, in the writings they have composed. The base, or body hereof, is the *Hebrew* and Chaldee, with divers alterations in the words of these two languages, the meanings whereof they have considerably enlarged and extended. Abundance of things they have borrowed from the Arabic: the rest is chiefly composed of words and expressions, chiefly from the Greek; some from the Latin; and others from the other modern tongues; particularly that spoken in the place where each rabbin lived or wrote.

The *rabbinical Hebrew* must be allowed a very copious language. M. Simon, in his Hist. Crit. du Vieux Testam. liv. iii. chap. 27. observes, that there is scarce any art, or science, but the rabbins have treated thereof in it. They have translated most of the ancient philosophers, mathematicians, astronomers, and physicians; and have wrote themselves on most subjects: they do not want even orators and poets. Add, that this language, notwithstanding it is so crowded with foreign words, has its beauties visible enough in the works of those who have written well in it.

M. Simon says, it is impossible to reduce it into an art, or system of rules; but several learned men are of another sentiment; and it not only appears possible, but has actually been performed. Genebrard first attempted it in his Modus Rabbinica, which yet goes no further than the learning to read it. Bustorf seconded him, at the end of his *Hebrew* Grammar; where we have an additional piece, under the title Lectionis Hebraeo-Germanicae Usus & Exercitatio. Others have gone yet farther: Malus has lately given us a rabbinical grammar, at Giessen, under the title of Johannis Mali Grammatica Rabbinica; and before him Sennert had done the same; Rabbinismus: h. e. Praecepta Targumica, Talmudico-Rabbinica. Wirtemb. an. 1666.

HEBREW *points* or *vowels*. See POINTS.

HEBREWS, *Epistle to the*, a canonical book of the New Testament, bearing no writer's name, but generally ascribed to the apostle Paul. Concerning the date of this epistle, and occasion of writing it, see EPISTLE.

HECATE, in *Mythology*, a name of the infernal Diana, represented with all the characteristics of a *fury*, holding instruments of terror in her hands, and grasping either cords, or swords, or serpents, or flaming torches. Under this character she was exhibited with three bodies, and invoked in enchantments.

HECATOMB, HECATOMBE, in *Antiquity*, a sacrifice of a hundred beasts of the same kind, at a hundred altars, and performed by a hundred priests, or sacrificers.

The word is formed of the Greek ἑκατὸν, which properly signifies a *sumptuous*, or *magnificent sacrifice*. Others derive it from the Greek ἑκατὸν, *centum*, a *hundred*, and βοὺς, *bos*, *bullock*, &c. On which footing the *hecatomb* should be a sacrifice of a hundred bullocks. Others derive the word from ἑκατὸν, and ϖὺς, *pes*, *foot*; and on that principle hold, that the *hecatomb* might consist of only twenty-five four footed beasts. They add, that it was of no importance what kind of beasts were chose for victims, provided the quota of feet were but had.

Pythagoras is said to have sacrificed a *hecatomb* to the Muses, of a hundred oxen, in joy and gratitude for his discovering the demonstration of the 47th proposition of the first book of Euclid, viz. that in a rectangled triangle, the square of the hypothenuse is equal to the squares of the two other sides.

For the origin of *hecatombs*. Strabo relates, that there were a hundred cities in Laconia; and that each city used to sacrifice a bullock every year, for the common safety of the country; whence the institution of the celebrated sacrifice of a hundred victims, called *hecatombs*. Others refer the origin of *hecatombs* to a plague, wherewith the hundred cities of Peloponnesus were afflicted; for the removal whereof, they jointly contributed to so splendid a sacrifice.

Julius Capitolinus relates, that for a *hecatomb* they erected a hundred altars of turf, and on these sacrificed a hundred sheep, and a hundred hogs. He adds, that when the emperors offered sacrifices of this kind, they sacrificed a hundred lions, a hundred eagles, and a hundred other beasts of the like kind.

HECATOMBÆON, in *Chronology*. See ECATOMBÆON.

HECATOMPHONIA, ἙΚΑΤΟΜΦΟΝΙΑ, an ancient sacrifice among the Messenians; offered by such as had slain a hundred enemies in battle.

The word comes from ἑκατὸν, a *hundred*, and ϕόνος, *to kill*.

HECATONSTYLON, ἙΚΑΤΟΝΤΑΣΤΥΛΟΝ, in the *Ancient Architecture*, a porch with a hundred columns. This designation was peculiar to the great porch of Pompey's theatre at Rome.

HECK, among *Husbandmen*, a rack, at which horses are fed with hay.

It is also used as the name of an engine, wherewithal to take

take fish in the river Ouſe. A *ſalmon hoek* is a grate for the catching that ſort of fiſh. See *Salmon*-Fishing.

Hence alſo HECKAGIUM, or HECCAGIUM, which occurs in ancient records, for a rent paid the lord for the liberty to uſe ſuch engines.

HECKLE, among *Hemp Dreſſers*. See HATCHEL.

HECKLING *of Hemp*. See HEMP.

HECTIC, or HECTIC FEVER, in *Medicine*, a ſort of ſlow habitual fever, ſeated in the ſolids, and gradually preying on and conſuming the ſubſtance thereof.

The word is *Greek*, formed of ἕξις, *habitus*, a quality hard to ſeparate from its ſubject.

A *hectic* is an uſual attendant of a CONSUMPTION, and is reputed one of the diagnoſtic ſigns thereof.

The *hectic*, according to Dr. Quincy, is the reverſe of thoſe fevers which ariſe from the plethora, or too great a fulneſs: this being attended with too lax a ſtate of the excretory paſſages, and particularly thoſe of the ſkin, whereby ſo much runs off, as leaves not reſiſtance enough in the contractile veſſels to keep them ſufficiently diſtended; ſo that they vibrate otherwiſe, agitate the fluids more, and keep them thin and hot.

The ſymptoms of this diſeaſe diſtinctively from the *febris lenta*, or *ſlow* FEVER, which is often confounded with it, are theſe: a perpetual dry burning in the fleſh, which is moſt ſenſible in the hands after eating; a weak, low, and quick pulſe; the return of a chilneſs in the middle of the fever; a thick orange-coloured urine, with a pale red ſediment, with a thin fatteſh cuticle upon it, and a ſtrong ſmell, though the urine is ſo various, that nothing can be aſcertained from its appearances; a languid habit of body, and a particular love of all cold meats; a dryneſs of the mouth, with continual thirſt, and a frothy or glutinous ſpittle; unſettled ſleep, not at all refreſhing to the patient; a ſucceſſive and continual waſting and emaciation of the body, a loſs of ſtrength, a langour of the mind, a ſenſe of a weight and pain in one of the hypochondria, a ſenſibility of the lighteſt changes in the weather, and a continual growing worſe at the greater changes which happen at the equinoxes; a vertiginous and dozing *Twimming* in the head when the patient gets up, and in the latter ſtages of the diſeaſe colliquative ſweats; and finally, the ſcene is cloſed by a diarrhœa, and the facies Hippocratica, which is ſeen in no other diſeaſe ſo remarkably as in this and a conſumption. A cough is no neceſſary conſequence of a *hectic*, but it uſually attends it, and ariſes from ſome conjunct cauſe.

Perſons ſubject to it. Men are much more liable to fall into *hectics* than women; and of thoſe principally ſuch as are of a tender conſtitution and dry habit, and are violently addicted to the paſſions, and live high, eating ſeaſoned food, and drinking large quantities of wine or other ſtrong liquors; and ſuch as have exhauſted their ſtrength and ſpirits by violent exerciſes, long watching, great ſtudy or thoughtfulneſs, want of nouriſhment, exceſſive venery, or by taking repeated doſes of ſtrong purgative medicines. Perſons often fall into this diſeaſe alſo by omitting habitual bleedings and other evacuations, and by ſtopping cuſtomary diſcharges of blood by the hæmorrhoidal veins, or other ways, by the taking aſtringent medicines; but more perſons are thrown into *hectics* by injudicious treatment in fevers, than fall into them by all theſe other ways together, and eſpecially by the bad treatment of intermittents. Lying-in women, and thoſe in whom the menſes ceaſe, are liable to this diſorder: as well as all perſons, of either ſex, whoſe glands are diſordered, or who are afflicted with abſceſſes or ulcers in the internal parts. The matter of theſe ulcers, abſorbed into the blood, occaſions a fever more or leſs violent.

Prognoſtics in it. When a *hectic* is confirmed and of ſome ſtanding, it is in vain to attempt the cure of it; for when one of the viſcera is ulcerated, nature will always bring on this fever to endeavour to abſterge it; and as the cauſe never can be removed, the ſymptoms never will ceaſe.

All that can be expected from medicine in theſe caſes, is the mitigating the ſymptoms, and putting off the fatal period longer than it would naturally have happened. Younger people are much more ſuddenly deſtroyed by *hectics*, and are much more ſubject to them, than thoſe more advanced in years; hence, from eighteen to five-and-thirty may be accounted the period of life moſt ſubject to danger from this diſeaſe; it is uſually ſudden in its deſtruction between theſe periods, afterwards if people fall into it, it becomes chronical, and they bear it a long time. The changes of the ſeaſons are dangerous times for *hectic* people, but moſt of all the autumnal equinox, and ſo alſo the climacteric years. Young perſons, firſt ſeized with *hectics* in ſpring, uſually die in the autumn following; and thoſe who are firſt ſeized with it in the ſummer ſolſtice, uſually live till the ſame ſeaſon of the following year. A diſcharge of blood by the hæmorrhoidal veins in the laſt ſtages of a *hectic* uſually haſtens the death of the perſon, but in the beginning of the diſeaſe the ſame evacuation often proves a cure.

Method of treatment. The viſcous humours collected in the primæ viæ are to be attenuated by tartarum vitriolatum and the neutral ſalts, and the bowels to be kept gently open by cliſters and ſmall doſes of manna and the other gentler cathartics; next the acrimony of the ulcerous matter is to be obtunded by the abſorbents ſated with vegetable acids, as by the crabs-eyes ſated with lemon juice; by coral, oyſter-ſhells, and the like teſtaceous ſubſtances, ſated in the ſame manner; decoctions of pimpernel and of hartſhorn with daiſy-flowers are alſo very ſerviceable; a mixture of ſpirit of hartſhorn and tincture of antimony, and powders of coral and diaphoretic antimony, are to be given twice or oftner in a day. Small doſes of ſtorax-pill will mitigate the cough, and emulſions of almonds, with a ſmall mixture of lemon-juice, will greatly abate the febrile heat. During the whole time the diet muſt be nouriſhing; and jellies, ſtrengthening puſſans, and milk food, are to be taken. Junker's Conſp. Med. 387 and 390.

But theſe medicines are not to be continued in an uninterrupted courſe; nature is to be ſometimes eaſed of ſuch a burden; and, in fine, the more the diſeaſe increaſes, the fewer medicines are to be given, as there grows leſs and leſs hope of benefit from them.

If a cough attends a *hectic*, great relief is uſually found from a linctus of oil of ſweet almonds and ſyrup of poppies; or liquid laudanum may be occaſionally given in ſmall doſes. The cough may be ſometimes appeaſed by bleeding, and the expectoration promoted by pills formed of freſh ſquills, gum ammoniac, and powdered cardamom ſeeds, of each a quarter of an ounce; four or five of theſe, made of a moderate ſize, may be taken twice or thrice a day. The milk of gum ammoniac and vegetable acids, as apples, oranges, lemons, &c. are proper medicines. The colliquative ſweats which attend this diſeaſe are not to be cured by ſuppreſſing them violently, but the patient is to keep himſelf moderately cool, and to take powders of coral, terra Lemnia, and the other abſorbents, and a grain of opium may be added to the quantity of three or four doſes. Whey and the cooling emulſions alſo have their good effects. Gum Arabic, added in moderate quantities to theſe emulſions, alſo is of great uſe in checking the diarrhœa which often attends *hectics*; and conſerve of red roſes with chalybeated milk are to be taken conſtantly to mitigate this ſymptom; and when it is more violent, a doſe of diaſcordium diſſolved in cinnamon water often proves a very efficacious medicine; and when the violence of the purging is once ſtopped by this, it will be kept from returning by the other methods. Heiſter's Comp. Med. p. 115.

The loſs of appetite which uſually attends theſe caſes is to be remedied by bitters, ſuch as tinctures of orange-peel and cortex elcutheriæ, to which may be added a ſmall quantity of the Jeſuits bark; and to theſe a ſmall quantity of ſpirit of ſulphur or of vitriol may be added, the more immediately to excite the appetite.

When there is reaſon to apprehend that an impoſthume is formed in the breaſt, recourſe muſt be had to the Peruvian bark. Sir John Pringle obſerves, that he found nothing diminiſh the *hectic* fits ſo much as ſmall but repeated bleedings, accompanied with ſaline draughts and cooling diet. Dr. Huſme recommends fixed air in *hectic* fevers, attended with pulmonary complaints. For the manner of adminiſtering it, ſee *Putrid* FEVER. But more depends on exerciſe, particularly riding, air, and diet, than on medicine. The diet muſt be chiefly vegetables and milk.

A milk diet is much recommended in *hectics*, and particularly aſſes milk, as being the leaſt viſcid and heavy of any kind; but it muſt be uſed ſoon, and in ſufficient quantities, to the amount of half a pint three or four times a day, and duly perſiſted in. When it happens to purge, it may be mixed with old conſerve of roſes, or powder of crabs-claws.

Dr. Barnard propoſes butter-milk as a ſucceedaneum to aſſes milk. According to him, it anſwers moſt of the indications in this caſe, as it cools moiſtens, nouriſhes, &c. He adds, that he has known many perſons cured of obſtinate *hectics* only by a continued uſe thereof. This ſhould be uſed ſparingly at firſt, and the quantity gradually increaſed, till it becomes almoſt the only food. Though much may be expected from a milk and vegetable diet, regular exerciſe, and wholeſome air, in the firſt ſtages of a conſumption, yet thoſe who have been accuſtomed to animal food and ſtrong liquors muſt make the change by degrees; and if they have ſtrength and ſufficient reſolution to perſiſt in this courſe, they will

seldom be disappointed of a cure. Buchan's Dom. Med. p. 185. ed. 1776.

HEDAGIUM *anciently* signified a toll or cuſtom, paid at the hythe or wharf, &c. for landing merchandize, goods, &c.

The word is formed from *heda*, *a hythe*, *port*, or *wharf*. From ſuch toll, or cuſtomary duty, exemptions were ſometimes granted by the ſovereign to particular perſons and ſocieties.

HEDERA, *ivy*. See IVY.

HEDERA *terreſtris*. See GROUND-*ivy*.

Lacryma HEDERÆ. See IVY.

HEDERALIS, *in Botany*, a name uſed by Ruellius, and ſome other authors, for the plant called by others *aſclepias* or SWALLOW-*wort*.

HEDERARIUS *plexus*, a ſort of reticular plexus formed by the ſpermatic vein and artery in their progreſs to the teſticles.

HEDGE, in *Agriculture*, &c. a fence incloſing a field, garden, or the like, made of branches of trees interwoven.

The word is formed of the German *hag* or *haeg*, or the Anglo-Saxon *hegge*, or *hege*, which ſignifies ſimply *incluſure*, *circumference*.

HEDGE, *quickſet*, is that made of quick or live trees, which have taken root, in contradiſtinction to that made of faggots, hurdles, or dry boughs, &c.

The hawthorn is allowed the beſt of all the Engliſh ſhrubs for quickſet *hedges*. The beſt method of raiſing this for uſe, is to put the haws into the ground as ſoon as ripe, and cover them with earth, and by the ſpring twelvemonth the young ſhoots will be of a due ſize to tranſplant from the ſeed-pot into *hedge*-rows. The crab-tree is a common mixture with the hawthorn in *hedges*; but it grows falter than the hawthorn, and requires cutting to keep the *hedge* even. The young hawthorns raiſed from ſeed always thrive better than thoſe picked up wild in the fields.

The great conſideration in making quickſet *hedges* is to bring the plants from a worſe ſoil than that in which it is intended to ſet them. They muſt be about the thickneſs of a gooſe-quill, well-rooted and ſtrong, and muſt be planted about four or five inches out of the ground. If there be a ditch to the *hedge*, it ſhould be ſix feet wide at the top, one and a half at the bottom, and three feet deep.

If the bank be without a ditch, the plants ſhould be ſet in two rows, at a foot diſtance below one another. The turf is to be laid, with the graſs-ſide downward, on that ſide of the ditch on which the bank is deſigned to be made, and ſome of the beſt mould muſt be laid upon it to bed the quick; then the quick is to be laid upon it a foot aſunder, ſo that the end of it may be inclining upwards; and, at equal diſtances of thirty feet, plant an aſh, oak, crab, or elm, to grow with the quick. When the firſt row of quick is laid, it muſt be covered with mould, and the turf laid upon it as before, and ſome more mould upon that; ſo that, when the bank is a foot high, another row of ſets may be laid againſt the ſpaces of the lower quick. Theſe muſt be then covered as the former, and the bank is to be then topped with the bottom of the ditch, and a dry or dead *hedge* laid to ſhade the under plantation. There ſhould then be ſtakes driven into the looſe earth quite down to the firm ground, at about two feet and a half diſtance from each other; oak ſtakes are accounted the beſt of all for this uſe, and the next to this thoſe of black-thorn or ſallow. Small buſhes are to be laid below, but not too thick, only to cover the quick from being injured as it ſhoots.

The young plants muſt be conſtantly weeded, and great care muſt be taken to preſerve them from the bitings of cattle, eſpecially of ſheep. If they have been cropped, or are not found to grow well, it is a good cuſtom among the farmers to cut them down in February to the ground, or within an inch of it, for after this they uſually ſend out new roots, and ſhoot very vigorouſly.

When the *hedge* is of eight or nine years growth, it may be plaſhed or laid down, by giving the ſhoots or branches a cut with a knife or a bill half through, and then weaving them about the ſtakes, and trimming off the ſmall ſuperfluous branches. See PLASHING.

The crab, black-thorn or ſloe, and holly, are ſometimes planted for *hedges*. See FENCE.

Inſtead of building a garden wall facing the north-eaſt, Mr. Lawrence adviſes, that to ſave charge, &c. a crab-tree *hedge* of three rows be planted; which will be a good mound, and quickly grow up to be a better fence than a wall againſt the weſt and ſouth-weſt winds, which make the greateſt deſtruction in a garden, and which blow two parts in three of the whole year: beſides the ſtock of fruit ſuch a *hedge*, grafted with red-ſtreak or gennet moyl, will yield.

Hedges for ornament in gardens, are ſometimes planted with evergreens, in which caſe the HOLLY is preferable to any other. Next to this, moſt people prefer the YEW, on account of its growing very cloſe; but the dead colour of its leaves renders theſe *hedges* leſs agreeable. The LAUREL is one of the moſt beautiful evergreens, but the ſhoots are ſo luxuriant, that it is difficult to keep it in any tolerable ſhape; but *hedges* that are formed of laurel, which has large leaves, ſhould be pruned with a knife, cutting the ſhoots juſt down to a leaf; and this method is much better than that of cutting them with ſhears. The *lauruſtinus* is alſo a very fine plant for the purpoſe of ornamental *hedges*; but this is liable to the ſame objection as the laurel: it ought, therefore, to be pruned with a knife, in April, when the flowers are going off; but the new ſhoots of the ſame ſpring muſt by no means be ſhortened. The ſmall-leaved and rough lauruſtines are the beſt plants for this purpoſe. The true PHILYREA is the next beſt plant for *hedges*, which may be led up to the height of ten or twelve feet; and if they are kept narrow at the top, that the ſnow may not have room to lodge upon them, they will become cloſe and thick, and make a fine appearance. The *box*, or evergreen oak, is alſo planted for *hedges*, and is a fit plant for thoſe that are deſigned to be very tall. The deciduous trees, which are uſually planted to form *hedges* in gardens, are the hornbeam, which may be kept neat with leſs trouble than moſt other plants; the beech; and the ſmall-leaved Engliſh elm, which ſhould not be planted cloſer than ſeven or eight, or even ten feet: the lime-tree has alſo been recommended for this purpoſe; but, as *hedges* thus formed become thin at bottom, and the leaves turn of a black diſagreeable colour, it is now diſuſed. The alder is frequently uſed for *hedges*; and, where the ſoil is moiſt, it is preferable to any of the deciduous trees, becauſe its leaves are of a lively green till late in autumn, and when they decay their litter is ſoon over. Many of the flowering ſhrubs have been planted for *hedges*, ſuch as roſes, honey-ſuckles, ſweet-briar, &c. but theſe are difficult to train; and if they are cut to keep them within compaſs, their flowers, which are their greateſt beauty, will be entirely deſtroyed. However, theſe *hedges* are by no means to be recommended for pleaſure-gardens, either as ornamental or uſeful. Miller.

By 43 Eliz. cap. 7. *hedge*-breakers are bound to pay ſuch damages as a juſtice of the peace ſhall think fit; and if not able to pay, they ſhall be committed to the conſtable to be whipped. And *hedge*-ſtealers may be apprehended, and the juſtice ſhall adjudge a penalty, not exceeding 10*s.* to the poor; or, in want of payment, they ſhall be ſent to the houſe of correction for a month. 15 Car. II. cap. 2. And perſons convicted of buying ſtolen wood ſhall forfeit treble the value.

HEDGES, *ripallier*. See ESPALIER.

To line a HEDGE, *in Military Affairs*, is to plant muſketeers along it, under cover; either to fire upon an enemy that is advancing, or to ſave themſelves from the horſe, or to defend a paſs or defile.

HEDGE-*hog*. See *Hedge*-HOG.

Sea HEDGE-*hog*. See CENTRONIA and ECHINODERMA.

HEDGE-*hog*, *in Botany*. See *Snail*-TREFOIL.

HEDGE-*hog*, *medica*, *in Botany*. See LUCERNE.

HEDGE-*hog-thiſtle*, a name ſometimes given to a diſtinct genus of plants, called by authors CACTUS. See *Melon* THISTLE.

Spaniſh HEDGE-*hog-thorn or awl-wiſe*. See LADY'S *finger*.

HEDGE-*hyſſop*. See *Hedge*-HYSSOP.

HEDGE-*hyſſop*, is alſo a name ſometimes given to a diſtinct genus of plants, called by botaniſts DIGITALIS. See FOX-*glove*.

HEDGE-*muſtard*, the name of a genus of plants, known among botaniſts by that of ERYSIMUM. See *Hedge*-MUSTARD.

HEDGE-*nettle*, a name ſometimes given to a genus of plants, called by botaniſts GALEOPSIS. See *Stinking Dead*-NETTLE.

HEDGE-*nettle-ſtraw*, a name by which ſome call the *peaſtone*, a diſtinct genus of plants. See *Shrubby Hedge*-NETTLE.

HEDGE-*ſparrow*, the Engliſh name of a ſpecies of *motacilla*. See *Hedge*-SPARROW.

HEDIUNDA, *in Botany*. See *Baſtard* JASMINE.

HEDYOSMOS, *of ἡδὺς ſweet, and ὀσμὴ ſmell, in Botany*, a name given by ſome writers to mint, becauſe of its ſweet ſmell.

HEDYOTIS, *in Botany*, a genus of the *tetrandria monogynia* claſs. The corolla has a ſingle petal and is funnel-ſhaped; and the fruit is a two-celled capſule, containing many ſeeds.

HEDYPNOIS, *in Botany*. See HYOSERIS.

HEDYSARUM, *in Botany*. See *French* HONEY-*ſuckle*.

HEEL, *in Anatomy*, the hind part of the FOOT.

In

In winter, the *heels* are liable to a kind of chilblains called *kibes*, which sometimes tend to a mortification.

The bone of the *heel* is called CALCANEUM.

HEEL *of a horse*, is the lowest hind part of the foot, comprehended between the quarters and opposite to the toe. The *heel* should be high and large, and one side not rise higher on the pastern than the other. The diſtempers incident to this part are ſcabbineſs and SCRATCHES.

Some narrow-*heeled* horſes have high *heels*, but ſo weak and tender, that by preſſing the two ſides of the *heel* one againſt another they will ſenſibly yield. See HOOF.

To open the HEELS, is to pare the foot and cut the *heel* low, almoſt cloſe to the fruſh; taking it down within a finger's breadth of the coronet or top of the hoof, ſo as to ſeparate the quarters, and by that means weaken and take away the ſubſtance of the foot, and make it cloſe and become narrow at the *heels*.

HEEL *of a horſeman*. This being the part which is armed with a ſpur, the word is uſed for the ſpur itſelf; as, this horſe underſtands the *heels* well.

To ride a horſe from one HEEL *to another*, is to make him go ſideways, ſometimes towards one *heel*, and ſometimes another.

HEEL, among *Carpenters*, denotes an inverted OGEE.

HEEL, in *Sea-language*, is a name often given to the after-end of a ſhip's keel; and alſo to the lower-end of the ſtern-poſt, to which it is firmly joined.

If a ſhip lean on one ſide, whether aground or afloat, they ſay ſhe *heels* a-ſtarboard or a port, or ſhe *heels* offward or to the ſhore; that is, ſhe inclines more to one ſide than to the other.

HEEL *of a maſt*, is that part of the foot thereof which is pared away ſlanting, that the MAST may be ſtayed aftward on it.

HEEL *of a lip-maſt*, is the lower end, ſuſtained on the treſſel-trees by means of an iron bar, called the FIDD.

HEELER, or *Bloody*-HEEL *Cock*, is a fighting cock which ſtrikes or wounds much with his ſpurs.

The maſters know ſuch a cock, even while a chicken by the ſtriking his two *heels* together in his going.

HEGEMONE, in *Mythology*, one of the GRACES. See AUXO.

HEGIRA, in *Chronology*, a celebrated epocha, uſed by the Arabs and Mahometans for the computation of time.

The word is Arabic, formed of הגרה, *hegirah*, *flight*; of הגר, *to fly, to quit one's country, family, friends*, &c.

The event which gave occaſion to this epocha, was Mahomet's flight from Mecca. The magiſtrates of that city, fearing his impoſtures might raiſe a ſedition, reſolved to expel him: this, accordingly, they effected in the year of our Lord 622, on the evening of the 15th or 16th of July.

To render this epocha more creditable, the Mahometans affect to uſe the word *hegira* in a peculiar ſenſe, for an act of religion, whereby a man forſakes his country, and gives way to the violence of perſecutors and enemies of the faith: they add, that the Coraſhites, being then the ſtrongeſt party in the city, obliged their prophet to fly, as not being able to endure his aboliſhing of idolatry. This flight was not the firſt of Mahomet's, but it was the moſt famous. It happened in the fourteenth year from his aſſuming the character of prophet and apoſtle, and promulgating his new religion.

The Orientals do not agree with us as to the time of the *hegira*. Among the Mahometans, Amaſi fixes it to the year of Chriſt 630, and from the death of Moſes 3347; and Ben Caſſem, to the year of the world 5800: according to the Greek computation, among the Chriſtians, Said Ebn Batrik refers the *hegira* to the year of Chriſt 614, and of the creation 6114.

Khondemir relates, that it was Omar, the ſecond caliph, that firſt eſtabliſhed the *hegira* as an epocha, and appointed the years to be numbered from it: at the time he made this decree, there were already ſeven years elapſed. This eſtabliſhment was made in imitation of the Chriſtians, who, in thoſe times, reckoned their years from the perſecution of Dioclesian.

But there is another *hegira*, and the earlier too, though of leſs eminence. Mahomet, in the fourteenth year of his miſſion, was obliged to relinquiſh Medina: the Coraſhites had all along oppoſed him very vigorouſly, as an innovator and diſturber of the public peace; and many of his diſciples, not enduring to be reputed followers of an impoſtor, deſired leave of him to abandon the city, for fear of being obliged to renounce their religion. This retreat makes the firſt *hegira*. Theſe two *hegiras* the Mahometans, in their language, call *hegiratan*.

The years of the *hegira* conſiſt only of 354 days. To reduce theſe years to the Julian calendar, i. e. to find what Julian year a given year of the *hegira* anſwers to, reduce the year of the *hegira* given into days, by multiplying by 354, divide the product by 365, and from the quotient ſubtract the intercalations, i. e. as many days as there are four years in the quotient; and laſtly, to the remainder add 622. See YEAR.

HEIGHT, the third DIMENSION of a body, conſidered with regard to its elevation above the ground.

To find the *height* of a hill, ſee the article of LEVELLING, toward the end.

HEIGHT, *in Aſtronomy, Geography*, &c. See ALTITUDE and ELEVATION.

HEIGHT, in the *Manage*, &c. the ſtature of a horſe, &c.

It is reputed an imperfection in a horſe, when ſet too *high* on his legs, i. e. when the legs are too long in proportion to the body.

Some jockeys have determined a meaſure for them thus: take a ſtring, and meaſure from the horſe's withers to his elbow; and what length that is, the ſame ſhould he have betwixt the elbow and the lower part of the heels. Some meaſure their colts after this manner at a year old, being of opinion that the legs of a colt at this age are as long as they ever will be.

The duke of Newcaſtle, and ſir W. Hope, allow this to hold generally, but not univerſally.

HEIGHTS, in the *Military Art*, are the eminences round a fortified place, whereon the armies uſually poſt themſelves. The enemy had ſeized all the *heights*, appeared on the *heights*, &c.

HEINASE, among *Sportſmen*, a roe-buck of the fourth year.

HEIR, HÆRES, in the *Civil Law*, denotes the perſon who ſucceeds to the whole eſtate and effects of another, whether by right of blood or of teſtament.

The word is formed of the Latin *hæres*, of the verb *hæreo, to ſtick, remain faſt, be near, follow immediately*, &c.

The inſtitution of an *heir* is a circumſtance neceſſary to the validity of a teſtament.

There are two principal kinds of *heirs*, the *apparent* and *preſumptive*.

HEIR *apparent*, is he on whom the ſucceſſion is ſo ſettled, that he cannot be ſet aſide without altering the laws of ſucceſſion; or, whoſe right of inheritance is indefeaſible, provided he ſurvives the anceſtor; as the eldeſt ſon or his iſſue, who muſt by the courſe of the common law be *heir* to the father, whenever he happens to die.

HEIR *preſumptive*, is one who, if the anceſtor ſhould die immediately, would, in the preſent circumſtances of things, be his *heir*; but whoſe right of inheritance may be defeated by contingency of ſome nearer *heir* being born; as a brother or nephew, whoſe preſumptive ſucceſſion may be deſtroyed by the birth of a child; or a daughter, whoſe preſent hopes may be cut off by the birth of a ſon. Nay, even if the eſtate hath deſcended, by the death of the owner, to ſuch brother or nephew, or daughter; in the former caſe the eſtate ſhall be taken away by the birth of a poſthumous child, and in the latter, by the birth of a poſthumous ſon.

HEIR, *in Common Law*, is he who ſucceeds, by right of blood, to any man's lands, or tenements in fee.

For nothing paſſes in common law, *jure hæreditatis*, by right of inheritance, but *fee*.

By common law, therefore, a man cannot be *heir* to goods or chattels; for *hæres dicitur ab hæreditate*, it is the inheritance denominates the *heir*.

Every *heir* having lands by deſcent, is bound by the acts of his anceſtors, if he be named; it being a maxim, that *qui ſentit commodum, ſentire debet & onus*. But, though ever ſo much land come to him from ſuch anceſtors by gift in tail, or conveyance of the father, and not by deſcent, he is no way chargeable; and the caſe is the ſame in all other eſtates, except fee-ſimple.

Eſtates are tranſmitted from the anceſtor to the *heir*, according to certain rules or canons of inheritance, for which ſee DESCENT *collateral*.

Thoſe that are incapable of being *heirs* are BASTARDS, ALIENS, and perſons attainted for treaſon or felony, (ſee ATTAINDER); but idiots and lunatics, perſons excommunicated, or that are attainted in a *præmunire*, outlaws in debt, &c. are capable of being *heirs*.

The *heir* is favoured by common law; for not only land, but rent not due and in arrear at the death of the anceſtor, ſhall go to the *heir*; ſo corn ſown by a tenant for years, where his term expires before his corn is ripe, and every thing faſtened to the freehold, timber-trees, deeds belonging to the inheritance, deer, conies, pigeons, fiſh, &c. go to the *heir*. If an *heir* hath made over lands fallen to him by deſcent, execution ſhall be had againſt him to the value of the land, &c. if it be not ſold *bonâ fide* before the action brought, in which caſe there is a ſaving by the ſtat. 3 and 4 Will. and Mary, cap. 14. and it ſhall be

be tried by a jury, whether the *heir* hath such lands, and what is their value, in order to make the *heir* answerable. A creditor may sue either the *heir*, executor, or administrator, each of whom is chargeable; but, when an *heir*, on being sued, pays his ancestor's debts, he shall be reimbursed by the executor of such ancestor, if he has assets in his hands. The *heir* can force the administrator to pay debts out of the personal estate, in order to preserve the inheritance free; and where an executor has assets, he is compellable in equity to redeem a mortgage and discharge debt.

Moveables, or chattels immoveable, are given by testament, to whom the testator thinketh fit; otherwise they lie at the disposition of the ordinary, to be distributed as he in conscience likes best.

HEIR, *adj.* See LAST *heir*.

HEIR-*loom*, formed of *heir* and the Saxon *loom*, denoting *limb* or *member*, in our *Law-books*, signifies such goods and personal chattels as are not inventoried after the owner's decease, but necessarily come to the *heir* along with the house.

Consuetudo hundredi de Stretford, in com. Oxon. est quod haeredes tenementorum infra hundredum praedict. reliquo post mortem antecessorum suorum habebunt, &c. principalem, Anglice an heir-loome, *viz. de quolibet genere catallorum, utensilium, &c. optimum plaustrum, optimum aurocum, optimum ciphum, &c.* Coke on Littleton.

Heir-looms comprehends divers implements; as tables, presses, cupboards, bedsteads, furnaces, wainscot, and such-like: which in some countries have belonged to a house for certain descents, and are never inventoried after the decease of the owner as chattels are, but accrue by custom, not by common law, to the *heir*, with the house itself. The ancient jewels of the crown are held to be *heir-looms*, and are not devisable by will, but descend to the next successor.

HEISTERIA, in *Botany*, the name given by Linnæus to a genus of plants of the *decandria monogynia* class; the characters of which are these: the perianthium consists of five leaves, which are lanceolated, erect, and pointed at the ends; these are little shorter than the petals of the flower, and do not fall with it: the flower is of the gaping kind, and consists of one petal divided almost to its base into two segments; the upper lip, which is the vexillum, is erect and slightly divided into two oval segments which gape asunder; the carina, which is properly the nectarium of the flower, is hollow, almost shut, and of a cordated form, and forms the lower part of the under lip: the lower lip, which makes the ala, is placed on the summit of the nectarium; it is divided into two segments, and hangs down: the stamina are eight filaments, which grow at the bottom into an oval membrane, and are of the diadelphous kind; the antheræ are eight in number, and are placed within the nectarium; the germen of the pistil is oval, and is terminated by four oval points, which close together, among these stands the style, which is of the length of the stamina, and the stigma which terminates this is obtuse, compressed, and obliquely bifid: the fruit is a roundish compressed capsule, terminated by four bristles, which stand at a distance from one another, and is composed of two cells, each containing a seed of an oval figure.

HELCESAITES. See ELCESAITES.

HELCOMA, of ἕλκω, *I draw*, a word used by the old writers in surgery, to signify an ulcer.

HELCYDRION, of ἕλκος, *ulcer*, a word used by the old writers in medicine and surgery, to express a small excoriation or ulcerous pustule in any part of the body.

HELCYSMA, of ἕλκω, a word used by some of the old writers to signify the scoriæ of silver, called also by some encaustica. Dioscorides says, this has the same virtues with the molybdæna, and that it was in his time used like that in plasters.

HELCYSTER, of ἕλκω, *I draw*, in *Surgery*, a hook used to extract the fœtus in difficult parturition.

HELEGUG, in *Ornithology*, a name by which the people in some parts of England call the *anas urinatrix Clusii*, a web-footed fowl common on our shores. See DUCK.

HELENA. See CASTOR and *Pollux*.

HELENIUM, in *Botany*. See *Bastard* SUN-*flower*.

HELENIUM is also sometimes used for *inula* or ELECAMPANE, and also for STAR-*wort*.

HELEPOLIS, in *Antiquity*, a military machine for battering down the walls of a place besieged.

The word is Greek, ἑλέπολις; compounded of the words ἕλειν, *to take*, and πόλις, *a city*.

The *helepolis*, as described by Diodorus Siculus, &c. appeared to have been no more than the ARIES or battering-ram, with a roof or covering over it, to prevent its being set on fire, as also to screen the men who worked it. Some will have it a combination of two or three battering-rams, moving on large strong wheels, roofed over, and covered with raw or wet skins. It had several iron points or heads, wherewith the execution was done, formed much like the thunderbolts which painters represent. Within was a great number of soldiers, who drove it with force of arm, and by means of ropes, violently against the wall where the breach was intended.

Others will have *helepolis* a general name, comprehending all the machines used by the ancients in besieging towns; as, among us, the name *artillery* includes all the sorts of large fire-arms. But this opinion is chiefly founded on the origin of the name, and does by no means suit with those minute descriptions given of the *helepolis* in the ancient writers.

The invention of the *helepolis*, and divers other military machines, is ascribed to Demetrius; which, with the great number of cities he took thereby, gave him the denomination of *Poliorcetes*, or city-taker.

HELFING, in our *Old Writers*, a brass coin among the Saxons, equivalent to our halfpenny.

HELIACA, formed from ἥλιος, *sun*, in *Antiquity*, sacrifices and other solemnities performed in honour of the sun.

HELIACAL, of ἥλιος, *sun*, in *Astronomy*. HELIACAL *rising of a star, planet*, &c. is its issuing or emerging out of the rays and lustre of the sun, wherein it was before hid; whether this be owing to the recess of the sun from the star, or that of the star from the sun.

HELIACAL *setting*, is a star's entering or immerging into the sun's rays, and so becoming inconspicuous by the superior light of that luminary.

A star rises *heliacally*, when after it has been in conjunction with the sun, and on that account invisible, it gets at such a distance from him, as to be seen in the morning before the sun's rising.

The same is said to set *heliacally*, when it approaches so near the sun as to be hid therein. So that, in strictness, the *heliacal* rising and setting are only an apparition and occultation.

The *heliacal* rising of the moon happens when she arrives at the distance of 17 degrees from the sun; for the other planets, 20 degrees distance is required; and for the stars more or less, as they are greater or smaller. See ARCH *of Vision*.

The ancients computed that a star, between the tropics, would be forty days before it got clear of the sun's rays, and became conspicuous again. Hesiod first made this computation, and the rest followed him. The period comes very near to the computation of the moderns; for the sun advancing nearly a degree every day, it will be twenty days approaching thereto, from the *heliacal* setting of the star, and thirty days more withdrawing, till the *heliacal* rising.

Some nations of America, and particularly the inhabitants of Cayenne, regulate their civil year by the course of Sirius, beginning it with the *heliacal* rising of that star.

To find the HELIACAL *rising and setting by the globe*, see GLOBE.

HELIACAL *year*. See CANICULAR and *Egyptian* YEAR.

HELIADES, in *Mythology*, the daughters of the Sun and Clymenes, according to the poets: they were so afflicted, as they say, with the death of their brother Phaeton, that the gods, moved with compassion, transformed them into poplars on the banks of the river Eridanus.

HELIANTHEMUM. See *Dwarf* SUN-*flower*.

HELIANTHUS. See SUN-*flower*.

HELIASTES, in *Antiquity*, officers or magistrates of Athens, who constituted a court of five hundred persons, called *Heliæa*, and were judges for taking cognizance of civil matters.

Ulpian gives us two etymologies of the word: some, says he, derive it from ἥλιος, *helios, sun*; and hold it thus called, because they sat in the open air, in sight of the sun. Ulpian himself chuses rather to derive *heliastes*, from Ἡλιαία, *Heliæa*, the place where this court or council was held; and that from ἅλις, *I assemble*, or ἀλέξω, *satis, enough*.

The court or *heliastes* was one of the six civil jurisdictions of Athens, and that before which matters of the greatest moment were usually brought; to that it was held the first and most considerable of all the civil tribunals. The delinquencies of the military men were also brought before the *heliastes*.

This court consisted sometimes of a thousand, and sometimes of fifteen hundred or more judges; in the former case the members of two other courts, and in the latter those of three courts, were summoned by the THESMOTHETÆ, and before whom they took a solemn oath, which is preserved by Demosthenes in his oration against Timocrates: this court sat from sun-rise to sun-set.

HELICE, or ELICE, the name given by the ancient Greeks to the willow.

HELICE,

HELICE, ἕλιξ, in *Aſtronomy*, the ſame with URSA *major*.

HELICOID *parabolic*, or the *parabolic ſpiral*, a curve ariſing upon a ſuppoſition of the axis of the common Apollonian PARABOLA's being bent round into the periphery of a circle.

The *helicoid parabola*, then, is a line paſſing through the extremities of the ordinates, which converge towards the centre of the ſaid circle.

Suppoſe, e. gr. the axis of the common parabola to be bent into the periphery of the circle BDM, (*ſee Tab. Conics, fig.* 14.) then the curve BFGNA, which paſſes through the extremities of the ordinates CF and DG, which converge towards the centre of the circle A, conſtitutes what we call the *helicoid*, or ſpiral PARABOLA.

If the arch BC, as an abſciſs, be called *x*, and the part CF of the radius, as an ordinate to it, be called *y*, and the parameter of the parabola be called *l*, the nature of this CURVE will be expreſſed by the equation $lx = yy$. See EQUATION.

HELICON, in *Ancient Geography*, the name of a mountain in the neighbourhood of Parnaſſus and Cytheron, ſacred to Apollo and the Muſes, who are thence called *Heliconiades*. This fountain *Hippocrene* flowed at the foot of this mountain, and here was alſo ſhewn the ſepulchre of Orpheus. It is ſituated in Livadia, and now called Zagora or Zogura.

HELICTERES, in *Botany*, the *Screw-tree*, a genus of the *gynandria decandria* claſs. Its characters are theſe: the flower has a cochleous empalement of one leaf; it hath five oblong equal petals, which are fixed to the empalement, and ten ſhort ſtamina at the baſe of the germen, with five nectariums ſurrounding the germen, which have the appearance of petals; the ſtyle ſupports the germen at the top, which afterward turns to a twiſted ſpiral fruit with one cell, including many kidney-ſhaped ſeeds. There are three ſpecies, natives of the Weſt Indies. Miller.

HELIOCARPUS, in *Botany*, a genus of the *dodecandria digynia* claſs. Its characters are theſe: the flower hath one petal, which is cut into five ſegments, and hath an empalement of one leaf, which is cut into five parts; in the centre is ſituated a roundiſh germen, attended by ſeveral ſtamina, which becomes an oval compreſſed capſule, about three lines long and two lines broad, with a tranſverſe partition dividing it into two cells, each containing a ſingle roundiſh ſeed ending in a point; the borders of the capſule are ſet with hairs reſembling rays. We know but one ſpecies of this plant, which was diſcovered by Dr. Houſton growing at Old La Vera Cruz, in New Spain. Miller.

HELIOCENTRIC *place of a planet*, is the place wherein the planet would appear to be if viewed from the centre of the ſun, or the point of the ecliptic, wherein a planet viewed from the ſun would appear to be.

The word is compounded of ἥλιος, *ſun*, and κέντρον, *centre*. The *heliocentric* place, therefore, coincides with the longitude of a planet viewed from the ſun. See PLACE.

HELIOCENTRIC *latitude of a planet*, is the inclination of the line drawn between the centre of the ſun and the centre of a planet to the plane of the ecliptic.

The *heliocentric* latitude of a planet is thus determined: if the circle KDM (*ſee Tab. Aſtron. fig.* 62.) repreſent the orbit of the earth round the ſun, and the inner one ANBn, be placed ſo as to be inclined to the plane of the other (for which reaſon it appears in the form of an ellipſis), when the planet is in N or n (which points are called its *nodes*), it will appear in the ecliptic, and ſo have no latitude; if it move to P, then, being ſeen from the ſun, it will appear to decline from the ecliptic, or to have a latitude; and the inclination of the line RP to the plane of the ecliptic, is called the planet's *heliocentric latitude*; and the meaſure of it is the angle PRq, ſuppoſing the line Pq to be perpendicular to the plane of the ecliptic.

This *heliocentric* latitude will be continually increaſing, till it come to the point A, which they call the limit or utmoſt extent of it; and then it will decreaſe again, till it come to nothing in N; after which it will increaſe again, till it come to B; and laſtly, it will be decreaſing again, till the planet comes to be in n, &c.

HELIOCENTROS, in *Natural Hiſtory*, a name given to an inſect or the poiſonous kind, called by Ariſtotle PHALANGIUM *dolichum*, and by the Latins SOLIPUGA.

HELIOCOMETES, *comet of the ſun*, a phenomenon ſometimes obſerved at the ſetting of the ſun; thus denominated by Starmius and Pylen, who had ſeen it, becauſe it ſeems to make a comet of the ſun, being a large tail, or column of light, fixed or hung to that luminary, and dragging after it at its ſetting, much in the manner of a tail of a comet.

In that obſerved by M. Pylen, at Gryphſwald, March 15, 1702. at five o'clock in the afternoon, the end which touched the ſun was only half the ſun's diameter broad, but the other end, oppoſite to the ſun, was much broader; its length was above ten diameters of the ſun, and it moved in the ſame tract as the ſun; its colour was yellow next the ſun, and darker farther off; it was only ſeen painted on the thinner higher clouds; a little teleſcope eaſily diſcovered, that there was nothing of it on the thicker and lower clouds, though the naked eye could not diſcover ſo much. It laſted in its full vigour the ſpace of an hour, and then gradually diminiſhed.

HELIOMETER, formed of ἥλιος, *ſun*, and μέτρον, *I meaſure*, the name of an inſtrument called alſo *eſtrameter*, invented by M. Bouguer in 1747, for meaſuring with particular exactneſs the diameters of the ſtars, and eſpecially thoſe of the ſun and moon.

This inſtrument is a kind of teleſcope, conſiſting of two object-glaſſes of equal focal diſtance, placed one of them by the ſide of the other, ſo that the ſame eye-glaſs ſerves for both. The tube of this inſtrument is of a conic form, *larger* at the upper end, which receives the two object-glaſſes, than at the lower, which is furniſhed with an eye-glaſs and micrometer. By the conſtruction of this inſtrument two diſtinct images of an object are formed in the focus of the eye-glaſs, whoſe diſtance, depending on that of the two object-glaſſes from one another, may be meaſured with great accuracy: nor is it neceſſary that the whole diſc of the ſun or moon come within the field of view; ſince, if the images of only a ſmall part of the diſc be formed by each object-glaſs, the whole diameter may be eaſily computed, by their poſition with reſpect to one another: for, if the object be large, the images will approach, or perhaps lie even over one another; and the object-glaſſes being moveable, the two images may always be brought exactly to touch one another, and the diameter may be computed from the known diſtance of the centres of the two glaſſes: beſides, as this inſtrument has a common micrometer in the focus of the eye-glaſs, when the two images of the ſun or moon are made in part to cover one another, that part which is common to both the images may be meaſured with great exactneſs, as being viewed upon a ground that is only one half leſs luminous than itſelf; whereas, in general, the heavenly bodies are viewed upon a dark ground, and, on that account, are imagined to be larger than they really are. By a ſmall addition to this inſtrument, provided it be of a moderate length, M. Bouguer thought it very poſſible to meaſure angles of three or four degrees, which is of particular conſequence in taking the diſtance of ſtars from the moon. With this inſtrument M. Bouguer, by repeated obſervation, found, that the ſun's vertical diameter, though ſomewhat diminiſhed by the aſtronomical refraction, is longer than the horizontal diameter; and, in aſcertaining this phenomenon, he alſo found, that the upper and lower edges of the ſun's diſc are not ſo equally refined as the other parts; on this account his image appears ſomewhat extended in the vertical direction. This is owing to the decompoſition of light, which is known to conſiſt of rays differently refrangible in its paſſage through our atmoſphere. Thus, the blue and violet rays, which proceed from the upper part of the diſc at the ſame time with thoſe of other colours, are ſomewhat more refracted than the others, and, therefore, ſeem to us to have proceeded from a higher point; whereas, on the contrary, the red rays proceeding from the lower edge of the diſc, being leſs refracted than the others, ſeem to proceed from a lower point; ſo that the vertical diameter is extended or appears longer than the horizontal diameter. Mem. Acad. Sc. Par. 1748.

Mr. Servington Savery diſcovered a ſimilar method of improving the micrometer, which was communicated to the Royal Society in 1743. See MICROMETER.

HELIOPHILA, in *Botany*, a genus of the *tetradynamia ſiliquoſa* claſs. The corolla conſiſts of two nectaria, that are recurved towards the veſicular baſe of the calyx.

HELIOSCOPE, in *Optics*, a ſort of teleſcope, peculiarly fitted for viewing and obſerving the ſun, without doing prejudice to the eye.

The word is compounded of ἥλιος, *the ſun*, and σκοπέω, *video, ſpecto, I ſee, view, conſider*.

Helioſcopes are neceſſary in viewing the phenomena of the ſun, as his ſpots, eclipſes, &c.

There are various apparatuſes of this kind. As coloured glaſſes are found to diminiſh the force of the ſun's rays, to make a *helioſcope*, it is enough that both the object-glaſs and the eye-glaſs of the teleſcope be of coloured glaſs; the firſt, e. gr. of red, and the latter green.

But as there is a neceſſity for the glaſſes to be very tranſparent and equally coloured, which rarely happens, Hevelius chuſes rather to uſe two plain-coloured glaſſes, with a piece of paper between, either tied or cemented together, and applied before the eye-glaſs.

Dr. Hooke, in an expreſs treatiſe on *heliſcopes*, recommends four reflecting glaſſes placed in the tube: by theſe, he obſerves, the force of the rays will be ſo weakened, as only to ſtrike the eye with a 256th part of their force; and this *heliſcope* he preſers to all others.

M. Huygens's method is much eaſier: he only blackens the inſide of the eye-glaſs of the teleſcope, by holding it over the flame or ſmoke of a lamp or candle; or, which is yet more commodious, blackens a piece of plain glaſs, and holds it between the eye and the object-glaſs; or, which is the beſt of all, joins the ſmoked glaſs to another, with a rim of thick paper between, to keep the black from rubbing off, and fits the two into a cell or frame, to be applied between the eye and the eye-glaſs.

HELIOSTATA, *from* ἥλιος, *ſun*, and ἵστημι, *I fix*, *in Optics*, the name of an inſtrument invented by Dr. s'Graveſande, and thus called from its property of fixing the ſun-beam in one poſition, viz. in a horizontal direction acroſs the dark chamber whilſt it is uſed.

This is an automatum, or piece of clock-work, conſiſting of the following parts: AA (*Tab. II. Optics, fig. 29*) is a frame in which a metalline ſpeculum S is ſuſpended, moveable about its axis by means of two ſmall ſcrews at *a a*. This frame is fixed to the piece C, which being hollow, is moveable upon the cylindric ſhaft P about the iron pin *c*. (See the part by itſelf.) This pillar P is fixed to a triangular baſe or foot ſet perpendicularly by the three ſcrews B, B, B.

On the back part of the ſpeculum is fixed a long cylindric wire or rail D E, in a perpendicular poſition. By this it is connected to the ſecond part of the *heliſtata*, which is a common twenty-four hour clock, repreſented at H; the plane of which clock is parallel to that of the equator in any given place. This clock is ſuſtained on the column F G, in which it is moveable up and down by a thin lamina or plate that enters it as a caſe, and fixed to a proper height by the ſcrews *d*, *d*, at the ſide. The whole is truly adjuſted to a perpendicular ſituation by means of the three ſcrews I, I, I, in the tripod L L M, and the plummet Q, whoſe cuſpis muſt anſwer to the points beneath.

The axis of the wheel, which moves the index N O over the hour-circle is ſomewhat large, and perforated with a cylindric cavity verging a little to a conical figure; and receives the ſhank *p q* of the ſaid index N O very cloſe and tight, that by its motion the index may be carried round. In the extremity O of the index is a ſmall cylindric piece *n*, with a cylindric perforation to receive the tail *r* of the fork T, yet ſo as to admit a free motion therein. In each ſide of the fork are ſeveral holes exactly oppoſite to each other, in which go the ſcrews *r*, *r*, upon whoſe ſmooth cylindric ends moves the tubular piece R on its auricles *m*, *m*.

When the machine is to be fixed for uſe, another part is made uſe of to adjuſt it; which is called the *poiſer*, and is denoted by the letters V X Y Z. The cylinder C is removed with the ſpeculum from the foot P, and the braſs column V X put on in its ſtead, and adheres more ſtrictly to the pin *c*, that it may keep its poſition while the machine is conſtituted.

On the top of the column, about X as a centre, moves the lever Y Z, ſo that it may be any-how inclined to the horizon, and keep its poſition. The arm Y X may be of any length at pleaſure, but the arm Y Z is of a peculiar conſtruction, and of a determinate length. To this arm, which extends no farther than *y*, is adapted a ſliding-piece Z *x* ſharp-pointed at Z. By this the arm X Z is determined to a given length, the piece Z *x* being fixed by the ſcrews *x x*.

Upon this arm is drawn the ſhort line *v x*, by which it may be lengthened in the whole, and in $\frac{1}{10}$ths of the whole length X Z when ſhorteſt. The reaſon is, this arm is always to increaſe and decreaſe in proportion to the ſecant of the ſun's declination to the radius X Z when ſhorteſt: but the radius is to the ſecant of 23° 30′ (the ſun's greateſt declination) as 10000000 to 10904411, or as 100 to 109.

Now the reaſon of this conſtruction of the arm X Z is to find for any given day the diſtance of the centre of the ſpeculum S from the top *l* of the ſtyle *l* N, which muſt ever be equal to the ſecant of the ſun's declination; for it muſt always be equal to the diſtance of the top of the ſaid ſtyle *l* from the centre of the cylinder R in the fork T, and that is ever equal to the ſaid ſecant of declination.

For ſince the ſtyle *l* N and the fork T are in a poſition parallel to each other, therefore the middle hole in the ſides of the fork being (as they muſt be) of the ſame height above the end of the index O as is the height of the ſtyle N T, it is evident that on an equinoctial day the ſun's rays will paſs directly through the perforation of the piece R, if it be put in a poſition parallel to the plane of the ecliptic, or that of the clock; and alſo that the top of the ſhadow of the ſame ſtyle will fall exactly on the ſaid hole.

In this caſe the top of the ſtyle is at the leaſt diſtance from the central point of R, and therefore may be repreſented by radius, whilſt in any other poſition above or below, the diſtance will increaſe in proportion to the ſecant of the angle which the rays make with this firſt or middle ray, that paſs by the top of the ſtyle, and through the hole R.

Now it may be demonſtrated, that on any day of the year, if the clock and its pedeſtal be ſo fixed that the line of XII be exactly in the meridian, and that the poſition of R in the fork be ſuch that the ſun's rays go directly through it, and the ſhadow of the ſtyle's top fall juſt upon the hole; moreover, if the diſtance of the centre of the ſpeculum S from the top of the ſtyle *l* be made equal (by the poiſer) to the diſtance of the central point R therefrom; and laſtly, the tail of the ſpeculum D E paſſing through R; if then the clock be put into motion, the index N O ſhall carry about the tail of the ſpeculum in ſuch a manner, that at all times of that day when the ſun can come upon the ſpeculum it will reflect the rays conſtantly in one and the ſame poſition and direction all the time without variation.

The machine thus conſtituted is placed in a box or caſe, and ſet in a window with one ſide open, expoſed to the ſun, and all the other parts cloſe; ſo that when the room is made dark, and the ſolar microſcope fixed to the fore-part of the box in which the *heliſtata* is placed, juſt againſt the centre of the ſpeculum to receive the reflected horizontal beam, all the experiments of the darkened room are then performed as uſual. This is a very ingenious conſtruction of a ſolar microſcope apparatus, and full of art, but, it is to be feared, too expenſive and troubleſome for common uſe. However, it is eaſy to ſee that this machine is capable of being greatly reduced; for it may be made to anſwer the end very well without a clock; alſo the ſpeculum may be glaſs inſtead of metal, and all fixed on one foot or pedeſtal.

For a farther account of this inſtrument, the principles of its conſtruction, and its uſe, ſee s'Graveſande's Phyſices Element. Mathematica, &c. tom. ii. p. 715, &c. ed. 3tia. 1742.

HELIOSTROPHUS, in the *Materia Medica*, a name given by ſome of the Greek writers of the later ages to the gum ammoniacum of the ancients, which ſeems to have been a very different thing from what is called gum ammoniacum at this time; it being yellow and friable, our's whitiſh and tough.

HELIOTROPE, *heliotropium*, among the *Ancients*, an inſtrument or machine for ſhewing when the ſun arrived at the tropics and the equinoctial line. This name was alſo uſed for a ſun-dial in general.

HELIOTROPE is alſo a precious ſtone, of a green colour, ſtreaked with red veins.

Pliny ſays, it is thus called, becauſe, when caſt into a veſſel of water, the ſun's rays, falling thereon, ſeem to be of a blood colour; and that, when out of the water, it gives a faint reflection of the figure of the ſun, and is proper to obſerve eclipſes of the ſun, as a helioſcope.

The *heliotrope* is alſo called *oriental jaſper*, on account of its ruddy ſpots.

It is found in the Eaſt Indies; as alſo in Ethiopia, Germany, Bohemia, &c. Some have aſcribed to it the faculty of rendering people inviſible, like Gyges's *ring*. See HÆMATITES.

HELIOTROPE, *heliotropium*, from ἥλιος, *ſun*, and τρέπω, *I turn*, in *Botany*. See TURNSOLE.

HELISPHERICAL *line*, in *Navigation*, denotes the RHUMB *line*.

It is thus called, becauſe, on the globe, it winds round the pole helically, i. e. ſpirally, and ſtill comes nearer and nearer to it.

HELIX, in *Geometry*, a ſpiral line. See SPIRAL.

The word is Greek, ἕλιξ, and literally ſignifies a *wreath* or *winding*; of σπεῖρα, *involvo*, *I twiſt* or *twiſt on*.

In *Architecture*, ſome authors make a difference between the *helix* and the ſpiral.

A ſtair-caſe, according to Davila, is in a *helix*, or is *helical*, when the ſtairs or ſteps wind round a cylindrical newel; whereas the ſpiral winds round a cone, and is continually approaching nearer and nearer its axis.

HELIX is alſo applied, in *Architecture*, to the cauliculos, or little volutes, under the flowers of the Corinthian capital; called alſo *urilli*. See *Tab. Archit. fig.* 27. See alſo CAULICOLES.

HELIX, in *Anatomy*, is the whole circuit of extent of the auricle, or border of the EAR outwards.

In oppoſition to which, the inner protuberance ſurrounded thereby, and anſwering thereto, is called *anthelix*.

HELIX

HELIX *xanthina* and *violacea*, a kind of shell-fish or testaceous animal always found floating on the water. It is about the size of a snail, and supported on the surface of the sea by a small cluster of bubbles, which are filled with air, and a testaceous slimy substance, that will not easily part with its contents. This animal is oviparous, and these bubbles serve only as a nidus for its eggs. It is probable it never goes down to the bottom, nor willingly approaches any shore; for the shell is exceedingly brittle, few fresh-water snails having fouls to this. Every shell contains about a tea-spoonful of liquor, which it easily discharges on being touched, and which is of the most beautiful red purple that can be conceived. It dyes linen cloth, and it may be worth enquiry, as the shell is certainly found in the Mediterranean, whether it be not the *purpura* of the ancients. The *lurca cerebellum* probably feeds upon it, as its dung is of the same colour with that of the beautiful liquor contained in its shell.

HELL, a place of punishment, wherein the wicked are to receive the rewards of their evil deeds after this life.

In this sense *hell* stands opposed to HEAVEN.

Among the ancients *hell* was called *Tartarus*, *Tartara*, *Tartarus*, *Orcus*, *Hades*, *Infernus*, *Inferna*, *Inferi*, &c.

The Jews, wanting a proper name for it, called it *Gehenna*, or *Gehinnom*, from a valley near Jerusalem, where in was a Tophet, or place where a fire was perpetually kept.

Divines reduce the torments of *hell* to two kinds; *pœna damni*, the loss and privation of the beatific vision; and *pœna sensûs*, the horrors of darkness, with the continual pains of fire inextinguishable.

Most nations and religions have their notions of a *hell*. The *hell* of the poets is terrible enough: witness the punishment of Tityus, Prometheus, the Danaïds, Lapithæ, Phlegyas, &c. described by Ovid in his Metamorphosis. Virgil, after a survey of *hell*, Æneid, lib. vi. declares, that if he had a hundred mouths and tongues, they would not suffice to recount all the plagues of the tortured. The New Testament represents *hell* as *a lake of fire and brimstone*, and *a worm which dies not*, &c. Rev. xx. 10, 14, &c. Mark ix 43, &c. Luke xvi. 23, &c.

The Cabbalists are said to admit thirteen *hells*, and twenty-seven paradises; where every person finds a place of recompence suited to the degree of good or evil he has done.

There are two great points of controversy among writers concerning *hell*: the first, whether there really be any local *hell*, any proper and specific place of torment by fire? the second, whether the torments of *hell* are to be eternal?

I. The locality of *hell*, and the reality of the fire thereof, have been controverted from the time of Origen. That father, in his treatise Περι Αρχων, interpreting the scripture account metaphorically, makes *hell* to consist not in external punishments, but in the conscience of sinners, the sense of their guilt, and the remembrance of their past pleasures. St. Augustine mentions several of the same opinion in his time; and Calvin, and many of his followers, have embraced it in our's.

The retainers to the contrary opinion, who are much the greatest part of mankind, are divided as to the situation and other circumstances of this horrible scene. The Greeks after Homer, Hesiod, &c. conceived *hell*, τοπον τινα υπο την γην μεγαν, *&c. a large and dark place under the earth*. Lucian, De Luctu; and Eustathius, on Homer.

Some of the Romans lodged it in the subterranean regions directly under the lake Avernus, in Campania; which they were led to from the consideration of the poisonous vapours exhaled by that lake. Through a dark cave near this lake Virgil makes Æneas descend to *hell*. See AVERNI.

Others placed *hell* under Tenarus, a promontory of Laconia; as being a dark frightful place, beset with thick woods, out of which there was no finding a passage. This way, Ovid says, Orpheus descended to *hell*. Others fancied the river or fountain of Styx, in Arcadia, the spring-head of *hell*, because the waters thereof were deadly.

But these are all to be considered as only fables of poets, who, according to the genius of their art, allegorizing and personifying every thing, from the certain death met with in those places took occasion to represent them as so many gates or entering places into the other world.

The primitive Christians, conceiving the earth a large extended plain, and the heavens an arch drawn over the same, took *hell* to be a place of the earth, the farthest distant from the heavens; so that their *hell* was our antipodes.

Tertullian, De Anima, represents the Christians of his time as believing *hell* to be an abyss in the centre of the earth; which opinion was chiefly founded on the belief of Christ's descent into *Hades*, *hell*, Mat. xii. 40. See the following article HELL.

Mr. Whiston has advanced a new opinion. According to him, the comets are to be conceived as so many *hells*, appointed in the course of their trajectories or orbits, alternately to carry the damned into the confines of the sun, there to be scorched by his flames; and then to return them to suffer in the cold, dreary, dark regions, beyond the orb of Saturn.

Mr. T. Swinden, in an express enquiry into the Nature and Place of *Hell*, not contented with any of the places hitherto assigned, contends for a new one. According to him the sun itself is the *local hell*.

This does not seem to be his own discovery: it is probable he was led into the opinion by that passage in Rev. xvi. 8, 9. Though it must be added, that Pythagoras seems to have had the like view, because he places *hell* in the sphere of fire, and that sphere in the middle of the universe. Add, that Aristotle mentions some of the Italic or Pythagoric school, who placed the sphere of fire in the sun, and even called it Jupiter's Prison. De Cœlo, lib. ii.

His arguments for the sun's being the *local hell* are,

1. Its capacity. Nobody will deny the sun spacious enough to receive all the damned conveniently; so that there will be no want of room. Nor will *hell* be wanting, if we admit of Mr. Swinden's argument against Aristotle, whereby he demonstrates *that the sun is hot*, p. 208, &c. seq. The good man is "filled with amazement to think what Pyrenean mountains of sulphur, "how many Atlantic oceans of scalding bitumen, must "go to maintain such mighty flames as those of the sun; "to which our Ætna and Vesuvius are mere glow-"worms." P. 137.

2. Its distance and opposition to the empyreum, which has usually been looked upon as the local heaven: Such opposition is perfectly unwearable to that opposition in the nature and office of a place of angels and devils, of elect and reprobate, of glory and horror, of hallelujahs and curfings; and the distance quadrates well with Dives seeing Abraham *afar off, and the great gulf between them*, which this author takes to be the solar vortex.

3. That the empyreum is the highest and the sun the lowest place of the creation, considering it as the centre of our system; and that the sun was the first part of the visible world created, which agrees with the notion of its being primarily intended or prepared to receive the angels, whose fall he supposes to have immediately preceded the creation.

4. The early and almost universal idolatry paid to the sun; which suits well with the great subtilty of that spirit to entice mankind to worship his throne.

II. As to the eternity of *hell*-torments, we have Origen, again, at the head of those who deny it: it being the doctrine of that writer, that not only men, but devils themselves, after a suitable course of punishment, answerable to their respective crimes, shall be pardoned and restored to heaven. Aug. De Civit. Dei, lib. xxi. cap. 17. The chief principle Origen went upon was this, that all punishments are emendatory; applied only as painful medicines, for the recovery of the patients health. And other objections insisted on by modern authors are the disproportion between temporary crimes and eternal punishments, &c.

The scripture phrases for eternity, as is observed by archbishop Tillotson, do not always import an infinite duration: thus, in the Old Testament, *for ever* often signifies only a long time, particularly to the end of the Jewish dispensation: thus, in the Epistle of Jude, ver. 7. the cities of Sodom and Gomorrah are said to be set forth for an example, suffering the vengeance of *eternal fire*; that is, of a fire that was not extinguished till those cities were utterly consumed. So one generation is said to come, &c. but the earth endureth *for ever*.

In effect, M. Le Clerc notes, that there is no Hebrew word which properly expresses eternity: עולם, *olam*, only imports a time whose beginning or end is not known; and is accordingly used in a more or less extensive sense according to the thing treated of.

Archbishop Tillotson, however, argues very strenuously, that where *hell-torments* are spoken of, the words are to be understood in the strict sense of infinite duration; and what he esteems a peremptory decision of the point is, that the duration of the punishment of the wicked is in the very same sentence expressed by the very same word which is used for the duration of the happiness of the righteous, which all agree to be eternal. "These, "speaking of the wicked, shall go away, εις κολασιν "αιωνιον, *into eternal punishment*; but the righteous, "εις ζωην αιωνιον, *into life eternal*."

The same great author attempts to reconcile this eternity with the divine justice, which had not been satisfactorily done

done before. Some had urged, that all sin is infinite, in respect of the object it is committed against, viz. God; and therefore deserves infinite punishment: but, that crime should be heightened by the quality of the object to such a degree, is absurd; since the evil and demerit of all sin must be equal, inasmuch as none can be more than infinite; and consequently there can be no foundation for degrees of punishment in the next life. Add, that for the same reason as the least sin against God is infinite, in respect of its object, the least punishment inflicted by God may be said to be infinite, because of its author; and thus all punishments from, as well as sins against God, would be equal.

Others have urged, that if the wicked were to live for ever they would sin for ever: but this, says the author, is mere presumption. Who can say, that if a man lived ever so long, he would never repent? besides, the justice of God only punishes sins which men have committed, not those they might possibly have committed.

Others therefore urged, that God gives men the choice of everlasting happiness and misery; and that the reward promised to obedience is equal to the punishment threatened to disobedience. To which it was answered, that though it be not contrary to justice to exceed in rewards, that being matter of mere favour, it may be so to exceed in punishments.

It may be added, that a man in this case has nothing to complain of, since he has only his election. But though this may suffice to silence the sinner, and make him acknowledge his destruction to be of himself, it does not satisfy the objection from the disproportion between the crime and the punishment. All the considerations, therefore, hitherto alledged, proving ineffectual, our great author is left to solve the difficulty himself.

In order to this he observes, that the measure of penalties with respect to crimes, is not only, nor always, taken from the quality and degree of the offence, much less from the duration and continuance of it; but from the reasons of government, which properly require such penalties as may secure the observation of the law, and deter men from the breach of it. Among men it is not reckoned injustice to punish murder, and many other crimes, which perhaps are committed in a moment, with perpetual loss of estate, or liberty, or life: so that the objection of temporary crimes being punished with such long sufferings is of no force.

In effect, what proportion crimes and penalties are to bear to each other, is not so properly a consideration of justice as of wisdom and prudence in the lawgiver, who may enforce his laws with what penalties he pleases, without any impeachment of his justice, which is out of the question.

The primary end of all threatening is not punishment, but the prevention of it: God does not threaten, that men may sin, and be punished; but that they may not sin, and so escape: and therefore the higher the threatening runs, the more goodness there is in it.

After all, it is to be considered, says the good archbishop, that he who threatens has still the power of execution in his own hands. There is this difference between promises and threatenings; that he who promises, passes over a right to another, and thereby stands obliged to him, in justice and faithfulness, to make good his word: but it is otherwise in threatenings; he that threatens, keeps the right of punishing still with him, and is not obliged to execute what he has threatened, any farther than the reasons and ends of government require. Thus, God absolutely threatened the destruction of Nineveh, and his peevish prophet understood the threatening to be absolute, and was angry for being employed in a message that was not made good; but God understood his own right, and did what he pleased, notwithstanding the threatening he had denounced, and notwithstanding Jonah was so touched in point of honour, that he had rather have perished than Nineveh should have escaped. Tillotson's Sermons, vol. i. p. 411. ed. fol. 1712.

HELL, *hades*, is sometimes also used, in the scripture style, for *death* and *burial*; because the Hebrew and Greek names signify sometimes the place of the damned, and sometimes simply the grave. See HADES.

The word *hell* is of Saxon extraction, and signifies *a covered place*: and thence, by an easy transition, the place of the dead, or the invisible state into which death removes mankind. From the same original we still retain in our language the word *hele*, or *hele*, which signifies *to cover over*: and in this sense lord King maintains that the word *hell* is used and ought to be understood in the Apostle's Creed: the meaning of the article relating to our Saviour's descent into *hell* being no other than this, that his soul, being separated from his body by a real transition and local motion, went into the unseen region of spirits, where, according to the laws of death it remained among other pious departed souls till the resurrection of his body. Others contend, that he descended into the place of torment, where he triumphed over the devils. &c. Crit. Hist. of the Apostles Creed, p. 181, &c. Pearson on the Creed, p. 249.

The Romanists add, that he there comforted the souls in purgatory, and brought away the spirits of the patriarchs, and other just persons, departed till that time, carrying them with him into paradise.

In the Romish church, that part of *hell*, wherein those were retained who died in the mercy and favour of God before our Saviour's sufferings, is called LIMBUS.

HELLEBORE, ΕΛΛΕΒΟΡΟΣ, or ELLEBORUS, a medicinal plant, reputed among the ancients, a specific for the cure of melancholy and madness.

There are two kinds of *hellebore*, the *black* and the *white*.

The characters of the *black hellebore*, also called the Christmas-flower, which is a genus of the *polyandria polygynia* class, are these: the flower has no empalement, but has five large, roundish permanent petals, and many small nectaria placed circularly; it has a great number of stamina, and several compressed germina, which afterward turn to compressed capsules with two keels, the lower short, and the upper convex, filled with round seeds adhering to the seam. Miller enumerates six species, Linnæus five.

The *white hellebore*, *veratrum*, which is a genus of the *polygamia monœcia* class, has these characters: it has hermaphrodite and male flowers intermixed in the same spike; the flowers have no empalement, but have six oblong spear-shaped petals which are permanent, and six awl-shaped stamina sitting on the point of the germen, spreading afunder, and terminated by quadrangular summits; they have three oblong erect germina sitting upon the style, which are scarcely visible, crowned by a single spreading stigma; the germina afterward become three oblong, erect, compressed capsules, with one cell opening on the inside, including many oblong, compressed, membranaceous seeds: the male flowers have the same characters with the hermaphrodite, but are barren. There are four species according to Miller, and three in the Linnæan system.

It is only the roots that are used in each kind, which are to be chosen large and fair, furnished with thick fibres; those of the *white*, tan-colour without, and white within; and those of the *black*, blackish without, and brownish within; dry, clean, and of a sharp, disagreeable taste.

The ancients, as already observed, had a great opinion of their efficacy in diseases of the mind: whence various phrases and forms of speaking among writers; as *cepit* helleboro *dignum*: Juvenal says, Misers need a double dose of *helleboro*; *danda est* elleboro *multo pars maxima avaris*. The island of Anticyra, situate against mount Œta, was famous for the growth and use of this plant; it being here in its greatest perfection, and used with the best effects: whence the proverb *Navigat Anticyras, sanè bim a voyage to Anticyra*, spoken of a madman.

The white, which is common in mountainous places, in Germany, Switzerland, and other parts of Europe acts in doses of ten or fifteen grains, as a purgative, but so very violently both upwards and downwards, as frequently to cause convulsions; whence the use of it internally is now discontinued: but it is still retained with success for the farcy in horses and the scab in sheep, and for some kinds of maniacal cases, as a last resource.

The chief use wherein the present practice acknowledges it, is in form of a sternutatory powder, to clear and open the head, in lethargic and other disorders: the powder has likewise been used, with other external applications, for destroying cutaneous insects. Infusions of the root in water, and the extracts obtained by inspissating them, operate with less violence.

There is a preparation in the shops, which is used sometimes in glysters, called *mel helleboratum*, which is obtained by macerating a pound of the root for three days in four pints of water, and boiling it a little; the decoction, strained, is mixed with three pounds of clarified honey, and the mixture boiled down till the water has exhaled. There is also a tincture, drawn with a quart of proof spirit from eight ounces of the root, which is sometimes given in doses of a few drops as an alterative, and one or two drams and upwards as a cathartic and emetic.

The black *hellebore*, called also *melampodium*, and used among us, Dr. Quincy suggests to be much inferior in virtue to that of the ancients; because it will not operate much by stool, but is only a powerful alterative, getting far into the habit, and to promoting sweat; however, in doses of ten grains to half a dram, it will prove a strong

a strong, though not very violent cathartic: the root and its preparations are chiefly used, in small doses, as attenuants and deobstruents.

He adds, that he has known it do wonders in the gout and rheumatism, and that it rarely fails in obstructions of the menses. It is also serviceable in plethoric and sanguine constitutions, where chalybeats are ineffectual or injurious.

The extract made with water, given in doses from eight or ten grains to a scruple or more, is the best and chief preparation of this root, when designed for a cathartic; and a tincture made in proof spirits appears to be the most eligible preparation for the purposes of an alterative and deobstruent: four ounces of the root may be digested in a quart of the spirit, with the addition of thirty or forty grains of cochineal; and the filtered tincture may be given in the quantity of a tea-spoonful twice a day, in warm water or any other convenient vehicle. Lewis, Mat. Med.

HELLEBORE, *bastard*, or *Helleborine*, *serapias*, in *Botany*, a genus of the *gynandria diandria* class. Its characters are these: it has a single stalk, and the sheath of the flower is at a distance; the germen sustains the flower, which has no empalement, but has five oblong oval petals; the nectarium is the length of the petals, hollowed at the base, oval and gibbous below, cut into three points; the flower has two inner stamina, sitting upon the pointal, terminated by erect summits, placed under the upper lip of the nectarium, and an oblong contorted germen, situated under the flower, the style growing to the upper lip of the nectarium, crowned by an obsolete stigma; the germen becomes an oval, obtuse, three-cornered capsule, armed with three keels, opening with a valve under each, having one cell, filled with small seeds. There are four species. Miller. Linnæus reckons six.

HELLEBORE *with a globose flower*, or *globe ranunculus*, *trollius*, in *Botany*, a genus of the *polyandria polygynia* class. Its characters are: the flower has no empalement; it has about fourteen almost lower petals, whose points meet together; it has nine narrow, plain, incurved, umbilicated nectariums, which are perforated at their base; and a great number of bristly stamina, terminated by erect summits, with numerous germina forming a column, without styles, which afterward become as many capsules, collected into an oval head, each containing one seed. There are two species. Miller.

HELLENISM, a sort of Grecism; or a phrase peculiarly accommodated to the genius and construction of the Greek tongue.

Hellenism is distinguished from Grecism, in that the former is not applied to authors who have written in Greek; their language, it is evident, should be a continual *Hellenism*; but it is applied to authors, who, writing in some other language, use terms and expressions peculiar to the Greek.

There are abundance of *Hellenisms* in the Vulgate version of the scriptures.

HELLENISTIC, or HELLENISTICK *language*, that used among the HELLENISTS.

The critics are divided as to this language. Several of them, and among the rest Drusius and Scaliger, take it to be the language used among the Grecian Jews. They add, that it is in this language the Greek translation of the Septuagint was written, and even the books of the New Testament composed. M. Simon calls it *the language of the synagogue*.

It must not be imagined, that this was any peculiar language distinct from all others, or even any peculiar dialect of the Greek; it was thus denominated, to shew that it was Greek, mixed with Hebraisms and Syriacisms. Salmasius rejects the common opinion of the learned touching the *Hellenistic* language, and has written two volumes on the subject, in which there is not a little logomachia.

HELLENISTS, HELLENISTÆ, a term occurring in the Greek text of the New Testament, and which in the English version is rendered *Grecians*.

The critics are divided as to the signification of the word. Œcumenius, in his Scholia on Acts vi. 1. observes, that it is not to be understood as signifying those of the religion of the Greeks, but those who spoke Greek, τοὺς Ἕλληνας ὁμογλώσσους. The authors of the Vulgate version, indeed, render it, like ours, *Græci*: but Mesieurs Du Port Royal, more accurately, *Juifs Grecs*, *Grecs* or *Grecian Jews*; it being the Jews who spoke Greek that are here treated of, and who are hereby distinguished from the Jews called *Hebrews*, that is, who spoke the Hebrew tongue of that time.

The *Hellenists*, or Grecian Jews, were those who lived in Egypt, and other parts, where the Greek tongue prevailed. It is to them we owe the Greek version of the Old Testament, commonly called the SEPTUAGINT, or that of the Seventy.

Salmasius and Vossius are of a different sentiment with regard to the *Hellenists*. The latter will only have them to be those who adhered to the Grecian interest.

Scaliger is represented, in the Scaligerana, as asserting the *Hellenists* to be the Jews who lived in Greece and other places, and who read the Greek Bible in their synagogue, and used the Greek language *in sacris*; and thus they were opposed to the Hebrew Jews, who performed their public worship in the Hebrew tongue; and in this sense St. Paul speaks of himself as a Hebrew of the Hebrews, Phil. iii. 5. i. e. a Hebrew born by nation and language. The *Hellenists* are thus properly distinguished from the *Hebrews* or Greeks, mentioned John xii. 20. who were Greeks by birth and nation, and yet proselytes to the Jewish religion.

HELLENODICÆ, Ἑλλανοδίκαι, in *Antiquity*, the directors of the Olympian games. At first there was only one, afterwards the number increased to two and to three, and at length to nine. They assembled in a place called Ἑλλανοδικαῖον, in the Elean forum, where they were obliged to reside ten months before the celebration of the games, to take care that such as offered themselves to contend, performed their προγυμνάσια, or preparatory exercises, and to be instructed in all the laws of games by certain men called νομοφύλακες, i. e. keepers of the laws. And the better to prevent all unjust practices they were farther obliged to take an oath, that they would act impartially, would take no bribes, not discover the reason for which they disliked or approved of any of the contenders. At the solemnity they sat naked, having before them the victorial crown till the exercises were finished, and then it was presented to whomsoever they adjudged it. Nevertheless, there lay an appeal from the *hellenodicæ* to the Olympian senate. Pott. Archæol. Græc. lib. ii. cap. 22. tom. i. p. 448.

HELLENODICÆUM, Ἑλλανοδικαῖον, in *Antiquity*, the place where the HELLENODICÆ were used to assemble.

HELLENOTAMIÆ, Ἑλλανοταμίαι, in *Antiquity*, Athenian officers appointed to receive the money due from the tributary cities.

They were also called *hellenotamiæ*.

HELLOTIA, Ἑλλώτια, in *Antiquity*, two festivals, one of which was celebrated in Crete, in honour of Europa, called *Hellotia*; the other was celebrated by the Corinthians, with solemn games and races, wherein young men contended, running with lighted torches in their hands. See a farther account of these festivals in Pott. Archæol. Græc. lib. ii. cap. 20. tom. i. p. 393.

HELLOTIS, Ἑλλώτις, in *Antiquity*, a myrtle garland, carried in procession with Europa's bones at the festival called HELLOTIA.

This garland was no less than twenty cubits in circumference.

HELM, in *Sea-language*, is a long and flat piece of timber, or an assemblage of several pieces, suspended along the hind-part of a ship's stern-post, where it turns upon hinges to the right or left, serving to direct the course of the vessel. The *helm* is usually composed of three parts, viz. the RUDDER, the TILLER, and the wheel, except in small vessels, where the wheel is unnecessary.

HELM, *a-lee the*. See A-LEE.

HELM, *bear up the*. See BEARING.

HELM, *ease the*. See EASE.

HELM, *port the*. See PORT.

HELM, *right the*, or *helm the midship*. See RIGHT.

Shifting the HELM. See SHIFTING.

HELM, *starboard the*. See STARBOARD.

HELM, in *Chemistry*, is the head of a still or alembic; thus called, because in figure it sometimes resembles a *helm* or helmet.

Hence, to bring the thing *over the helm* is the same as to force it by fire up to the top of the vessel, that it may distil down into the receiver by the beak of the head.

And when they say, such a thing cannot be brought over the *helm*, they mean that it is of too fixed a nature to be raised into vapour by the force of fire.

HELM, a term used by country people for straw, bruised by threshing or otherwise, and bound up in bundles for thatching. See THATCH.

HELMET, or HELM, an ancient armour of defence, worn by the cavaliers, both in war and in tournaments, as a cover and defence of the head; and still used by way of a crest or ornament over the shield or coat of arms.

The *helmet* is known by divers other names, as the *vasor*, *head-piece*, *steel cap*, &c.

The *helmet* covered the head and face, only leaving an aperture about the eyes, secured by bars, which served as a visor.

The *helmet* is borne in armory as a mark of nobility; and by the different circumstances of the bearing of the *helmet*, are the different degrees of nobility indicated. In France, whence all our heraldry originally came, the following rules obtain.

A perſon newly ennobled, or made a gentleman, bears over his eſcutcheon a *helmet* of bright iron or ſteel, in profile, or ſtanding ſideways; the viſor quite cloſe.

A gentleman of three deſcents bears it a little open, but ſtill in profile, ſhewing three bars of the viſor.

Ancient knights, &c. have it in profile, but ſhewing five bars: the edges of ſilver.

A baron's *helmet* is of ſilver; the edges gold, with ſeven bars neither quite in profile, nor yet in front, with a coronet over it adorned with pearls.

Viſcounts and earls formerly bore a ſilver *helmet*, with gold edges, its poſition like the former: but now they bear it quite fronting, with a coronet over it.

Marquiſſes bear a ſilver *helmet*, damaſked, fronting; with eleven bars, and their coronet.

Dukes and princes have their *helmet*, damaſked, fronting, the viſor almoſt open, and without bars, with their coronets over them.

Laſtly, the *helmets* of kings and princes are all of gold, damaſked full fronting, and the viſor quite open, and without bars.

The *helmets* of baſtards are to be turned to the left, to denote their baſtardy.

Among the Engliſh heralds, theſe laws are of late ſomewhat varied. Leigh will have the *helmet* profile and cloſe to belong to knights; but all other authors give it to eſquires and gentlemen. *Vide* III. *Heraldry, fig.* 91.

To a knight's and baronet's, they aſſign the *helmet* ſtanding right forward, with the beaver a little open, and without bars. *Fig.* 93.

The *helmet* in profile, or poſited ſideways, and open, with four bars, belongs to a nobleman under the condition of a duke. *Fig.* 94.

The *helmet* right forward and open, with many bars, is aſſigned to dukes, princes, and kings: that appropriated to dukes and marquiſſes has *five* bars, one exactly in the middle, and two on each ſide, (*fig.* 95.) whereas the king's *helmet* has ſix bars, three on each ſide. *Fig.* 91.

Thoſe turned ſideways are ſuppoſed to be giving ear to the command of their ſuperiors; and thoſe right forwards, to be giving orders with abſolute authority.

Commonly there is but one *helmet* in a ſhield; but ſometimes there are two or three: if there be two, they muſt be placed facing each other; if three, the two extremes muſt be looking towards that in the middle.

HELMET-*flower*, in *Botany*. See ACONITE and WOLF'S-*bane*.

HELMET *pigeon*, the name given to a particular ſpecies of pigeon, called by Moore the *columba galeata*. It has its name from its having its head covered with a plumage of a diſtinct colour from that of the reſt of the body, and appearing ſomewhat like a *helmet* covering the head. It is a moderate ſized pigeon, a little bigger than the ſpecies called the nun. The head, tail, and flight-feathers of the wings, are always of the ſame colour, which is either black, red, or yellow, and ſometimes, though rarely, blue; the reſt of the body is all white. They are reſtleſs, and have no hood like that of the nun, otherwiſe they approach much to that ſpecies. Moore's Columbarum, p. 48.

HELMET *ſhell*, in *Natural Hiſtory*. See GALEA.

HELMINTHAGOGA, of ἕλμινς, *worm*, and ἀγω, *I expel*, medicines contrived to deſtroy and expel worms.

HELMINTHES, in the *Medicinal Writers*, a word uſed to ſignify the worms in human bodies.

HELMINTHOLITHUS, of ἕλμινς, *worm*, and λιθος, *ſtone*, in *Natural Hiſtory*, a name given by Linnæus to petrified bodies reſembling worms. Of theſe he enumerates twenty-four different genera.

HELMINTHOTHECA, in *Botany*, a name given by Vaillant to a genus of plants, ſince deſcribed by Linnæus under the name PICRIS.

HELMONTII *ludus*. See LUDUS *Helmontii*.

HELODES, formed of ἑλος, *marſh*, in *Natural Hiſtory*, a term applied to certain plants, to ſignify their place of growth to be in fens, bogs, or marſhy places; thus a kind of St Peter's wort, which is diſtinguiſhed from the others by being hairy, and growing always in boggy places, is called by Ray and others, *aſyrum villoſum helodes*. In *Medicine*, the ſame word, or *elodes*, is uſed as a characteriſtic epithet in certain fevers. Theſe are ſuch as are attended, in their beginning, with profuſe ſweats, which afford no relief; and all the time the tongue is dry and the ſkin hard, and as if it were parched. Theſe are uſually of dangerous conſequence.

HELONIAS, in *Botany*, a genus of the *hexandria triginia* claſs. The characters are, that the corolla has ſix petals, that it has no calyx, and the fruit is a three-celled capſule. There are two ſpecies.

HELOPS, in *Ichthyology*, the name of a fiſh which often occurs in the old Greek and Latin writers. Ariſtotle, Ælian, Ovid, and others, mention it. It ſeems to have been the ſame with their oniſcus and acipenſus, which was our STURGEON. Pliny's account of the *helops* countenances this opinion.

HELOSIS, of ἑλοω, *I fold up*, in *Medicine*, the name of a diſorder of the eyes, attended with an everſion, or turning up of the eye-lids.

HELOTIS, a name given by ſome authors to a diſeaſe called PITTA *Polonica*.

HELOTS, in *Antiquity*, a kind of ſlaves, among the Lacedemonians, ſo named from Helos, a Laconian town, conquered by the Spartans, who made all the inhabitants priſoners of war, and reduced them and their poſterity to the condition of ſlavery.

On theſe ſlaves lay the whole care of ſupplying the city with proviſions; the ground was tilled, and all manner of trades managed by them; whilſt their maſters ſpent all their time in dancing and feaſting, in their exerciſes, hunting-matches, and the λεσχαι, or places where good company uſed to meet. Notwithſtanding the great uſefulneſs of the *Helots*, they were treated in a moſt barbarous manner, and often murdered without committing any fault, and without any ſhew of juſtice. Poſt. Archæol. Græc. lib. i. cap. 10.

HELPS, in the *Manege*. To teach a horſe his leſſons, there are ſeven *helps* or aids to be known: theſe are the *voice*, *rod*, *bit* or *hauſſle*, the *calves* of the legs, the *ſtirrups*, the *ſpur*, and the *ground*. See AIDS.

The *helps* are occaſionally turned into CORRECTIONS.

HELPESED, in *Natural Hiſtory*, a name uſed by ſome writers for CORAL.

HELSEBON, an affected word, uſed by ſome of the chemical writers to expreſs common ſea-ſalt, well purified by ſolution and cryſtallization.

HELSINGIC *character*, a character inſcribed on ſome ſtones found in Helſingland, in the north parts of Sweden. It differs from the Runic; though one of theſe characters may eaſily be transformed into the other. See RUNIC.

HELVE, the handle of a hatchet, pick-ax, mattock, &c. and to *helve* theſe is to put handles to them.

HELVELLA, in the *Linnæan Syſtem of Botany*, a genus of the *cryptogamia fungi*. See TURBAN-*top*.

HELVETIC, ſomething that has a relation to the Switzers or inhabitants of the Swiſs cantons, who were anciently called *Helvetii*.

The *Helvetic* body comprehends the republic of Switzerland, conſiſting of thirteen cantons, which make ſo many particular commonwealths.

By the laws and cuſtoms of the *Helvetic* body, all differences between the ſeveral ſtates and republics are to be decided within themſelves, without the intervention of any foreign power.

The government of this body is chiefly democratic, with ſome mixture of the ariſtocratic.

HELVIDIANS, a ſect of ancient heretics denominated from their leader Helvidius, a diſciple of Auxentius the Arian, whoſe diſtinguiſhing principle was, that Mary, the mother of Jeſus, did not continue a virgin, but had other children by Joſeph.

The *Helvidians* are called, by the Greeks, ANTIDICOMARIANITES.

HELXINE, in *Botany*, a name uſed, by ſome authors, for the parietaria, or PELLITORY *of the wall*.

HELXINE *ciſſampelos*, in *Botany*, a name given by ſome authors to a ſpecies of bindweed, called by Mr. Tournefort *convolvulus major alius craſſiori & auriculato folio maritimus*; the great white-flowered ſea bindweed, with thick auriculated leaves. See CONVOLVULUS.

HEM, a partition in the ovens, wherein the *hopi calominarii*, or *calamine*, is baked. Theſe ovens have a hearth made on one ſide, divided from the oven itſelf by a partition, or *hem*, open at the top, by which the flame paſſes over, and ſo heats and bakes the *calamine*.

HEMATOPUS, in *Ornithology*, a name uſed by Bellon us and ſome others, for the bird commonly known in England by the name of the ſea-pie, and called by Mr. Ray and ſome authors PICA *marina*.

HEMEROBAPTISTS, a ſect among the ancient Jews thus called from their waſhing and bathing every day, in all ſeaſons; and performing this cuſtom with the greateſt ſolemnity, as a religious rite neceſſary to ſalvation.

Epiphanius, who mentions this as the fourth hereſy among the Jews, obſerves, that in other points theſe heretics had much the ſame opinions as the Scribes and Phariſees; only that they denied the reſurrection of the dead, in common with the Sadducees, and retained a few other of the impropriеties of theſe laſt.

The ſects who paſs in the Eaſt under the denomination of Sabians, calling themſelves *Mendai Iahi*, or the diſciples of John, and whom the Europeans entitle the Chriſtians of St. John, becauſe they yet retain ſome knowledge of the Goſpel, is probably of Jewiſh origin, and ſeems to have been derived from the ancient *Hemerobaptiſts*; at leaſt it is certain, that that John, whom they conſider as the founder of their ſect, bears no ſort of ſimilitude

similitude to John the Baptist, but rather resembles the person of that name, whom the ancient writers represent as the chief of the Jewish *Hemerobaptists*. These ambiguous Christians dwell in Persia and Arabia, and principally at Bassora; and their religion consists in bodily washings, performed frequently, and with great solemnity, and attended with certain ceremonies which the priests mingle with this superstitious service. Mosheim's Eccl. Hist. vol. iii. p. 498, 8vo. 1758.

HEMEROBIUS, in *Zoology*, a genus of insects of the *neuropterous* order; the characters of which are, that the mouth has two tentacula, the wings are deflex, without folds, and the antennæ are longer than the convex thorax, setaceous, and extended. There are fifteen species. See CHRYSOPA.

HEMEROCALIS. See LILY.

HEMERODROMI, compounded of ἡμερα, *day*, and δρομος, *course*, &c. among the *Ancients*, were centinels, or guards, appointed for the security and preservation of cities, and other places.

They went out of the city every morning, as soon as the gates were opened, and kept all day patrolling round the place; sometimes, also, making excursions farther into the country, to see that there were no enemies lying in wait to surprise them.

HEMERODROMI were also a sort of couriers, among the *Ancients*, who only travelled one day, and then delivered their packets, or dispatches, to a fresh man, who run his day, and so on, to the end of the journey.

The Greeks had of these sort of couriers which they derived from the Persians, who were the inventors thereof, as appears from Herodotus. Augustus had the same; at least he established couriers, who if they did not relieve each other from day to day, yet did it from space to space, and that space was not very great.

HEMEROTROPHIS, in *Antiquity*, a measure of capacity, the same with the CHOENIX.

It was so called from its holding one day's food.

The word is compounded of ἡμερα, *day*, and τροφη, *food*.

HEMEROLOPIA, of ἡμερα, *day*, and ωψ, *eye*, a distemperature of the eyes, by means of which persons can only see in broad day-light, and not distinguish objects at all in the dusk of the evening. It is owing to a great contraction of the pupil.

HEMI, a word used in the composition of divers terms. It signifies the same with *semi* or *demi*, viz. *half*; being an abbreviature of ἡμισυς, *hemisys*, which signifies the same. The Greeks pronounced the last syllable of the word ἡμισυ, in the composition of words; and after their example, we have done so too, in most of the compounds borrowed from them.

HEMICRANIA, *Hemigrame*, in *Medicine*, a species of cephalagia, or head-ach; wherein only one hemisphere, or half, or one side of the head, is affected; and owing to a congestion of blood in the vessels of that half.

Physicians divide the *hemicrania* into four kinds. 1. The idiopathic, when it is properly a disease of itself. 2. The symptomatic, where it is properly only the symptom of some other disease. 3. The continual or fixed, where it admits of no absolute intermissions. And, 4. The periodic, where the patient is regularly free from it at certain stated periods.

Signs of it. Among these are vibrative and very acute pains: the pain occupies only one part of the head, while the other part is wholly free and at ease. The left side of the head is usually the part in pain. In that side of the head where the pain is, it is not fixed to any one spot, but wanders up and down from one part to another; and sometimes the eye on that side, sometimes the jaw and teeth are affected by it. When the lower part of the head is in pain, the upper part is somewhat easy; and in some cases the pain has been known to descend to the arm of that side. To this it is to be added, that the patient is usually costive, and makes very little urine. Women are much more subject to this distemper than men, and among them principally such as live high, and use little exercise: such also are subject to violent passions of the mind; such as have had frequent suppressions of the menses; and such as live in a married state without having children.

The principal cause of the disease is a plethora, occasioned usually by a suppression of the menses, or hæmorrhoids, or some other natural evacuation, or the omission of habitual bleedings at spring or *fall*. To these causes are to be added a distemperature of the primæ viæ, and consequent acidities or indigestion, a change of the course of life from one full of exercise to a sedentary one; excessive watchings or studies; too great heat of the body, or too sudden cooling of it; violent passions, as of anger, or the like, suppressed; and, finally, too high living, and the free use of strong liquors.

Prognostics. This species of head-ach not unfrequently brings on suffusions, and other disorders of the eyes, and often is a fore-runner of the gout, especially if it be imprudently treated during the fit; if the congestion of blood be driven by repellents at this time to the feet, it constitutes that painful distemper; but if it fall upon the vitcers, it usually brings on an inflammatory fever. When it extends to the arm and side of the affected half of the head, there is danger of a palsy coming on. In itself it is not difficult to cure in young people; but in women advanced in years, after the cessation of the menses, it is scarce ever perfectly cured so as not to return.

Method of cure. As the primæ viæ are almost always obstructed in this complaint, the regular beginning of a cure is by emptying them; and a gentle vomit and purging medicines are to be given. Stahl advises, to answer both these purposes at once, by rhubarb and emetic tartar mixed together. After this emollient clysters are to be given; then the violent motion of the blood is to be quieted, by giving powders composed of nitre, crabs-eyes, and cinnabar; and in cases where the pain is violent and unsufferable, a gentle opiate may be given; such as a small dose of the thorax pill; and at other times the quantity of the cinnabar may be increased from five grains to ten or twenty in a dose; and this will supply the place of the opiate, and produce the same effect in giving ease. After the bowels have been sufficiently cleansed, chalybeate waters, and such bitters as strengthen the stomach, will be necessary. Spirit of wine camphorated may also be used externally; and frequently bathing the feet in the decoctions of the warm and emollient herbs, has a great effect. In the absence of the fit, the methods to be used, by way of prevention, are bleeding in the ancle, to remove the plethora; and where the suppression of the menstrual, or any other discharge, has been the cause, this is to be restored, if possible, to its wonted periods; and in all cases a sedentary life is to be avoided. Bleeding is never proper in the time of the fit, unless the plethora be very great, or the congestion in the head so great, that worse consequences are to be feared. Junker, Consp. Med. p. 118.

HEMICYCLE, HEMICYCLIUM, compounded of ἡμισυς, *half*, and κυκλος, *circle*, a SEMICIRCLE.

HEMICYCLE is particularly applied, in *Architecture*, to vaults in the cradle form; and arches, or soweps, of vaults, constituting a perfect semicircle.

To construct an arch of hewn stone, they divide the *hemicycle* into so many voussoirs; taking care to make them an uneven number, that there be no joint in the middle, where the key-stone should be. See KEY and BRIDGE.

HEMICYCLIUM was also a part of the orchestra in the ancient theatre. Scaliger, however, observes, it was no standing part of the orchestra; being only used in dramatic pieces, where some person was supposed to be arrived from sea, as in Plautus's Rudens.

The ancients had also a sort of sun-dial called *hemicyclium*. It was a concave semicircle, the upper end, or cusp whereof, looked to the north.

There was a style, or gnomon, issuing from the middle of the *hemicycle*, whereof that point corresponding to the centre of the *hemicycle*, represented the centre of the earth; and its shadow projected on the concavity of the *hemicycle*, which represented the space between one tropic and another, the sun's declination, the day of the month, hour of the day, &c.

HEMINA, formed of ἡμισυς, *half*, a vessel used as a measure among the ancient Romans, containing half the sextary. The *hemina*, called also *cotyla*, and *acetabulum*, contained eight ounces of liquor; and was the twelfth part of the congius.

Several authors have wrote expres treatises on the Roman *hemina*; particularly Meif. Arnaud and Pelletier.

St. Benedict prescribes the *hemina* as the portion or quantity of wine to be allowed the religious of his order at each meal. F. Mabillon, who has wrote on the subject, shews that this *hemina* was a measure peculiar to the Benedictines, as well as the pound of bread allowed the same religious, which only consisted of fifteen ounces. F. Pandectes has a dissertation to prove, that the *hemina* of wine prescribed by St. Benedict, only amounts to a demi sextier of Paris measure; but others make it two sextiers; and others three.

HEMIOBOLON, a weight often mentioned by the ancient writers in medicine, and expressing the half of their obolus, or the twelfth part of a dram, that is five grains.

HEMIOLIUS, or HEMIOLIA, compounded of ἡμισυς, *half*, and ὁλος, *whole*, an ancient mathematical term, occurring chiefly in musical writers. It signifies the ratio of two things, whereof the one contains the other once and a half; as 3: 2, or 15: 10, otherwise called *sesquialterate*. See RATIO, and SESQUIALTERATE.

Macrobius, on the Somnium Scipionis, lib. ii. cap. 1. observes, that the concord, called in the ancient music *diapente*, and in the modern a *fifth*, arises from this proportion.

HEMI-

HEMIONITIS, of ἡμίονος, *a mule, mata* or *mule-fern*, in the Linnæan system of *Botany*, the name of a genus of *ferns*; the character of which is, that the fructifications are disposed in branched lines, or such as intermix with and intersect one another.

The characters of *hemionitis*, according to Tournefort, are these: the flowers are not discovered, but the seeds stand in clusters on the back part of the leaves; the leaves are all furnished with broad auricles at their base, and are in some species simple, and in others branched or compound. Tourn. Inst. p. 540.

The species of *hemionitis*, enumerated by Mr. Tournefort, are thirteen; and by Linnæus three.

HEMIOPE, or HEMIOPIS, compounded of ἡμισυ, *half*, and ὀπη, *hole*, a musical instrument in use among the ancients.

The *hemiopa* was a FLUTE with only three small holes.

HEMIPAGIA, a pain that affects only one half of the head: the same as HEMICRANIA.

HEMIPLEGIA, or HEMIPLEXIA, compounded of ἡμισυ, *half*, and πλησσω, *I strike*, or *seize*, in *Medicine*, a palsy of one whole side of the body. See PALSY, and *Medical* ELECTRICITY.

HEMIPTERA, derived from ἡμισυ, *half*, and πτερον, *wing*, in the Linnæan system, the second order of insects, comprehending twelve genera, viz. the *blatta*, *mantis*, *gryllus*, *fulgora*, *cicada*, *notonecta*, *nepa*, *cimex*, *aphis*, *chermes*, *coccus*, and *thrips*, and a great number of species. The characters of this order are, that the mouth is either situated in the breast, or inclined towards it; and that the upper wings are semi-crustaceous, semi-membranaceous, and incumbent, and not connected by a strait longitudinal suture, as in the order of COLEOPTERA.

HEMISPHERE, HEMISPHÆRIUM, compounded of ἡμισυ, *half*, and σφαιρα, *sphere*, in *Geometry*, is one half of a globe, or sphere, when divided into two by a plane passing through its centre.

If a diameter of a sphere be equal to the distance of the two eyes; and a right line drawn from the centre of the sphere to the middle of that distance be perpendicular to the line which joins the eyes; the eyes making a rotation on the axis, or middle point between them, will see the whole *hemisphere*. If the distance of the eyes be either greater or lesser than the diameter of the *sphere*, in making such rotation they will view respectively more or less than a *hemisphere*. *See* VISION.

The centre of gravity of a *hemisphere* is five eighths of the radius distant from the vertex.

HEMISPHERE, in *Astronomy*, is particularly used for one *half* of the mundane sphere.

The *equator* divides the sphere into two equal parts, called the *northern* and *southern hemispheres*.

The *northern hemisphere* is that half in whose vertex is the north pole. Such is that represented by DPA (*Tab. Astronomy, fig.* 52.) terminated by the equator DA, and having the pole P in its zenith.

The *southern hemisphere* is that other half DQA, terminated by the equator DA; and having the south pole Q in its zenith.

The horizon also divides the sphere into two *hemispheres*; the *upper* and the *lower*.

The *upper hemisphere* is that also of the mundane sphere HZR, terminated by the horizon HR, and having the zenith Z in its vertex.

The *lower hemisphere* is that other half HNR, terminated by the horizon HR, and having the nadir N in its vertex.

HEMISPHERE is also used for a map, or projection, of half the terrestrial globe, or half the celestial sphere, on a plane. *Hemispheres* are frequently called *planispheres*.

HEMISPHÆRIA, a name by which Dr. Hill calls the genus of flies known in English by that of *lady-case*, or *lady-bird*.

Ray, and other writers, have described these among the beetles. See SCARABÆUS.

HEMISPHEROIDAL, in *Geometry*, something that approaches to the figure of a *hemisphere*, but is not justly so.

HEMISTICH, compounded of ἡμισυ, *half*, and στιχος, *verse*, in *Poetry*, a half VERSE.

Such, e. gr. are, *Cernis Deus omnia nimbo*—

or *Attolite tarissimos ibis*, &c.

It is disputed, whether or no the *hemistichs* in the Æneid were left with design; or whether they are owing to the work's being unfinished?

In English, &c. the common and Alexandrine verses require a rest at the end of each *hemistich*; common verses require it at the end of four syllables; and Alexandrine at the end of six.

Leonine verses rhythm both at the end and at the *hemistich*. See LEONINE.

HEMITONE, in the *Ancient Music*, was what we now call a half-note, or semi-tone.

HEMITRITÆUS, Ἡμιτριταῖος, compounded of ἡμισυ, *half*, and τριταιος, *third*; or, as modern Latin authors express it, *semitertiana*, in *Medicine*, an irregular intermitting fever, which returns twice every day; by which it is distinguished from the quotidian, which only returns once in the day.

HEMIXESTON, a measure among the ancients, containing half a xestes. The xestes contained two cotyles, and therefore the *hemixeston* was a cotyle.

HEMLOCK, *Conium*, in *Botany*, a genus of the *pentandria digynia* class. Its characters are these: it is an umbelliferous plant; the petals of the greater umbels are uniform; each flower is composed of five unequal heart-shaped petals, which turn inward, and have five stamina; the germen, which is situated under the flower, supports two reflexed styles, and becomes a roundish channelled fruit, divided into two parts, containing two seeds. There are three species, the greater *hemlock*, with striated seeds, and smaller leaves, the greater *hemlock* with narrower leaves, and the *hemlock* with prickly seeds.

The first and common sort grows naturally on the sides of banks and roads in many parts of England; and is a biennial plant, perishing after it has ripened its seeds; it hath a long taper root like a parsnip, but much smaller; the stalk is smooth, spotted with purple, and rises from four to six feet high; branching out toward the top into several stalks, which are garnished with decompounded leaves, whose small leaves are cut at the top into three parts; these are of a lucid green, and have a disagreeable smell; the stalks are terminated by umbels of white flowers, each being composed of about ten rays, or small umbels, which have a great number of flowers spread open, each sitting upon slender footstalks; the seed is small, and channelled like those of anise.

Hemlock is seldom allowed room in gardens, being supposed to have a poisonous quality: some physicians have affirmed that it is so to all animals, while others have affirmed that it is eaten by the inhabitants of some parts of Italy when it is young, and is by them esteemed a great dainty. Mr. Ray tells us, that he found the gizzard of a thrush full of *hemlock* seeds, with four or five grains of corn intermixed, which in the time of harvest that bird had neglected for what we reckon so very pernicious. However, it is very certain that scarce any animal will eat the green herb.

This plant is esteemed by many physicians as an excellent remedy to dissolve scirrhous tumors; and some have greatly recommended it for cancers: most of them agree that it may be prescribed as a good narcotic.

We are chiefly indebted for the knowledge of the beneficial effects of *hemlock* to the experiments of Dr. Storck, physician at Vienna, an account of which was published in the year 1760. This ingenious writer relates, that bags of the dry leaves, quilted together, boiled for a few minutes in water, or milk, then squeezed from the superfluous liquid, and applied warm, checked the progress of very bad gangrenes, and procured a suppuration of the corrupted parts; that the same application abated the pains of an obstinate gout, and discussed the tophaceous concretions; and that its effects were likewise considerable in œdematous tumors, scirrhous tumors, indurations of the glands of the breast, and in very bad cancers; and that plasters, containing the juice of *hemlock*, often resolve and discuss what resists all other applications. With us this herb has been chiefly used in the form of plaster, prepared by mixing the recent juice with a solution of twice its quantity of gum ammoniac, made in vinegar of squills, and boiling down the mixture to a due consistence.

For internal purposes, Dr. Storck directs the fresh juice to be inspissated in an earthen vessel over a very gentle fire, till it acquires the consistence of a thick extract; which is to be mixed with as much of the powdered leaves as will reduce it into a mass for pills. This preparation produced very powerful and salutary effects in some diseases that were reputed incurable, acting, though slowly and insensibly, as a high sedative. He relates instances of inveterate scirrhous cancers, and the worst kinds of ulcers and fistulæ, being completely cured by its use; and says, that it also relieves recent carcinomata, or at least restrains their progress. He begins always with small doses, giving one pill of two grains, first twice a day, then thrice a day, and gradually increasing the number to six or more for a dose. The good effects of the medicine were sometimes visible in a few days, though the cure generally required several months.

It appears from several late trials of this medicine, both in England and Ireland, particularly by Dr. Fothergill and Dr. Rutty, that, though it is far from answering the high expectations which Dr. Storck had formed of it, it may, nevertheless, be a very useful acquisition, and may assist in curing or alleviating disorders, in which the common medicines

dicines are insufficient. In real cancers, whether ulcerated or occult, there is no instance of its effecting a complete cure; but it has been found to retard the progress of this disease, to mitigate the pain, and to change the thin, ichorous, fetid discharge, to a state more approaching that of laudable pus. In different kinds of ulcers it likewise mended the discharge, and disposed the ulcers to heal. Some scrophulous tumors have been completely resolved by it, and the cure has stood for several seasons; in other cases of this kind, the patient has frequently relapsed, especially in the spring. Dr. Fothergill observes, that the success of this medicine depends on its being given in as large a dose as the patient can bear; that the *hemlock* is in greatest perfection when the flowers begin to fade, and the habit of the plant inclines to yellow; and that in making the extract, the less heat it undergoes, the better; that he has found twenty grains of one sort of extract equal in efficacy to near forty of another; that the dose is to be increased by degrees, till it produces certain effects, which seldom fail to attend a full dose, and which are generally a giddiness of the head, and motions of the eyes, as if they were pushed outwards, or a slight sickness and trembling agitation of the body, or a laxative stool or two; that here we must stop till these effects subside, and in three or four days advance a few grains more; that a greater quantity can commonly be borne at night than at noon, and at noon than in the morning; that the method he usually pursues is to order two drams of the extract to be made into thirty pills, of which two are to be taken in a morning, two at noon, and three or four at night, and one pill added to each dose, as the patient can bear it; that the extract, given in this manner, is apparently anodyne, promotes rest, and eases pain; seldom creates thirst, or that kind of morning head-ach which succeeds an opiate; rarely occasions costiveness, but in most cases procures a laxative stool the next day; that in some habits very small drops offend the stomach, excite inordinate twitchings, heat, and thirst; and that in such cases its use is immediately forbid. Lond. Med. Mus. and Inq. vol. iii. p. 209 and p. 469, &c. vol. iv. p. 358, &c. vol. v. p. 113, &c.

The root of *hemlock* is generally supposed to have greater activity than the leaves, both when applied externally, and when taken internally. The juice applied on a drop or two to the tongue, will occasion rigidity, pain, and swelling, so as to prevent speech, which Dr. Storck says may be removed by washing and rubbing the tongue with citron juice. In drying it loses its virulence; and there are instances, in which twenty and thirty grains have been given, with advantage, in scirrhuses of the liver, in quotian agues on the approach of a fit, and even in acute fevers. The seeds have been recommended by some as demulcent, paregoric, and antiphrodisiac. Lewis's Mat. Med.

HEMLOCK, *bastard*. See LOVAGE.

HEMLOCK, *lesser*, *Æthusa*, a genus of the *pentandria digynia* class. This is also called fool's parsley, and is a kind of poisonous weed frequently found in gardens and rich ground. It may be distinguished from parsley by the narrowness of the small leaves, which are also more pointed, and of a darker green.

HEMLOCK, *water*, *Cicuta*, a genus of the *pentandria digynia* class: the characters are, that it has an umbellated flower; the principal umbel is composed of several smaller, called rays, and has no involucrum, as the smaller have; the flowers have each five petals, nearly equal, turning inward, and five hairy stamina; the germen is situated below the flower, and supports two slender styles, which are permanent, and longer than the petals, and afterward becomes a roundish channelled fruit, dividing in two parts, containing two oval seeds, plain on one side and convex on the other. There are two species, one of which grows naturally to the height of near four feet, in stagnant waters, in many parts of England. It has a branching hollow stalk, garnished with winged leaves; the stalks are terminated by umbels of yellowish flowers, which are succeeded by small channelled seeds, like those of parsley. It flowers in June and July, and the seeds ripen in autumn.

The leaves are commended by Blancard in virulent inflammations of the penis; internally, it is an emetic. It is supposed to be much like the common *hemlock* in its nature and quality, but more poisonous: it is therefore very seldom used in the shops. Wepfer has wrote a treatise entirely on this plant. Miller.

The CICUTA so much celebrated among the ancients was the juice of a species of this plant, called *œnanthe aquatica dicta tale*.

The second species grows naturally in North America.

HEMLOCK *drop-wort*, see *Water* DROP-WORT.

HEMP, *Cannabis*, in *Botany*, a genus of the *dioecia pentandria* class. Its characters are these: it is male and female in different plants; the male flowers have a five-leaved concave empalement, without petals, but have five short hairy stamina, terminated by oblong, square summits: the female flowers have permanent empalements, of one leaf, without petals, but a small germen, which afterward becomes a globular depressed seed, inclosed in the empalement. We have but one species of this plant, which is propagated in the rich sandy parts in Lincolnshire in great quantities, for its bark, which is useful for cordage, cloth, &c.

Hemp bears a near analogy to flax, *linum*; in respect of form, culture, and use. It rises quick into a tall, slender sort of shrub, whose stem, however is hollow, and big enough to be charred; and is often thus used in the composition of gunpowder. Its leaves arise by fives or fives from the same pedicle, and are a little jagged; yielding a strong smell, which affects the head. Its flowers grow in clusters, opposite to each other, in manner of a St. Andrews cross; each consisting of five yellowish stamina, encompassed with a like number of petals, purple without, and white within; its fruit, or seed, is small and round, filled with a white solid pulp, and grows on the top of the stem, having its stalks distinct from those of the flowers: lastly, its bark is a tissue of fibres, joined together by a soft matter, which easily rots away.

Hemp is always sowed on a deep, moist, rich soil, such as that of Holland, Lincolnshire, and the fens in the isle of Ely, where it is cultivated to great advantage, as it might in many other parts of England, where there is the like soil; but it will not thrive on cold clay, or stiff cold land. It is esteemed very good to destroy weeds, which is no other way effected but by robbing them of their nourishment; for *hemp* greatly impoverishes the ground, so that this crop must not be repeated on the same land. Miller.

The best *hemp-seed* for sowing, is that which looks brightest, and which will retain its brightness, and not break when rubbed. It should be always of the growth of the preceding year, and every second or third year taken from a different soil. Three bushels of seed are the general allowance for an acre; but the richer the land is, the thicker it should be sown; and the poorer on the contrary the thinner sown. Some people only give the land one ploughing for *hemp*, which is just before they sow it; but others prepare it as finely as the gardeners do their mould. For this purpose it should be ploughed once in the preceding autumn, and two or three times in the spring; and after the first spring plowing in February, it should be well manured; though M. Du-Hamel recommends the laying on of the manure before the winter ploughing, that the dung may rot on the ground, and be afterwards thoroughly mixed with the earth by the spring ploughings. The time for sowing *hemp* is from the beginning of April till the end; and the best season is just after a gentle fall of rain. The seed must not be buried, but only just covered in the ground. When *hemp* is chiefly cultivated for the seed, it is much the best way to sow it thin; and if the plants are raised on ridges, and horse-hoed, the seed will be superior to what is obtained from broad-cast *hemp*; and with respect both to seed and *hemp*, it will be best to drill it in equidistant rows, and to hand-hoe it, which will improve both the land and crop; and less manure will suffice than when it is sown by hand. If it be sown in a dry time, it must be at first carefully preserved from the *birds*, which are great devourers of the seed before it shoots. When the plants are come up, they should be hoed out like turnips, leaving the plants twelve or fifteen inches apart, and cutting down all the weeds. This crop will require a second hoeing about a month or six weeks after the first, in order to destroy the weeds; after which the hemp will soon cover the ground, and prevent the growth of weeds.

An acre of *hemp* in the best land yields from two to three quarters of seed; and this seed, with the *hemp* unwrought, is worth from 6*s* to eight pounds; and if the *hemp* be wrought, from ten to twelve pounds, or more; but the male, or *fimble-hemp*, is not worth more than half as much as the other. The growing of *hemp* on proper lands would not only be a great advantage to the farmers, but also to the poor, as it would give them a second harvest-work after the corn-harvest was over, and which would employ them even in wet seasons; yet it is a piece of husbandry too much neglected among us.

It does not appear, that the ancients were acquainted with the use of *hemp*, in respect of the thread it affords. Pliny, who speaks of the plant in his Natural History, lib. xx. cap. 23. says not a word of this; contenting himself with extolling the virtues of its stem, leaves, and root. In effect, what some writers of the Roman antiquities remark,

mark, viz. that the *hemp* necessary for the use of war was all stored up in two cities of the western empire, viz. at Ravenna and Vienne, under the direction of two procurators, called *procuratores linthia*, must be understood of linum, or flax.

The culture and management of *hemp* makes a considerable article of agriculture; there being divers operations required therein: as *pulling*, *watering*, *beating*, *swingling*, &c.

The first season for pulling the *hemp* is about the middle of August, when they begin to pull the male plants, which the farmers call the *simple-hemp*: but Mr. Miller says it would be better to defer this for a fortnight or three weeks longer, till these male plants, which contain the *farina fœcundans*, have shed their dust; without which the seeds will prove abortive, produce nothing if sown the next year, and fetch no price at the oil-mills, because they are only empty husks, without any kernel for yielding the oil; but they begin to decay after having shed their farina. The signs of its maturity are the yellowness of its leaves, and the whiteness of its flakes. The remaining plants, which are the female *hemp*, called by the farmers *true-hemp*, are to be pulled a little after Michaelmas, when the seeds are ripe. The ripeness of the female *hemp* is known, not only by the same signs as that of the male, but also by the seeds beginning to turn brown, and by the capsules which contain them beginning to open.

The way of gathering it, to pull it up by the roots; after which, they bind it up in handfuls, or bundles. The female they let stand eight or ten days in the air, that the seed may dry and ripen; after which they cut off the heads, and beat or thresh them, to get out the seeds. The seed which falls out easiest is always ripest, and best, and should therefore be reserved for sowing the next spring; and as to that which remains in the heads after this operation, it is got out by combing the heads on the teeth of a ripple, which pulls off the leaves, the husks of the seeds, and the seeds themselves, all together. These are gathered in a heap, and left in that condition for a few days, in order to their heating a little, after which they are spread out to dry; then they are threshed, and the seeds are separated by winnowing and sifting. This second seed is much inferior to the first, and accordingly it is used only for extracting oil from it, or feeding of poultry. They also beat the male, to get out a hurtful, thick, fetid sort of dust contained therein.

This done, they proceed to *water* or *rate* it, by laying it five or six days in a pool, or other stagnant water, to rot the bark; so that it may be the more easily separated from the reed. A stream, or running water, would do the business much better, but that it infects the water, and gives it a quality very pernicious to the health: for which reason it is forbid to put it in any waters used for domestic purposes.

When it is sufficiently *rotted*, and taken out again, they dry it; for which there have been various contrivances. In many parts of France they dry their *hemp* in a kind of cavern, described by M. Du-Hamel and Marcandier, which is generally six or seven feet high, five or six feet wide, and nine or ten feet long. At about four feet above the floor of this drying place, and two feet from its entrance, three bars of wood, about an inch thick, are placed across the cavern, from side to side, and there fixed. On these bars the *hemp* is laid about six inches thick, and under it is kept a small fire made of the fragments of the reeds of *hemp* that has already been broken or peeled. When a small quantity of *hemp* is to be dried, an oven, of a moderate heat, is the safest method; and when the quantity is greater, it is useful to dry it in a kiln; and the best fuel that can be used for this purpose, is coke.

When the *hemp* is sufficiently dried, they proceed either to peele, by taking one flake after another, breaking the reed, and stripping off the bark, or to break or *brake* it. The operation of breaking *hemp*, or beating out the dry bun or hex, which is the woolly part of the stem, from the rind or bark which covers it, is performed three ways, viz. by beating the *hemp* with beetles, which is laborious and tedious; or by a toothed instrument called a *brake*, beginning with the root end; or, which is the best method, by fluted rollers, that are wrought by horses, wind, or water. The Moravian *hemp-mill* used in America is a good instrument for this operation: it consists of a large, heavy stone, shaped like a sugar-loaf, with the small end cut off: this is moved by a water-mill, and the *hemp*, being laid on the floor, is bruised by the weight of the stone falling over it. Mr. Robert Macpherson, assistant secretary to the commissioners and trustees for improvements in Scotland, has lately invented a new water-mill, and foot machines, for breaking, scutching, and beating flax and *hemp*.

When the bun is sufficiently broke, and hangs by small shivers, they *swingle*, *scutch*, or beat it out with a piece of wood, caged for the purpose, called a *swingle-board*, or *scutcher*. But this operation is now performed more expeditiously by means of water-mills, in which several scutchers fixed in the same axle-tree, are moved with great velocity. The intention of this process is to separate the reed from the *hemp*. Note, the *tarie-hemp* they sometimes break with the fingers and strip off the rind, without the help of the brake or swingle.

The next thing is to *heat*, or *hetle*, the *hemp*; which is done either on a block, or in a trough, with a hammer, or with beetles, till it feels sufficiently soft and pliable. The hectics used for this purpose are moved either by hand or by water. M. Marcandier, in his Treatise on *Hemp*, translated into English in 1760, proposes, instead of heatchling and beetling the *hemp*, to give it a second steeping after it has been peeled or broken, in order to soften the bark, and then the more easily to bring it to a proper degree of limpness. The *hemp* is for this purpose, to be divided into small parcels, and tied loosely with packthread, and thus laid in a vessel of water, where it is to remain for a longer or shorter time, according to the hardness of its fibres, and the quantity of glutinous matter adhering to it. Afterwards it should be washed clean in a running stream; and if many of the fibres of the *hemp* are found to cling together, he advises to beat it in the manner that linen is beaten in bleaching. After this watering, the parcels are opened, spread on a board, and laid in the sun to dry. The *hemp* may be again steeped and washed in a ley of pot-ash, or wood ashes, which will shorten the time required for bleaching. M. Marcandier also used for this purpose a ley, prepared of horse-chestnuts peeled, and reduced into soft water, in the proportion of two or three nuts to every quart of water. This ley is to be used rather hotter than the hand can bear; and the *hemp*, after having been steeped and washed in it, is carefully dried, and then tied up in bundles. *Hemp* thus prepared, lays the same author, may be died *like silk*, wool, or cotton, and made into various cloths and garments, which will be in no danger of being destroyed by those worms that eat woollen cloth. The *hemp* remains now to be *heckled*, or pulled through divers toothed instruments, not unlike the wool-dresser's combs, to different fineness: this separating the shorter tow from it, the reft is fit to be spun, wove, &c. for thread, cordage, or the like.

Hemp-seeds are used in medicine on many occasions; but they are suspected of being bad for the head. An emulsion made from them, by trituration in water, and decoctions of them in milk, are of great use in old coughs, and the jaundice. They have been formerly believed to occasion impotency; but that is not at all likely; for they not only cause hens to lay eggs in plenty, if given moderately, but the famous banguc, so much used by the Persians and Indians to invigorate them, is a species of *hemp*. Miller.

HEMP, *bastard*, *Dutch*, *in Botany*, a genus of the *decandria dodecandria* class. Its characters are these: there are male and female flowers in different plants; the male flowers have a five-leaved empalement, but no petals, with ten stamina; the female flowers have no petals, but empalements like the male, with an oblong pervious germen, supporting three styles, and an oblong triangular capsule with three valves, filled with small seeds, adhering to the three sides of the capsule. There are two species. Miller.

HEMP, *water*, *in Botany*. See *Water-hemp* AGRIMONY.

Bastard HEMP-*agrimony*. See AGERATUM.

HEMP-*agrimony*, *water leaved*. See VERBESINA.

HEMP-*agrimony*. See *Hemp*-AGRIMONY.

HEN, in *Ornithology*. See *Tame* FOWL, and GALLINACEOUS.

HEN, *Guinea*. See GUINEA-*hen*.

HENBANE, *Hyoscyamus*, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are these: the flower has a cylindrical empalement of one leaf, which is permanent; it has one funnel-shaped petal, cut into five obtuse parts, with five inclined stamina; in the centre is situated a roundish germen, which becomes an obtuse capsule, divided into two cells by an intermediate partition, opening with a lid at the top, to let out many seeds which adhere to the partition. There are six species.

The roots of the common *henbane* are used for anodyne necklaces, to hang about children's necks, to prevent fits, and cause them to breed their teeth easily; but they are very dangerous to use inwardly. Miller.

There are two kinds of *henbane* seed used in medicine, which possess the same narcotic virtues, but in a different degree; the white is the milder of the two, and therefore generally prescribed. They are recommended in many cases, particularly in spitting of blood, sharp defluxions

fluxions on the lungs, and likewise in some convulsive disorders. This medicine, however, is of suspicious qualities, and appears at best to be only a precarious succedaneum to the products of the poppy.

Henbane has been always esteemed poisonous; and we have a late account of the manner of its affecting those who have taken it, from Toucy in France, which appears very singular. See Phil. Transf. N° 450. p. 449.

Henbane-seed, is used by many people in the tooth-ach, and in several other maladies, and is an ingredient in some of the officinal compositions, particularly in the philonium Romanum; but it has been found, when taken alone, to be poisonous. Sir Hans Sloane gives an account in the Philosophical Transactions, of some children who, eating the seeds of the common *henbane*, were affected with intense thirst, ravings, dimness of sight, and a profound sleep, which in one of them lasted two days. These were all recovered by bleeding, blistering, purging, and vomiting. What Sir Hans observes particularly of the case is, that the delirium which was occasioned by these seeds was not of the common kind, but was of the nature of that produced by the datura, a species of stramonium, and by the bangue of the East Indies, which is a plant with leaves like hemp. Phil. Transf. N° 430.

The virtues of this seed may compensate for the mischief it may do when taken in any improper manner; in the tooth-ach nothing perhaps is equal to it. Sir Hans Sloane mentions an account of a quack who cured this pain immediately by burning these seeds, and causing the vapour to be received into the tooth through a funnel. The empiric slily contrived to have some small maggots conveyed at the same time into a pail of water placed under the patient's head, which he pretended to have fallen out of the tooth; by the virtues of the medicine; but these being bred up to their change, became small beetles, and were doubtless of the common kind.

HENBANE, *yellow*. See TOBACCO.

HENBANE-*bird*, in *Natural History*, a name given by some to a peculiar insect found very frequently on that plant in the summer months. It is one of the curiosities of authors, and is very well described by Lister in the Philosophical Transactions. It is a very large cimex, of a fine red, spotted with black. It feeds on the juices of the *henbane*, whole leaves and stalks it pierces with its trunk. It is very remarkable that the juices of this stinking plant become of a very agreeable and aromatic flavour in the body of this insect; and on trial it may perhaps be found, that the mischievous narcotic quality of the plant may be rendered wholesome, and a good medicine, in the body of this insect. Phil. Transf. N° 71.

In June and July it is common to see several *scries* of oblong orange-coloured bodies adhering to the upper sides of the leaves of this plant; these are the eggs of this cimex. These eggs are white in the belly of the insect, and whitish when laid first; but they grow more deep-coloured when the young one come near the time of hatching. They are hatched into perfect cimices, not into worms. These eggs yield a colour, which is so fine, that it may be worth introducing into use in some manner; it is a fine lively carnation. There needs no more to obtain it, but the rubbing or crushing the eggs, while fresh, upon white paper. The insects themselves are so common, that from May to the end of June it is scarce possible to find a plant without them; and the eggs are not less frequent in their season, in hot weather. They are sometimes laid in May, but never later than June; their colour is apt to fade of itself; but this might probably be much assisted as to holding, by alum, or other additions.

HENDECAGON, compounded of ἑνδεκα, *eleven*, and γωνια, *angle*, in *Geometry*, a figure which has eleven sides, and as many angles.

HENDECAGON, in *Fortification*, is used for a place defended by eleven bastions.

HENDECASYLLABUM, Ἑνδεκασύλλαβον, compounded of ἑνδεκα, *eleven*, and συλλαβὴ, *syllable*; of συλλαμβάνω, *I comprehend*, in Greek and Latin *Poetry*, a VERSE of eleven syllables.

Sapphic and Phalœcic verses are, *hendecasyllaba*, or *hendecasyllabic*. E. g.

Sap. *Jam satis terris nivis atque diræ.*
Phal. *Passer mortuus est meæ puellæ.*

HENED-*penny*, in our *Old Writers*, a customary payment of money instead of *hens*, at Christmas. It is mentioned in a charter of king Edward III. Mon. Angl. tom ii. p. 327. Du-Cange is of opinion it may be *hen-penny*, *gallinagium*, or a composition for eggs; but Cowel thinks it is misprinted *hened-penny* for *hened-penny*, or *head-penny*.

HEN-HARRIER, in *Ornithology*, the English name for the *falco cyaneus* of Linnæus, which has been supposed to be the male subbuteo, the female of which is so very different, that it has been called by another name, the RING-TAIL. But males have been lately discovered of this species.

The *hen-harrier* is smaller than the ring-tail; its head, neck, and back, are of a dove-colour; its shoulder-feathers, however, are somewhat brownish; its rump is somewhat whitish, and its breast of a fine clear white, variegated with transverse brown spots; its wings and tail are grey or dove-coloured, variegated with black, and its legs smaller and slenderer than is usual in the hawk-kind, and of a yellow colour. These birds, which fly near the surface of the ground in search of prey, and breed on the ground, without ever settling on trees, are extremely destructive to young poultry, and the feathered game. Ray and Pennant.

HEN-HOUSE, a place or building for confining or sheltering poultry.

HENIECOE, in *Botany*, a name given by the people of Guinea to a species of plant which we are unacquainted with, but which they give with very great success in all kinds of the colic, boiled in water. Phil. Trans. N° 232.

HENIOCHAS, Ἡνίοχος, *Auriga*, in *Astronomy*, a northern constellation. See AURIGA.

HEN-MOULD, *soil*, in *Agriculture*, a term used by the husbandmen in Northamptonshire, and other counties, to express a black, hollow, spungy, and mouldering earth, usually found at the bottoms of hills.

It is an earth much fitter for grazing than for corn, because it will never settle close enough to the grain to keep it sufficiently steady while it is growing up, without which, the farmers observe, it either does not grow well; or, if it seems to thrive, as it will in some years, the growth is rank, and yields much straw, but little ear.

It is too moist, and in that is principally to be attributed the rankness of the crop in some years, and the occasion of its retaining so much moisture is, that it usually has a bed of a stiff clay, which will not let the water run off into the under strata.

In some places they also give this name to a black, rich, and dense earth, with streaks of a whitish mould in many parts. This sort of *hen-mould* is usually found very rich and fertile. Morcton's Northamp. p. 37.

HENNA, in *Botany*, a name given by Ludwig to a genus of plants, called *alkea* by Dr. Shaw and others, and since named by Linnæus LAWSONIA.

HENOTHRIX, in *Natural History*, the name of a fly of the setiçauda or hair-tailed kind. This is distinguished from the others by having only one hair, and is called also by some unicta. The whole body of this species is black, except the middle of the back and belly, which are red; the wings are silvery, and the antennæ very small and black. It is very common in the warm climates, and is usually found sitting on the ammi, or bishop's weed; whence it is called by some the ammi fly.

HENOTICUM, Ἑνωτικὸν, q. d. *reconciliative*, of ἑνω, *I unite*, in *Church History*, a famous edict of the emperor Zeno, published A. D. 482, and intended to reconcile and re-unite the Eutychians with the Catholics.

It was procured of the emperor by means of Acacius, patriarch of Constantinople, with the assistance of the friends of Peter Mongus and Peter Trullo.

The thing of this edict lies here; that it repeats and confirms all that had been enacted in the councils of Nice, Constantinople, Ephesus, and Chalcedon, against the Arians, Nestorians, and Eutychians, without making any particular mention of the council of Chalcedon. It is in form of a letter, addressed by Zeno to the bishops, priests, monks, and people of Egypt and Lybia. It was opposed by the Catholics, and condemned in form by pope Felix II.

HENRICIANS, in *Ecclesiastical History*, a sect so called from *Henry* its founder, who, though a monk and hermit, undertook to reform the superstition and vices of the clergy; for this purpose he left Lausanne in Switzerland, and removing from different places, at length settled at Thoulouse in the year 1147, and there exercised his ministerial function, till being overcome by the opposition of Bernard abbot of Clairval, and condemned by pope Eugenius III. at a council assembled at Rheims, he was committed to a close prison in 1148, where he soon ended his days. This reformer rejected the baptism of infants; severely censured the corrupt manners of the clergy; treating the ceremonies and festivals of the church with the utmost contempt, and held clandestine assemblies for inculcating his peculiar doctrines. Mosheim's Eccl. Hist. vol. ii. p. 448. ed. 8vo. 1768. See PETROBUSIANS.

HENRICUS *rubens*, in the affected language of some chemists, a name given to vitriol when calcined to a redness.

HENTINGS, in *Agriculture*, a term used by the farmers for a particular method of sowing before the plough: the corn

corn being caſt into a ſtraight line juſt where the plough is to come; is by this means preſently ploughed in. By this way of ſowing they think they ſave a great deal of ſeed and other charge, a dextrious boy being as capable of ſowing this way out of his hat, as the moſt ſkilful ſeeds-man. Plott's Hiſt. of Oxfordſhire, p. 251.

HENTING is alſo a term uſed by the plowmen, and others to ſignify the two furrows that are turned from one another at the bottom, in the ploughing of a ridge. The word ſeems to be a corruption of *ending*, becauſe thoſe furrows make an end of ploughing the ridges. The tops of the ridges they call veerings.

HENWEED, *Guinea, Peterwia*, in *Botany*, a genus of the *hexandria tetragynia* claſs. Its characters are theſe: the flower hath a permanent empalement; it hath four ſmall white petals, placed in form of a croſs, which ſoon fall off; and ſix awl-ſhaped erect ſtamina, terminated by ſingle ſummits; in the centre is ſituated an oblong compreſſed germen, with four awl-ſhaped ſtyles; the germen afterward becomes one oblong ſeed, narrow at the bottom, and riper, but broad, and indented at the top, reſembling an inverted ſhield, armed with the acute ſtyle, which is reflexed.

We know but one ſpecies of this plant, which is a very common plant in Jamaica, Barbadoes, and moſt of the other iſlands in the Weſt Indies, where it grows in ſuch plenty as to become a very troubleſome weed. In Europe this plant is preferred in the gardens of thoſe perſons who are curious in botany; but there is little beauty in it; and having a ſtrong rank ſcent upon being handled, it is but little valuable. Miller.

HEORIPENNY, in our *Old Writers*, the ſame with what at firſt was called *Romſcot*, and afterwards PETER-*pence*.

The word is Saxon, from *hearth*, *focus*, a *hearth*, and *penning*, *denarius*, a *penny*.

HEPAR, in *Anatomy*. See LIVER.

HEPAR, in *Chemiſtry*. See LIVER.

HEPAR *ſtibiatum*, the ſame with PLACENTA.

HEPATIC, in *Medicine* and *Anatomy*, ſomething that relates to the liver; by the Greeks called ἡπατικὸς, *hepar*.

HEPATIC *aloes*. See ALOES.

HEPATIC *duct*, is a veſſel more uſually called *porus* BILARIUS.

HEPATIC *flux, fluxus hepaticus*, a flux of the belly of a very ſingular kind, and ſo rarely met with, that many authors have confounded the accounts of it with thoſe of dyſenteries and hæmorrhoidal fluxes. The ſigns by which it is known, are theſe: the patient voids by the anus a liquid matter, reſembling water in which raw fleſh had been waſhed; this is attended with pains and a ſenſe of weight and tenſion in the abdomen, and ſpaſtic motions about the loins, which ſometimes extend themſelves to the right-ſide, toward the region of the liver. In ſome patients there is no ſenſation of any pain, or any particular ſymptom, and in ſome a teneſmus is joined continually with this voiding of a bloody flux.

The perſons principally ſubject to this diſeaſe are men, and thoſe between the age of eighteen and forty for the moſt part, as alſo ſuch as are of a ſanguineo-phlegmatic habit, and of a ſedentary life. This diſeaſe is obviouſly diſtinguiſhed from a dyſentery, in that there is always in that diſeaſe blood mixed with a mucous matter voided, which is not at all the caſe in this; and in that there is always more or leſs of a fever attending, whereas in this there is none.

Cauſes of it. The ancients ſuppoſed this to be owing to a debility in the liver, which was not able in this caſe properly to attract or retain the blood. But it ſeems rather to belong to the hæmorrhoidal diſcharges; and as in the menſes, when the pure and proper blood is not diſcharged, a bloody water is; ſo in theſe caſes when true blood is not voided, this fluid comes in its place. This flux is never dangerous at the time; but when it is long continued it will at length wear down the ſtrength, and bring on bad habits.

Method of cure. This is to be treated in the ſame manner as a hæmorrhoidal diſcharge when obſtructed, and attenuating and abſterging medicines are to be given, with gentle purges. Rhubarb, in doſes from a ſcruple to two or more, is to be given every day for a long time; after this nitre, tartarum vitriolatum, the alkaline ſalts of plants, as of wormwood, with the abſorbent powders, ſuch as crabs eyes; and to theſe may be added ſtoechas, tops of ſmall centaury, and the like herbs. Junker's Conſp. Med. p. 50.

HEPATIC *plants*. See PLENUS *hepaticus*.

HEPATIC *vein*, is that otherwiſe called BASILICA.

HEPATI-CYSTIC *ducts*. See CYSTI-HEPATIC *duct*.

HEPATICA, in *Botany*. See LIVER *wort*.

HEPATIS *infarctus*, in *Medicine*, the name of a diſeaſe conſiſting in a ſtagnatory congeſtion of the blood in the liver. This is of two kinds, the one owing to an immediate contraction of the liver, which is uſually the caſe when this happens to adults; the other is owing to a too great expanſion of that viſcus, which is the caſe more frequently in youths. Either of theſe diſtempratures of this organ prevents the free paſſage of the blood through it, and by that means lays the baſis of this infarction.

Signs of it. Theſe are a ſtraitneſs of the præcordia, eſpecially about the right hypochondrium, and a difficulty of breathing, a heavy and obtuſe pain in the ſame part, which ſometimes becomes pulſative, an uncertain and irregular heat of the whole body, and frequent flushings of the face; a violent thirſt at times, but not continual, a ſtrineſs of the mouth, and often a bitter taſte in it; a glutinous texture of the ſpittle; a dry cough, a loſs of appetite, and laſſitude of the limbs; uneaſy, and not found ſleep, frequent toſſing about while in bed; a flaccid habit of body; and to all theſe it is to be added, that the urine is thin and limpid at firſt; but as the hectic, that always attends it, increaſes, it becomes of a deep orange colour, and finally depoſits a deep red ſediment; and in caſe of an expanſion of the liver being the cauſe, the right hypochonorium is ſenſibly ſwelled.

Perſons ſubject to this diſorder, are principally ſuch as are of a ſluggiſh and ſedentary, or idle life; ſuch as have omitted uſual bleedings, or have had ſuppreſſions of the natural diſcharges by the hæmorrhoids or menſes, and ſuch as uſe too thick a diet.

Cauſes of it. Theſe are a plethora, joined with a too great thickneſs of the blood, and this occaſionally increaſed by improper treatment in different diſeaſes, as in intermittents, with too powerful aſtringents; and in acute fevers with too cooling a regimen or the abuſe of the volatile ſalts in large doſes. To theſe may be added violent paſſions of the mind; and the ſudden chilling the body when very hot.

Prognoſtics. This is a diſeaſe that when recent admits of a cure under the proper methods of treatment; but when neglected, it very eaſily degenerates into a ſcirrhus, and finally into a hectic and a dropſy.

Method of cure. This differs greatly in regard to the different cauſes of the diſeaſe, which, as before obſerved, are exact contraries; it ſometimes ariſes from an over-contraction, ſometimes from an over-expanſion of the liver. In caſes ariſing from the expanſion, the ſame method is to be uſed as in infarctions of the SPLEEN. But on the contrary, when it ariſes from a contraction of this viſcus, the method muſt be this: the prime viæ muſt be firſt cleanſed and evacuated by gentle purges; after this bleeding in the foot is to be ordered, and then the matter impacted in the liver is to be incided and attenuated by decoctions of dande-lion and pimpernel roots, with maiden-hair, ſorrel, dodder, and daiſy-flowers; after this the gums, as ammoniacum, and the reſt, are to be taken; and after theſe the digeſtive ſalts, as tartarum vitriolatum, nitre, and the like; and during the uſe of theſe, all the external medicines of the emollient kind are to be applied to the right hypochondrium; but this not continually, but at different intervals, leſt they ſhould bring on a ſuppuration in the liver. Junker's Conſp. Med. p. 204. &c.

HEPATITIS, in *Medicine*, the name of an acute, continuous, and inflammatory fever, in which nature frequently and forcibly propels the humours through the liver, ſeemingly with intent to reſolve and abſterge congeſtions and ſtaſes of the blood in that viſcus.

The *hepatitis* is diſtinguiſhed from all other fevers by the ſeat of it in the liver, and by its being of all fevers the moſt fatal. It differs however in degree, ſome caſes depending on a more ſuperficial, ſome on a deeper and more internal inflammation of the liver.

Signs of it. This dangerous fever uſually ſeizes the patient with a chillneſs, which laſts a conſiderable time; this is at length ſucceeded by a violent heat, which is much more intenſe ſometimes than at others, and is attended with an inſupportable thirſt. The patient perceives a ſevere and heavy pain on the right ſide about the ſeventh or eighth rib, and is afflicted with a violent ſtraitneſs of the breaſt, and difficulty of breathing, and the extremities are very apt to become cold. After drinking any thing they uſually belch, and the narrowneſs of the breaſt and difficulty of breathing always increaſe upon this, though not the pain. Often alſo there are nauſeas and reachings to vomit, and a bilious matter is thrown up, and ſometimes ſpaſtic motions of the throat are very frequent and painful. The one or the other of theſe ſymptoms occur, as the pibbous ſide or the other part of the liver are affected. The cough attending this diſeaſe is dry, and not violent, and the ſweats are continual, but moderate, and eaſily ſtruck back, or often cold and clammy. The urine for the firſt days is reddiſh and thick, and about the fourth day it uſually begins to depoſit a ſediment,

diment, the remaining part of it being however ſtill turbid; the ſediment is mucous, and of a pale fleſh-colour; it has ſo much the appearance of putrid matter, that many have ſuppoſed it to be ſuch; but theſe ſediments and true pus are eaſily diſtinguiſhed, as the pus always ſubſides immediately on making the water; but the other ſediment not till it has ſtood to be cold, and this ſediment becomes diſſolved and mixed again with the urine, if the veſſel containing it be ſet in hot water. This is one great proof of inflammation. Another very peculiar ſymptom in this diſeaſe is, that the patient very frequently changes colour, being at times pale, and at times brownith or yellowiſh; the yellowneſs principally affecting the eyes and face. The ſymptoms vary according to the degree of inflammation, and the particular part of the liver where it happens. The pain is ſometimes inconſiderable, but when the inflammation happens in the upper or convex part of the liver, it is more acute, the pulſe quicker, and the patient is often troubled with a dry cough, a hiccup, and a pain extending to the ſhoulder, with difficulty of lying on the left ſide, &c. In caſes where the matter in the liver comes to a ſuppuration, all the ſymptoms become more ſevere, the heat is greater, the reſpiration more difficult, and the anxieties and ſenſe of pain in the part, and the coldneſs of the extremities, all become greater. Finally, the breaking of the tumor is known by a ſudden remiſſion of the pain, with a terrible faintneſs and lowneſs of ſpirits, and a hectic; and when the matter is diſcharged into the cavity of the abdomen, it is known by the ſwelling of that part.

Cauſes of it. The general cauſes of the *hepatitis* are a plethora, and a derivation of blood into the liver, which there forms conglutions and ſtaſes; a ſcirrhus of the liver; violent ſhocks from ſtrong vomits, when the liver was before unſound; ſtones obſtructing the courſe of the bile; drinking ſtrong wines and ſpirituous liquors; uſing hot, ſpicy aliment; obſtinate hypocondriac affections, &c.

This is brought on by violent motions of the body; ſuch as running, dancing, leaping, and the like, and by endeavouring to lift great weights; by ſudden cooling the body at times, when the blood is in a great heat; by taking aſtringent medicines in inflammatory fevers, and by driving back the matter of cutaneous eruptions, ſuch as the St. Anthony's fire, and the like, into the blood; and, finally, by applying cold external medicines to the region of the liver, by ſopping upon the part.

Prognoſtics. The *hepatitis* is one of the moſt dangerous kinds of inflammation; and the deeper it lies the more obſtinate it is, and the more difficult to be diſcuſſed, and the more liable to corruption, which muſt occaſion immediate death, or elſe to maturating and breaking, which would be attended with no leſs danger, though not ſo ſudden. A vehement and unaccuſtomed commotion of the humours immediately at the beginning of this diſeaſe, is a bad omen. The more violently inflammatory fevers attack perſons in the morning, and that without any particular cauſe, the greater always is the danger. A conſtant hiccupping, violent fever, and exceſſive thirſt, are bad ſymptoms. This diſeaſe, if properly treated, is ſeldom mortal; though the cure of it is very difficult, and its manner of going off very variable and uncertain. In ſome caſes it goes off by regular diſcuſſion in a longer time, ſometimes by copious hæmorrhages of the noſe, or by profuſe ſweats which come on, on the regular critical days. Black matter, reſembling the rob of elder, whether diſcharged by vomit or ſtool, is a very bad omen, in this and all other inflammatory diſeaſes of this kind; but when voided by vomit, the danger is greater than when by ſtool.

Method of treatment. Bleeding is very proper in the beginning of the diſeaſe, and it will be often neceſſary to repeat it; and after this the bowels are to be kept gently open, not by ſtimulating purges, but by emollient glyſters, and the milleſt and gentleſt cathartics. A decoction of tamarinds, with a little honey or manna, will anſwer this purpoſe very well. The mixtura ſimplex is a very valuable medicine given ſeveral times a day; and in the intermediate hours the following powder is to be given: take purified nitre, and tartarum vitriolatum, each two drams; crabs eyes, and the jaw of a pike reduced to powder, and mixed with lemon-juice, of each four ſcruples; diaphoretic antimony, a dram. The doſe of this mixed powder is a ſcruple. When there is an inclination to ſweat, it ought to be promoted by plenty of warm diluting liquors, of the temperature of the human blood. While theſe things are given internally, the region of the liver ſhould be barbed externally with ſpirit of wine camphorated, impregnated with ſaffron. If the diſeaſe is very violent, a gentle anodyne may be mixed with one of the powders, to be taken at night; but this muſt only be done while the diſeaſe is in its increaſe; and above all things, reſt, moderate warmth, and a placid regimen, are to be obſerved. Junker's Conſp. Med. p. 227. and Buchan's Dom. Med. p. 339, &c. See LIVER.

HEPATITIS *Lapis*, in *Natural Hiſtory*, a name given by ſome of the ancients to a ferruginous ſtone of a yellowiſh red colour; others called a coarſe jaſper. and ſome a dirty kind of hyacinth, by this name: in ſhort, they ſeem to have called any thing *hepatitis* that was of a liver-colour. The ſtone moſt generally ſo called, however, ſeems to have been of the nature of ſome of our poor iron ores.

HEPATOSCOPIA, Ἡπατοσκοπία, formed of ἧπαρ, *liver*, and σκοπέω, *I conſider*, in *Antiquity*, a ſpecies of divination, wherein predictions were made by inſpecting the livers of animals.

HEPATOSCOPIA is alſo uſed as a general name for divination by intrails. See an account of the ſymptoms of the liver, whence good or evil were foretold, in Potter's Archæol. Græc. lib. ii. cap. 14. tom. i. p. 316. See EXTISPEX.

HEPATUS, *in Ichthyology*, the name of a ſea-fiſh caught in the Mediterranean, and remarkable for its colour, which is that of the liver, from whence it has its name. It is of a broad flat ſhape, and has very prominent eyes, and a remarkably broad tail, in which near the baſis there is a large black ſpot; its teeth are round and large, and ſomewhat pointed; and it has only one back-fin, the anterior rays of which are prickly, the hinder ones ſoft to the touch. Rondelet. De Piſc. lib. v. cap. 21.

This name is given by Bellonius, Geſner, and others, to the fiſh more uſually called *ſachetia*, and by ſome *channodella*.

All theſe however are arbitrary and unexpreſſive names. Artedi has referred the fiſh to its proper genus, which is the LABRUS, and calls it the labrus with the lower jaw longer than the upper, with a forked tail, and with black tranſverſe lines on the ſides.

HEPHÆSTIA, Ἡφαίστια, in *Antiquity*, an Athenian feſtival in honour of Ἥφαιστος, i. e. Vulcan; the chief ceremony of which was a race with torches. For an account of the ceremonies and games, on this occaſion, ſee Potter's Archæol. Græc. lib. ii. cap. 20. tom. i. p. 399.

HEPHÆSTIAS, in the *Hiſtory of the Ancients*, the name of a plaiſter uſed among the ſurgeons to excite a cicatrix. It was principally compoſed of burnt earth, or of the tiles that had been long burnt in the kilns, reduced to powder.

HEP, in the *Materia Medica*. See HIP.

HEPHTHEMIMERIS, compoſed of ἑπτὰ, *ſeven*, ἡμι, *half*, and μέρος, *part*, in the Greek and Latin *Poetry*, a ſort of verſe conſiſting of three feet and a ſyllable; that is, of ſeven half feet.

Such are moſt of the verſes in Anacreon.

Θέλω	νέκταρ	Λέγειν	ἔως
Θέλω	δὲ καὶ	μὲν α	θεὸς, &c.

And that of Ariſtophanes, in his Plutus:

Ἐπτὰ μὲν μέτρα χαμαὶ.

They are alſo called *trimetri catalectici*.

HEPHTHEMIMERIS, or HEPHTHEMERES, is alſo a cæſura after the third foot; that is, on the ſeventh half-foot. It is a rule, that this ſyllable, though it be ſhort in itſelf, muſt be made long, on account of the cæſura, or to make it an *hephthemimeres*. As in that verſe of Virgil:

Et furiis agitatus amor, & conſcia virtus.

It may be added, that the cæſura is not to be on the fifth foot, as it is in the verſe which Dr. Harris gives us for an example:

Ille latus niveum molli fultus Hyacintho.

This is not a *hephthemimeris* cæſura, but a hemeneamimeris, i. e. of nine half feet.

HEPSETUS, in *Ichthyology*, the name of a ſmall ſea-fiſh, called alſo ANGUILLA, and by ſome ATHERINA. It is long, ſlender, and almoſt pellucid; its tail is forked, and its back variegated with black ſpots. It is caught on the ſhores of the Mediterranean, and ſome other ſeas, and is of a delicate taſte, but very full of bones; whence it is not much valued.

HEPTACHORD, of ἑπτὰ, *ſeven*, and χορδὴ, *chord*, in the *Ancient Poetry*. *Heptachord* verſes were thoſe ſung, or played, on ſeven chords; that is, in ſeven different notes, or tones; and, probably, on an inſtrument with ſeven ſtrings.

HEPTAGON, of ἑπτὰ, *ſeptem*, *ſeven*, and γωνία, *angle*, in *Geometry*, a figure conſiſting of ſeven ſides, and ſeven angles.

If the ſides be all equal, it is called a *regular heptagon*.

HEPTAGON, in *Fortification*, a place ſtrengthened with ſeven BASTIONS, for its defence.

HEPTAGONAL *numbers*, are a ſort of polygonal numbers, wherein the difference of the terms of the correſponding arithmetical progreſſion is five.

One property, among others, of theſe numbers, is, that if they be multiplied by 40, and 9 be added to the product, the ſum is always a ſquare NUMBER.

HEPTAMERIS, literally ſignifies a *ſeventh part*; being formed of the Greek ἑπτὰ, *ſeven*, and μέρος, *part*, or *portion*.

The word is uſed by M. Sauveur, in his Principles of Acouſtics, for the ſeventh part of a MERIS; and, in his Syſtem, for the forty-third part of the octave.

HEPTAMERON, a term literally implying *ſeven days*; being compounded of ἑπτὰ, *ſeven*, and ἡμέρα, *day*.

It is chiefly uſed as a title of certain books, containing the tranſactions of ſeven days.

The *Heptameron* of Margaret de Valois, ſiſter to Francis I. of France, and queen of Navarre, is a very ingenious piece, in the manner of Boccace's Decameron.

HEPTANDRIA, in *Botany*, the ſeventh claſs of plants with hermaphrodite flowers, and ſeven male parts or ſtamina in each.

The word is formed of the Greek ἑπτὰ, *ſeven*, and ἀνὴρ, *male*.

This claſs comprehends four orders; viz. *monogynia*, which includes three genera, viz. horſe-cheſnut, trientalis, and diſſandra; *digynia*, having one genus, viz. linum; *tetragynia*, including one genus, viz. ſaururus; and *heptagynia*, of which there is alſo one genus, viz. ſeptas. See *Tab.* I. *Botany*. *Heptandria*, and *Tab.* IV. *Botany*, *Claſs* VII. See FRUCTIFICATION.

HEPTANGULAR *figure*, in *Geometry*, a figure with ſeven angles, or ſeven ſides.

HEPTAPHARMACUM, a relaxing, ſuppurating, and incarnating medicine, compoſed of ſeven ingredients. This is much talked of among the ancient writers in medicine. The ingredients were, cerus, wax, pitch, litharge, colophony, bull's fat, and frankincenſe. It is deſcribed by Actius in his Tetrab. ſerm. 3. cap. 27.

HEPTAPLEURON, *Septinervia*, having ſeven ribs; a word uſed in botany to expreſs a ſort of common plantain, every leaf of which has ſeven ribs belonging to it.

HEPTARCHY, compounded of the Greek ἑπτὰ, *ſeven*, and ἀρχὴ, *imperium*, *government*, a government compoſed of *ſeven* perſons; or a country governed by ſeven perſons, or divided into ſeven kingdoms.

The Saxon *heptarchy* included all England, which was cantoned out into ſeven petty independent kingdoms, peopled and governed by different clans and colonies; viz. thoſe of Kent, the South Saxons, Weſt Saxons, Eaſt Saxons, Northumberland, the Eaſt Angles, and Mercia. The *heptarchy* was formed by degrees, from the year 445, when firſt the kingdom of Kent was erected, and Hengiſt aſſumed the title of king of Kent immediately after the battle of Eglesford; and it terminated in 827, or 828, when king Egbert reunited them into one, made the *heptarchy* into a MONARCHY, and aſſumed the title of king of England. It muſt be obſerved, however, that though Egbert became monarch of England, he was not perfectly abſolute. The kingdom which he actually poſſeſſed conſiſted of the ancient kingdoms of Weſſex, Suſſex, Kent, and Eſſex, that had been peopled by Saxons and Jutes. As for the other three kingdoms, whoſe inhabitants were Angles, he contented himſelf with preſerving the ſovereignty over them, permitting them to be governed by kings, who were his vaſſals and tributaries.

The government of the *heptarchy*, reckoning from the founding of the kingdom of Mercia, the laſt of the ſeven Anglo-Saxon kingdoms, laſted two hundred and forty-three years; but if the time ſpent by the Saxons in their conqueſts from the arrival of Hengiſt in 449 be added, the *heptarchy* will be found to have laſted three hundred and ſeventy-eight years, from its commencement to its diſſolution. The cauſes of the diſſolution of the *heptarchy* were the great inequality among the ſeven kingdoms, three of which greatly ſurpaſſed the others in extent and power; the default of male heirs in the royal families of all the kingdoms, that of Weſſex excepted; and the concurrence of various circumſtances which combined in the time of Egbert.

HEPTATEUCH, in *Matters of Literature*, a volume, or work, conſiſting of ſeven books.

The word is compounded of ἑπτὰ, *ſeven*, and τεῦχος, *I do*, *I work*; whence τεῦχος, a *work*, *book*; and ἑπτάτευχος, *heptateuch*, a work of ſeven parts or ſeven different works joined in one volume.

Heptateuch is chiefly applied to the firſt ſeven books of the Old Teſtament; viz. Geneſis, Exodus, Leviticus, Numbers, Deuteronomy, Joſhua, and Judges; that is, the five books of Moſes called the *Pentateuch*, and the two following ones, which are uſually joined therewith.

HERACANTHA, in *Botany*, a term uſed by ſome authors to expreſs the common wild carline-thiſtle. See CARLINA.

HERACLEON, in *Botany*, a name given by ſome of the Greek writers to the lithoſpermum, or GROMWELL. It was originally called the *heracleon ſperma*, ἡρακλεῶν σπέρμα, *the heraclean-ſeed*, from the remarkable hardneſs of the ſeed; but the latter word was dropped, and the *heracleon* only preſerved. There is great reaſon againſt uſing the word dioſpyros as a ſynonym for the gromwell, becauſe it is a name given by ſome of the Greeks to a very different kind of vegetable, a ſort of cherry. Pliny, lib. xvii. cap. 11.

HERACLEONITES, ancient heretics of the ſect of the Gnoſtics; thus called from their leader, Heracleon.

St. Epiphanius, Hær. 36. is very ample on this hereſy. He repreſents Heracleon as one who had reformed the theology of the Gnoſtics in many points; though, at bottom, he had retained the principal articles thereof. He refined on the ordinary interpretations of abundance of texts of Scripture; and even altered the words of ſome, to make them conſiſt with his own notions.

He diſtinguiſhed two kinds of worlds; the one divine, the other corruptible; and reſtrained the word πάντα, *all things*, to this laſt. He held, that the Word did not create the world immediately, and of himſelf; but only that he gave occaſion to the demiurgos to do it.

The *Heracleonites*, after the example of their maſter, annulled all the ancient prophecies; holding that St. John was really the voice that proclaimed and pointed out the Meſſiah; but that the prophecies were only empty ſounds, and ſignified nothing. They held themſelves ſuperior, in point of knowlege, to the apoſtles; and, on that footing, dared to advance the moſt extravagant paradoxes, on pretence of explaining Scripture in a ſublime, elevated manner. They were ſo fond of theſe myſtic interpretations, that Origen, though a ſtickler that way himſelf, was obliged to reproach Heracleon with his abuſing Scripture by that means.

HERACLEUM, in *Botany*. See *Cow* PARSNEP.

HERACLEUS *lapis*, in the *Natural Hiſtory of the Ancients*, a name by which many have called the loadſtone. This was the name given to it by the ancient Greeks from Heraclea, a city of Lydia, near which it uſed to be found; but ſubſequent writers ſo far erred from the origin and orthography of the word, as to call it *herculeus lapis*, as if it had been named from Hercules.

The after-ages of the Greeks called it alſo *magnetis lapis*, but this was a name by no means applied to it in the earlier times, but then was uſed to expreſs a very different ſubſtance, a white ſilvery looking ſtone, which had no power of attraction, but was turned into beautiful veſſels for the uſe of the table; and the not attending to the ages in which the authors lived who uſe the word *magnetis*, has been the occaſion of great errors in their commentators, who did not conſider that in the ſucceſſion of a few ages, the ſame word became the name of two very different things. Hill's Theoph. p. 79. See BASALTES.

HERACLIA, Ἡράκλεια, in *Antiquity*, an Athenian feſtival celebrated every fifth year in honour of Hercules.

The Thebans and Thebans in Beotia obſerved a ſolemn feſtival in honour of Hercules, ſurnamed Musan, becauſe apples were offered to him. Beſides theſe there were other feſtivals kept in honour of Hercules; for a deſcription of all which, ſee Potter's Archæol. Græc. lib. ii. cap. 20. tom. i. p. 398, ſeq.

HERACLIDÆ, in *Antiquity*, the deſcendants of Hercules, whom the Greeks called Ἡρακλεῖδαι, *Heraclei*, from Ἥρα, *Juno*, and κλέος, *glory*, on account of the glory he acquired by executing what Juno induced him to undertake.

The *Heraclidæ* were expelled from Peloponneſus by Euriſtheus, king of Mycenæ, after the death of Hercules.

HERACLIDÆ, *return of the*, into Peloponneſus, is a celebrated epocha in the ancient chronology.

The time of this return is differently aſſigned; becauſe authors miſtake the divers attempts which they made to return, for the return itſelf. The firſt attempt was twenty years before the taking of Troy; the ſecond was a hundred years later, or eighty years after the taking of Troy. This laſt is ſuppoſed to have ſucceeded; at leaſt, according to Petavius, who mentions only theſe two. Rat. Temp. p. 1. lib. i. cap. 12. and Doct. lib. ix. cap. 30. Scaliger diſtinguiſhes three attempts; and fixes the firſt fifty years later than Petavius; viz. thirty years after the taking of Troy. He ſays nothing of the ſecond, which was unfortunate, like the firſt; but he places the third in the ſame year with Petavius.

As it occaſioned many changes and revolutions in the affairs of Greece, inſomuch that ſcarce a ſtate, or people, but were turned upſide down thereby, the return of the *Heraclidæ* is the epocha of the beginning of profane hiſ-

tory; all the time that preceded it is reputed fabulous. Accordingly, Ephorus, Cumanus, Callisthenes, and Theopompus, only begin their histories from hence. See *Newtonian Principles of* CHRONOLOGY.

HERACLITISM, in *Antiquity*, denotes the philosophy of *Heraclitus*, who was born at Ephesus, and flourished about the sixty-ninth Olympiad. This philosopher differing from the vulgar concerning the nature of the gods and of the universe, was slighted and persecuted by his countrymen, and betook himself to a private life, and living in the mountains, subsisted on grass and herbs. His writings were comprised in a treatise, which, according to Laertius, contained a continued discourse on nature, and was divided into three books; one concerning the universe; the second, concerning politics; and the third, of theology. This book he deposited in the temple of Diana; and it is said, that he affected to write obscurely, lest it should be read by the vulgar, and become contemptible. The fundamental doctrine of his philosophy was, that fire is the principle of all things; and the ancient philosophers have collected and preserved admirable apophthegms of this philosopher.

HERÆA, Ἡραῖα, in *Antiquity*, a festival celebrated at Argos in the honour of Juno, called in Greek Ἥρα. See a description of the ceremonies attending this solemnity, in Potter's Archæol. Græc. lib. ii. cap. 20. tom. i. p. 397.

There was another festival of this name, celebrated every fifth year in Elis, where sixteen matrons were appointed to weave a garment for the goddess.

There were other solemnities of this nature. See Potter, loc. cit. seq.

HERALD, an officer of arms, anciently in great repute, and possessed of several considerable functions, rights, and privileges.

The word *herald*, according to Du-Cange, comes from the Saxon *here*, or German *heer*, *army*, and *ald*, *servant*; because chiefly serving in the army. Others will have the two words signify *champion of the army*; in allusion to their office of denouncing war, proclaiming peace, &c. Du-Cange adds, that they were called *clarigarii*, as well as *heraldi*. Borel derives the word from the Latin *herus*, *master*; q. d. one coming from his master; others from *herbaut*; q. d. *high lord*; others from *herald*, which is the same with *dominus intimus*; and others, lastly, from *here*, *master*, or *army*; and *bald*, q. d. *bound to his lord*, or the *armour bound*.

The origin of *herald* is very ancient. Stentor is represented, by Homer, as *herald* of the Greeks, who had a voice louder than fifty men together. The Greeks called them κηρυκες, and ἐπισκοπακες; and the Romans, *fetiales*.

The Romans had a college of *heralds*, appointed to decide whether a war were just or unjust; and to prevent its coming to open hostilities, till all means had been attempted for deciding the difference in a pacific way.

Heralds, or *heralds at arms*, have formerly been denominated *dukes at arms*, because properly belonging to dukes; as kings at arms, to kings.

In England we have six *heralds*; viz. 1. Richmond; 2. Lancaster; 3. Chester; 4. Windsor; 5. Somerset: 6. York. To which may be added three *heralds* extraordinary; viz. Arundel, Norfolk, and Mowbray. Their office is, to wait at court, to order and attend public solemnities, as coronations, installations, &c. to proclaim war and peace, to look to the regulation of the bearings of arms, and to search pedigrees, &c. under the authority of the earl marshal and his deputy.

They were formerly created and christened by the king; who, slowly pouring a gold cup of wine on their head, gave them their *herald's* name: now it is done by the earl marshal. They could not arrive at the dignity of *herald*, without having been seven years POURSUIVANT; nor could they quit the function of *herald*, but to be made KING *at arms*.

Their principal employment was, to compose, or make out, coats of arms, genealogies, and titles, of the nobility. They were the superintendents of military exploits, and the conservators of the honours of war. They had a right to take away the arms of such as, for cowardice, treason, &c. deserved to be degraded. They had a commission to examine and correct the vices and disorders of the nobles, and, on such occasions, to exclude them from justs, tournaments, &c. to them belonged also the correcting of all usurpations and abuses relating to crowns, coronets, casks, crests, supporters, &c. They took cognizance of all differences among the nobles, with respect to their bearings, the antiquity of their families, precedencies, &c. They went into the several countries to search into the grounds and pretensions of nobility; and had a right to open all libraries, and to command all the ancient charters and instruments in the archives to be shewn them; they had admission into all foreign courts, where they were commissioned to proclaim war and peace; and their persons were held sacred as those of ambassadors. To them it belonged to make publication of justs and tournaments; to call the people to them; to signify the cartels; to mark the ground, list, or place of duel; to see fair play observed; and to divide the sun between the two parties. In the army, they advertised the cavaliers and captains of the day of battle, and assisted therein before the standard; retiring, after the first onset, to some place of eminence, there to observe who behaved best, and to give a faithful report thereof to the king. They also numbered the dead, relieved the ensigns, re-demanded prisoners, summoned places to surrender, and in capitulations walked before the governor of the place, to secure and warrant his person. They were the principal arbitrators of the distribution of the spoils of the vanquished, and of military rewards. They published victories, and gave notifications thereof to foreign courts. They convened the estates of the kingdom, assisted at royal marriages, and frequently made the first demand; they also officiated at solemn feasts, &c.

The modern *heralds*, i. e. those we properly call *heralds*, have lost a good deal of the distinction and office of the ancient ones. What relates to the making out arms, the rectifying of abuses therein, &c. is chiefly committed to the kings at arms. And in the army, drums and trumpets have succeeded to the functions of *heralds*, being sent by the generals on the same errands; and on that account enjoying the same rights and privileges. Their persons are under the protection of the law of nations, when they bear the marks of their offices publicly, i. e. the trumpeter his trumpet, and the drummer his drum; in the same manner as the *herald* his coat.

The *heralds*, with the kings at arms, and the four pursuivants, are a COLLEGE, or corporation; erected into such by charter of Richard III. who granted them divers privileges, as to be free from subsidies, tolls, and all troublesome offices. Clarenceux and Norroy king at arms are also called *provincial heralds*.

HERALDRY, the art of armoury and blazoning, or the knowledge of what relates to the bearing of arms, and the laws and regulations thereof. See ARMS, BLAZONING, &c.

It is an established rule among the heralds, that in blazoning, *animals* are always to be interpreted in the best sense; that is, according to their most noble and generous qualities, and so as may redound most to the honour of the bearers.

Thus the fox, being reputed witty, and withal given to filching for his prey; if this be the charge of an escutcheon, we are to conceive the quality represented to be his wit and cunning, not his theft.

Guillim adds, that all savage beasts are to be figured in their fiercest action; as, a lion erected, his mouth wide open, his claws extended, &c. thus formed, he is said to be *rampant*. A leopard or wolf is to be pourtrayed going, as it were, *pedetentim*; which form of action, saith Chassanæus, fits their natural disposition, and is termed *passant*. The gentler kinds are to be set forth in their noblest and most advantageous action; as, a horse running or vaulting, a grey-hound couzing, a deer tripping, a lamb going with smooth and easy pace, &c.

Every *animal* is to be moving or looking to the right side of the shield; and it is a general rule, that the right foot be placed foremost, because the right side is reckoned the beginning of motion: add, that the upper part is nobler than the lower; so that things constrained either to look up or down, ought rather to be designed looking upwards. It must be noted, that notwithstanding these solemn precepts of Guillim, and the other masters of armoury, we find by experience, that there are lions passant, couchant, and dormant, as well as rampant, and that most *animals* in arms look down, and not up.

Birds are esteemed a more honourable bearing than fish; and wild and ravenous birds than tame ones.

Birds, according to Leigh, are to be numbered as far as ten; according to Chassanæus, to fifteen; after which they are to be blazoned without number. When their bills and feet are of a different colour from the rest, they are said to be *membered*.

Birds of prey are more properly said to be *armed*.

Birds borne of their natural colour are to be blazoned by *proper*, without mention of the colour. In the blazoning of fowls much exercised in flight, if the wings be not displayed, they are *said* to be borne *close*; e. gr. he beareth an eagle, a hawk, or a swallow, *close*. In the general, wherever a *bird* is found in any action or posture, to which nature does not ordinarily incline it, such action or posture is to be named, otherwise not. Coats, Her. Dict. p. 53.

Fish

Fish are of themſelves of leſs eſteem in a coat armour than beaſts and fowls, as being poſſeſſor thereto in the order of creation; but they ſometimes become ſo dignified by the perſons or families who bear them, as to be preferable to many birds and beaſts.

Fiſh are borne different ways; upright, embowed, extended, endorſed, ſurmounted of each other, fretted, trinngled, &c.

All *Fiſh* borne feeding ſhould be termed *devouring*.

Thoſe borne directly upright ſhould be termed HAURIANT.

And thoſe borne traverſe the eſcutcheon, *naiant*.

Heraldry likewiſe comprehends what relates to the marſhalling of ſolemn cavalcades, proceſſions, and other ceremonies at coronations, inſtallments, creations of peers, funerals, nuptials, &c.

HERB, a name common to all plants whoſe ſtalks or ſtems die away every year, after their ſeed is become ripe.

The word is formed of the Latin *herba*, which ſome derive from *arvum, field*, others from the *paſtus, to feed*, of Ορσω, *pabulum*. Of the Greek *phorbe*, the Latins formed *phorba*; and of *ferba, herba*, after the manner of the Spaniards, who always change the *f* at the beginning of a word into *h*.

There are ſome *herbs* whoſe root periſhes with the ſtem; and others, where the root ſurvives the ſtem by ſeveral years.

Of the former, thoſe which come to maturity the firſt year, and after they have caſt their ſeed die away, are called *annuals*: ſuch are wheat, rye, &c.

Thoſe which only bear flowers and fruit the ſecond year, or even the third year, and then periſh, are called *biennials* and *triennials*: ſuch are the garden angelica, and ſome others.

Herbs, whoſe root does not periſh after they have ſhed their ſeed, are called *perennials*: ſuch are mint, &c.

Of theſe, ſome keep their leaves all the year round, and are called *evergreens*; as the ſtrabacca, &c. See EVERGREENS.

The reſt loſe their leaves, and continue bare part of the year; as colſe-foot, &c.

Herbs are alſo diſtinguiſhed into *kitchen* or *ſallet-herbs*, and *medicinal herbs*.

HERB, *ſallet*. See SALLET.

HERB, *medicinal*. See SIMPLE.

HERB-*bane*, in *Botany*. See *Broom* RAPE.

HERB-*bane, great purple*. See LATHRÆA.

HERB, *St. Bartholomew's*. See HOLLY.

HERB *bennet, herb bleſſed, or avens, geum*, in *Botany*, a genus of the *icoſandria polygynia* claſs. Its characters are theſe: the flower has five roundiſh petals, which are narrow at their baſe, where they are inſerted in the empalement, and a great number of awl-ſhaped ſtamina, which are of the length of the empalement, into which they are inſerted; in the centre of the flower is ſituated a great number of germina collected into a head, which become ſo many ſtar hairy ſeeds, with the ſtyle, which is bent like a knee, adhering to them. Miller *enumerates* 6 ſpecies.

The common ſort grows plentifully by the ſides of hedges and in woods, in moſt parts of England, ſo is rarely admitted into gardens. This ſtands in the liſt of medicinal plants; the root is the part uſed, and is eſteemed cephalic and alexipharmic. It is manifeſtly of a binding nature, and ſo is uſeful in all fluxes, &c.

HERB *Chriſtopher, actea*, in *Botany*, a genus of the *polyandria monogynia* claſs. Its characters are theſe: the empalement of the flower is compoſed of four roundiſh concave leaves, which fall off; the flower has four petals which drop off, a great number of ſtamina, and an oval germen with one ſtigma, which becomes a ſmooth oval berry, including ſeveral roundiſh ſeeds. There are three ſpecies. Miller.

In the opinion of all botaniſts this is a very poiſonous plant; but Pliny ſays, it may be given in the quantity of an acetabulum, that is, half a quarter of a pint, in internal diſorders of women; which ſeems to argue ſome miſtake. James.

HERB *Gerard*, in *Botany*, a name ſometimes given to a diſtinct genus of plants, otherwiſe called ANGELICA; but more commonly to the wild angelica, called alſo ARCHANGEL.

HERB *of grace*, a name by which ſome call RUE.

HERB *willow*. See SAVORY.

HERB *Paris*. See PARIS.

HERB *Robert*, a name ſometimes uſed for the GERANIUM, or crane's bill.

HERB *trefoil*, in *Botany*. See TREFOIL.

HERB *trinity*, in *Botany*, a name ſometimes given to the VIOLET.

HERB *true-love*, the name by which the *herb* PARIS is ſometimes called.

HERB *two-penny*, the name of a diſtinct genus of plants, called otherwiſe *herniaria* or *nummularia*. See LOOSESTRIFE.

HERB *willow*, or *willow-herb*, a name ſometimes given to two or three diſtinct genuſes of plants. See LOOSE-*ſtrife*, *Purple* LOOSE-*ſtrife*, and *Herb* WILLOW.

HERBA *lucis*, in *Botany*, a name by which ſome authors have called the chelidonium majus, or great CELANDINE.

HERBA *roſſa*, in *Botany*, a name given by Latin writers to a plant uſed by the dyers in making their yellow colours, and by the women in tinging their hair yellow, which was the favourite colour of ancient times. It is alſo by ſome called *rubia herba*. It was from this ſimilitude with the word *rubia*, which ſignifies madder, a vegetable uſed alſo in the dying trade, ſuppoſed to be the ſame plant: but all the accounts we have of the rubia, or *roſſa herba*, ſhew it to be different in all reſpects from the madder. Paulus Ægineta, who calls it *rubia herba*, takes pains to diſtinguiſh it from the rubia, and ſhews that it was the plant called cocomenium and cyanene by the Greeks, and lutum, lutea *herba*, and corniola by the Latins. It is the genuſta tinctoria, or DYER'S-*weed*, at this time common both in England and Greece, and uſed in both places in dying yellow. Pliny tells us, that the lutum had the leaves of flax, and the flowers of broom: this ſufficiently ſhews that it was the plant we have mentioned.

HERBA *Scotica*, in *Botany*, a name by which ſome authors have called the common LIQUORICE, the root and inſpiſſated juice of which are uſed in the ſhops.

HERBA *Vaticani*, in *Botany*, a name uſed by ſome writers for the RANUNCULUS.

HERBAGE, a collective name, comprehending all kinds of herbs.

What makes the principal difference in the goodneſs of butter and cheeſe, is the difference of *herbage*.

HERBAGE, in *Law*, ſignifies the green paſture or fruits of the earth, provided by nature for the food of cattle.

HERBAGE is alſo uſed for a liberty which a man hath to feed his cattle in another man's ground; as, in the foreſt.

HERBAL, a book which treats of plants, or deſcribes the figure, genus, ſpecies, properties, virtues, &c. of herbs, trees, ſeeds, plants, &c.

Such are Gerard's *Herbal*, Parkinſon's *Herbal*, &c.

HERBAL is alſo uſed for a ſet or collection of ſpecimens of the ſeveral kinds of plants, dried and preſerved in the leaves of a book, called alſo a HORTUS SICCUS.

In the Philoſophical Tranſactions, we have a method deſcribed for preſerving ſpecimens for ſuch a *herbal*. The flowers, leaves, &c. gathered perfectly ripe, and in their true colours, are to be ſpread on white-brown paper, with the parts all diſplayed as diſtinctly as may be. If the ſtem, or body of the flower, &c. be thick, one half is to be pared away to make it lie flat. Over theſe is to be ſpread another paper; and the whole is to be put between two iron plates, ſcrewed tight together, and thus baked in an oven for two hours. When taken out, waſh the plants over with a mixture of brandy and aqua fortis, and lay them on freſh paper to dry. Laſtly, ſtick over the back ſides with a bruſh dipped in a diſſolution of gum tragacanth, to make them ſtick; and lay them in the paper book, where they will lie faſt, and always look freſh.

HERBALIST, or HERBORIST, a perſon ſkilful in plants; the ſame with *botaniſt*.

To *herboize* or *herborize*, is to go into the fields in ſearch of different or new herbs or plants.

HERBE, in the *French Academies*, a reward, or ſome good ſtuff given to a horſe that has worked well in the manege.

HERBENGER, or HARBINGER. See HARBINGER.

HERBER, in the *Manege*, is uſed by farriers to denote an application for ſome diſeaſes in horſes, particularly of the head and the antlers. It conſiſts only of a piece of hellebore-root, which, being put into the middle of the horſe's counter, makes it ſwell and ſuppurate.

HERBIDÆ *vedes*, green halls. See EARING *veſſes*.

HERBIVOROUS, an epithet given to thoſe creatures which feed only on vegetables, to diſtinguiſh them from the carnivorous, or ſuch as feed on fleſh.

HERBOSUM *marmor*, the name of a ſpecies of marble, much eſteemed and uſed by the ancient architects and ſtatuaries. It was of a beautiful green colour, but had always with it ſome caſt of yellow. It was dug in the quarries of Taygetum, but was eſteemed by the workmen the ſame in all reſpects, except colour, with the black marble dug at Temarus in Lacedæmonia, and thence called the Tenarian marble.

HERCINIAN *foreſt*, in *Geography*, a foreſt which formerly extended over the face of Germany; Cæſar reported it to be nine days journey in length, and ſix in breadth. It is now cut down in many places, and parcelled out into woods which go by particular names; as the Black foreſt, which ſeparates Alſace from Swabia; the Steygerwald, in

in Franconia; the Spissard, on the Main; the Thuringer, in Thuringia; Heserwald, in the duchy of Cleves; the Bohemerwald, which encompasses Bohemia, and was in the middle ages called Hercinia sylva; and the Hartz, in Luneburgh.

HERCULANEUM is the name of an ancient city of Campania, in Italy, which was destroyed by an eruption of Vesuvius in the first year of the empire of Titus, or the 79th of the Christian æra, and lately rendered famous on account of the curious monuments of antiquity discovered in its ruins; an account of which has been published by order of the king of Naples, in a work of six volumes folio.

The epocha of the foundation of *Herculaneum* is unknown; Dionysius Halicarnassensis conjectures, that it may be referred to sixty years before the war of Troy, or about 1342 years before Christ, and therefore that it lasted about 1400 years.

HERCULANIA, in *Botany*, a name by which some authors have called the verbena or vervain.

HERCULES, *Ηρακλεης*, in *Astronomy*, one of the constellations of the northern hemisphere.

The stars in the constellation *Hercules*, in Ptolemy's catalogue, are 29; in Tycho's, 28; in the Britannic catalogue, 113. The longitudes, latitudes, magnitudes, &c. whereof are as follow:

Names and situations of the stars.	Signs.	Figures. Chs.	Longit.		Latitude.		Magnitude.

Hercules, in *Mythology*, a celebrated hero of antiquity, who, on account of his singular exploits, was deified by the Pagans. He is said to have been the son of Jupiter and Alcmene, the wife of Amphitrion, king of Thebes. Herodotus fixes his birth a hundred years before the taking of Troy by the Greeks, or about the year 1382 before the commencement of the Christian æra. The adventures for which he was celebrated may be distributed into three classes: to the first class we may refer his strangling the two serpents which were sent to destroy him in his cradle, and his killing a large lion near his native city Thebes. The second class comprehends those exploits which have been commonly called his twelve labours: these he undertook by order of Eurystheus, in consequence of the fatality of his birth, and of a decree of the Delphian oracle, as some say, for expiating his crime of killing the three children which he had by his wife Megara, the daughter of Creon, and in order to acquire immortality; the first of these was his engagement with the Cleonæan lion; the second, his conquest of the hydra; the third, his destruction of the Erymanthian boar; the fourth, his killing of the wild stag; the fifth, his shooting the flying birds called stymphalides;

the fixth, his cleanſing Augæas's ſtables; the ſeventh and eighth, his deſtroying the bull, and Diomed, the barbarous tyrant of Thrace, with his horſes; the ninth labour is his combat with Geryon, who is generally repreſented with three bodies; the tenth, his conqueſt of the Amazon: the eleventh, his dragging Cerberus up from the infernal regions; and the laſt is his killing the ſerpent, and gaining the golden fruit in the gardens of the Heſperides. The third claſs of *Hercules*'s exploits were thoſe which he voluntarily undertook; the chief of which are his combat with the giant Anteus, whereby he freed Africa from this deſtroyer, and his killing Cacus, the notorious robber of Italy. Theſe ſeveral adventures are repreſented and deſcribed both by the ancient ſtatuaries and poets.

It is obſerved, that there are none, even of the twelve great gods of antiquity, that have ſo many ancient monuments relating to them as *Hercules*. The famous ſtatue of *Hercules*, in the Farneſe palace at Rome, is well known to the connoiſſeurs; this repreſents him, reſting after the laſt of his twelve labours above recited, leaning on his club, and holding the apples of the Heſperides in his hand. In this ſtatue, as in all the other figures of him, he is formed, by the breadth of his ſhoulders, the ſucculenteſs of his cheſt, the largeneſs of his face, and the firmneſs of his muſcles, to expreſs ſtrength and a capacity of enduring great fatigue, which conſtituted the chief idea of virtue among the ancient heathens. His other attributes are his lion's ſkin, his club, and his bow.

Hercules is repreſented by the ancients as an exemplar of virtue; however, the *Hercules bibax*, or *drunken Hercules* is no uncommon figure, and his amours are deſcribed both by the poets and artiſts. Thus, the Cupids are made to take away his club, and he is exhibited in the poſture of bending under a little boy; by which actions we perceive, that he, who conquered all difficulties, was a ſlave to love. The chief ſcene of his effeminacies was in Aſia, whilſt he lived with Omphale, queen of Lydia; and at length, viz. in the forty-ninth year of his life, he fell a ſacrifice to the jealouſy of his wife Dejanire, who, dreading the influence of his paſſion for Iole, the daughter of Eurytus, king of Oechalia, poiſoned his robe, ſo that he died in great agonies on mount Oeta. Ovid repreſents him as preparing his own funeral pile, and laying himſelf upon it with great compoſure. Met. ix. ver. 238.

The apotheoſis of *Hercules*, or the eſtabliſhment of his altars in the principal cities of Greece, is fixed by Thraſybulus, twenty-nine years before the taking of Troy.

Hercules has been particularly honoured by the Greeks under the name of *Muſagetes*, *the conductor of the Muſes*, and at Rome under that of *Hercules Muſarum*. He is repreſented on medals with a lyre in his hand; and the reverſe is marked with the figure of the nine Muſes, with their proper ſymbols. Encyclopedie, and Spence's Polymetis, p. 113, &c.

HERCULES's *allheal*. See GINSENG, *Cow* PARSNEP, and WOUND-*wort*.

HERCULES's *club*. See TOOTH-*ach-tree*.

HERCULEUS *morbus*, in *Medicine*, the EPILEPSY; thus called from the horror of his attacks, and the difficulty of cure.

HERD, among *Hunters*, a company or aſſemblage of black or fallow beaſts, in contradiſtinction to *flock*.

In the hunting language, there are various terms uſed for companies of divers kinds of game. We ſay a *herd* of harts and bucks, a *bevy* of roes, a *rout* of wolves, a *richeſs* of martens, &c. See HUNTING.

HERDEWICH, HERDEWYCH, or HERDEWYCH, in our *ancient Law-books*, a grange or place for cattle and huſbandry.

Et unam herdewycham *apud Hathecham in pace*, &c. Mon. Angl.

HERDING, among *Sportſmen*, is the reverſe of BREAKING *herd*.

HEREBODE, the king's edict, anciently iſſued to command his ſubjects into the field.

The word is formed of the Saxon, *here*, *army*, and *bode*, *meſſenger*.

HEREDITAMENTS, in *Law*, are ſuch immoveable things as a man may have to himſelf and his heirs by way of inheritance; or which, not being otherwiſe bequeathed, do naturally and of courſe deſcend to him who is next heir of blood, and fall not to the executor or adminiſtrator as chattels do.

Hereditaments is a word of large extent, and is much uſed in conveyances; for by the grant of *hereditaments*, iſſue, ſuigniories, manors, houſes, and lands of all ſorts, *charters*, rents, ſervices, advowſons, conveyances, and whatever may be inherited, will paſs.

HEREDITARY, ſomething appropriated to a family, or belonging thereto by right of ſucceſſion, from heir to heir.

Of monarchies, ſome are *hereditary*, others elective: of *hereditary* monarchies, ſome deſcend only to the heirs-male, as in France; others to the next of blood, whether male or female, as in England, Spain, &c.

The dominions of the emperor are diſtinguiſhed into *hereditary*, which are thoſe he derives from his anceſtors by right of blood and inheritance; and thoſe he enjoys in quality of emperor, by virtue of his election.

HEREDITARY is alſo applied to offices and honours annexed to certain families. Thus the office of earl marſhal and lord great chamberlain of England are *hereditary* in the families of the duke of Norfolk and the duke of Ancaſter.

It is of no very long date, that the dignities of duke, count, &c. are *hereditary*.

The canon law has taken all poſſible precautions to prevent benefice from becoming *hereditary*.

HEREDITARY is alſo applied figuratively to good or evil qualities, habitudes, &c. capable of being tranſmitted by blood from father to ſon.

The gout, king's evil, madneſs, &c. are *hereditary* diſeaſes; i. e. they are ſometimes tranſmitted from the parents in the ſtamen or firſt rudiments of the ſœtus: and ſuch, probably, is the origin of numerous other chronic diſeaſes.

HEREDITARY *right* denotes a right or privilege, in virtue whereof a perſon ſucceeds to the effects of his anceſtors. The monjours, &c. hold *hereditary* right to be *divine* right, i. e. of God's own appointment; and conſequently indiſpenſible, or, as they call it, *indefenſible*. On this account they contend for the obligation of *hereditary* right in favour of the deſcendents of king James II.

HEREGELD, in our *Old Writers*, a tribute or tax levied for the maintenance of an army. See SUBSIDY.

HERESIARCH, *arch-heretic*, the founder or inventor of a hereſy, or a chief and ring-leader of a ſect of heretics. The word is Greek αἱρεσιάρχης, compounded of αἵρεσις, *hereſis*, *hereſy*, and ἀρχὸς, *princeps*, *prince*, *chief*.

Thus Arius and Socinus are called *hereſiarchs*, as being the founders and patriarchs of the Arians and Socinians. Simon Magus is recorded as the firſt *hereſiarch* under the new law.

HERESY, an error in ſome eſſential point of Chriſtian faith, maintained with obſtinacy and diſingenuity.

It is properly the obſtinacy that conſtitutes the character of *hereſy*, not the error. When a man is humble and ingenuous, teady and deſirous to receive farther light and inſtruction, and when he gives every thing urged againſt him its due weight, he is not guilty of *hereſy*. *Errare poſſum, hæreticus eſſe nolo*, is a celebrated maxim of St. Auguſtine.

Tertullian, in his treatiſe Of Preſcriptions, defines *hereſy* by *choice*, agreeably to the etymology of the word. A heretic in this ſenſe, is one who, knowingly and of his own choice, propoſes, or even embraces, any new dogma or article of faith.

The word is formed of the Greek αἵρεσις, from αἱρεω, *I chuſe*, which, among the ancients, had nothing of that odious ſignification attached to it by eccleſiaſtical writers of later times. It only ſignified a peculiar opinion, dogma, or ſect.

In this ſenſe they ſaid, the *hereſy* of the Stoics, of the Peripatetics, &c. meaning their ſect, their ſyſtem, &c.

Thus alſo in the New Teſtament, we read of the ſect or *hereſy* of the Sadducees, of the Phariſees, of the Nazarenes, &c. See Acts v. 17. ch. xv. 5. ch. xxiv. 5. ch. xxvi. 5. ch. xxviii. 22.

It ſeems difficult, in the law of England, preciſely to determine what errors amount to *hereſy*, and what not. The ſtatute 2 Hen. IV. cap. 15. declares thoſe to be *heretics* who were teachers of erroneous opinions, contrary to the faith and bleſſed determinations of the holy church. And though the ſtatute 25 Hen. VIII. cap. 14. declared, that offences againſt the ſee of Rome are not *hereſy*, and the ordinary is reſtrained from proceeding upon mere ſuſpicion, i. e. unleſs the party be accuſed by two credible witneſſes, or an indictment of *hereſy* be firſt previouſly found in the king's courts of common law; yet the ſtatute 31 Hen. VIII. cap. 14. eſtabliſhed the ſix moſt conteſted points of popery, viz. tranſubſtantiation, communion in one kind, the celibacy of the clergy, monaſtic vows, the ſacrifice of the maſs, and auricular confeſſion; and farther enacted and declared all oppugners of the firſt to be heretics, and to be burnt with fire; and of the five laſt to be felons, and to ſuffer death. By ſtat. 1 Eliz. cap. 1. all former ſtatutes relating to *hereſy* are repealed, which leaves the juriſdiction of *hereſy* as it ſtood at common law, viz. as to the inflection of common cenſures, in the eccleſiaſtical courts; and, in caſe of burning the heretic, in the provincial ſynod

ſynod only, or, according to ſir Matthew Hale, in the dioceſan alſo; but in either caſe the writ was not demandable of common right, but grantable or otherwiſe, merely at the king's diſcretion. See *De* HÆRETICO *Comburendo*.

By this ſtatute the term *hereſy* is reſtrained to ſuch tenets as are either determinable by the words of the canonical ſcripture, or by one of the four firſt general councils, or by ſome other council which has only uſed the expreſs words of ſcripture, or by parliament, with the aſſent of the convocation.

It is agreed that the convocation may and always might declare what opinions are heretical, and that a conviction before them was anciently a good foundation for the writ *De Hæretico Comburendo*; but it is doubted whether they can, at this day, convene and convict a heretic. A biſhop, but no other ſpiritual judge, may puniſh a heretic by church cenſures; and a conviction before him was, as ſome ſay, anciently a good foundation for the writ *De Hæretico Comburendo*. But the temporal courts cannot puniſh a heretic, as ſuch, but only as a diſturber of the public peace; yet ſuch courts may incidentally take knowledge whether a tenet be heretical or not; as anciently, where biſhops grounded their commitment of a man as a heretic on 2 Hen. IV. which impowered them to impriſon for *hereſy*; or even at this day, where a biſhop pleads to a *quare impedit*, that he refuſed the clerk for *hereſy*; in both which caſes the temporal courts will relieve the party, unleſs the particular point charged againſt him be ſet forth, and ſuch point appear to be heretical. But regularly, the temporal courts cannot determine what is *hereſy*; and therefore if a man thinks himſelf aggrieved by a ſuit in the ſpiritual court *pro ſalute animæ*, for *hereſy*, his moſt proper remedy is by appeal not prohibition. Anciently an heretic convict, refuſing to abjure, or relapſing after abjuration, might be burnt by force of the writ *De Hæretico Comburendo*; but he forfeited neither lands nor goods: but though this writ is now aboliſhed, and all the old ſtatutes which gave a power to arreſt or impriſon perſons for *hereſy*, or introduced any forfeiture on that account, are repealed; yet by the common law, ſtill in force, an obſtinate heretic may be impriſoned by force of the writ *De* EXCOMMUNICATO *Capiendo*, till he make ſatisfaction to the church. The civil magiſtrate has ſtill a power of interpoſing with regard to one ſpecies of *hereſy*; for, by ſtat. 9 and 10 Will III. cap. 32. if any perſon, educated in the Chriſtian religion, and having made profeſſion of the ſame, ſhall by writing, printing, teaching, or adviſed ſpeaking, deny the Chriſtian religion to be true, or the holy ſcriptures to be of divine authority, or deny any one of the perſons in the holy Trinity to be God, or maintain that there are more Gods than one, he ſhall for the firſt offence be rendered incapable of holding any office or place of truſt; and for the ſecond, be rendered incapable of bringing any action, being guardian, executor, legatee, or purchaſer of lands, and ſhall ſuffer three years impriſonment without bail. But if, within four months after the firſt conviction, the delinquent will, in open court, publicly renounce his error, he is diſcharged at once from all diſabilities.

HERESY is ſometimes alſo uſed, by extenſion, for a propoſition that is notoriouſly falſe in ſome other ſcience.

Thus, it is a *hereſy* in morals to ſay, that a man muſt be ungrateful. It is a *hereſy* in geometry to ſay, that two triangles, whoſe angles are equal, are not ſimilar.

HERETIC, in a general ſenſe, is one that ſets up to be the head, or chuſes to join himſelf to a particular religious ſect.

Heretic, in a bad ſenſe, according to the opinion of Whitby, Foſter, and many others, is one who knowingly eſpouſes a falſe doctrine, is inſincere in his profeſſion, and aſſerts and defends what he is convinced is contrary to Chriſtianity, and conſequently ſupports the intereſt of a faction, in order to ſerve ſome bad deſigns. According to this opinion, a *heretic* not only entertains wrong ſentiments of Chriſtianity, but doth this wilfully, and with an ill intention: ſo that no mere error of the judgment can be hereſy, and no honeſt man, who is not condemned of himſelf, can poſſibly be a *heretic*.

The *heretics*, whom, in the New Teſtament, we are directed to avoid, were not the humble, modeſt, and peaceable, though erroneous Chriſtians, who adhered to the authority of Chriſt, and deſired to know and do his will; but the proud, pragmatical, turbulent party-men, who diſturbed and divided the church by their impoſitions and innovations, on the terms of brotherly affection and Chriſtian communion, and by aſſuming an authority over their fellow-Chriſtians. Hereſy, in the ſenſe of ſcripture, doth not conſiſt in ſimple error; nor were thoſe *heretics* who were anathematized and perſecuted; but only thoſe who anathematized and perſecuted others, refuſing to acknowledge them for true Chriſtians, on account of their ſuppoſed or real miſtakes; agreeably to this ſenſe of the appellation, it is juſtly obſerved by Mr. Hallet, that the pope is the greateſt *heretic* in the world. See Hallet's Notes, &c. v. I. iii. diſc. ix. p. 390. and Fumeaux's Letters to Judge Blackſtone, p. 30.

A real *heretic* is properly he who maintains a falſe opinion, out of a ſpirit of obſtinacy, faction, or hypocriſy. A *heretic* makes a profeſſion of Chriſtianity, by which he is diſtinguiſhed from an infidel, Jew, or idolater.

A man does not become an *heretic* by doing a thing condemned or forbidden by the goſpel, and of conſequence repugnant to the Chriſtian faith; but by a thiſt, ſtiffneſs, wilful, turbulent adherence to an opinion oppoſite to ſome article of the Chriſtian faith, whether it regard ſpeculation or practice.

Others, however, both in the early ages of the church and in modern times, have extended the odious appellation of *heretics* to thoſe that have been miſtaken in judgment, who have erred in fundamentals, or doctrines reckoned of the greateſt importance.

The ſects of *heretics*, who have, at different times, diſturbed the church, are innumerable.

The emperor Maximus, who uſurped the throne from Gratian, was the firſt that decreed the pains of death to *heretics*.

By our own law, *heretics* were anciently to be burnt; and there was a writ *De* HÆRETICO *Comburendo*, which lay for that purpoſe.

HERETOCHS, among our *Saxon Anceſtors*, ſignified the ſame with DUKES or *dreds*, denoting the commanders or leaders of their armies.

It appears, from Edward the Confeſſor's laws, that the military force of this kingdom was in the hands of the dukes or *heretochs*, who were conſtituted through every province and county in the kingdom, being ſelected out of the principal nobility, and ſuch as were moſt remarkable for being *ſapientes, fideles, & animoſi*. Their duty was to lead and regulate the Engliſh armies, with a very unlimited power; and becauſe of their great power, they were elected by the people in their full aſſembly, or folkmote, in the ſame manner as ſheriffs were elected.

HERIOT. See HARIOT.

HERISSON, in *Fortification*, a beam armed with iron ſpikes, the points whereof are turned outward, ſupported in the middle by a ſtake, wherein is a pivot on which it turns: it ſerves as a barrier to block up a paſſage.

Heriſſons are frequently placed before gates, eſpecially the poſterns of a town or fortreſs, to ſecure thoſe paſſages which muſt of neceſſity be frequently opened and ſhut.

HERITAGE. See INHERITANCE.

HERMÆA, *Ἑρμαία*, in *Antiquity*, a feſtival obſerved in honour of Mercury: yet there were ſeveral ſolemnities of this kind, ſome celebrated in Peloponneſus, others in Beotia, Crete, &c. See Pott. Archæol. Græc. lib. ii. cap. 20. tom. i. p. 896.

In Crete, during the celebration of the *hermæa*, the maſters ſerved their ſlaves at table. This cuſtom obtained likewiſe among the Athenians and Babylonians, as alſo among the Romans; witneſs the SATURNALIA.

HERMANNIA, in *Botany*, a genus of the *monadelphia pentandria* claſs. Its characters are theſe: the flower has a pitcher-ſhaped permanent empalement; it has five petals, which twiſt againſt the ſun with a the tubulous empalement, but ſpread open above; it has five broad ſtamina joined in one body; in the centre is ſituated a roundiſh five-cornered germen, which becomes a five-cornered roundiſh capſule, with five cells opening at the top, incloſing many ſeeds. Miller enumerates nine ſpecies, all natives of the Cape of Good Hope.

HERMAPHRODITE, *Ἑρμαφρόδιτος*, a perſon who has both the ſexes, or the genital parts both of male and female.

The word is formed of the Greek *Ἑρμαφρόδιτος*, a compound of *Ἑρμῆς, Mercury*, and *Ἀφροδίτη, Venus*; q. d. a mixture of Mercury and Venus, i. e. of male and female. For it is to be obſerved, *Hermaphroditus* was originally a proper name, applied by the heathen mythologiſts to a fabulous deity, whom ſome repreſent as a ſon of *Hermes, Mercury*, and *Aphrodite, Venus*; and who being deſperately in love with the nymph Salmacis, obtained of the gods to have his body and her's united in one. Others think this junction intended to ſhew, that *Venus, Phaſtus*, was of both ſexes; as in effect, the poet Calvus calls Venus a god.

M. Spon obſerves, Heſychius calls Venus *Aphroditus*; and Theophraſtus affirms, that Aphroditus, or Venus, is *Hermaphroditus*; and that, in the iſland of Cyprus, ſhe has a ſtatue, which repreſents her with a beard like a man. The Greeks alſo call *hermaphrodites androgyni*, q. d. *men-women*.

Naturaliſts diſtinguiſh four kinds of *hermaphrodites*; whereof

whereof one kind only are the perfect *hermaphrodites*, or those who have the pudenda of both kinds; but these are rarely, if ever, found. It is affirmed, however, that there were once two such *hermaphrodites*, married to each other, and that each beget children on the other. See various inſtances of *hermaphrodites*, in a diſſertation of M Loſſhagen, in the Nov. Lit. Mar. Balth. 1704. p. 105. Bauline, De *Hermaphrod.* Ludov. Bonacioli Tract. de Part. Form. cap 9. Aldrovand. De Monſtr. cap. 1. Paul. Zacch. Quæſt. Med. Legal. tom. i. lib. vii. § 8.

Others diſpute all that has been ſaid on the ſubject; maintaining, that the ill conformation of the parts of generation, the teſticles being detained or concealed in men, and the clitoris longer than ordinary in women, have been the ſole occaſion of ſo erroneous a notion. To which may be added, ſteatomatous tumors of the labia pudendi, which have ſometimes paſſed for teſticles. Dr. Quincy thinks that the frequent uſe of laſcivious frictions and titillations may contribute greatly to the extenſion of the clitoris, and make it paſs with the ignorant for a penis. This, he adds, was the caſe in the celebrated inſtance of the two nuns at Rome, who, after they had lived women for many years, were ſaid to have become men. But, on what grounds he aſſerts this we do not know.

" The extraordinary ſize of the clitoris, ſays Dr. Drake, " and its propendence, ſometimes, out of the body in " infants, makes the women miſtake ſuch children for " that ſort of monſters called *hermaphrodites*. Of this " kind I had one brought to me, the clitoris whereof " hung out of the body ſo far, at about three years old, " that it reſembled very much a penis, but it wanted a " perforation; and inſtead of that, juſt behind it, the " urine iſſued at a hole, which was nothing elſe but the " corner of the rima, the clitoris filling all the reſt of " the orifice; ſo that the parents miſtook it for a boy, " and as ſuch chriſtened it; but the neighbours called it " an *hermaphrodite*." Anthropol. p. 148.

Dr. Parſons has given us a treatiſe on this ſubject, where he endeavours to ſhew the notion of *hermaphrodites* to be a vulgar error; and, in particular, that the Anglo-Negro, ſhewn about this town ſome years ago, was a woman whoſe clitoris was overgrown. See *his* Mechanical and Critical Enquiry into the Nature of *Hermaphrodites*, Lond 1741, 8vo. Phil. Tranſ. vol. xlii. p. 142.

The interpreters and commentators of the civil law hold, that an *hermaphrodite* who has choſen the male ſex, as that which prevails moſt in him, may no longer do the office of a woman. And the French lawyers produce an arret of the parliament of Paris, whereby a young *hermaphrodite* was condemned to be burnt on that very account.

At Athens and Rome, they looked on *hermaphrodites* as ominous monſters, and precipitated them into the ſea, as we are informed by Alexander ab Alexandro.

Divers of the inſect and reptile kind are truly *hermaphrodites*; particularly worms, ſnails, &c.

In the Memoirs of the French Academy, we have an account of this very extraordinary kind of *hermaphrodites*, which not only have both ſexes, but do the office of both at the ſame time. Such are earth-worms, round tailed worms found in the inteſtines of men and horſes, land-ſnails and thoſe of freſh waters, and all the ſorts of leeches. And, as all theſe are reptiles, and without bones, M. Poupart concludes it probable, that all other inſects, which have theſe two characters, are alſo *hermaphrodites*.

The method of coupling practiſed in this claſs of *hermaphrodites*, may be illuſtrated in the inſtance of earth-worms. Ray's Hiſt. Inſect. p. 2. Theſe little creatures creep, two by two, out of holes proper to receive them, where they diſpoſe their bodies in ſuch a manner, as that the head of the one is turned to the tail of the other. Being thus ſtretched lengthwiſe, a little conical button or papilla is thruſt forth by each, and received into an aperture of the other.

Theſe animals, being male in one part of the body and female in another, and the body flexible withal, M. Hombery does not think it impoſſible that an earth-worm may couple with itſelf, and be both father and mother of its young; an obſervation which, to ſome, appears highly extravagant!

Among the inſects of the ſoft or boneleſs kind, there are great numbers, indeed, which are ſo far from being *hermaphrodites*, that they are of no ſex at all. Of this kind are all the caterpillars, maggots, and worms, produced of the eggs or ſpawn of all kinds; but the reaſon of this is plain; theſe are not animals in a perfect ſtate, but diſguiſes under which animals lurk. They have no buſineſs with the propagating of their ſpecies, but are to be tranſformed into animals of another kind, by the putting off their ſeveral coverings, and then only they are in their perfect ſtate, and therefore then only ſhew the differences of ſex, which are always in the diſtinct animals, each being only male or female. Theſe copulate, and their eggs produce theſe creatures, which ſhew no ſex till they arrive at that perfect ſtate again. Mem. Acad. Par. 1707. Mr. Hunter, in his account of the free martin, has lately obſerved, that, in many of the inferior tribes of animals, the male and female parts of generation are found to be united in the ſame animal, which, from poſſeſſing both parts, are called *hermaphrodites*. Theſe *hermaphrodites* he divides into the natural, and unnatural or monſtrous. The natural kind belongs to the inferior and more ſimple order of animals; but as animals become more complicated, and each part is more confined to its particular uſe, a ſeparation of the two neceſſary powers for generation takes place in them: and he apprehends that the unnatural kind may be occaſionally found among every tribe of animals having diſtinct ſexes, but that it is more common in ſome than in others. The human ſpecies has the leaſt; but in the horſe, aſs, ſheep, and cattle, they are very frequent. Phil. Tranſ. vol. lxix. part ii. p. 279, &c. See *Free* MARTIN.

HERMAPHRODITE is alſo applied in a botaniſal ſenſe.

The lateſt botaniſts make a diviſion of plants, which they call *hermaphrodites*, as having both the male and female parts of generation, viz. the ſtamina and piſtil in the ſame flower.

Theſe *hermaphrodite* flowers are ſometimes diſtinguiſhed into male *hermaphrodites* and female *hermaphrodites*: the caſe, in which this diſtinction, which is ſeldom neceſſary, occurs, is, when the flower contains the parts belonging to each ſex, but one of them proves abortive or ineffectual: if the defect be in the ſtamina, it is a female *hermaphrodite*; if in the piſtil, a male one.

HERMAPOLLON, in *Antiquity*, a ſtatue or figure compoſed of Mercury and Apollo, repreſenting a young man with the ſymbols of both divinities, viz. the petaſus and caduceus, with the bow and lyre.

HERMATHENA, *Ἑρμαθήνη*, in *Antiquity*, a ſtatue repreſenting Mercury and Minerva both in one.

The word is a compound of *Hermes*, *Mercury*, and *Athena*, a Greek name for *Minerva*.

M. Spon gives ſivers figures of *Hermathenæ*, in his Rech. Cur. de l'Antiquit. p. 98. They are a ſort of ſtatues raiſed on ſquare pedeſtals, after the manner of Hermæ, only that the attributes of Minerva are added thereto. See HERMES below.

HERMERACLES, in *Antiquity*, a ſtatue compounded of the figures of Mercury and Hercules.

M. Spon gives us a type of an *Hermeracles*, Rech. Cur. de l'Antiq. p. 96. fig. 13. The name, he obſerves, was given to a divinity repreſented after the manner of Hermes, with the additional attributes of Hercules, viz. a lion's ſkin and a club. This he aſcribes to the cuſtom among the Greeks of placing the ſtatues of Mercury and Hercules in the academy and gymnaſia, as both one and the other preſided over the exerciſes of the youth.

HERMEROS, compoſed of *Ἑρμῆς*, *Mercury*, and *Ἔρως*, *Cupid*, a ſtatue formed of Mercury and Cupid.

HERMES, or HERMA, among *Antiquaries*, a ſort of ſquare or cubical figure of the god Mercury, uſually made of marble, though ſometimes of braſs or other materials, without arms or legs, and planted by the Greeks and Romans in their croſs-ways.

Servius gives us the origin thereof, in his Comment on the eighth book of the Æneid. Some ſhepherds, ſays he, having one day caught Mercury, called by the Greeks *Hermes*, aſleep on a mountain, cut off his hands; from which he, as well as the mountain where the action was done, became denominated Cyllenius, from κλλω, *maimed*: and thence, adds Servius, it is, that certain ſtatues without arms are denominated *Hermetes* or *Hermæ*. But this etymology of the epithet of Cyllenius contradicts moſt of the other ancient authors; who derive it hence, that Mercury was born at Cyllene, a city of Elis, or even on the mountain Cyllene itſelf, which has ſome time enjoyed before him.

Sundas gives a moral explication of this cuſtom of placing ſtatues of Mercury without arms. The *Athenians*, ſays he, were ſtatues of ſtone placed at the veſtibules or porches of the doors and temples at Athens; for this reaſon, that, as Mercury was held the god of ſpeech and of truth, ſquare and cubical ſtatues were peculiarly proper; having this in common with truth, that, on what ſide ſoever they are viewed, they always appear the ſame.

It muſt be obſerved, that Athens abounded more than any other place in *Hermetes*: there were abundance of very ſignal ones in divers parts of the city, and they were indeed one of the principal ornaments of the place. They were alſo placed in the high-roads and croſs-ways, becauſe Mercury, who was the courier of the gods, preſided

ſided over the highways; whence he had his ſurname of Trivius, from *trivium*; and that of Viacus, from *via*.

From Suidas's account, above cited, it appears, that the terms *termini*, uſed among us in the door-caſes, balconies, &c. of our buildings, take their origin from theſe Athenian *Hermæ*; and that it was more proper to call them *hermetes* than *termini*, becauſe, though the Roman termini were ſquare ſtones, whereon a head was frequently placed, yet they were rather uſed as land-marks and mere ſtones than as ornaments of building.

HERMESIA, a name given by ſome authors to hermetic chymiſtry.

HERMETIC, or HERMETICAL *art*, a name given to chemiſtry, on a ſuppoſition that Hermes Trimegiſtus was the inventor thereof, or that he excelled therein. See ALCHYMY and CHYMISTRY.

We know but little of this Hermes; only that he was an ancient king of Egypt, a thouſand years prior to Æſculapius. Zoſimus Panopolity mentions him, as having wrote of natural things; and there are ſeveral pieces ſtill extant under his name, but they are all ſuppoſititious.

HERMETICAL *philoſophy* is that which undertakes to ſolve and explain all the phenomena of nature, from the three chemical principles, ſalt, ſulphur, and mercury.

A conſiderable augmentation was made to the ancient *Hermetical philoſophy*, by the modern doctrine of alcali and acid.

HERMETICAL *phyſic* or *medicine*, is that ſyſtem or hypotheſis in the art of healing, which explains the cauſes of diſeaſes, and the operations of medicine, on the principles of the *Hermetical* philoſophy, and, particularly, on the ſyſtem of alcali and acid.

HERMETICAL *ſeal*, a manner of ſtopping or cloſing glaſs veſſels, for chemical operations, ſo very accurately, that nothing can exhale or eſcape, not even the moſt ſubtle ſpirits.

It is performed by heating the neck of the veſſel in the flame of a lamp till it be ready to melt, and then with a pair of pincers twiſting it cloſe together. This they call putting on *Hermes's ſeal*.

There are alſo other ways of ſealing veſſels *Hermetically*; viz. by ſtopping them with a plug or ſtopple of glaſs, well luted into the neck of the veſſel; or, by turning another ovum philoſophicum upon that wherein the matter is contained.

HERMHARPOCRATES, or HERMARPOCRATES, in *Antiquity*, a deity, or figure of a deity, compoſed of Mercury, and Harpocrates the god of ſilence.

M. Spon gives us a *Hermharpocrates* in his Rech. Cur. de l'Antiquité, p. 98. fig. 15. having wings on his feet like Mercury, and laying his finger on his mouth like Harpocrates. It is probable they might mean, by this combination, that ſilence is ſometimes eloquent.

HERMIANI, or HERMIATITÆ, a ſect of heretics in the ſecond century, thus called from their leader Hermias. They were alſo denominated Scleniani.

One of their diſtinguiſhing tenets was, that God is corporeal. Another, that Jeſus Chriſt did not aſcend into heaven with his body, but ſet it in the ſun.

HERMIT, ERÆMITA, a devout perſon retired into ſolitude, to be more at leiſure for prayer and contemplation, and to diſencumber himſelf from the affairs of the world.

The word is formed from the Greek ἔρημος, *eremus, vaſtus, deſertus*; and, according to the etymology, ſhould rather be written *eremit*, the ſpirit being ſoft.

An *hermit* is not reputed a religious, unleſs he have made the vows.

Paul, ſurnamed the *Hermit*, *Paulus Eremitanus*, towards the cloſe of the ſecond century, is uſually reckoned the firſt *hermit*; though St. Jerom, at the beginning of the life of that ſaint, ſays, it is not known who was the firſt. Some go back to St. John the Baptiſt, and others to Elias.

Others make St. Antony the founder of the *hermetical* life; but others take him to have only rekindled and heightened the fervour thereof, and hold, that the diſciples of that ſaint owned St. Paul for the firſt perſon that practiſed it, who fled into the moſt ſolitary deſerts of Thebais, where he led, during the ſpace of ninety years, a life more worthy of a ſavage animal than of a rational being. Nevertheleſs this unſociable manner of life was very common in Egypt, Syria, India, and Meſopotamia, not only long before his time, but even before the coming of Chriſt; and it is ſtill practiſed among the Mahometans, as well as the Chriſtians, in thoſe dry and burning climates: for the glowing atmoſphere that ſurrounds theſe countries is a natural cauſe of that love of ſolitude and repoſe, of that indolent and melancholy diſpoſition, that are very common among their languid inhabitants. The perſecutions of Decius and Valerian are ſuppoſed to have been the occaſion; though the ſatirical ſyſtem of theology, derived from the Platonic ſchool, and adopted by Origen and his diſciples, that prevailed at this period, contributed to form the taſte and temper of the firſt *hermits*.

Several of the ancient *hermits*, as St. Antony, &c. though they lived in deſerts, had yet numbers of religious accompanying them.

There are alſo divers orders and congregations of religious, diſtinguiſhed by the title of *hermits*; as, *hermits* of St Auguſtine, of St. John Baptiſt, of St. Jerom, of St. Paul, &c.

HERMITS *of St. Auguſtine*, is a religious order, more frequently called Auguſtines, or Auſtin-friars.

It is commonly pretended to have been inſtituted by that father, but without much ground. This is pretty certain, he laid the foundations of a monaſtic order about the year 388, and retired to his father's eſtate near Tagaſta, to lead a religious life with ſome companions: but it does not at all appear, that this order has ſubſiſted ever ſince; nor that the *hermits* of St. Auguſtine are deſcended, without interruption, from them.

This order, in reality, only commenced under pope Alexander IV. in the middle of the thirteenth century, and was formed gradually by the union of divers congregations, as appears from his bull, publiſhed in the Mare Magnum of the Auguſtines.

That pontiff undertook this union from the firſt year of his pontificate, viz. the year 1254. It was the year 1256 before the ſuperiors of all the congregations could be got together. In the general chapter the union was effected; Lanfranc Septala, a Milaneſe, was choſen general, and the order divided into four provinces, viz. thoſe of France, Germany, Spain, and Italy. See AUGUSTINS.

Since that, other orders have been united to the *hermits* of St. Auguſtine; as the Poor Catholics, &c. and the order now conſiſts of forty-two provinces.

After ſo many unions, the order began to divide again into ſeparate congregations, according to the relaxations and reformations that afterwards got footing. Such are the bare-footed *Hermits* of St. Auguſtine; the congregation of Centorbi, or the Sicilian Reform; the congregation of the Colorites, in Calabria, &c.

There are alſo ſeveral congregations of nuns, under the appellation of *Hermits of St. Auguſtine*.

HERMITS *of Brittini*, was a congregation formed under pope Gregory IX. who gave them the rule of St. Auguſtine.

Their firſt hermitage or abode was in a ſolitary place, called Brittini, in the marquiſate of Ancona; whence the name. They led a very auſtere life; they never eat any meat, and faſted much.

HERMITS *of Camaldui*. See CAMALDULIANS.

HERMITS *of St. Jerom*. See JERONYMITES.

HERMITS *of St. John Baptiſt*, was a religious order in Navarre, whoſe principal convent or hermitage was ſeven leagues from Pampelona.

Till the time of Gregory XIII. they lived under the obedience of the biſhop of that city; but the pope confirmed them a religious order, approved their conſtitutions, and admitted them to make the vows. Their way of living was exceeding auſtere; they went bare-footed, wore no linen, lay on boards, with a large ſtone for their pillow, and bore a large wooden croſs on their breaſts.

Their houſe was a kind of lavra, rather than a convent, cantoned out into cells, in which they lived ſolitarily in the middle of a wood.

HERMITS *of St. Paul*, the firſt *hermit*, is an order formed in the thirteenth century, by the union of two bodies of *hermits* in Hungary, viz. thoſe of St. James de Patoch, and thoſe of Peſtis near Zante.

Upon being incorporated, they choſe St. Paul, the firſt *hermit*, for the common patron and protector of their order, and aſſumed his name. They multiplied very conſiderably in Hungary, Germany, Poland, and other provinces; and, at length, came to have ſeventy monaſteries in Hungary alone; but the revolutions and wars in that kingdom reduced them again.

HERMIT-*fiſh*, a name by which ſome call the long-tailed POMILEA, with a ſoft tail, and the right claw the larger.

HERMITAGE properly ſignifies a little hut or habitation, in ſome deſert place, where a hermit dwells.

HERMITAGE is alſo popularly attributed to any religious cell, built and endowed in a private and recluſe place, and thus annexed to ſome large abbey, of which the ſuperior was called *hermita*.

HERMODACTYL, or *Snake-headed Iris*, in *Botany*. This genus is by Dr. Linnæus joined to the IRIS; the characters of the flower agreeing pretty well with thoſe of that genus, from which, however, Tournefort, his ſepa-

rated it by the difference of the root. Its characters are these: it has a lily-shaped flower, consisting of one leaf, shaped exactly like the iris; but has a tuberous root divided like two or three dogs, like oblong bulbs. There is one species.

This plant is easily propagated by its tubers, which should be taken off and planted soon after the green leaves decay; for if they are kept long out of the ground, they shrink and rot when planted. The roots are apt to run deep in the ground, when they seldom produce flowers; in light soils, therefore, it may be proper to lay a thickness of rubbish under the border where they are planted. Miller

HERMODACTYLS, in *Medicine*, a drug used as a gentle purgative, &c.

The *hermodactyl* is a root about the size of a little chestnut, in figure resembling a heart; ruddy without, very white within; of a light fungous substance, without fibres; easily broken, and reducible into powder like flour; of a sweetish taste, but somewhat viscid. It is brought to us dried, from Egypt, Syria, and Turkey.

These have been too generally supposed a fruit, but they are unquestionably a root, and seem to be the roots of that species of meadow-saffron, called by authors *colchicum Clusii foribus fritillariæ instar variegatis, foliis undulatis*, or the Chinese meadow-saffron, with undulated leaves, and with flowers chequered like those of the fritillary. They were in great use among the ancients as a purge; but their operation is very slow, tedious, and fatiguing, and therefore they have been commonly quickened with aloes and other cathartics. They are best corrected by being joined with aromatics, and are now sometimes used, mixed with julap, in rheumatisms. The women of Egypt eat the fresh roots roasted, to make them grow fat.

Hermodactyls were chiefly used to purge pituitous humours of the brain and joints. They were deemed so efficacious in scouring the mucilaginous glands, and preserving them from the lodgments of gritty matter, which occasion the gout and arthritic complaints, that they were denominated, by some writers, *anima articulorum*. They also promote sweat. They are now expunged by the colleges both of London and Edinburgh from their catalogues of officinals.

HERMODE, in *Mythology*, the name of a divinity worshipped by the ancient inhabitants of the North, or Goths: he was reputed to be the son of Odin, the first of their gods.

HERMOGENEAN *code*, in *Law*. See CODE.

HERMOGENIANS, a sect of ancient heretics, denominated from their leader Hermogenes, who lived towards the close of the second century.

Hermogenes established matter as his first principle, and regarding matter as the fountain of all evil, he maintained that the world, and every thing contained in it, as also the souls of men and other spirits, were formed by the deity from an uncreated and eternal mass of corrupt matter.

The opinion of Hermogenes, with regard to the origin of the world and the nature of the soul, were warmly opposed by Tertullian.

The *Hermogenians* were divided into several branches under their respective chieftains, viz. Hermiani, Seleucians, Materiari, &c.

Some will have the Manichees also to have sprung from the *Hermogenians*.

HERMOPAN, in *Ancient Mythology*, a figure composed of Mercury and Pan.

HERMOSIRIS is a statue of Mercury and Osiris, with the distinct attributes of these divinities united; viz. the caduceus of Mercury, and the head of a hawk with an eagle for Osiris

HERMULES were two small statues of Mercury placed in the circus at Rome.

HERN. See HERON.

HERNANDIA, in *Botany*. See JACK *in a box*.

HERNIA, in *Medicine*, a descent of the intestines or omentum out of their natural place; or rather, the tumor formed by that descent, popularly called a rupture.

The word is latin, *hernia*, and originally signifies the same with *tumor foras*, called also *ramex*. Pliscian observes that the ancient Marsi gave the appellation *hernia* to rocks; whence some will have *hernios* thus called, *propter asperitatem*, on account of their hardness. Scaliger chuses rather to derive the word from the Greek ερνος, *ramus, branch*.

When the peritonæum happens to be extraordinarily dilated, (for it is hardly ever burst or broken) a portion of the omentum, a part of the intestinal canal, and sometimes (though very rarely) the stomach, fall out of their place, and form these sorts of tumors, called *hernias*.

The liver, spleen, uterus, bladder, &c. have at different times been found in different *hernia*, but these are cases that very seldom occur.

They happen most usually in the inguen or groin, in the labia pudendi, or in the scrotum and navel; though, sometimes, in other places, as above and below the navel: in the side, far above the inguen; in the upper part of the thigh, near the spine, &c. and as they make their appearance in the groin, scrotum, thigh, navel, or belly, they are hence called inguinal, scrotal, femoral, umbilical, and ventral.

Hernias are often occasioned by blows, violent contusions, over-stretching in vomiting, and hard labour, or wind; from which last cause it is, that they are so frequent in children, and so easily helped by timely care: in adults they are generally incurable. From *hernias* frequently arise the iliac passion, and sometimes inflammations, and even gangrenes of the intestines.

Hernias are variously denominated, both according to the parts displaced, and those wherein they fall.

If a *hernia* be formed by the descent of a portion of the intestines, which is the most usual kind of rupture, it is called ENTEROCELE, *hernia intestinalis*.

If, instead of the intestines, the omentum be fallen, it is called EPIPLOCELE, or *hernia omentalis*.

A descent of both is called ENTERO-EPIPLOCELE, or compound rupture.

If the intestines fall on the navel, it is called OMPHALOCELE.

If a piece of the gut or caul falls through the perforation of the obliquus descendens into the groin, it is called BUBONOCELE, or *inguinalis*; but if the scrotum be occupied by either of them, the rupture is said to be complete, and is called OSCHEOCELE: the latter was formerly attributed to the laceration of the peritonæum, and the former merely to its dilatation. But it has been more lately discovered, that both the scrotal and femoral *hernia* descend from the abdomen by openings which are natural to every human body. See the sequel of these articles.

Hernia have been also distinguished by different circumstances that attend them, into congenial, incarcerated, &c. There is another distinction of *Hernia* into true, and false or spurious: the former are occasioned by the removal of certain parts from their natural situation, whilst the parts themselves remain, in general, sound, and free from disease; such are those which have been already enumerated: the latter are originally disorders of the parts in which they are seated, occasioned by a various distension of the spermatic vessels, extravasated blood or water within the membranes either of the testicle or of the spermatic vessels, an inflammatory enlargement, and a scirrhous or cancerous state of the testis itself. The spurious *hernia* derive their names either from their supposed contents, as the PNEUMATOCELE, HÆMATOCELE, and HYDROCELE; or from the alteration made in the disease by the natural structure of the parts concerned, as the VARICOCELE, CIRSOCELE, and SARCOCELE, to which some have added the HERNIA *humoralis*.

A kind of prominent tumor in the throat is frequently also called BRONCHOCELE, or *hernia guttural*is.

To this general account of the several species of *hernia*, we shall subjoin a more particular description of each, referring to those that are elsewhere described in the course of this work.

HERNIA *aquosa*. See HYDROCELE.

HERNIA *carnosa*. See SARCOCELE.

HERNIA *congenita, or congenial hernia*, denotes a tumor, occasioned by a portion of intestine or omentum, which is found in contact with the naked testicle, and contained in a sac or bag formed by the *tunica vaginalis testis*. The testes are originally situated in the abdomen, and gradually descend, near the time of birth, through the orifice adapted for their passage, first into the groin, and then into the scrotum, each carrying along with it a peritoneal coat, by which it was covered in the cavity of the belly, and being received into a sacculus or fine membranous bag, which, when closed, constitute the tunicæ vaginales, and are true and original processes of the peritonæum. The upper part or neck of these bags passes through the apertures in the tendons of the external oblique muscles, and the lower part lies enveloped in the common cellular membrane on the outside of those muscles, in the groins. These saccules have free communication with the abdomen by means of their orifices until birth, and often for some time longer. However, when these orifices are closed, a bag or cavity is formed, which contains within it the testicle, covered only by its tunica albuginea, and which has never afterwards any communication with the orifice into the cavity of the belly. Nevertheless, it sometimes happens, that, while these passages are open, a piece of the intestine or omentum intrudes into the orifice of the tunica vaginalis, prevents its closing, and thus a hernial sac is formed of the vaginal coat of the testis, containing the

inteſtine or omentum, and the teſticle in immediate contact with each other. This is the congenial *hernia*; a diſeaſe unknown till within theſe few years, but by no means an uncommon one.

This diſcovery was made by Dr. Hunter, in 1755, aſſiſted by his brother Mr. John Hunter; and it is ingeniouſly accounted for and explained in Dr. Hunter's Medical Comment. N° 1. and by Mr. Pott, in his account of the Congenial *Hernia*, publiſhed in 1757, and in his Remarks on the Hydrocele, publiſhed in 1762.

The *hernia, now* deſcribed, appears in very early infancy, and, like all other kinds of ruptures, ſhould be reduced, and conſtantly kept up by a proper bandage, whenever this method is practicable; and when attended with ſymptoms of ſtricture, it requires the ſame aſſiſtance as the common *hernia*. But if it ſhould happen, that a piece of the inteſtine or omentum has deſcended low into the ſac, while the teſticle is in the groin, or even within the abdomen, the application of a truſs would be highly improper; for it might either prevent the deſcent of the teſticle from the belly into the ſcrotum, or injure it, and occaſion much pain without any benefit. No ſuch bandage ſhould, therefore, be applied to the rupture of an infant, unleſs the teſticle can be fairly felt in the ſcrotum, after the gut or caul is replaced; and, when it can be ſo felt, a truſs cannot be put on too ſoon. There are other circumſtances, which require the attention of a ſurgeon, in the management of this diſeaſe, for which we refer the reader to Mr. Pott's Chirurgical Works, vol. ii. p. 161, &c. 1776.

HERNIA *cruralis*. See HERNIA *femoralis*.

HERNIA *ciſtica* or *veſicalis*, is the *hernia* of the urinary bladder. This is liable to be thruſt forth, either through the opening in the oblique muſcle, like the inguinal *hernia*, or under Poupart's ligament, like the femoral *hernia*. The portion of the bladder which is liable to protruſion is not covered by the peritonæum, and therefore this *hernia* differs from every other in having no hernial ſac.

This kind of *hernia*, in a recent ſtate, is eaſily reduced, and kept from returning, by a proper bandage; but if the outer ſurface of the bladder adheres to the cellular membrane, which is the caſe in the advanced ſtate of this diſorder, the urine cannot be diſcharged without liſting up and compreſſing the ſcrotum, and the patient muſt be content with a ſuſpenſory bag. If this *hernia* be complicated with a bubonocele, and the operation becomes neceſſary, great care is required leſt the bladder ſhould be opened inſtead of the ſac.

M. Mery concludes, that *hernia ciſtica* this kind never ariſe from mere accident, but, when they do happen, they muſt be the effect of an original ill conformation: the bladder of urine, he ſays, is too big to paſs through the annuli, or rings, which the inteſtines paſs through; and, beſides, it is faſtened too ſtrongly on all ſides to admit of a deſcent. M. Petit, however, is of a different opinion, and maintains, that *herniæ* of the bladder may be produced after the ordinary manner of others. Mem. de l'Acad. 1717.

HERNIA *femoralis* is formed by the depreſſion of the omentum or inteſtine into the upper and fore-part of the thigh through the arch made by the ligamentum Poupartii, or, as others call it, the ligamentum Fallopii, between the points of its attachment to the os ilion and the os pubis. The hernial ſac, in this caſe, if it be not greatly extended, lies between the crural veſſels and the os pubis on which it reſts. The method of attempting reduction, and the treatment of the patient in caſe of difficulty, are the ſame as in an *inguinal hernia*; except that in this *hernia* the preſſure ought to be made directly upward, or a little towards the pubes.

There is another kind of *hernia femoralis*, called *hernia foraminis magni iſchii*, which happens when the inteſtines or omentum fall through the great hole of the iſchium into the internal part of the thigh, between and under the two anterior heads of the triceps muſcle. In this caſe, no preſſure nor operation can be attended with ſucceſs.

HERNIA *flatulenta*. See PNEUMATOCELE.

HERNIA *guttoralis*. See BRONCHOCELE.

HERNIA *humoralis* has been generally ſuppoſed to be a diſeaſe of the teſticle itſelf; but it appears, from ſome late obſervations, that its proper ſeat is the *tunica vaginalis*, which is very conſiderably enlarged as well as the ſpermatic chord, whilſt there is no appearance of diſeaſe in the teſtis. Mr. Pott aſcribes it to the defluxion of the inflammatory kind, occaſioned moſt commonly by an irritation in that part of the urethra where the vaſa deferentia or veſiculæ ſeminales terminate. It generally proceeds from venereal complaints, though ſometimes from external bruiſes. This diſorder is attended with pain and heat, and moſt frequently fever. When it proceeds from the ſtoppage of a venereal gonorrhœa, brisk purgatives are uſeful in order to produce a diſcharge; vomits alſo and bleeding are ſerviceable for removing the inflammation and tumor. The topical applications ſhould be of the aſtringent and ſtimulating kind, ſuch as Goulard's ſaturnine water, or a mixture of vinegar and brandy. When the inflammatory ſymptoms abate, mercury may be preſcribed internally, and the unguentum cereuleum forte may be rubbed on the ſcrotum every night, either to prevent or remove any degree of induration. When a ſuppuration cannot be prevented, an emollient cataplaſm muſt be applied warm, and continued till it produces a diſcharge of matter. If the knife be uſed, care muſt be taken that the teſticle is not wounded. Med. Obſ. vol. iii. art. 17. Motherby's Dict.

HERNIA *incarcerata, omental* or *ſtrangulated rupture*, derives its name from this circumſtance, that the protruded parts of the omentum or inteſtine, on account of their ſize, inflammation, or diſtenſion of the gut by feces or wind, the adherence of either of them to the hernial ſac, &c. the ſmallneſs of the aperture of the tendon through which the *hernia* paſſes, or any other cauſe, cannot be replaced without difficulty, pain, and hazard.

The ſymptoms of this diſeaſe are a ſwelling of the groin or ſcrotum, reſiſting the impreſſions of the fingers; and when the *hernia* is of the inteſtinal kind, it is painful to the touch; an increaſe of pain by coughing, ſneezing, or ſtanding upright; a ſickneſs of the ſtomach, and frequent inclination to vomit; and a ſtoppage of all diſcharge by the anus, attended with a frequent hard pulſe and ſome degree of fever. The immediate cauſe of theſe ſymptoms is a ſtricture made on the proleplcd part of the gut, by the borders of the natural aperture in the tendon of the oblique muſcle, which interrupts the paſſage of the aliment and faces, diſturbs the periſtaltic motion of the whole canal, obſtructs the circulation of the blood through its veſſels, and, without ſpeedy relief, brings on a mortification.

Writers are not agreed, whether this ſtricture be owing to a diſeaſe originally in the inteſtine, or to its diſlodgement and diſtenſion. The latter opinion has been generally received; but there are many circumſtances, which deſerve the ſurgeon's attention, that favour the former ſuppoſition; and when this is the caſe, the diſorder becomes more alarming and dangerous. In thoſe caſes, where all the miſchief ariſes from the mere proſapſus and ſtricture, the returned inteſtine becomes immediately pervious, and recovering its periſtaltic motion, keeps its place and performs its office; but if, by previous diſtemper, it is rendered impervious and deprived of its motion, it cannot execute its function, it remains violently diſtended, and is with great difficulty, kept within the belly, after it has been replaced.

Whatever be the immediate cauſe of this kind of *hernia*, the ſurgeon ſhould firſt endeavour, by gentle means, to reſtore the protruded parts to their proper ſituation in the belly: for this purpoſe, the patient ſhould be laid in a ſupine poſture, with his trunk ſomewhat lower than his thighs, and with the thigh on the diſeaſed ſide ſo elevated, as to contribute as much as poſſible to the relaxation of the abdominal aperture; and thus, by keeping the teſticle from aſcending and the inteſtine from deſcending, and continued gentle preſſing of the tumor, the inteſtine may be made to return. When the difficulty is conſiderable, the poſture of the body ſhould approach nearly to that which is commonly called ſtanding on the head. If this attempt fails, recourſe muſt be had to frequent and copious bleeding, the warm bath, catheters, the application of cataplaſms, fomentations, embrocations, &c. acrid ſtimulating glyſters and ſuppoſitories frequently repeated, particularly thoſe of the ſmoke of tobacco, and a compoſition of ſalt, honey, and aloes, boiled to a proper conſiſtence. Omental ruptures are generally more capable of reduction than the inteſtinal; but when, by adheſion to the ſides of the hernial ſac, or any alteration in their form, they cannot be reduced, their weight muſt be ſuſpended in a bag or truſs, and thus rendered as little troubleſome as poſſible.

When the parts are properly reduced, they ſhould be kept from falling down by a bandage or truſs, the pad of which is made to conſtantly preſs againſt the opening in the abdominal tendon, and ſo keep the gut or caul from protruding, and bring the ſides of the hernial ſac as near as poſſible to each other. After the operation is completed, the body ſhould be kept open, and the diet and regimen be low and ſparing, while the leaſt degree of tenſion or pain remain.

If the means above recited fail of effect, and the ſymptoms of the diſorder increaſe, the next remedy, which ſhould be applied to without delay, is chirurgical operation, in order to diſengage the parts where the ſtricture lies, before they become gangrenous. The manner of

performing

performing the operation, as described by Mr. Pott, is as follows: the patient muſt be laid on his back, on a table of convenient height, with his legs hanging eaſily over the end of it; and then the operator, with a ſtrait diſſecting knife, muſt make an inciſion through the ſkin and membrana adiposa, beginning juſt above the place where the inteſtine paſſes out from the belly, and continuing it to the lower part of the ſcrotum. When the adipoſe membrane is divided, there will appear a few ſmall, diſtinct, tendinous bands, lying cloſe on the hernial ſac, which muſt likewiſe be divided, as well as the ſac itſelf. The inciſion in the ſac, which requires caution and ſteadineſs, becauſe of its different degrees of thickneſs in different kinds and ſtages of the *hernia*, ſhould be made about an inch and a half below the ſtricture, and the opening be ſufficient to admit the end of the operator's fore-finger, which, introduced into the aperture, will ſerve as a director; and upon this a narrow-bladed, curved knife, with a bold probe-point, the point of the knife being always ſhort of the extremity of the finger, will ſerve to divide the ſac quite up to the opening of the tendon, and down to the bottom of the ſcrotum. When the ſac is firſt divided, there iſſues from it a fluid, which varies in quantity, colour, and conſiſtence, according to the date, ſize, and ſome other circumſtances attending the rupture. The ſac being laid open, the inteſtine immediately protrudes, unleſs it happens to be enveloped in the omentum; the operator is now to try, whether by gently drawing out a little more of the gut, and reducing its bulk, he can return it back to the belly without dividing the tendon; but if this cannot be eaſily accompliſhed, it is better to decline attempting it. In order to divide the ſtricture with the leaſt hazard, the ſurgeon ſhould firſt attend to the ſtructure and direction of the parts; and, as the natural opening in the tendon of the obliquus deſcendens muſcle, through which the *hernia* paſſes, is formed by a kind of ſeparation of the fibres from each other, and its direction is the ſame with that of the tendon, or obliquely downward from the oſ ilion to the oſ pubis, the knife ſhould be ſo managed as to continue this ſeparation, by applying its edge to the ſuperior and poſterior part of the oval, and carrying it upward and obliquely backward till a ſufficient opening is obtained: this opening ſhould afford room for paſſing the end of the finger on the inſide in caſe of any adheſion. When the ſac and ſtricture are divided, the contained parts will come into view, and their ſtate may be judged of by the ſurgeon. If they appear to be ſound and unconnected, they ſhould be immediately reduced. In returning the inteſtine, the part which came out laſt ſhould be put in firſt, that the gut may not be doubled on itſelf; and the fingers, in this operation, ſhould be applied to that part of the inteſtine which is connected with the meſentery, rather than with its convex part: during the reduction, the leg and thigh of the patient on the ruptured ſide ſhould be elevated. If the inteſtine be accompanied with a portion of the omentum, the latter ſhould be returned firſt. Slight adheſions of the parts of the inteſtines to one another, to the omentum, or to the hernial ſac, may be ſeparated without danger. When the prolapſed part is replaced, a conſiderable part of the hernial ſac may be ſafely removed, no part of it being of any conſequence, except that with which the ſpermatic veſſels are connected. If the protruded parts, by neglect, delay, or inflammation, are ſo diſeaſed, by gangrene or mortification, as not to be fit for immediate reduction, ſome previous attention will be neceſſary: the diſeaſed part of the omentum may be cut off from the ſound; and this has been the general practice. The common way of doing this has been by making a ligature juſt above the altered part, cutting off what is below the ligature, and leaving the ligature to hang out of the wound, that it may be more eaſily taken away when it is caſt off. But Mr. Pott condemns the uſe of the ligature as needleſs and pernicious, and obſerves, that any portion of the caul may be cut off without any previous tying. If the gangrene or ſphacelus has ſeized the inteſtine, and conſiſts of a black ſpot only, which, by caſting off, might endanger the ſhedding its contents into the belly, this inconvenience may be prevented by connecting the upper part to the wound by means of a needle and ſtrong ligature; ſo that, when the mortified part ſeparates, the faeces may be for ſome time diſcharged by the wound; after which it has been known to contract gradually and heal: but whatever be the event, this method of ſecuring the gut ſhould never be omitted. If the altered portion of the gut be large, and requires exciſion, the divided parts muſt be united by future, and both faſtened to the inſide of the belly, at the upper part of the wound, ſo that if the union does not ſucceed, the faeces may be diſcharged, if poſſible, through the groin: but if the two ends cannot be brought together, they muſt both be connected with a proper needle and a ſtrong ligature to the upper edge of the wound. The dreſſing ſhould be ſoft and light, and the patient muſt obſerve the moſt rigid ſeverity of diet, and the moſt perfect ſerenity of body and mind. Old age is an advantage in performing the operation for *hernia*, becauſe old people's guts are not ſo liable to inflame or gangrene as thoſe of young perſons. After all, the hazard of ſucceſs is ſo great, and the utmoſt power of art ſo little, ſays Mr. Pott, that what Iapis ſaid to Aeneas, with relation to his cure, may be applied here:

Non has humanis opibus, non arte magiſtra
Proveniunt; neque te Aeneas mea dextera ſervat:
Major agit deus.

Pott's Works, vol. ii. p. 100, &c. 1779. Heiſter's Surgery, part ii. ſect. 5. cap. 117.
See an account of a ſtrangulated *hernia*, by Mr. Elſe, Med. Obſ. vol. iv. art. 30.

HERNIA *inguinalis*, or *rupture in the groin*, called alſo BUBONOCELE, is occaſioned by the deſcent of a portion of the inteſtine, moſt commonly of the ileum, and often of the caecum, or colon, or omentum, through the rings of the abdominal muſcles into the groin. This is called an incomplete rupture, in contradiſtinction to the ſcrotal or ONCHOCELE. The ſign of an inguinal and ſcrotal rupture is a ſwelling in the groin, or in the upper part of the ſcrotum, beginning at the opening of the abdominal muſcles, the appearance of which will depend on the nature and quantity, and ſtate of its contents. If the tumor be formed by a ſmall portion of the inteſtine, it will be proportionably ſmall; and when it is diſtended with wind, or inflamed, or has any degree of ſtricture upon it, it will be tenſe, and reſiſt the impreſſion of the finger, and handling of it will occaſion pain. But if there be no ſtricture or inflammation, the tenſion of the tumor, whatever be its ſize, will be inconſiderable, unleſs the patient coughs; and no pain will attend the handling of it. The reduction of this *hernia*, in the ſtate laſt deſcribed, is very eaſy, and requires only the moſt gentle means; the inteſtine generally ſlips up at once, and in its return makes a kind of guggling noiſe.
If a portion of the omentum hath deſcended, the tumor will be more flabby and compreſſible, and its ſurface will be more uneven; the ſcrotum will aſſume a more oblong appearance than it bears in an inteſtinal *hernia*; and when the quantity of its contents is large, and the patient adult, it may in ſome meaſure be diſtinguiſhed by its weight. In this caſe the return is not ſo ſpeedy as in the former, nor attended with the ſame noiſe, and requires to be followed by the finger to the laſt. See EPIPLOCELE.
If both the inteſtine and omentum have deſcended, the characteriſtic marks will be leſs diſtinct, and ſome degree of experience will be neceſſary, in order to diſtinguiſh it from other complaints. When this *hernia* is reduced, the inteſtine returns firſt, and the omentum feels flabby, but, being farther compreſſed, ſoon follows it. See ENTERO-EPIPLOCELE.
Hernia, where the omentum falls down with the inteſtine, are more dangerous than where the gut is alone, becauſe the omentum hinders the reduction of the gut, grows to the rings of the muſcles, ſwells, and forms a thick ring, which ſtrangulates the gut. See Phil. Tranſ. N° 450. ſect. 1. See HERNIA *incarcerata*.
In every kind of rupture, as ſoon as the parts are returned, their deſcent ſhould be prevented by the application and conſtant uſe of a ſteel truſs, which ſhould be well made and properly fitted: the uſe of a truſs by infants and young perſons, and in recent caſes, will ſerve to compreſs the neck of the HERNIAL *ſac*, while it is in its ſoft and thin ſtate, ſo as to unite the ſides with each other, or at leaſt to diminiſh the paſſage, and prevent the deſcent of any thing into it from the belly: and will frequently effect a radical and perfect cure. In thoſe of mature age, or whoſe ruptures are of long ſtanding, the entrance into the ſac is large, and the ſides thicker and firmer; therefore the compreſſion and union of the ſides of the neck are more difficult, though they are ſometimes ſufficiently contracted to hinder the falling down of any thing from the abdomen. But in very ancient people, and very old ruptures, this union is ſtill more improbable, and therefore a truſs, the part of which ſerves to keep the parts in their proper place, can hardly ever be laid aſide.
Inteſtinal ruptures are in themſelves more hazardous than the omental; and this hazard ariſes from the ſtricture and the functions of the parts concerned; which are incapable of bearing any conſiderable degree of inflammation, and which perform offices, ſuch as digeſtion, propulſion of the chyle into and through the lacteals, and

expulſion

expulsion of the fæces, necessary to the existence of the animal.

The female *hernia*, when recent, has much the same appearance as the *hernia inguinalis* in men; and when more of the gut or caul is thrust down than the groin can conveniently contain, it pushes down into one of the labia pudendi, and sometimes forms a tumor of considerable size. When the *hernia* of women are easily reducible, they give little pain, and generally return into the belly, when they lie in a supine posture. The same kind of truss is necessary for women as for men.

For the method of treatment in the more dangerous stages of this disorder, see the preceding article.

HERNIA *intestinalis*. See ENTEROCELE, and the preceding articles.

HERNIA *lachrymalis*. See ÆGILOPS, ANCHILOPS, and FISTULA *lachrymalis*.

HERNIA *mentalis*. See EPIPLOCELE and HERNIA *inguinalis*.

HERNIA *ovarii*, is occasioned by the descent of the ovaria through the tendinous opening of the oblique muscles into the groin. Mr. Pott mentions a remarkable case of this kind, in which the ovaria were taken away, by making a ligature on the membranous bag containing them, just below the tendon, and cutting them off. The woman on whom this operation was performed, became thinner and more muscular; her breasts, which before were large, diminished, and in great measure disappeared, and her menstruation ceased; but she enjoyed good health after the operation.

HERNIA *scrotalis*. See OSCHEOCELE and HERNIA *inguinalis*.

HERNIA *vaginalis*, is a tumor of the vagina, formed by the descent of the intestines, and their pressure on the peritonæum, between the rectum, and the posterior part of the uterus.

HERNIA *varicosa*, called also CIRSOCELE, is a varicous distention of the spermatic vein, attended with pain, and occasionally with a wasting of the testicle. Frequent bleeding, exercise, and attenuating medicines, may be recommended for the prevention of this disease; and the pain of the back that attends it may be relieved by suspension of the scrotum.

HERNIA *ventosa*. See PNEUMATOCELE.

HERNIA *ventralis*, is a tumor which appears almost in any part of the belly; but is most frequently found in or between the recti muscles, either above or below the navel. The protruded parts should be reduced, and kept in their place by a proper bandage.

HERNIA *vesicæ urinariæ*. See HERNIA *cystica*.

HERNIA *umbilicalis*. See OMPHALOCELE and EXOMPHALUS.

HERNIAL *sac*, is formed by a portion of the peritonæum, thrust before the descending part in a rupture, though some have erroneously imagined, that it is produced by mere pressure of the common cellular membrane; and is larger or smaller, according to the quantity of its contents. This sac is at first small and thin, and seldom descends lower than the groin at first, except in congenial *hernia*, but by degrees it extends itself into the scrotum, and as it enlarges in length, its texture becomes firmer and stronger, till in old age, or old ruptures, it is found of very considerable thickness. Mr. Pott apprehends, that this sac is incapable of returning back into the abdomen, after it has been fairly pushed out through the aperture in the tendon. It is now generally acknowledged, that to whatever size the *hernial* sac may be extended, and however large its contents may be, it is merely dilated, and hardly ever burst or broken. See HERNIA *incarcerata*, and HERNIA *inguinalis*.

See on the subject of the preceding articles, Pott's Chirurgical Works, vol. ii. and vol. iii. Heister's Surgery, part ii. Sharp's Operations, &c.

HERNIARIA, in *Botany*. See RUPTURE-*wort*.

HERNSHAW, or HERNERY, a place where herons breed.

HERO, in the *Ancient Theology*, and *Mythology*, a great and illustrious person, of mortal nature, though by the populace supposed to partake of immortality, and after his death, placed by them among the number of the gods.

The word is formed of the Latin *heros*, and that of the Greek ἥρως, *semideus, demi-god*. St. Augustine, *De Civit. Dei*, lib. x. observes, that it is highly probable, that some one of Juno's sons was originally called by this name; that goddess being called in Greek Ἥρα: or it may be, that great men were distinguished by this appellation; in allusion to the opinion of the ancients, that virtuous persons, after their deaths, inhabit the wide expanse of the air, which is Juno's province. Others incline to think, that *heroes* were thus called *quasi aereos, aerii*, persons of superior merit, and worthy of heaven. Plato derives the word from the Greek ἔρως, *love*; as intimating the *heroes* to have risen from the copulation of a god with a mortal woman; or of a goddess with a man. Others derive the name from the Greek εἴρειν, *dicere, to speak*; the *heroes* being persons who, by their eloquence, led the people at their pleasure. Others, lastly, derive it from the Greek ἠρα, *terra, earth*; the *heroes*, on their principle, being the *dii terrestres*, or *gods of the earth*.

Heroes were, properly, persons partly of divine, and partly of human extraction; being produced between a deity and a mortal: as Achilles, who was the son of the goddess Thetis, by Peleus; and Hercules, who was the son of Jupiter, by Alcmena.

A *hero*, then, coincides with what we otherwise call a *demi-god*: accordingly, Lucian defines a *hero* to be a medium between a god and a man; or rather, a composition of both.

The Greeks erected columns and other monuments over the tombs of their *heroes*, and established a kind of worship in honour of the manes both of their *heroes* and heroines. The Romans also raised statues in honour of their *heroes*; but there were six of their *heroes* of a superior order, and who were supposed to be admitted into the community of the twelve great gods: these were Hercules, Bacchus, Æsculapius, Romulus, Castor, and Pollux. Writers have distinguished between the worship which the ancients paid to their *heroes*, and that offered to their gods. The latter, it is said, consisted of sacrifices and libations; the former was only a kind of funeral honour, in which they celebrated their exploits, concluding the rehearsal with feasts.

HERO is *also* used in a more extensive sense, for a great, illustrious, and extraordinary personage; particularly in respect of valour, courage, intrepidity, and other military virtues.

F. Bouhours makes this distinction between a great man and a *hero*, that the latter is more daring, fierce, and enterprising; and the former more prudent, thoughtful, and reserved. In this sense we properly say, Alexander was a *hero*, Julius Cæsar a great man.

HERO *of a poem or romance*, is the principal personage, or he who has the chief part in it.

Thus the *hero* of the Iliad is Achilles; of the Odyssey, Ulysses; of the Æneid, Æneas; of Tasso's Jerusalem, Godfrey of Bulloign; of Milton's Paradise Lost, Adam; though Mr. Dryden will have the devil to be Milton's *hero*, because he gets the better of Adam, and drives him out of Paradise.

The character of Achilles is the inexorable wrath of a haughty, valiant, unjust, and revengeful prince; that of Ulysses, is the wise and prudent dissimulation of a courageous king, whose constancy nothing could shake; that of Æneas, is piety, goodness, gentleness, good-nature, and humanity, sustained, like the others, with an invincible courage.

Many of the critics find fault with the *hero* of the Æneid: they say he is too sensible and delicate; and wants the fire, firmness, and uncontrolable spirit, remarkable in the *hero* of the Iliad. Piety, tenderness, and submission to the gods, are the virtues of the middle class of mankind; they do not strike and command enough for a *hero*, who is to be the instrument of such notable exploits. St. Evremond looks on Æneas as fitter to have been the founder of a religious order than of an empire. F. Bossu defends Virgil's *hero*, or at least Virgil, with admirable address. Æneas's character, he observes, was not to be formed on the model, either of Achilles, or Ulysses, nor to be of the same kind with them; as the fable and the design of the Æneid was very different from those of the Iliad and Odyssey.

What Virgil had in view was, to make the Romans receive a new kind of government, and a new master: this master, then, must have all the qualities requisite for the founder of a state, and all the virtues which make a prince beloved. The violence of Achilles was, of consequence, precluded; and so was the dissimulation of Ulysses; that being a quality which renders a man suspected, not beloved.

Virgil was restrained in his choice; his *hero* was to be of the genius of Augustus; and the poet was in the condition of a painter, who is obliged to accommodate a piece of history to the model of a face that is given him. The character of Homer's two *heroes*, as being directly opposite to his design, he has thrown upon Turnus and Mezentius, who are the counterparts to his *hero*.

It is disputed among the critics, whether it be necessarily required, that the *hero* of an epic poem be a good and virtuous man? F. Bossu maintains the negative; between a *hero* in morality, and a *hero* in poetry, the same distinction is to be made, as between moral and poetical goodness. Hence as the manners of Achilles, and Mezentius, are poetically as good as those of Ulysses, and Æneas, so those two cruel and unjust men are as regular poetical *heroes*, as these two just, wise, and good men.

Aristotle,

Ariſtotle, indeed, repreſents the *heroic* virtue, as a virtue more than human; and of conſequence, *heroes*, as divine perſons, whom the excellency of their nature raiſes above our claſs; but this he ſays only in his books of morality: in his Poetics he ſpeaks another language. The prime perſon of a poem, whom he calls the *hero*, he there obſerves, muſt neither be good nor bad, but between both: he muſt not be either ſuperior to the generality of mankind, by his virtue and juſtice; nor inferior to them, by his crimes and wickedneſs: the moral and epic *heroes*, therefore, even on Ariſtotle's principles, have nothing in common with each other; the one muſt be raiſed above mankind, and the other muſt not be on a level with the moſt perfect of men.

In effect, reaſon, the nature of the poem, which is to be a fable, the practice of Homer, and the rules of Ariſtotle and Horace, all agree, that ſo far is it from being neceſſary, that the *hero* of an epopee be a perfect, faultleſs man, that it is not neceſſary he be an honeſt man; and that it is no ways irregular, to make him as preſidious as Ixion, as unnatural as Medea, or as brutal as Achilles.

It is another ſubject of controverſy, among the critics, whether the cataſtrophe, or concluſion of the action, is neceſſarily to leave the *hero* happy, and at eaſe; or whether it be allowable to leave him unhappy?

The general practice of the *heroic* poets ſtands for the firſt. We have ſcarce one example of a *hero* who is overcome, and remains unhappy; excepting Adam in Milton. In tragedy, the caſe is different: unhappy cataſtrophes, according to Ariſtotle, are preferable to happy ones, and were always much better received among the ancients. The tragic ſcene is the throne of the paſſions, and terror and pity are there to rule in a peculiar manner: now theſe paſſions ariſe the moſt naturally from unhappy events: and the audience, quitting the theatre full of the miſfortunes wherewith the piece was cloſed, preſerve their concern much longer, and feel more forcible effects from it, than if their tears had been wiped away, and their ſighs ſmothered, in the ſatisfaction of a more happy periperia.

But theſe reaſons have no place in the epopea; which is not intended ſo much to affect the paſſions, as to remove ill habitudes. But it is true, withal, that the epopea does not exclude all unhappy concluſions; the nature of epic fable is ſuch as admits equally of good and bad perſons for the prime parts; the unhappy adventure of a lamb unjuſtly devoured by a wolf, is a ſubject every way as inſtructive, and as regular, as the generoſity of a lion, who lets himſelf be diſarmed of his rage by the innocence of the lamb.

It is true, if the poet propoſed his *hero* as a pattern of perfection for imitation, the misfortunes falling on him would ſuit very ill with the deſign: but this was, doubtleſs, the fartheſt thing from the intentions of the great maſters of the epopea above mentioned. The only reaſon, perhaps, that can be given for the uniform practice of the poets in this reſpect, is, that an epic poem containing an action of much more extent than that of a tragic poem, the reader would not be ſo well ſatisfied, if, after ſo many labours and difficulties as the *hero* is brought to ſtruggle with, he ſhould not at laſt be brought off, but periſh miſerably. There is ſomething, no doubt, great and good in the *hero*, which, in the courſe of the poem, makes us concerned for him; ſo that, after ſo long an acquaintance, we cannot leave him miſerable without ſome anxiety; which it is not the final buſineſs of the poet to raiſe.

HERODIANS, a ſect among the Jews, at the time of Jeſus Chriſt, mentioned by St. Matthew, xxii. 16. and St. Mark, iii. 6. and xii. 13.

The critics and commentators on the New Teſtament, are very much divided with regard to the *Herodians*; ſome making them to be a political party, and others a religious ſect. The former opinion is favoured by the author of the Syriac verſion, who calls them the domeſtics of Herod, and alſo by Joſephus; having paſſed them over in ſilence, though he profeſſes to give an account of the ſeveral religious ſects of the Jews. The latter opinion is countenanced by our Lord's caution againſt the leaven of Herod, which implies, that the *Herodians* were diſtinguiſhed from the other Jews by ſome doctrinal tenets.

St. Jerome, in his Dialogue againſt the Luciferians, takes the name to have been given to ſuch as owned Herod for the Meſſiah; and Tertullian, Epiphanius, Chryſoſtom, and Theophylact, among the ancients; and Grotius, and other moderns, are of the ſame ſentiment. But the ſame St. Jerome, in his comment on St. Matthew, treats the ſame opinion as ridiculous; and maintains, that the Phariſees gave this appellation, by way of deriſion, to Herod's ſoldiers, who paid tribute to the Romans; agreeably to which, the Syriac interpreters render the word by the *domeſtics of Herod*; i. e. his courtiers.

M. Simon, in his notes on the twenty-ſecond chapter of Matthew, advances a more probable opinion. The name *Herodians*, he imagines to have been given to ſuch as adhered to Herod's party and intereſt, and were for preſerving the government in his family; about which there were, at that time, great diviſions among the Jews.

F. Hardouin will have the *Herodians* and Sadducees to have been the ſame.

Dr. Prideaux is of opinion that they derived their name from Herod the Great, and that they were diſtinguiſhed from the other Jews by their concurrence with Herod's ſcheme of ſubjecting himſelf and his dominions to the Romans, and likewiſe by complying with many of their heathen uſages and cuſtoms. This ſymbolizing with idolatry upon views of intereſt and worldly policy, was probably that leaven of Herod, againſt which our Saviour cautioned his diſciples. It is farther probable that they were chiefly of the ſect of Sadducees; becauſe the leaven of Herod is alſo denominated the leaven of the Sadducees. Pilid. Conn. part ii. book v. ſub. fin.

HERODIUS *avis*, in *Natural Hiſtory*, a name given by Aldrovand, and ſome others, to the chryſaetos, or *golden* EAGLE.

HEROIC, ſomething belonging to a hero, or heroine.

Thus we ſay, *heroic* actions, *heroic* virtue, *heroic* ſtyle, *heroic* verſe, *heroic* poet, *heroic* age, &c.

HEROIC *age*, is that age or period of the world, wherein the *heroes*, or thoſe called by the poets the *children of the gods*, are ſuppoſed to have lived.

The *heroic age* coincides with the fabulous AGE.

HEROIC *poem* is that which undertakes to deſcribe ſome extraordinary action, or enterprize.

Homer, Virgil, Statius, Lucan, Taſſo, Camoens, Milton, and Voltaire, have compoſed *heroic poems*.

In this ſenſe, *heroic poem* coincides with EPIC *poem*.

HEROIC *verſe*, is that wherein *heroic* poems are uſually compoſed; or, it is that proper for ſuch poems.

In the Greek and Latin, hexameter verſes are peculiarly denominated *heroic verſes*, as being alone uſed by Homer, Virgil, &c.

Alexandrine verſes of twelve ſyllables, were formerly called *heroic verſes*, as being ſuppoſed the only verſe proper for *heroic* poetry; but later writers uſe verſes of ten ſyllables.

HEROINE, HEROINA, or HEROIN, a woman that has the qualities and virtues of a HERO; or that has done ſome heroic action.

HERON, *Ardea*, in *Ornithology*, the name of a large genus of birds, the diſtinguiſhing character of which is, by Mr. Ray, fixed in their inteſtines, they having only one inteſtinum cæcum, or blind gut, as is the cuſtom of nature in quadrupeds, moſt other birds having two.

In the Linnæan ſyſtem this is a genus of the grallæ, diſtinguiſhed by a long, ſtrait, pointed bill, with furrows from the noſtrils to the end, linear noſtrils, and feet with four toes. To this genus belong the ARDEOLA, BITTERN, COCOI, CRANE, the GARA *guiana*, or ſmall white *heron*, the GAZZA, or greater white *heron*, the SOCO, the STORK, *night*-RAVEN, &c.

The common *heron*, or *ardea major* of Linnæus, has a ſmall body, always lean, and covered with a very thin ſkin. See *Tab.* II. *Birds. fig.* 18. It builds in trees, and ſometimes in high cliffs over the ſea; forms its neſt of ſticks lined with wool, and in the month of February lays five or ſix large eggs of a pale green colour. This bird was formerly much eſteemed as a food; it is remarkably long-lived, ſometimes exceeding even fifty years. The male is a very elegant bird; its forehead and crown, and upper part of the neck, are white; the head is adorned with a pendent creſt of long black feathers; the covers of the wings are of a light grey colour; the fore part of the neck is white, ſpotted with a double row of black; the feathers are white, long, narrow, and unwebbed, and the ſcapulars are of the ſame texture, of a grey colour, ſtreaked with white: beneath the wings there is a bed of black feathers, which are very long and ſoft, and were formerly uſed as ornaments to the caps of the knights of the Garter: the breaſt, belly, and thighs, are white; the laſt being daſhed with yellow; the tail is compoſed of twelve ſhort cinereous feathers; the legs are of a dirty green, the claws ſhort, and the inner edge of the middle claw finely ſerrated. The head of the female, which was formerly ſuppoſed to be a diſtinct ſpecies, is grey; inſtead of a creſt, it has only a ſhort plume; the ſcapulars are grey and webbed, and the ſides grey. Pennant. This bird is a very great devourer of fiſh, and does more miſchief to a pond than even an otter. People who have kept *herons*, have had the curioſity to number out the fiſh they fed them with into a tub of water, and counting them again afterwards, it has been found that they

they will eat fifty moderate fized dace and roaches in a day. It has been found that in carp ponds, vifited by this bird, one *heron* will eat up a thoufand ftone carp in a year, and will hunt them fo clofe as to let very few efcape. The readieft method of deftroying this mifchievous bird, is by fifhing for him in the manner of pike, with a baited hook. When the haunt of the *heron* is found out, three or four fmall roach or dace are to be procured, and each of them is to be baited on a wire, with a ftrong hook at the end, entering the wire juft under the gills, and letting it run juft under the fkin to the tail, the fifh will live in this manner five or fix days, which is a very eflential thing; for if it be dead, the *heron* will not touch it. A ftrong line is then to be prepared of filk and wire twifted together, and is to be about two yards long; tie this to the wire that holds the hook, and to the other end of it there is to be tied a ftone of about a pound weight; let three or four of thefe baits be funk in different fhallow parts of the pond, and in a night or two's time, the *heron* will not fail of being taken by one or other of them.

When hawking was more in ufe, and laws were eftabliſhed for the preſervation of the ſpecies, the *heron* afforded a great deal of ſport to the people who loved that diverſion. There is but very little art in this flight of the hawk; but as both the birds are large and courageous, the fight is finer than in the flight of fmaller birds that make no reſiſtance. At the beginning of March the *herons* begin to make their paſſage; if, therefore, you will adapt your hawks to the *heron*, they muſt at this time be uſed to fly at the rivers, and about waters; and they muſt be fed with light meats; then the hawk is to be entered at the game by getting a living *heron*, and cutting its wings, or diſabling it in ſuch a manner that it cannot fly; then it is to be ſet on the ground, and the hawk unhooded and let go at her. If the hawk ſeize the *heron*, the falconer muſt run in to her aſſiſtance, and kill the *heron*, giving the hawk her reward, the heart, and letting her ſtand over the opened breaſt, and feed on other parts of the entrails; then let her be hooded; and afterwards the bird is to be ſwung about the head, and the hawk taught to come and feed on it out of the falconer's hand.

When the hawk is thus fairly entered, another live *heron* is to be procured, and let off in an open field undiſabled. As ſoon as ſhe is riſen to a conſiderable height in the air, the hawk is to be let out after her; if the hawk cloſe with her, and bring her down, the falconer is to run up to her aſſiſtance, and ſticking the *heron's* bill in the ground, and breaking her wings and legs, the hawk is to be left to feed and plume upon her. When ſhe is thus well managed, ſhe may be taken to the waters, and let at a wild *heron*, in the following manner.

When a *heron* is found, the falconer is to get as nigh her as he can, going under the wind with his hawk, which muſt be a gerfalcon, or jerkin, with a haggard falcon for the driver. Thus having the hoods looſe, as ſoon as ever the *heron* is up, let off the driver, which makes up to her, and cauſes her to work in the wind; then let go the hawks that are to fly at her; but when they have worked above the *heron* that they come through her, they will make her come to ſiege. When they have got her down, the falconer muſt make up to them as quick as poſſible, and aſſiſt them by breaking her legs and wings, and thrulling her bill into the ground. For this flight of the hawk there ſhould always be a dog trained up to the ſport, whoſe buſineſs it is to come up and kill the *heron* the moment that he ſees her fall.

If the hawk cannot bring her down, or gives over the flight, then give her a train *heron* or two, in a proper place, before ſhe is truſſed at a wild *heron* again, otherwiſe ſhe will be diſheartened and ſpoiled.

A *heron* at ſiege is one ſtanding at the water-ſide watching for prey.

HEROS *copulationis*, the *hero of copulation*, an affected name given by Paracelſus to the ſpirit of ſea-ſalt; a menſtruum he was particularly fond of, and which ſeems to have been one great ingredient in his alcaheſt.

HERPES, ἕρπης, in *Medicine*, a cutaneous heat, or inflammation, attended with a roughneſs of the ſkin, and the eruption of a number of little puſtules ſpreading every way.

The word is formed of the Greek ἕρπω, *paulatim repo, rapo*; becauſe the eruptions *creep* from place to place.

Therefore divers kinds of this diſeaſe are,

HERPES, *miliaris*. This is an aſſemblage of innumerable little puſtules, under the cuticle, of the ſize of millet-ſeeds; popularly called the SHINGLES.

HERPES, *ſimplex*, is a ſingle puſtule, or two, riſing chiefly on the face, of a whitiſh or yellowiſh colour, pointed, and with an inflamed baſe. Theſe dry away, of their own accord, upon letting out the drop of pus contained in them.

A third ſpecies of *herpes* is what we otherwiſe call SERPIGO *ſicca*, in Engliſh, a *tetter*, or RING-*worm*.

HERPES *exedens* is of a more corroſive kind: the puſtules are ſudoſy, and attended with an itching; and ulcerate the parts on which they riſe.

HERPES *feroz*. See EREYSIPELAS.

HERRING, *Harengus*, in *Ichthyology*, a ſpecies of the CLUPEA. The characters by which this fiſh is diſtinguiſhed from the reſt which approach to it in ſhape, and which are thence called *harengiformes*, are theſe: its uſual length is ſeven or eight inches, though it ſometimes grows to a foot; its head is flatted, and its mouth placed upwards; the colour of the back and ſides is green, varied with blue, and that of the belly ſilvery; the ſcales are large and round; it is not at all ſpotted; and its belly is ſharply carinated, but the ridge is quite ſmooth, and not in the leaſt ſerrated; its ſide-lines are ſmall, and ſcarce diſtinguiſhable; the lower jaw is longer and more prominent than the upper; its gills are four in number, as in other fiſhes, but their fibres are remarkably long, and open very wide; ſo that the *herring* almoſt inſtantly dies when taken out of the water; it has one fin on its back, which conſiſts of about ſeventeen rays, and is in the midway between the head and tail; the two ventral fins have nine rays; the pectoral ſeventeen, the anal fourteen, and the tail is forked.

The name *herring* is derived from the German *heer*, an *army*, which expreſſes their number, when they migrate into our ſeas. *Herrings* are found in great plenty from the higheſt northern latitudes as low as the northern coaſt of France. They are alſo met with in vaſt ſhoals on the coaſt of America, as low as Carolina: they are found alſo in the ſea of Kamtſchatka, and poſſibly reach Japan: but their winter rendezvous is within the arctic circle, whither they retire after ſpawning, and where they are provided with plenty of inſect food. For an account of the remarkable migration of *herrings*, and the hiſtory of the fiſhery, &c. ſee *Herring* FISHERY.

They are in full roe at the end of June, and continue in perfection till the beginning of winter, when they begin to depoſite their ſpawn.

There are divers names given to preſerved *herrings*, according to the different manners wherein they are ordered: as,

1. *Sea-ſticks*. Theſe are ſuch as are caught all the fiſhing ſeaſon, and are but once packed. A barrel of theſe holds ſix or eight hundred; eight barrels go to the tun, by law; a hundred of *herrings* is to be a hundred and twenty; a laſt is ten thouſand; and they commonly reckon fourteen barrels to the laſt.

There are others, repacked on ſhore, called *repacked herrings*; ſeventeen barrels of ſea-ſticks commonly make from twelve to fourteen of repacked *herrings*.

The manner of repacking them is, to take out the *herrings*, waſh them out in their own pickle, and lay them orderly in a freſh barrel: theſe have no ſalt put to them, but are cloſe packed, and headed up by a ſworn cooper, with pickle, when the barrel is half full. The pickle is brine; ſo ſtrong, as that the *herring will* ſwim in it.

2. *Sammons*. Theſe are ſuch as the Dutch chaſers, or divers, catch from June to the fifteenth of July. Theſe are ſold away in ſea-ſticks, to be ſpent preſently, in regard of their fatneſs; becauſe they will not endure repacking. They go one with another, full and ſhotten; but the repacked *herrings* are ſotted, the full *herrings* by themſelves.

3. The *ſhotten* and *ſick herrings* by themſelves; the barrel whereof is to be marked diſtinctly.

4. *Crau herrings*; which are ſuch as are caught after the fourteenth of September. Theſe are cured with that kind of ſalt called ſalt upon ſalt, and are carefully ſotted out, all full *herrings*, and uſed in the repacking.

5. *Corved herrings*. Theſe ſerve to make red *herrings*, being ſuch as are taken in the Yarmouth ſeas, from the end of Auguſt to the middle of October; provided they can be carried aſhore within a week, more or leſs, after they are taken. Theſe are never gipped, but rowed in ſalt, for the better preſerving of them, till they can be brought on ſhore; and ſuch as are kept to make *red herrings*, are waſhed in great vats in freſh water before they are hung up in the *herring-hangs*, or *red-herring* houſes.

As for the *manner of baking herrings*. The nets being hauled on board, the fiſhes are taken out, and put into the warbacks, which ſtand on one ſide of the veſſels. When all the nets are thus unloaded, one fills the gippers baſkets. The gippers cut their throats, take out their guts, and fling out the full *herrings* into one baſket, and the ſhotten into another. One man takes the full baſket when they are gipped, and carries them to the rower-back, wherein there is ſalt. One boy rows and ſtirs them about in the ſalt, and another takes them, thus rowed, and carries them in baſkets to the packers. Four men

pack

pack the *herrings* into one barrel, and lay them, one by one, ſtraight and even; and another man, when the barrel is full, takes it from the packers. It is left to ſtand a day, or more, open to ſettle, that the ſalt may melt and diſſolve to pickle; after which it is filled up, and the barrel headed. The pickle is to be ſtrong enough to ſuſtain a *herring*; otherwiſe the fiſh decay in it. See *Herring* FISHERY.

It is unlawful to buy or ſell *herrings* at ſea, before the fiſhermen come into the haven, and the cable of the ſhip be drawn to the land. 31 Edw. III. ſtat. 2. No *herring* ſhall be ſold in any veſſel, but where the barrel contains thirty-two gallons, and half-barrel and firkin accordingly; and they muſt be well packed, of one time's packing and ſalting, and be as good at the middle as the ends, on the pain of forfeiting 3*s.* 4*d.* a barrel, &c. by ſtat. 22 Edw. IV. cap. 7. The veſſels for *herrings* are to be marked with the quantity, and place where packed, and packers to be appointed and ſworn in all fiſhing ports, &c. under the penalty of 100*l.* ſtat. 15 Car. II. cap. 16. Freſh *herrings* conſidered as a food, are ſaid to be very good aliment, if uſed moderately; but if taken in quantities diſproportioned to the powers of digeſtion, they produce a putrefaction in the ſtomach of the alkaline kind, and are attended with all the bad conſequences of highly alcalefcent aliment: but pickled *herrings* are very bad aliment, the fleſh being rendered hard, and ſcarcely digeſtible by the vital powers: theſe, however, are leſs injurious than thoſe which are ſalted and dried.

The parts of the *herring* uſed in medicine, are the veſicles called *animæ*, and the entire fiſh. The *animæ* are ſaid to excite urine taken internally. Salted *herrings* are ſometimes applied to the ſoles of the feet in fevers, with an intent to derive the humours from the head, and mitigate the febrile heat. The pickle of *herrings* is uſed in cliſters, for pains in the hip, and a dropſy; externally applied, it mondifies ferid ulcers, ſtops the progreſs of a gangrene, and diſſipates ſtrumous ſwellings. It is alſo of ſervice in a quinſy, if the parts affected are anointed with this and honey mixed together.

HERRING *buſs*, a veſſel uſed in the *herring*-fiſhery. See BUSS and FISHERY.

HERRING *cob* is a young *herring*. See *Herring* FISHERY.

HERRING *ſiſhery*. See *Herring* FISHERY.

HERRING-*gull*, in *Ornithology*, the name of a bird of the *larus* kind, called by authors *larus cinereus maximus*, or the great grey gull, and by Linnæus the *larus fuſcus*. It is of the ſize of our common duck: its beak is yellow, and is narrow, and two fingers breadth long, a little hooked at the end, and has on the lower chap an orange-coloured ſpot; the edges of the eye-lids are red; the head, neck, and tail, white; the back and coverts of the wings aſh-coloured; the upper part of the five firſt quill-feathers are black, marked with a white ſpot near their end; the legs are of a pale fleſh colour; it feeds on herrings and other fiſh, and is very voracious bird. It breeds on the ledges of rocks that hang over the ſea. Ray and Pennant.

HERRING-*ſilver*, a compoſition in money, formerly paid in lieu of a certain quantity of *herrings* for the proviſion of a religious houſe.

HERRIOT. See HARIOT.

HERRISON, in *Fortification*, is a beam or barrier made of one ſtrong piece of wood, full of iron ſpikes. It is commonly ſupported in the middle, and turns upon a pivot, or axis. It is uſed for ſecuring any paſſages, which are to be often opened and ſhut.

HERRNHUTERS, in *Eccleſiaſtical Hiſtory*, the name of a fanatical ſect, called alſo Moravians, which ſprung up in Upper Luſatia towards the beginning of this century. This ſect was founded by Nicholas Lewis count of Zinzendorf; and to his activity and zeal the progreſs of it is to be aſcribed. According to the account which he gives of himſelf, he had formed a deſign, when only ten years old, of collecting a ſmall ſociety of *believers*, who ſhould altogether employ themſelves in exerciſes of devotion, under his direction. Accordingly, when he became of age, in the year 1721, he ſettled at Bertholſdorf, a village in Upper Luſatia, where he was ſoon joined by a number of proſelytes from Moravia; ſo that in a few years Bertholſdorf became a conſiderable village, having an orphan-houſe, and other public buildings. In 1728, forty-four new houſes were erected; and in 1732 the number of inhabitants amounted to ſix hundred. From the name of a hill in the neighbourhood of this village, called *Hutb-berg*, theſe coloniſts gave their dwelling place the appellation of *Hutb des Herrn*, and afterwards *Herrnhutb*, ſignifying the guard or proteCtion of the Lord; whence roſe the denomination of their ſect. As their number increaſed, Zinzendorf eſtabliſhed a peculiar diſcipline, dividing his adherents into different claſſes of married men, married women, widowers, widows, maids, bachelors, and children; each claſs being under the inſpection of a director, choſen by its members; and the claſſes are alſo ſubject to the ſuperintendance of an elder, co-elder, and vice-elder. Particular attention was paid by theſe ſeveral claſſes to the inſtruction of youth; and as a great part of their worſhip conſiſted in ſinging, they pretended that children were inſtructed in their religion by hymns. There are ſome perſons of both ſexes appointed by rotation to pray for the ſociety, who are admoniſhed of their duty by an inward feeling; and they pretend to determine the divine will in particular caſes by caſting lots. All matrimonial contracts are ſubject to the direction and approbation of the elders. This ſect profeſſed in their firſt eſtabliſhment to belong to the Lutheran church; but count Zinzendorf, for the greater credit of this new ſociety, afterwards pretended that it was a revival of the ancient Moravian church, or Bohemian brethren, who were converted from popery by John Huſs. But this ſeems to have been a mere pretence. Such was the origin of a ſect, which in proceſs of time became very conſiderable and extenſive, and which adopted tenets and practices as unjuſtifiable as they are ſingular. Zinzendorf was denominated the truſtee and guardian of the brethren; in 1737 he was conſecrated biſhop of this ſect, a dignity which he reſigned in 1740. Towards the cloſe of the year 1744, he was denominated miniſter plenipotentiary and œconomiſt; and it was enacted that nothing of importance ſhould be done without his conſent; and he afterwards ſtyled himſelf the lord advocate of the *unitas fratrum*. Zinzendorf has travelled in perſon all over Europe, and been twice in America; and he has alſo ſent miſſionaries almoſt throughout the known world. It would be endleſs to recount the numberleſs attempts which this ſectary has made uſe of to eſtabliſh his own authority, and to extend the intereſt of his party. According to his own account, publiſhed in 1749, the ſociety had almoſt a thouſand labourers diſperſed all over the world, who preached in fourteen languages, and ninety-eight different eſtabliſhments, among which are caſtles, that have twenty, *fifty*, or ninety apartments. How far this account is juſtified by fact, we cannot pretend to determine; but it is certain, that the decline of this ſect has been no leſs ſignal and rapid than its progreſs. With regard to the tenets of the *Herrnhuters*, it may be obſerved, that at their firſt riſe they profeſſed to admit the confeſſion of Augſburgh, and count Zinzendorf has always referred to this confeſſion, as the ſtandard of his doctrine. However it is well known, that he has advanced very pernicious notions, and recommended very unwarrantable practices; ſuch notions and practices as diſfigure the ſacred truths of the Goſpel, and ſap the foundations of morality. The count himſelf ſpeaks in very derogating terms of the Scripture, and expreſly aſſerts, that the reading of the Scripture appears to him to be more dangerous than uſeful to the ſociety. To avoid idolatry, *he ſays*, people ought to learn from the Father and Holy Ghoſt, and conduct to Chriſt, with whom alone we have to do. The Holy Ghoſt is called by the *Herrnhuters* the eternal wife of God, the mother of Chriſt, the mother of the faithful, and of the church. The language of their devotion approaches to obſcenity: and the ideas excited by it are ſuch as no chaſte mind can entertain. In ſome of their hymns of devotion, they have been charged with making their direct addreſſes to what was formerly adored at Lampſacus. The conjugal act is a piece of ſcenery, in which the male repreſents Chriſt the huſband of ſouls, and the female the church: and they have actually appointed ſuch ceremonies, in the celebration of marriage, as ſuppoſe them to have entirely given up all ſenſe of ſhame. Count Zinzendorf expreſly declares, that the law is not a rule of life to a believer; that the moral law belongs only to the Jews, and that a converted perſon cannot ſin againſt light. It has been ſaid, that no example can be found of a fanaticiſm more extravagant, and a myſtical more groſs and ſcandalous than thoſe of the *Herrnhuters*: and that it would be impoſſible to multiply ſpecimens of their creed or devotion, extracted from the ſermons and writings of their founder, without offending the chaſte reader. Thoſe whoſe curioſity leads them to wiſh for farther information, may conſult Moſheim's Eccl. Hiſt. vol. v. p. 85, note *(t)*. Warburton's Doctrine of Grace, vol. ii. p. 153 and Rimius's Candid Narrative of the Riſe and Progreſs of the *Herrnhuters*, commonly called Moravians, or Unitas Fratrum, &c. 1753. and Supplement, &c. publiſhed in 1755. In juſtice to thoſe, who diſavow the opinions and practices charged upon the *Herrnhuters*, an account of this ſect, extracted from their writings, is given under *Unitas Fratrum*.

HERSE, in *Fortification*, a lattice, or PORTCULLICE, in form of a harrow, beſet with iron ſpikes.

The word *herſe* is French, and literally ſignifies *harrow*; being formed of the Latin *herpex*, or *irpex*; which denote the ſame.

It

It is usually hung by a rope fastened to a moulinet; to be cut, in case of surprize, or when the first gate is broken with a petard; that the *herse* may fall, and stop up the passage of the gate, or entrance of the fortress.

The *herse* is otherwise called a *sarrasin*, or *estacade*; and when it consists of straight stakes, without any cross-pieces, it is called ORGUES.

HERSE is also a harrow, which the besieged, for want of chevaux de frize, lay either in the way, or in breaches, with the points up, to incommode the march as well of the horse as the infantry.

HERSILLON, in the *Military Art*, a sort of plank, or beam, ten or twelve feet long, whose two sides are drawn full of spikes, or nails, to incommode the march of the infantry or cavalry.

The word is a diminutive of herse; the *hersillon* doing the office of a little herse.

HERSIPHORIA. See ARRHEPHORIA.

HERTHA, or HERTHUS, in *Mythology*, a deity worshipped by the ancient Germans. This it mentioned by Tacitus, in his book De Moribus Germanorum, cap. 40. Vossius conjectures that this goddess was Cybele; but she was more probably Terra, or the earth; because the Germans still use the word *hert* for the earth, whence also the English *earth*. Some have supposed that STONEhenge was a temple consecrated to the goddess *Hertha*.

HERTHAMAN, in the *Materia Medica*, a name given by Avicenna and Serapion to the grain called ZEA, used much in medicine in their time, and supposed to be of a middle nature between wheat and barley.

HESPER, HESPERUS, in *Astronomy*, the *evening star*; an appellation given to Venus when she follows, or sets after the sun.

The word is formed of the Greek Ἕσπερος, and is supposed to have been originally the proper name of a man, brother of Atlas, and father of the HESPERIDES.

Diodorus, lib. iii. relates, that *Hesperus* having ascended to the top of mount Atlas, the better to observe and contemplate the stars, never returned more; and that hence he was fabled to have been changed into this star.

HESPERIDES, Ἑσπερίδες, in the *Ancient Mythology*, were the daughters of Hesper, or Hesperus, the brother of Atlas. According to Diodorus, Hesperus and Atlas were two brothers, who possessed great riches in the western parts of Africa. Hesperus had a daughter called Hesperia, who married her uncle Atlas, and from this marriage proceeded seven daughters, called *Hesperides*, from the name of their mother, and Atlantides, from that of their father. According to the poets, the *Hesperides* were three in number, Ægle, Arethusa, and Hesperthusa. Hesiod, in his Theogony, makes them the daughters of *Nox*, *Night*, and seats them in the same place with the Gorgons; viz. at the extremities of the west, near mount Atlas: it is on that account he makes them the daughters of Night, because the sun sets there. The *Hesperides* are represented by the ancients as having the keeping of certain golden apples, on the other side the ocean. And the poets give them a dragon to watch the garden where the fruit grows: this dragon they tell us Hercules slew, and carried off the apples.

Pliny and Solinus will have the dragon to be no other than an arm of the sea, wherewith the garden was encompassed, and which defended the entrance thereof. And Varro supposes, that the golden apples were nothing but sheep. Others, with more probability, say they were oranges.

The gardens of the HESPERIDES, *Hesperidum horti*, or *horti Hesperidum*, are placed by some authors at Larache, a city of Fez; by others, at Bernich, a city of Barca, which rallies better with the fable. Others take the province of Sus, in Morocco, for the island wherein the garden was seated. And lastly, Rudbecks places the Fortunate Islands, and the gardens of the *Hesperides*, in Sweden.

HESPERIS, in *Botany*. See *Dame's* VIOLET.

HESSIAN *bellows*. See BELLOWS.

HESYCHASTES, HESYCHASTA, a person who keeps himself vacant, and at leisure, to attend the better, and with the less interruption, to the contemplation of divine things.

The word is Greek ἡσυχαστὴς, formed of ἡσυχάζω, *quiesco*, *quieti indulgeo*, a derivative of ἡσυχὴ, *quietus*, *quies*; so that ἡσυχάζειν, in Greek, answers to the literal sense of *quietisi* in English.

The name was chiefly used by the ancients for such among the monks as did not employ themselves in any labour of the hands, but renounced all bodily action, to resign themselves wholly to prayer and meditation.

HESYCIUS, in *Natural History*, the name of a fly of the carnivorous kind, often found preying on the bodies of other flies, beetles, &c. and of serpents; whence it has been called also ophioboros. Its wings are of a shining pale yellow, or the colour of polished brass; whence it has also been called by some CHALCOMUIA.

HETERIARCH, HATAIRIARCHA, in *Antiquity*, an officer in the Greek empire, whereof there were two species; the one called simply *heteriarch*; and the other, *great heteriarch*, who had the direction of the former.

The word is Greek ἑταιρίαρχος, formed of the Greek ἑταῖρος, *socius*, *comparticeps*, *sodalis*, and ἄρχω, *imperium*, *summand*. Their principal function was to command the troops of the allies; besides which, they had some other duties in the emperor's court, described by Codin, De Officiis, cap. v. n. 30, 31, 32, 37.

HETEROCLITE, HETEROCLITON, in *Grammar*, an irregular, or anomalous word, which either in declension, conjugation, or regimen, deviates from the ordinary rules of grammar. See ANOMALOUS.

The word is Greek ἑτερόκλιτον, formed of ἕτερος, *alter*, *another*, *different*, and κλίνω, *I decline*.

Heteroclite is more peculiarly applied to nouns, which vary, or are irregular, in point of declension; having fewer cases, numbers, &c. than ordinary; or that are of one declension in one number, and another in another.

We have various sorts of *heteroclites*, as defective, and redundant *heteroclites*, &c. Under the class of *heteroclites*, come APTOTES, DIPTOTES, MONOPTOTES, TRIPTOTES, TETRAPTOTES, PENTAPTOTES, &c.

HETERODOX, in *Polemical Theology*, something that is contrary to the faith or doctrine established in the true church.

The word is formed of the Greek ἑτερόδοξος, a compound of ἕτερος, *alter*, and δόξα, *opinion*.

Thus, we say, a *heterodox* opinion, a *heterodox* divine, &c.

The word stands in opposition to *orthodox*.

HETERODOX, *Heterodoxi*, in *Botany*, that set of systematical writers on this science, who formed their distributions and classes of the plants on wrong foundations, not on the divisions made by nature in the different structure of the parts of fructification in the different classes, but on the shape of their leaves, or roots; or who ranged them by their common names, according to the letters of the alphabet. Linnæi Fund. Bot. p. 2. See BOTANY.

HETERODROMUS *vectis*, in *Mechanics*, a lever wherein the fulcrum, or point of suspension, is between the weight and the power.

This is what we otherwise call a *lever of the first kind*. Such is that represented *Tab. Mechanics*, *fig.* 1.

This term is used by way of contradistinction to the HOMODROMUS *vectis*.

HETEROGENEITY, in *Physics*, the quality or disposition which denominates a thing *heterogeneous*.

The word is also used for the *heterogeneous* parts themselves. In which sense, the *heterogeneities* of a body are the same thing with the *impurities* thereof.

Heterogeneity is a term of a very lax signification, and is brought by the chemists to serve almost for every thing they do not understand; so that all disagreement, or inaptitude to mixture between any bodies, is imputed to the *heterogeneity* of their parts.

But so far as the term may be made use of, to convey any distinct signification, it must be by considering natural bodies under different sorts, according as they are diversified by figure, bulk, motion, and their more sensible properties; so that those of different sorts are *heterogeneous* to one another, and the parts of the same sort are homogeneous. Thus the division chemistry makes of bodies into oils, salts, spirits, &c. may be reckoned, with respect to one another, *heterogeneous*: though the parts of each division are among themselves homogeneous.

In effect, they are two terms, which serve frequently as a refuge for ignorance; otherwise the common terms of *like* and *unlike* may serve every whit as well. Quincy.

HETEROGENEOUS, or HETEROGENEAL, literally imports something of a different nature, or that consists of parts of different, or dissimilar kinds: in opposition to HOMOGENEOUS.

The word is Greek, formed of ἕτερος, *alter*, *different*, and γένος, *genus*, *kind*; q. d. composed of different kinds of parts.

HETEROGENEOUS is particularly applied, in *Mechanics*, to those bodies, whose density is unequal in different parts of their bulk.

Or, *heterogeneous* bodies are such, whose gravities in different parts are not proportionable to the bulks thereof. Bodies equally dense, or solid in every part, or whose gravity is proportionable to their bulk, are said to be homogeneous.

HETEROGENEOUS *light*, is that which consists of parts or rays of different refrangibility, reflexibility, and colour.

HETEROGENEOUS *nouns*, in *Grammar*. See NOUN, GENDER, &c.

HETEROGENEOUS *numbers*. See NUMBERS.

HETEROGENEOUS *quantities*, are those which are of such different kind and consideration, as that one of them, taken any number of times, never equals or exceeds the other.

HETEROGENEOUS *surds*, are such as have different radical signs; as $\sqrt{12}$, and $\sqrt[3]{63}$ $\sqrt{9}$, and $\sqrt{19}$.

How to reduce the *heterogeneous surds* to homogeneous ones, see under the article SURDS.

HETEROPHAGI, formed of *ἕτερος, different*, and *φαγω I eat*, in *Natural History*, a term used by some authors to express a peculiar class of insects distinguished by their eating many different things; but not feeding on one another, as those do which are of the class of the ZELOPHAGI, of which there are a great number of species.

HYTEROPLON, in *Antiquity*. See ANTHOTEROPLON.

HETEROPYRÆ, in *Natural History*, the name of a genus of ferruginous fossils, composed of several coats, including a nucleus of a different substance from themselves, and often loose, and rattling in them. See SIDEROCHITA.

Of this genus there are seven species. Hill's Fossils, p. 136.

HETERORHYTHMUS, compounded of *ἕτερος*, and *ῥυθμος, measure*, a term used by some fanciful writers, for a course of life unsuitable to the age of those who live in it.

The same is also applied to pulses, when they beat irregularly or irregularly in diseases; or rather when a pulse belonging to one age is found in a patient of another.

HETEROSCII, formed of *ἕτερος, different*, and *σκια, shadow*, in *Geography*, a term vulgarly applied to those inhabitants of the earth, whose shadow at noon-tide is always projected the same way, either northward, or southward.

In this sense, the inhabitants of the temperate zones are denominated *heteroscii*. See ZONE.

HETEROSCII, however, in strictness, and according to the origin and reason of the word, is a term of relation, and denotes those inhabitants, which, during the whole year, have their noon-tide shadows projected different ways from each other. Thus, we who inhabit the northern temperate zone, are *heteroscii* with regard to those who inhabit the southern temperate zone; and they *are heteroscii* with respect to us.

From this definition it follows, that only the inhabitants of the two temperate zones are *heteroscii*; nor is the word ordinarily applied to any other: though, in reality, there is always one part of the torrid zone, whose inhabitants are *heteroscii* with regard to those of the rest, and with regard to those of one of the temperate zones, except at the time of the solstices. And even at that time, all of the torrid zone are *heteroscii* with regard to those of one of the temperate zones. But as this is variable, and the people of the torrid zone have their shadow now on this, and then on that side, the custom is to call them AMPHISCII, and not *heteroscii*.

HETEROSTROPHE, formed of *ἕτερος* and *στρεφω, I turn*, an epithet applied to certain shells, the wreaths of which turn a contrary way from those of other shells of the same genera. We have in the Philosophical Transactions, N° 96, an account of two very remarkable smallshells of this kind.

HETEROUSII, HETEROUSIANS, composed of *ἕτερος*, and *οὐσια, substance*, a sect or branch of Arians, the followers of Aetius, and from him also denominated AETIANS.

They were called *Heterousii* because they held not that the Son of God was of a substance like, or similar to, that of the Father; which was the doctrine of another branch of ARIANS, thence called HOMOOUSIANS, *homousii*; but that he was of another substance different from that of the Father.

HEUCHERA, in *Botany*, a genus of the *pentandria digynia* class: the corolla of which consists of five petals, and the fruit is a capsule, containing two cells. Of this genus there is only one species.

HEWHOLE, or, as it is pronounced in some places, the *high-boy*, a name given by many to the common green WOOD-*pecker*, from its making holes in trees.

HEXACHORD, compounded of *ἕξ, six*, and *χορδη, chord*, or *string*, in the *Ancient Music*, a concord commonly called by the moderns a *fixth*.

The *hexachord* is twofold, the *greater* and *leffer*. The *greater hexachord* is compofed of two greater tones, two leffer tones, and one greater femitone; which make five intervals.

The *leffer hexachord* conſiſts only of two greater tones, one leſſer tone, and two greater ſemitones.

The proportion of the former, in numbers, is as 3 to 5; and that of the other, as 4 to 8.

In the table inſerted under the head INTERVAL, we have reſtrained the term *hexachord* to ſignify the ſixth of the Greek ſcale, which is not a true ſixth major, but a comma more, being a tone major above the fifth.

HEXACONTALITHUS, in *Natural Hiſtory*, the name of a ſtone deſcribed by Pliny, and other of the ancient writers, as being very ſmall, yet ſhewing an almoſt infinite variety of colours. It ſeems only another name for the OPAL.

HEXAEDRON, or HEXAHEDRON, formed of *ἕξ, ſix*, and *ἕδρα, ſeat*, in *Geometry*, one of the five regular bodies, popularly called a CUBE.

The ſquare of the ſide of a *hexaedron* is in a ſubtriple ratio to the ſquare of the diameter of the circumſcribed ſphere. Hence, the ſide of the *hexaedron* is to the axis of the ſphere as 1 is inſcribed in, as one to the $\sqrt{3}$; and, conſequently, it is incommenſurable to it.

HEXAGON, formed of *ἕξ, ſix*, and *γωνια, angle*, in *Geometry*, a figure of ſix ſides and as many angles.

If theſe ſides and angles be equal, it is called a *regular hexagon*.

The ſide of a *hexagon* is demonſtrated to be equal to the radius of a circle circumſcribed about the ſame.

Hence, a regular *hexagon* is inſcribed in a circle, by letting the radius of it ſix times upon the periphery.

To deſcribe a *hexagon* on a given line AB (*Tab. II. Geometry, fig. 48.*) draw an equilateral triangle ACB; the vertex C will be the centre of a circle, which will circumſcribe the *hexagon* required.

HEXAGON, in *Fortification*, is a fortreſs with ſix baſtions.

HEXAHEDROSTYLA, in *Natural Hiſtory*, the name of a genus of STARS.

The word is derived of the Greek *ἕξ, ſix*, *ἕδρα, ſide*, and *στυλος, a column*.

The bodies of this genus are ſpars of a columnar form, adhering to ſome ſolid body at the baſe, and terminated at the point by a pyramid. The pyramid and column are both hexahedral, or compoſed each of ſix ſides.

Of this genus there are three known ſpecies. 1. A ſlender one with a long pyramid, compoſed of ſo pure and clear a ſpar, that it reſembles cryſtal, and is found in Derby Hole, on Matlock hills, and in ſome other parts of England. 2. A ſomewhat thick one, with a long irregular pyramid, found in the mines of Cornwall and Devonſhire, and common alſo in thoſe of Germany. 3. One with a very ſhort pyramid, found in the Derbyſhire lead-mines, and in thoſe of the Hartz-wald in Germany. Hill's Hiſt. of Foſſils, p. 218.

HEXAMERON, or HEXAMERON, a name given to divers writings, both of ancient and modern authors, containing commentaries, or diſcourſes, on the firſt chapter of Geneſis; wherein is delivered the hiſtory of the creation, or the firſt ſix days of the world.

The word is Greek, formed of *ἕξαμερος*, or *ἑξαμερος*; compoſed of *ἕξ, ſix*, *ἡ*, and ; and *ἡμερα*, which in the Doric dialect is wrote *ἁμερα, day*.

St. Baſil. St. Ambroſe, &c. have wrote *Hexameron*.

HEXAMETER, compoſed of *ἕξ, ſix*, and *μετρον, meaſure, foot*, in the *Ancient Poetry*, a verſe uſed by Greek and Latin writers, conſiſting of ſix feet.

The firſt four feet of an *hexameter* may be indifferently either dactyls, or ſpondees; but the laſt foot, in ſtrictneſs, is always to be a ſpondee, and the laſt but one a dactyl. Such is that of Homer,

Ἐς Διὸς ἠ τείρεται, τὸν δὲ θεὸν ἐπιεικτὸν ἐόντα.

And that of Virgil,

Diſſilit in ſpiram cornua, & non timentes aperit.

Hexameter verſes are divided into *heroic*, which are to be grave and majeſtical, ſuitable to the dignity of heroic poetry; and *familiar*, which may be more looſe and negligent, as thoſe of the epiſtles of Horace.

Epic poems, as the Iliad, Odyſſey, Æneid, &c. conſiſt of *hexameter* verſes alone; elegies and epiſtles ordinarily conſiſt, alternately, of *hexameters* and pentameters.

Some of the French and Engliſh poets have attempted to compoſe in *hexameter* verſes, but without ſucceſs. Jodelle made the firſt eſſay in 1553, with a diſtich in praiſe of Olivier de Magny, which Paſquier repreſents as a maſterpiece. It is this:

Phœbus, Amour, Cypris, vint ſavoir, pourvoir & orner
Ton ver, Magny chef, d'ambre, de flamme, de fleurs.

But this kind of poetry pleaſes nobody. The modern languages are not at all fit for a kind of verſe whoſe cadence depends altogether on long and ſhort ſyllables.

HEXAMILION, HEXAMILE, or HEXAMILIUM, in *Antiquity*, a celebrated wall, built by the emperor Emanuel, in 1413, over the iſthmus of Corinth.

It took its name from *ἕξ, ſix*, and *μιλιον*, which in the vulgar Greek ſignifies a *mile*; as being ſix miles long.

The deſign of the *hexamilion* was, to defend Peloponneſus from the incurſions of the Barbariſans. Amurath II. having raiſed the ſiege of Conſtantinople, in the year 1424, demoliſhed the *hexamilion*; though he had before concluded a peace with the Greek emperor.

The

The Venetians reſtored it in the year 1463, by thirty thouſand workmen, employed for fifteen days, and covered by an army commanded by Bertoldo d'Eſe, general of the land-forces; and Louis Lauredano, commander of the ſea.

The infidels made ſeveral attempts upon it, but were repulſed, and obliged to retire from the neighbourhood thereof; but Bertoldo being killed at the ſiege of Corinth, which was attempted ſoon after, Bertino Calcinato, who took on him the command of the army, abandoned, upon the approach of the beſieged, both the ſiege and the defence of the wall, which had coſt them ſo dear; upon which it was finally demoliſhed.

HEXANDRIA, in *Botany*, the ſixth claſs of plants with hermaphrodite flowers, and ſix ſtamina or male parts in each, which are in ſome plants all of the ſame length, and in others are alternately one ſhorter and another longer.

The word is derived from the Greek ἕξ, *ſix*, and ἀνὴρ, *male*.

This claſs contains five orders, viz. the *monogynia*, comprehending fifty-ſix genera; the *digynia*, two; the *trigynia*, nine; the *tetragynia*, one; and the *polygynia*, one. See *Tab. Botany*, N° 6. and *Tab.* III, *Botany, Claſs* 6. See FRUCTIFICATION.

HEXAPLA, formed of ἕξ, *ſix*, and ἁπλόω, *I draw, I unfold*, in *Church Hiſtory*, a bible diſpoſed in ſix columns; containing the text, and divers verſions thereof, compiled and publiſhed by Origen, with a view of ſecuring the ſacred text from future corruptions, and to correct thoſe that had been already introduced.

Euſebius, Hiſt. Eccl. lib. vi. cap. 16. relates, that Origen, after his return from Rome under Caracalla, applied himſelf to learn Hebrew, and began to collect the ſeveral verſions that had been made of the ſacred writings, and of theſe to compoſe his Tetrapla and *Hexapla*: others, however, will not allow him to have begun till the time of Alexander, after he had retired into Paleſtine, about the year 231.

To conceive what this *Hexapla* was, it muſt be obſerved that, beſides the tranſlation of the ſacred writings, called the Septuagint, made under Ptolemy Philadelphus, above 280 years before Chriſt, the Scripture had been ſince tranſlated into Greek by other interpreters. The firſt of thoſe verſions, or (reckoning the Septuagint) the ſecond, was that of Aquila, a proſelyte Jew, the firſt edition of which he publiſhed in the twelfth year of the emperor Adrian, or about the year of Chriſt 128; the third was that of Symmachus, publiſhed, as is commonly ſuppoſed, under Marcus Aurelius, but, as ſome ſay, under Septimus Severus, about the year 200; the fourth was that of Theodotion, prior to that of Symmachus, under Commodus, or about the year 175: theſe Greek verſions, ſays Dr. Kennicott, were made by the Jews from their corrupted copies of the Hebrew, and were deſigned to ſtand in the place of the Seventy, againſt which they were prejudiced, becauſe it ſeemed to favour the Chriſtians. The fifth was found at Jericho, in the reign of Caracalla, about the year 217; and the ſixth was diſcovered at Nicopolis, in the reign of Alexander Severus, about the year 228: laſtly, Origen himſelf recovered part of a ſeventh, containing only the Pſalms.

Now Origen, who had held frequent diſputations with the Jews in Egypt and Paleſtine, obſerving, that they always objected againſt thoſe paſſages of Scripture quoted againſt them, and appealed to the Hebrew text; the better to vindicate thoſe paſſages, and confound the Jews, by ſhewing that the Seventy had given the ſenſe of the Hebrew, or, rather, to ſhew, by a number of different verſions, what the real ſenſe of the Hebrew was, undertook to reduce all theſe ſeveral verſions into a body, along with the Hebrew text, ſo as they might be eaſily confronted, and afford a mutual light to each other.

He made the Hebrew text his ſtandard; and allowing that corruptions might have happened, and that the old Hebrew copies might and did read differently, he contented himſelf with marking ſuch words or ſentences as were not in his Hebrew text, nor the later Greek verſions, and to add ſuch words or ſentences as were omitted in the Seventy, prefixing an aſteriſk to the additions, and an obeliſk to the others.

In order to this, he made choice of eight columns; in the firſt he gave the Hebrew text in Hebrew characters; in the ſecond, the ſame text in Greek characters; the reſt were filled with the ſeveral verſions above mentioned; all the columns anſwering verſe for verſe, and phraſe for phraſe; and in the Pſalms there was a ninth column for the ſeventh verſion.

This work Origen called *Exapla*, *Hexapla*, q. d. *ſexuplex*, or a work of ſix columns, as only regarding the firſt ſix Greek verſions. See TETRAPLA.

Indeed, St. Epiphanius, taking in likewiſe the two columns of the text, calls the work Octapla, as conſiſting of eight columns.

This celebrated work, which Montfaucon imagines conſiſted of fifty large volumes, periſhed long ago, probably with the library at Cæſarea, where it was preſerved, in the year 653; though ſeveral of the antient writers have preſerved us pieces thereof: particularly St. Chryſoſtom on the Pſalms, Philoponus in his Hexameron, &c. Some modern writers have earneſtly endeavoured to collect fragments of the *Hexapla*, particularly Flaminius Nobilius, Druſius, and F. Montfaucon, in two folio volumes, printed at Paris in 1713.

HEXAPOD, *it* and *with*, in *Zoology*, an animal with ſix feet.

HEXAPTRAMIDES, in *Natural Hiſtory*, the name of a genus of ſpars.

The word is derived from the Greeks ἕξ, *ſix* and πυραμὶς, *a pyramid*.

The bodies of this genus are ſpars formed into pyramids, compoſed of ſix ſides or planes, and attired to no column, but adhering to ſome ſolid body by their baſes. Of this genus there are only two known ſpecies: 1. A ſhort one with a broad baſe, which is very rare, and found only in the great mine at Goſſelar in Saxony. And, 2. A long-pointed one, with a narrow baſe: this is found in the fiſſures of the alabaſter quarries of the Horte-foreſt. Hill's Hiſt. of Foſſ. p. 225.

HEXASTYLE, compoſed of ἕξ, *ſix*, and στύλος, *column*, in the *Ancient Architecture*, a building with ſix columns in front.

The temple of Honour and Virtue at Rome, built by Marius, was a *hexaſtyle*.

HEXIS, in the *Writings of the Greek Phyſicians*, a word uſed to expreſs a firm and permanent habitude, in oppoſition to ichelea and diathelis, importing a tranſient or eaſily removed diſpoſition.

HEYRS, in *Huſbandry*, young timber-trees, uſually left for ſtandards in felling of wood or copſes.

HHAHB, in *Modern Hiſtory*, is a name which the Mahometans give to one of the officers of their moſques, anſwering to our curates.

HIANA, in *Zoology*. See HYÆNA.

HIASTAOTOMTEHOM, a Chineſe name, expreſſing a plant, the root of which is ſaid to change, at a certain time, into a worm. Mr. Reaumur has given it the name of *plante-ver* in the French, but he has diſcovered the error of ſuppoſing ſuch a tranſformation; the whole truth of the caſe being, that a certain caterpillar, when about to change into the chryſalis ſtate, ſo nicely joins itſelf to the root of this plant, as to appear a part of it.

HIATICULA, in *Ornithology*. See SEA LARK.

HIATULA, in *Ichthyology*, a name given by ſome to the fiſh more uſually called the CHANNA. It has this name from its opening its mouth to a great width, eſpecially when dying, which is owing to its under jaw being much longer than the upper.

HIATULA is alſo a name by which Gara, and ſome other authors, have called the ſhell-fiſh more uſually named CHAMA; a genus diſtinguiſhed from other kinds by its always keeping its ſhells in ſome degree open, and in many ſpecies having no power to ſhut them entirely; for this reaſon they defend their naked bodies by burying themſelves in the mud, or in other ſubſtances.

HIATUS, a Latin term, properly ſignifying the aperture of the mouth, from the verb *hiare*, *to gape*.

It is variouſly uſed, in works of literature, &c. to denote a *chaſm* or *gap*; particularly in verſe, where there is a clathing of vowels, by one word ending with a vowel, and the following one beginning with another:

As in *Tho' oft the ear the open vowels tire*.

This clathing of vowels, ſo diſagreeable to the ear, is called a *hiatus* in proſe as well as verſe. The Romans were ſo very careful to avoid it, that they always ſuppreſſed the preceding vowel even in proſe; as it is obſerved by Cicero in his Orator. In writing, to avoid it, they uſed to inſert the letter *d*: as in *redire*, *redimo*, *medeo*, &c. Hence, on the baſe of the Duilian column, we meet with *prædad. aitod. marid.* &c. Voſſ.

HIATUS is alſo uſed for a defect in a manuſcript copy, where ſomething is loſt or effaced by the injuries of time or otherwiſe.

In a theatrical piece, there is ſaid to be a *hiatus*, when a ſcene is not well connected to the next, but leaves the action interrupted, and the ſtage empty.

In matters of genealogy, *hiatus* is an interruption in a line or ſeries of deſcendants.

HIBISCUS, in *Botany*. See *Syrian* MALLOW.

HICCUP, HICCOCK, HICCOUGH, HICKET, or HICCUP, *ſingultus*, in *Medicine*, a ſudden irregular inſpiration, wherein the ſtomach, and the parts contained in the lower venter, are impelled downwards.

The

The word ſeems formed of the Iriſh *hick*, which ſignifies the ſame thing: others derive it *ab hiſcendo*; others *a difficile anhelitu*; but others think the moſt natural derivation to be from the ſound yielded in this action.

The *hickup* is not immediately a diſorder of the ſtomach, as is uſually imagined, but a convulſive motion of the diaphragm; whereby the muſcle, retiring impetuouſly downwards, impels the parts beneath it.

It is occaſioned by ſharp humours; a too great plenitude of the ſtomach; a bit of any thing ſtopped at its upper oriſice; or, in general, by any thing capable of irritating the nerves of the diaphragm.

The remedy for the *hickup*, according to Hippocrates, is to ſetch the breath very long, or even to ſtop the breath for ſome time. A ſneezing, happening upon a *hickup*, generally cures it; the diaphragm, ſhook by the violent expiration, being apt to throw off what before irritated it.

This motion, when it happens in acute diſeaſes, is to be diſtinguiſhed from that which happens at other times: and there is yet another kind of it different from either of theſe, which is familiar to children in dying.

The chronic *hickup* is of two kinds; in its common ſtate it remains on a perſon but a very ſhort time, and in the other it remains long, and is attended with a febrile heat and a difficulty of breathing, with a remarkable noiſe in expiration.

Signs of it. It is uſually preceded by a ſenſe of a heavy pain in the breaſt and abdomen, and this is followed by a more or leſs difficult breathing, with a ſound or noiſe in the expiration; and the *hickup* itſelf, which in chronic caſes is attended with a ſenſation of internal ulceration.

Perſons ſubject to it. Theſe are principally men who eat large meals, and load the ſtomach by drinking largely after them, and who eat large quantities of the ſummer fruits, eſpecially when unripe. In acute fevers, a *hickup* is very familiar to thoſe perſons who any have internal inflammation; and it is very common in the fevers that attend women in their lying-in. The cauſes of the common *hickup* are an overloading the ſtomach with food, chiefly with ſuch as is hard of digeſtion; eſpecially if ſwallowed voraciouſly, and large draughts taken after it: large draughts of cold liquors, or cooling internal medicines, alſo ſometimes bring it on; and it frequently happens when the periſtaltic motion of the bowels is diſturbed by violent purges or vomits. In acute diſeaſes, it is principally owing to inflammation either in the pylorus, the meſentery, or the ſinuous part of the liver; and in dyſenteries it ſometimes comes on from an inflammation of the ileum. Slow poiſons alſo ſometimes ſhew their effects in a violent and unmitigable *hickup*.

Prognoſtics. The common *hickup* is uſually a diſtemper of little trouble, and attended with no danger; yet there have been inſtances of perſons dying of it without any other diſorder: but theſe fatal *hickups* will be found, when all circumſtances are conſidered, to have been very different in their nature and origin from the common kind, and uſually to have ariſen from ſome violent motion of the body. When the *hickup* comes on in acute fevers, about the day of the criſis, it is always dangerous; for this, though in itſelf but a ſemi-convulſive motion, yet very eaſily degenerates into an univerſal convulſion of the whole body, under which the patient uſually ſoon expires. In malignant fevers alſo, and gangrenes, they are often the forerunners of death. *Hickups* attending colics, in perſons who have not before been ſubject to them, are always a bad omen.

Method of cure. The common *hickup* ſeldom requires any thing of medicine for its cure; it uſually goes off in a little time of itſelf, or if not, is eaſily thrown off by warm liquors, as tea, coffee, or the like. But when it remains on the perſon a long time, as it ſometimes will do for ſeveral weeks, the following method is proper for its cure: the crudities of the primæ viæ are to be carried off by gentle purges, as ſmall doſes of rhubarb, and the like; and by the aſſiſtance of the abſtergent and emollient clyſters. After this the ſtomach is to be ſtrengthened by bitters and mild chalybeats, and by wearing externally bags with camphor, and the aromatic roots and carminative ſeeds. Sometimes alſo it will be neceſſary to give abſorbents mixed with the calx of antimony, to correct the acrimony of the humours. When the firſt has by theſe means been carried off, the return of it is to be prevented by taking now and then a doſe of ſome gentle purge, and after every meal ſwallowing two or three corns of pepper in a glaſs of hot wine. When the *hickup* comes on as a ſymptom in acute diſeaſes, reſpect is always to be had to the primary diſeaſe, and then the common alexipharmics are to be given, with ſpirit of nitre dulciſied, and a gentle doſe of the nitrous and abſorbent medicines, ſuch as a powder prepared of puriſied nitre and crabs-eyes, or the like; and bags with aromatics may be worn externally. Caſtor, and the other nervous medicines, externally, have their uſe in this caſe, but internally taken they have no effect, either in this or any the like complaints in the lower belly. Caſſia ſiſtula, ſenna, and the other purges, which are apt to create flatulencies, are not to be given in theſe caſes. When the *hickup* proceeds from an inflammation of the ſtomach, &c. cooling regimen muſt be uſed; the patient muſt be bled, and frequently take a few drops of the ſweet ſpirits of nitre in a cup of wine-whey, and his ſtomach ſhould be fomented with cloths dipped in warm water, or bladders filled with warm milk and water may be applied to it. When it is occaſioned by a gangrene or mortification, the Peruvian bark and other antiſeptics ſhould be freely uſed. When it proceeds from a foul ſtomach, a gentle vomit and purge will be of ſervice. When it proves obſtinate, recourſe muſt be had to the moſt powerful aromatic and antiſpaſmodic medicines. In this intention, fifteen or twenty grains of muſk may be made into a bolus, and repeated occaſionally: opiates, uſed cautiouſly, are alſo of ſervice; a lump of ſugar, dipped in compound ſpirits of lavender, or the volatile aromatic tincture, may be taken often. External applications, ſuch as the *ſtomach* PLASTER, or a cataplaſm of Venice treacle, to the region of the ſtomach, are ſometimes beneficial. People who are ſubject to habitual *hickups*, will find relief by uſually wearing a belt round the abdomen; and ſuch ſhould always uſe moderate exerciſe, and avoid large draughts of cold liquors. Junker's Conſp. Med. p. 639. Buchan's Dom. Med. p. 475.

Dr. Hoyer informs us, that a moſt violent *hickup*, which had reſiſted a great number of medicines, was at laſt cured by ſucking women's milk. Act. Acad. Nat. Curioſ. vol. iv. obſ. 3.

HICKWALL, in *Ornithology*, the name of a ſmall ſpecies of wood-pecker, called by authors picus varius minor; a ſmall bird of not above an ounce weight, very beautifully variegated with black, white, and brown. The head in the female of this ſpecies has a white ſpot on the crown, and in the males a red one. It climbs trees like the common large wood-pecker, and like it feeds on worms and other inſects which it finds there.

HIDAGE, or HYDAGE, an extraordinary tax, anciently payable to the king for every hide of land. See HIDE.

Sunt etiam quædam consuetudines ſe. auxilia, quæ ſervilia non dicuntur, nec ita conſuetudines communes, niſi cum rationabilitas intervenerit, vel cum res generali ſanctione judicata, tallagia, & carvagia, & alia gravia de rusticitate, & ex conſenſu communi totius regni introducta, & quæ ad dominum non pertinent, &c. Bracton, lib. ii. cap. 6.

King Ethelred, in the year of Chriſt 994, upon the landing of the Danes at Sandwich, taxed all his lands by hides. Every three hundred and ten hides of land, on this occaſion, found one ſhip furniſhed; and every eight hides found one jack and one ſaddle, for the defence of the realm. William the Conqueror took ſix ſhillings for every hide of land in England.

HIDAGE is alſo uſed for being quit of that tax; otherwiſe called HIDE-*gild*.

HIDALGO, q. d. *a ſon of birth*, in *Modern Hiſtory*, a title given in Spain to all who are of noble family.

HIDE, the ſkin of a beaſt; particularly that of a bullock or cow. See SKIN and TANNING.

We have *hides* of divers denominations, according to their ſtate, quality, &c.

HIDE, *curried*, is that which, after tanning, has paſſed through the currier's hands, and has thus received its laſt preparation, and is fitted for uſe. See CURRYING.

HIDE, *raw*, or *Green* HIDE, is that which has not undergone any preparation; being in the ſame condition as when taken off the carcaſe.

HIDE, *ſalted*, is a green *hide*, ſeaſoned with ſea-ſalt and alum, or ſaltpetre, to prevent its ſpoiling and corrupting, either by keeping it too long in cellars, or in tranſporting it too far in a hot ſeaſon.

Theſe are alſo *hides dried in the air*, ſent from America; particularly thoſe of buffalos.

HIDE, *tanned*, is a *hide* either green, ſalted, or dried, further dreſſed and prepared by the tanner, by paring off the hair, and ſteeping it in pits of lime and tan. See TANNING.

Tanned *hides* are commonly carried along with the artillery of an army. They are uſed in the fire-workers ſtores, for covering powder or charged bombs from the rain or from ſparks of fire. They are alſo uſed on batteries, or in a laboratory.

HIDE, or HYDE, HYDA, in our *Ancient Cuſtoms*, denoted a meaſure or quantity of land, containing ſo much as could be yearly tilled with a ſingle plough.

Beda calls the *hide* of land *familia*, and defines it to be ſo much as was ſufficient for the ordinary maintenance of one family. In other authors it is called *manſum*, *manſa*, *carucata*, &c.

Crompton, in his Juriſdict. fol. 322, ſays, a *hide* of land contains one hundred acres: he adds, that eight *hides*

make a knight's fee. In ancient manuſcripts, the *hide* is fixed at one hundred and twenty acres. But Sir Edward Coke notes, that a knight's fee, a *hide* or plough-land, a yard-land, and an oxgang of land, do not contain any certain determinate number of acres. See CARUCATE.

The diſtribution of England into *hides* of land is very ancient, there being mention made of it in the laws of king John, cap. 14. *Hereſium I. mandavit fillæ ſuæ gratia imperatrici, cepit ab unoquoque hida Angliæ tres ſol.* Spelman.

HIDE *and* GAIN, in our *Old Writers*, ſignified arable land, to gain the land being as much as to till it.

HIDE-*bound*, a diſorder of a horſe or other beaſt, wherein his ſkin ſticks ſo tight to his ribs and back, as not to be looſened from it with the hand.

The diſorder is ſometimes owing to poverty and bad keeping; at other times to over-riding or a forfeit, the horſe being ſuffered when he is hot to ſtand long in the wet; or to a morbid dyſcraſy of the blood, which, not having its natural courſe, cauſes the ſkin to ſhrink up and cleave to the bones.

Among *Huſbandmen*, trees alſo are ſaid to be *hide-bound* when the bark ſticks too cloſe.

HIDEL, in our *Ancient Statutes*, ſignifies a place of protection or ſanctuary.

HIDGELD, or HIDEGELD, in the laws of king Canute, is explained by *pretium redemptionis ſervi*, the price by which a ſervant was to redeem his ſkin from being whipped.

The word is formed from the Saxon *hide*, *ſkin*, and *gild*, *payment*. *Si liber feſtis diebus operatur perdat libertatem; ſi ſervus eorum perdat, vel hidgeldum*: i. e. let him be whipped (which was the puniſhment for ſervants), or let him pay for his ſkin; by which payment he is to be excuſed from whipping.

HIDROA, from ἱδρὼς, *ſudor*, in the *Medicinal Writings of the Ancients*, a kind of puſtules ariſing from bilious, viſcid, and irritating humours, very troubleſome to the ſkin, and moſt ſo in ſummer-time, when they make their eruption with the ſweat. They are reckoned by Hippocrates among the diſeaſes peculiar to the ſummer.

HIDROCRITICA, a term uſed to expreſs the judgments paſſed by phyſicians on their patients, on obſerving the ſweats that have attended the diſeaſe.

HIDRONOSOS, a name given, by ſome authors, to that terrible diſeaſe the *ſudor Anglicanus*, or SWEATING *ſickneſs*.

HIDROPYRETOS, of ἱδρὼς, *ſweat*, and πυρετὸς, *fever*, *the ſweating fever*, a name given by ſome to the *ſudor Anglicus*, or SWEATING *ſickneſs*.

HIDROTICS, or HYDROTICS, in *Medicine*, the ſame with SUDORIFICS.

The word is compoſed of the Greek ἱδρὼς *ſweat*.

Contrayerva, zedoary, guaiacum, angelica, &c. are of the number of *hidrotics*, or *hidrotic* medicines.

HIEMALIA, in *Antiquity*, the ſame with BRUMALIA.

HIERACHOIDES, in *Botany*, a name given by Vaillant to a genus of plants, ſince called by Linnæus *crepis*. See *Botany* IN SUPPLEMENT.

HIERACITES, HIERACITÆ, a ſect of ancient heretics, at the cloſe of the ſecond century, denominated from their leader Hierax, a bookſeller of Leontium, and eminently diſtinguiſhed by his extenſive learning, and a venerable air of ſanctity and virtue.

He abſolutely denied the reſurrection of the body, maintaining, that the ſoul alone roſe again, and that the reſurrection was altogether ſpiritual. Epiphanius furniſhes, that he might have imbibed this error from Origen.

The ſame Hierax, and his followers, likewiſe condemned the uſe of fleſh, wine, and marriage; being of opinion, that they were only allowed under the Old Teſtament, and till the coming of Jeſus Chriſt; but that under the new law, they were prohibited, as incompatible with the kingdom of God.

St. Epiphanius produces the paſſages of Scripture, whereon he founded this doctrine; he adds, that Hierax did not give into Origen's error with regard to the myſtery of the Trinity, but allowed the Son to be really and truly begotten of the Father. He was alſo orthodox with reſpect to the Holy Ghoſt, excepting for ſome peculiarities received from the Melchiſedecians, on which he had refined, maintaining that Melchiſedec was the Holy Ghoſt. He alſo excluded from the kingdom of heaven children, who died before they had arrived to the uſe of reaſon. He lived a very auſtere life, and promoted the ſame among his followers; but, after his death, they degenerated very faſt.

HIERACIUM, in *Botany*. See HAWKWEED.

HIERA PICRA, in *Pharmacy*, originally a kind of electuary, firſt deſcribed by Galen, compoſed of aloes, cinnamon, ſaſſafrage, ſpica-nardi, ſaffron, and maſtic, made up with honey, or ſyrup of violets and honey.

It is denominated from the Greek ἱερὸς, *ſacer*, *holy*, becauſe of its rare virtues; and πικρὸς, *amarus*, *bitter*; aloes, which is the baſe thereof, rendering it extremely bitter.

It was uſed to purge and cleanſe the ſtomach, remove obſtructions, promote the menſes and hæmorrhoids, and ſweeten the blood; but its chief uſe among us is in powder, for making the tincture ſacra.

Beſides this *ſimple hiera picra*, there is a *compound* ſort, called *diacholocynthidos Pauli*, becauſe colocynthis is the baſe thereof; and it was firſt uſed, with good ſucceſs, by Paulus of Antioch, in divers obſtinate diſeaſes. It is compoſed of colocynth, opopanax, ariſtolochia rotunda, agaric, and other ingredients. It is uſed in epilepſies, apoplexies, palſies, and lethargies; and to excite the menſes, and promote the expulſion of the after-birth.

There is alſo a third ſort of *hiera*, called *hieranus*; but rarely uſed. Dr. Quincy ſays, it is one of the moſt ridiculous medleys ever contrived. It paſſes for a cordial, &c.

HIERA PICRA, *tincture of*. See TINCTURA *ſacra*.

HIERARCHY, HIERARCHIA, in *Theology*, the order or ſubordination among the ſeveral choirs or ranks of angels.

The word is Greek ἱεραρχία, formed of ἱερὸς, *ſacer*, *holy*, and ἀρχὴ, *principatus*, *rule*; q. d. ἱερὰ ἀρχὴ, *holy command*, or *rule of holy things*.

St. Dionyſius, and other of the ancient writers, eſtabliſh nine choirs or orders of celeſtial ſpirits; viz. *ſeraphim*, *cherubim*, *thrones*, *dominions*, *principalities*, *powers*, *virtues*, *angels*, and *archangels*: and theſe they divide into three *hierarchies*.

HIERARCHY is alſo uſed for the ſubordination between prelates and other eccleſiaſtics. See PRIEST, &c.

Archbiſhops, biſhops, prieſts, and deacons, compoſe the *hierarchy* of the church of England. In that of Rome, the pope has likewiſe a place at the head of the *hierarchy*.

F. Cellot, a Jeſuit of Paris, has publiſhed a volume expreſs (De *Hierarchia & Hierarchis*) on the *hierarchy*, and thoſe who compoſe it. He there diſtinguiſhes a created and an uncreated *hierarchy*; a divine and a human, or eccleſiaſtical *hierarchy*: and in this, a *hierarchy* of juriſdiction, a *hierarchy* of an order, and a *hierarchy* of graces, the moſt ſublime of all.

He defines *hierarchy*, in the general, a command or ſovereignty in holy things; *principatus, ſive imperium, in rebus ſacris*; on which footing he holds, that *hierarchy* excludes all below biſhops; and that neither prieſts nor deacons can be reckoned among the number of hierarchiſts. Bellarmin, Hallier, Aureolus, &c. he holds, were all miſtaken, and did not diſtinguiſh between being *of the hierarchy*, and being *under it*.

HIERATIC *paper*, among the *Ancients*, was the fineſt ſort of paper, which was ſet apart only for ſacred or religious uſes. See PAPER.

HIERO's *crown*, in *Hydroſtatics*. The hiſtory of this crown and of the important hydroſtatical propoſition, to the diſcovery of which it gave occaſion, is as follows: Hiero, king of Syracuſe, having furniſhed a workman with a quantity of gold for making a crown, ſuſpected that he had been cheated, and that the workman had uſed a greater alloy of ſilver than was neceſſary in the manufacture of it; he, therefore, applied to Archimedes for a diſcovery of the fraud. This celebrated mathematician was led by chance to a method of detecting the impoſture, and of determining preciſely the quantities of gold and ſilver of which the crown was compoſed: for he obſerved, whilſt he was bathing in a tub of cold water, that as he immerged his body in it, the water ran out; and he immediately concluded, that the water which ran out, when his whole body was immerged, was equal in bulk to his body. It is ſaid, that he was ſo pleaſed with the diſcovery, as to run about naked crying out, εὕρηκα, εὕρηκα, *I have found it*; and others affirm, that he offered a hetacomb to Jupiter for having inſpired him with the thought.

On this principle he procured a ball of gold and another of ſilver, exactly of the weight of the crown, conſidering, that if the crown were altogether of gold, the ball of gold would be of the ſame bulk as the crown, and when immerſed in water, would raiſe the water juſt as high as the crown immerſed; but if it were wholly of ſilver, the ball of ſilver being immerſed, would raiſe the water no higher than the crown immerſed; and if the crown was of gold and ſilver mixed in a certain proportion, this proportion would be diſcovered by the height to which the crown would raiſe the water higher than the gold, and lower than the ſilver. Accordingly, let AMLB (*Tab. IV. Hydroſtatics, fig.* 29.) be a veſſel filled with water to the height DC, and let the maſs of gold, equal in weight to the crown, on being immerſed into the water, raiſe the ſurface of it to E, and the maſs of

silver raise it to G; then if the height of the vessel above DC be divided into equal parts, and DF=11, and DG =19, it is plain the bulks of gold and silver will be as DF to DG, and the specific gravities in the inverse proportion of these quantities, or as DG to DF. If the crown be immersed, it will raise the surface of water to E; whence the proportion of the bulks of the gold and silver in the crown may be determined. For since the difference of the specific gravities of the gold and silver is DG−DF=FG=8, if the bulk of the crown is divided into eight equal parts, it is evident, that since the specific gravities of the debased and pure gold crowns will be as the bulks inversely, that is, as DF to DE, we can easily find the point H, which will express the specific gravities of the former; for DE : DF :: DG : DH. This point H always divides the difference FG into two parts GH, HE, which have the same proportion as the parts of silver in the crown to the parts of gold; for as the point E ascends, the point H descends, and when E coincides with G, H falls upon E, and the crown becomes wholly silver; on the contrary, when E descends to F, and H ascends to G, the crown becomes wholly gold; therefore FH will be every where to HG as the parts of gold to the parts of silver in the crown. Consequently, in the present case, because the crown, when immersed, raises the water to the height DE, and H is three divisions below G, it shews that three of the eight parts of the crown are silver, and the other five parts gold, as H is five of the divisions above F. Hence the bulk of the gold in the crown is to that of the silver as 5 to 3. In some such method as this Archimedes deduced his proposition, viz. that the difference of the specific gravities of the compound and lighter ingredient, *i. e.* 5, (supposing the specific gravity of gold to silver as 19 to 11, and the specific gravity of the king's crown to be 16,) is to the difference of the specific gravities of the heavier ingredient and the compound, i. e. 3, as the bulk of gold to that of silver made up of: so that if the whole crown were divided into eight parts, the gold would consist of five, and the silver of three; and the magnitudes 5 and 3, multiplied by the specific gravities 19 and 11 respectively, will give the numbers 95 and 33, expressing the proportion of the weight of the gold to that of the silver.

This proposition of Archimedes may be demonstrated analytically in the following manner: let the magnitudes of the gold and silver in the crown be A and B, and their specific gravities as a and b; then since, the absolute gravity of any body is compounded of its magnitude and specific gravity, the weight of the gold is aA, of the silver bB, and of the crown $aA+bB=c\times A+B$, supposing c to be the specific gravity of the mixture. Hence $aA-cA=cB-bB$; and consequently $c-b : a-c :: A : B$, as before. Cotes's Hydrostatical, &c. Lectures p. 81. Martin's Phil. Brit. vol. i. p. 305, &c. See *Specific* GRAVITY and EQUATION.

HIEROBOTANE, in *Botany*. See VERVAIN.

HIEROBULBUM, in *Botany*, a name given by the ancients to the COLCHICUM.

Some have wondered that the medical writers of those times should give this name, which signifies the *sacred root*, to a thing that was generally allowed to be a poison; but Wedelius has proved that it may be given, under proper regulations, with safety and great success, in malignant and petechial fevers, and in the worst kinds of the small-pox and measles. The manner he gave it was in a mixture with bezoar and plantane-root, and this he called his ARCANUM *duplicatum cathelicum*, or pestilential alexipharmic. The ancients had a custom of wearing this root about their necks, by way of an amulet, to prevent infection; and it was probably from this that it obtained the name of the sacred bulb.

HIEROCERYCE, in *Mythology*, the chief of the sacred heralds in the mysteries of Ceres, whose office was to exclude all improper persons, to preserve order in the celebration of these mysteries, and to recite the formulæ of initiation.

The *hieroceryces* represented Mercury, and was distinguished by the same attributes: the office was perpetual, and belonged to the family of the Ceryces, the descendants of Ceryx, the last son of Eumolpus.

HIEROCORACES, q. d. *sacred crows*, in *Mythology*, were ministers of Mythras, or of the Sun, which the Persians worshipped under this title.

HIEROGLYPHIC, τερογλυφικη, a symbol or mystic figure, used among the ancient Egyptians to cover or conceal the secrets of their theology.

The word is composed of the Greek ἱερος, *sacer*, *holy*, and γλυφειν, *sculpere*, *to engrave*; it being the custom to have the walls, doors, &c. of their temples, obelisks, &c. engraven with such figures.

Hieroglyphics are properly emblems or signs of divine, sacred, or supernatural things; by which they are distinguished from common symbols, which are signs of sensible and natural things.

Hermes Trismegistus is commonly esteemed the inventor of *hieroglyphics*: he first introduced them into the Heathen theology; from whence they have been transplanted into the Jewish and Christian.

Sacred things, says Hippocrates, should only be communicated to sacred persons. Hence it was, that the ancient Egyptians communicated to none but their kings and priests, and those who were to succeed to the priesthood and the crown, the secrets of nature, and the secrets of their morality and history; and this they did by a kind of cabbala, which, at the same time that it instructed them, only amused the rest of the people. Hence the use of *hieroglyphics*, or mystic figures, to veil their morality, politics, &c. from profane eyes. Spon. This author, it may be observed, and many others, do not keep to the precise character of a *hieroglyphic*, but apply it to profane as well as divine things.

Hieroglyphics are a kind of real characters, which do not only denote, but in some measure express the things. Thus, according to Clemens Alexandrinus, Strom. v. 2 lion is the *hieroglyphic* of strength and fortitude; a bullock, of agriculture; a horse, of liberty; a sphinx, of subtilty, &c.

Such is the opinion that has generally been embraced both by ancient and modern writers, of the origin and use of *hieroglyphics*; it has been almost uniformly maintained that they were invented by the Egyptian priests, in order to conceal their wisdom from the knowledge of the vulgar. But the late bishop Warburton hath, with much ingenuity and learning, endeavoured to shew, that this account is erroneous.

According to this writer, the first kind of *hieroglyphics* were mere pictures; because the most natural way of communicating our conceptions by marks or figures was by tracing out the images of things: and this is actually verified in the case of the Mexicans, whose only method of writing their laws and history was by this picture-writing. But the *hieroglyphics* invented by the Egyptians, were an improvement on this rude and inconvenient essay towards writing; for they contrived to make them both pictures and characters: in order to effect this improvement, they were obliged to proceed gradually, by first making the principal circumstance of the subject stand for the whole, as in the *hieroglyphics* of Horapollo, which represent a battle of two armies in array by two hands, one holding a shield, and the other a bow; then putting the instrument of the thing, whether real, or metaphorical, for the thing itself, as an eye and sceptre to represent a monarch, a ship and pilot the governor of the universe, &c. and finally, by making one thing stand for or represent another, where their observations of nature or traditional superstitions led them to discover or imagine any resemblance; thus, the universe was designed by a serpent in a circle, whose variegated spots denoted the stars; and a man who had nobly surmounted his misfortune was represented by the lion of the hymn, because this was supposed to furnish an invulnerable defence in battle.

The Chinese writing, he observes, was the next kind of improvement in the use of *hieroglyphics*; the Egyptians joined characteristic marks to images, the Chinese threw out the images, and retained only the contracted marks, and from these marks proceeded LETTERS. The general concurrence of different people in this method of recording their thoughts, can never be supposed to be the effect of imitation, sinister views, or chance; but must be considered as the uniform voice of nature, speaking to the rude conceptions of mankind: for not only the Chinese of the East, the Mexicans of the West, and the Egyptians of the South, but the Scythians, likewise, of the North, and the intermediate inhabitants of the earth, viz. the Indians, Patricians, Ethiopians, &c. used the same way of writing by picture and *hieroglyphic*.

The bishop farther shews, that the several species of *hieroglyphic* writing took their rise from nature and necessity, and not from choice and artifice, by tracing at large the origin and progress of the art of speech. He proceeds to shew how, in process of time, the Egyptian *hieroglyphics* came to be employed for the vehicle of mystery. They used their *hieroglyphics* two ways; the one more simple, by putting the part for the whole, which was the *curiologic hieroglyphic*: and the other more artificial, by putting one thing, of resembling qualities, for another, called the *tropical hieroglyphic*: thus the moon was sometimes represented by a half circle, and sometimes by a cynocephalus. They employed their proper *hieroglyphics* to record openly and plainly their laws, policies, public morals, and history, and all kinds of civil matters: this is evident from their obelisks, which were full of *hieroglyphic*

hieroglyphic characters designed to record singular events, memorable actions, and new inventions; and also from the celebrated inscription on the temple of Minerva at Sais, where an infant, an old man, a hawk, a fish, and a river-horse, expressed this moral sentence: All you who come into the world and go out of it know this, that the gods hate impudence. However, the tropical *hieroglyphics*, which were employed to divulge, gradually produced symbols which were designed to secrete or conceal: thus Egypt was sometimes expressed by the crocodile, sometimes by a burning censer with a heart upon it; where the simplicity of the first representation and the artfulness of the latter shew, that the one was a tropical *hieroglyphic* for communication, and the other a tropical symbol invented for secrecy.

Enigmatic symbols were afterwards formed by the assemblage of different things, or of their properties that were less known; and though they might have been intelligible at first, yet, when the art of writing was invented, *hieroglyphics* were more generally disused, the people forgot the signification of them, and the priests, retaining and cultivating the knowledge of them, because they were the repositories of their learning and history, at length applied them to the purpose of preserving the secrets of their religion.

Symbols were the true original of animal worship in Egypt, as Sir John Marsham conjectured, Can. Chron. p. 58. because in these *hieroglyphics* was recorded the history of their greater deities, their kings, and lawgivers: represented by animals and other creatures: the symbol of each god was well known and familiar to his worshippers, by means of the popular painting and engravings on their temples, and other sacred monuments; so that the symbol presenting the idea of the god, and that idea exciting sentiments of religion, it was natural for them, in their addresses to any particular god, to turn to his representative mark or symbol; especially when we consider further, that the Egyptian priests feigned a divine original to *hieroglyphic* characters, in order to increase the veneration of the people for them. These would of course bring on a relative devotion to these symbolic figures, which, when it came to be paid to the living animal, would soon terminate in an ultimate worship.

Another consequence of the sacredness of the *hieroglyphic* characters was, that it disposed the more superstitious to engrave them on gems, and wear them as amulets or charms. This magical abuse seems not to have been much earlier than the established worship of the god Serapis, which happened under the Ptolemys, and was first brought to the general knowledge of the world by certain Christian heretics and natives of Egypt, who had mixed a number of Pagan superstitions with their Christianity. These gems, called ABRAXAS, are frequently to be met with in the cabinets of the curious, and are engraven with all kinds of *hieroglyphic* characters. To these abraxas succeed the TALISMANS. Warburton's Divine Legation of Moses demonstrated, vol. ii. passim.

HIEROGRAMMATEI, *Ἱερογραμματεῖς*, among the *Ancient Egyptians*, were the priests appointed to explain mysteries of religion, and to direct the performance of the ceremonies thereof; and for this purpose they had a kind of sacred alphabetical character, different from the political one, and which the writer, cited in the last article, considers as one of the four kinds of Egyptian writing. This, as well as the epistolic, used in civil matters, was formed by the letters of an alphabet; and, from its being used only in religious matters, was called *hieogrammatic*. The other two species of writing were the HIEROGLYPHIC and *symbolic*.

The *hierogrammates* invented and wrote hieroglyphics and hieroglyphical books, and occasionally explained them, together with other matters relating to the doctrines of religion. If we may believe Suidas, they were all prophets; at least, he relates, that a *hierogrammates* foretold to an ancient king of Egypt, that there would be an Israelite of great wisdom, virtue, and renown, who should humble Egypt.

The *hierogrammates* were always near the king, to assist him with their informations and counsels: the better to fit them for this, they made use of the skill and knowledge they had acquired in the stars and the motions of the heavenly lights, and even of the writings of their predecessors, wherein their functions and duties were delivered. They were exempted from all civil employments, were reputed the first persons in dignity next the king, and bore a kind of sceptre in form of a ploughshare.

After Egypt became a province of the Roman empire, the *hierogrammates* sunk into neglect.

HIEROLOGY denotes a discourse on sacred things. Among the Jews and Greeks, this term was used for the nuptial benediction.

HIEROMANTIA, *Ἱερομαντεία*, in *Antiquity*, a general name for all kinds of divination, made from the various things offered in sacrifice to the gods. They first made conjectures from the external parts and motions of the victim; then from its entrails, from the flame in which it was consumed, from the cakes and flour, from the wine and water, &c. Vide Port. Archæol. Græc. lib. ii. cap. 14. tom. i. p. 314.

HIEROMENIA, *Ἱερομηνία*, in *Ancient Chronology*, a name given to the months in which the Nemean games were celebrated. It was the same with the Athenian month Boëdromion, and answered to the latter end of our August and beginning of September.

HIEROMNEMON, *Ἱερομνήμων*, among the *Ancient Greeks*, signified a delegate chosen by lot, and sent to the great council of the AMPHICTYONS, where he was to take care of what concerned religion. The *hieromnemones* were reckoned more honourable than the other members of that assembly, the general meetings of which were always summoned by them, and their names were prefixed to the decrees made by that council.

HIEROMNEMON, compounded of *ἱερὸς*, *sacred*, and *μνήμων*, *one who advertises or puts in mind of*, an officer in the ancient Greek church, whose principal function was to stand behind the patriarch at the sacraments, ceremonies, &c. and shew him the prayers, psalms, &c. which he was to rehearse.

He also clothed the patriarch in his pontifical robes, and assigned the places of all those who had a right to be around him when seated on his throne, as the master of the ceremonies now does to the pope.

The *hieromnemon* was commonly a deacon: when he was in priest's orders, as it sometimes happened, he was excused from dressing the patriarch in his pontifical habits. Whether he were deacon or priest, he had always under him an officer named *cathysius*. He had also the keeping of the book entitled Contacion, or book of ordination; and that called the Enthronistimus, which was a sort of ritual.

HIEROMNEMON, in the *Writings of the Ancients*, was also the name of a stone said to have been used in divination, and called by others crotylos and amphiconæ. There is no description left us of it by the ancients, from which we may guess what stone it was, or from whence it was brought.

HIERONYMITES, compounded of *ἱερὸς*, *holy*, and *ὄνομα*, *name*, or *Hermits of St. Jerom*. See JERONYMITES.

HIEROPHANTES, or HIEROPHANTA, from *ἱερὸς*, *holy*, and *φαίνω*, *I appear*, in *Antiquity*, a priest among the Athenians.

The *hierophantes* was properly the chief person that officiated in the ELEUSINIA, that great solemnity sacred to Ceres.

This office was first executed by Eumolpus, and continued in his family for twelve hundred years, though when any person was appointed to this dignity, he was required always to live in celibacy.

St. Jerom says, that the *hierophantes* extinguished the fire of lust, by drinking cicuta or the juice of hemlock, or even by making themselves eunuchs. Apollodorus observes, that it was the *hierophantes* who instructed persons initiated into their religion in the mysteries and duties thereof, and that it was hence he derived his name: for the same reason he was called *prophetes*, *the prophet*. He had officers under him to do the same thing, or to assist him therein, who were also called *prophetes* and *exegetæ*, i. e. *expositors of divine things*.

To the *hierophantes* it belonged to dress and adorn the statues of the gods, and to bear them in processions and solemn ceremonies.

There were also women employed in the ceremonies of the Eleusinia.

HIEROPHYLAX, of *ἱερὸς*, *sacred*, and *φύλαξ*, *keeper*, of *φυλάττω*, *I keep*, an officer in the Greek church. His function is that of guardian or keeper of the holy things, utensils, vestments, &c. answering to our *sacristan* or *sexton*.

HIEROSCOPY, HIEROSCOPIA, formed of *ἱερὸς*, *sacred*, and *σκοπέω*, *I view or consider*, a kind of divination performed by considering the victim, and observing every thing that occurs during the course of the sacrifice.

HIGH, *altus*, a term of relation, applied to a body, considered according to its third dimension, or its elevation above the horizon, or even above the ground.

HIGH is also used to denote a person in power, dignity, &c.

So in England we say *high* court of parliament.

HIGH *chancellor, lord*. See CHANCELLOR.

HIGH *church*. See CHURCH.

HIGH-*bearing cock*. See COCK.

HIGH *commission court*. See COMMISSION.

HIGH *constable of England*. See CONSTABLE.

HIGH *court of Parliament*. See PARLIAMENT.

HIGH *and* DRY is a phrase, among *Seamen*, denoting the ſituation of a ſhip when ſhe has run aground, ſo as to be ſeen dry upon the ſtrand.

HIGH *Dutch* is the German tongue in its greateſt purity, as ſpoken in Miſnia, &c. See TEUTONIC, &c.

HIGH, in *Muſic*, is ſometimes uſed in the ſame ſenſe with *loud*, in oppoſition to *low*; and ſometimes in the ſame ſenſe with *acute*, in oppoſition to *grave*.

HIGH *operation, in Surgery*, is a method of extracting the ſtone; thus called, becauſe the ſtone is taken out at the upper part of the bladder.

For the method of performing the *high* operation, ſee LITHOTOMY.

The *high* operation is ſaid to have been firſt practiſed by Roſſetus; others ſay by Franco a ſurgeon of Lauſanne. It was retrieved by Mr. Douglas, and practiſed with good ſucceſs by *Mr.* Cheſelden and others.

HIGH *prieſt*. *See* PONTIFEX.

HIGH *relievo*. See RELIEVO.

HIGH *ſea*, or ocean, is that far from land. See SEA.

HIGH *ſteward, lord*. See STEWARD.

HIGH *taper*, in *Botany*. See MULLEIN.

HIGH *treaſon*. See TREASON.

HIGH *treaſurer, lord*. See TREASURER.

HIGH *water*, is that ſtate of the TIDES when they ceaſe to flow up, or the greateſt height of the flood-tide.

HIGH-*way, via regia*, a free paſſage for the king's ſubjects; on which account it is called the king's *high-way*, though the freehold of the ſoil belongs to the lord of the manor, or the owner of the land. Thoſe *ways* that lead from one town to another, and ſuch as are drift or carr-ways, and are for all travellers in great roads, or that communicate with them, are *high-ways* only; and their reparation is under the care of ſurveyors.

A river that is common to all men, is alſo called a *high-way*.

Where a *high-way* lies within a pariſh, the pariſh is bound to repair it, unleſs it appears that the ſame ought to be repaired by ſome particular perſon, either by reaſon of tenure or preſcription. At common law it is ſaid, that all the country ought to make good the reparations of a *high-way*, where no particular perſons are bound to do it, becauſe the whole country have their eaſe and paſſage by that way.

If a *high-way* leading through a field is out of repair, travellers may juſtify going out of the track, though there be corn ſowed; and in caſe a *high-way* is not ſufficient, any paſſenger may break down the incloſure, and go over the land adjoining, until a ſufficient way be made.

All kinds of injuries to *high-ways*, that render them leſs commodious to travellers, are deemed nuiſances; ſuch as laying logs of timber in them, erecting gates, or making hedges acroſs them, permitting boughs of trees to hang over them, &c. By ſtat. 13 Geo. III. cap. 78. no tree or buſh is to be allowed to grow or ſtand within fifteen feet of the centre of the *high-way*, on forfeiture of 10s. by the owner. The poſſeſſors of land next adjoining ſhall cut, prune, or plaſh their hedges, and lop trees growing in or near ſuch hedges, or be liable to a complaint of the ſurveyor, after ten days notice; and the juſtices at a ſpecial ſeſſions ſhall order ſuch hedges to be cut or plaſhed, and ſuch trees to be lopped; and the poſſeſſor, who refuſes to comply within ten days after notice of ſuch order, ſhall forfeit 2s. for every twenty-four feet in length of ſuch hedge, and 2s. for every tree; the ſurveyor ſhall order the ſame to be done, and the poſſeſſor, beſide the penalties, ſhall pay the charges of doing the ſame, to be levied by diſtreſs, by warrant of one juſtice. The occupiers of ſuch lands ſhall keep their ditches, drains, and water-courſes, in proper order, on forfeiture of 10s. after ten days notice given by the ſurveyor. No ſtone, timber, ſoil, or other matter, ſhall be laid in the *high-way*, ſo as to obſtruct or prejudice it, and remain there five days after notice by the ſurveyor, on forfeiture of 10s. and if ſuch ſtone, &c. ſhall be laid within fifteen feet of the centre of the *high-way*, the owner of the adjacent lands, after five days notice, may remove and diſpoſe of the ſame to his own uſe. Perſons making incroachments on the *high-way* by any fence, or breaking up the ſoil, within fifteen feet from its centre, ſhall forfeit 40s. to the informer, and the ſurveyor ſhall cauſe the damage to be repaired by the offender; and one juſtice may levy the penalty and expence by diſtreſs. The ſurveyor is required to give written notice to thoſe who offend in theſe reſpects; and if they do not comply within twenty days after ſuch notice, he ſhall proceed to remove nuiſances, &c. to cleanſe ditches, &c. and to cut hedges, &c. at the expence of the offender, who ſhall beſides forfeit for his neglect one penny for every foot in length. If the *high-way* is wilfully obſtructed by carriages, or implements of huſbandry, the perſon offending ſhall forfeit 10s.

It is further enacted by the ſame ſtatute, 13 Geo. III. cap. 78. that no driver of any cart, dray, or waggon, ſhall ride upon ſuch carriages, without having ſome perſon on foot to guide the ſame, excepting ſuch carriages as are conducted by perſons holding the reins of the horſe or horſes drawing them; or damage or obſtruct the paſſage of any perſon or carriage in the ſtreet or *high-way*, or quit the *high-way*, or wilfully be at ſuch a diſtance from his carriage, ſo that he cannot have the government of the horſes, &c. drawing the ſame, or refuſe or neglect to make way for loaded carriages; or drive a carriage not having the owner's name, and refuſe to diſcover it, under the penalty of forfeiting any ſum not exceeding 10s. if the driver be not the owner of the carriage; and if he be the owner, any ſum not exceeding 20s. on conviction by confeſſion, view of the juſtice, or oath of one witneſs, before one juſtice. Owners of carriages are alſo required to have their names and places of abode painted in large legible letters on ſome conſpicuous part; and the owner of every ſtage, waggon, or cart, ſhall, moreover, have the following words, *common ſtage waggon*, or *cart*, as the caſe may be, under the penalty of a forfeiture not exceeding 5l. nor leſs than 20s. And no alehouſes ſhall be kept by toll-collectors at any public bridge, under a penalty of 5l.

It is alſo enacted by the ſame ſtatute, that the juſtices ſhall iſſue their precept to the ſurveyor, requiring him to erect poſts or ſtones in places where ſeveral *high-ways* meet, with inſcriptions on them in large legible letters, containing the names of the towns or chief villages to which the ſeveral ways lead; and alſo in places ſubject to floods, inſcribed with marks denoting the greateſt depth of the water; and if he ſhall neglect or refuſe for three months, he ſhall forfeit 20s. And if any perſons remove or deſtroy poſts, blocks, banks, &c. let up for the ſecurity of horſe and foot cauſeways, or the battlements of bridges, or deſtroy or even deface any mile-ſtone or direction-poſt, they ſhall forfeit, on conviction on the oath of one witneſs, before one juſtice, or upon view of the juſtice, a ſum not exceeding 5l. nor leſs than 10s. and on default of payment be committed to the houſe of correction for any term not exceeding one month, nor leſs than ſeven days.

The ſame ſtatute farther enjoins, that no waggon, the felloes of whoſe wheels are nine inches broad, ſhall be drawn with more than eight horſes, nor carts of the ſame dimenſions with more than five horſes; and no waggon, the felloes of whoſe wheels are ſix inches broad, and rolling on each ſide a ſurface of nine inches, ſhall be drawn with more than ſeven horſes; and no waggon rolling a ſurface of ſix inches only, with more than ſix horſes; nor cart, the breadth of whoſe wheels is ſix inches, with more than four horſes; and no waggon, the felloes of whoſe wheels are of leſs breadth than ſix inches, ſhall be drawn with more than five horſes, nor cart of the ſame breadth with more than three horſes; the owner that offends againſt theſe regulations ſhall forfeit 5l. and the driver, not being the owner, 10s. for every horſe above the proper number, to the ſole uſe of the informer. But carriages moving upon wheels or rollers, of the breadth of ſixteen inches on each ſide, with flat ſurfaces, ſhall be allowed to be drawn with any number of horſes. No regulations affecting the number of horſes, and wheels of carriages, ſhall extend to carriages uſed in carrying one ſtone or block of marble, cable rope, piece of metal, or piece of timber, or to ſuch ammunition and artillery as may be required for his majeſty's ſervice. For all the purpoſes of this act, two oxen, or horned cattle, ſhall be conſidered as one horſe.

By the common law, no *high-way* can be changed without the king's licence firſt obtained, upon a writ of *ad quod damnum*. In aid of the common law, and to render the changing of *high-ways* leſs troubleſome and expenſive, power is given by 13 Geo. III. cap. 78. to the juſtices of the peace to widen, divert, and change *high-ways*, as they ſhall judge moſt convenient. And it is enacted, that the ſurveyor ſhall make every public carr-way leading to any market-town twenty feet wide at the leaſt, and every public horſe-way or drift-way eight feet wide at the leaſt, wherever the ground between the fences ſhall admit of it; or on the view of two juſtices, it ſhall be widened or diverted at their pleaſure, provided that its breadth exceeds not thirty feet, and that no houſes or buildings are pulled down, or any garden, park, court, or yard, taken away; and the owners of the ground, which ſhall be laid into the *high-way*, or through which it ſhall paſs, ſhall be recompenſed for it, and every injury redreſſed. The expences of making, repairing, &c. *high-ways*, are levyed by equal aſſeſſments, made by a warrant of the juſtices, at a ſpecial ſeſſions, on all occupiers of lands, tenements, woods,

tithes, and hereditaments; provided that no such assessment in one year shall exceed six pence in the pound. In extraordinary cases another assessment may be made, provided this and the preceding shall not in any one year exceed the rate of nine pence in the pound.

By the same statute the justices are enjoined to hold a special sessions for the *high-ways* in the week next after the Michaelmas general quarter-sessions *yearly*; and notice shall be given to the constables of the respective parishes at least ten days before it shall be held. Surveyors of the *high-ways* are to be chosen yearly out of a list of proper persons, nominated by the householders, assessed to any parochial or public rate, by the justices at their sessions; and their number shall depend on the extent of the parish, &c. But no person is liable to be appointed to serve this office within three years from the time of his having served it, without his own consent. Those who refuse to serve, after having been nominated by the parish and justices, shall forfeit 5*l.* and if they were only nominated by the justices, they shall forfeit 50*s.* In this case, the justices may appoint a proper person to this office, with a salary not exceeding one eighth part of what shall have been raised by assessment of six pence in the pound for the use of the *high-ways* in the district where the assessment hath been raised: and they shall also appoint one substantial inhabitant of such parish, &c. for assistant to such surveyor, till the next annual appointment, whose refusal incurs a forfeiture of 50*s.* And if a second person refuse, he shall also forfeit 50*s.* and a third shall be appointed, with a salary. Special surveyors returned to the justices by two parts out of three of those who have the choice, with a settled salary, may be appointed by them with the said salary. In case of the death of a surveyor, two justices at a special sessions may appoint another in his room.

It is the business of the surveyor to preserve *high-ways* in proper repair, &c. For this purpose it is enacted by the statute already cited, that every person keeping a team, draught, or plough, i. e. who keeps a waggon, cart, wain, plough, or coomb-rel, and three or more horses or beasts of draught, shall six days in the year furnish one wain, cart, or carriage, and other necessaries, and two able men, on the day and place appointed by the surveyor. Those who occupy lands of 50*l.* a year shall do the same; and in like manner for every 50*l.* a year respectively. Those who occupy lands under 50*l.* shall pay to the surveyor, in lieu of the duty, for every 40*s.* annual value of their land, &c. one penny for every day's statute duty, &c. and the same for every 20*s.* above the annual value of 50*l.* and less than 100*l.* Persons keeping a team, but occupying land of the yearly value of 30*l.* shall be obliged to send only one labourer with such team. Persons not keeping a team, but keeping one or more cart or carts, and one or two horses, shall send one labourer with each cart; and persons keeping a wheel-carriage, but no team, nor occupying 30*l.* a year, shall pay to the surveyor 1*s.* in respect of every day's statute duty, for every horse which he shall use in such carriage. Every inhabitant eighteen years of age, and upwards, but under sixty, not chargeable in any other way for 4*l.* a year, or upwards, and not being an apprentice or menial servant, or not having served or compounded in any other place for that year, shall go in person, or find a labourer, on each of the foresaid days. Carriages shall be changed, at the discretion of the surveyor, for men, three being allowed for each team, or 4*s.* 6*d.* shall be paid in lieu of them. Persons liable to perform statute duty may compound at such rates as the justices shall think fit, not exceeding 6*s.* nor less than 3*s.* for each team, for each day, or, in default of their adjudging the same, the sum of 4*s.* 6*d.* for every cart and one horse 2*s.* for every cart with two horses 3*s.* in lieu of each day's duty. And every inhabitant liable to perform such duty, and not chargeable in any other respect, may compound for 4*d* each day. The surveyor shall give four days notice to those whose attendance is required, and they shall bring with them their own tools, continue at work for eight hours in each of the appointed days; and defaulters in finding a team, &c. shall forfeit 10*s.* those in sending a cart with one horse and man, 3*s.* for not sending a cart with two horses and one man, 4*s.* and for each labourer 1*s.* 6*d.* Surveyors for neglect of duty, where no particular penalty is imposed, shall forfeit a sum not exceeding 5*l.* nor less than 10*s.* at the discretion of the justices. All defects of repairs of *high-ways* shall be presented in the county where they lie; and the indictment must shew, that they are *high-ways*; also the places from and to which they lead: where the nuisance was done, and how far it extends: it must likewise state the fact clearly.* Justices may present on their own view. For the farther regulations relating to *high-ways*, the principal of which have been already recounted, the reader is referred to 13 Geo. III. cap. 78.

HIGH-*ways, turnpike.* See TURNPIKE.

HIGH-*way men, are* subjects on the *high-way*; for the apprehending and taking of whom, a reward of 40*l.* is given by the statute of 4 and 5 W. & M. to be paid within a month after conviction by the sheriff of the county; to which the statute 8 Geo. II. cap. 16. superadds 10*l.* to be paid by the hundred indemnified by such taking.

HIGHNESS, a quality, or title of honour, given to princes.

The kings of England and Spain had formerly no other title but that of *highness*; the first, till the time of Henry VIII. and the second, till that of Charles V. See KING.

The petty princes of Italy began first to be complimented with the title of *highness* in the year 1630. And the duke of Orleans assumed the title of *royal highness* in the year 1631, to distinguish himself from the other princes of France.

The duke of Savoy, afterwards king of Sardinia, bore the title of *royal highness*, on account of his pretensions to the kingdom of Cyprus. It is said that the duke only took the title of *royal highness*, to put himself above the duke of Florence, who was called *great-duke*; but the great-duke has since assumed the title of *royal highness*, to put himself on a level with the duke of Savoy.

The prince of Conde first took the title of *most serene highness*, leaving that of simple *highness* to the natural princes.

At present all the sons of crowned heads are styled *royal highness*, as the electors of Germany are called *electoral highness*.

HIGLER is a name frequently mentioned in our statutes for a person who carries from door to door, and sells by retail, small articles of provisions, &c. They are laid under various restraints by the statute laws.

HIJABILA, in *Botany*, a name given by some authors to the tamarind-tree.

HIS *testibus*, q. d. *those witnesses*, a phrase anciently added in the end of a deed, written in the same hand with the deed, upon which the witnesses were called, the deed read, and then their names entered. See WITNESS.

This clause of *his testibus*, in subjects deeds, continued till, and in, the reign of Henry VIII. but it is now omitted. Coke on Littleton.

HILARIA, in *Antiquity*, feasts celebrated every year, by the Romans, on the eighth of the calends of April, or the twenty-fifth of March, in honour of Cybele, the mother of the gods. As is observed by Macrobius, lib. i. cap. 10. and Lampridius, in his Life of Alexander Severus.

The *hilaria* were solemnized with great pomp and rejoicing. Every person dressed himself as he pleased, and took the marks or badges, of whatever dignity or quality, he had a fancy for. The statue of the goddess was carried in procession through the streets of the city, accompanied by multitudes in the most splendid attire. The day before the festival was spent in tears and mourning. Cybele represented the earth, which at this time of the year begins to feel the kindly warmth of the spring; so that this sudden transition from sorrow to joy was an emblem of the vicissitude of the seasons, which succeeded one another.

The Romans took this feast originally from the Greeks, who called it ἀναστήρια, q. d. *asteriosa*, the feast of that day they spent in tears and lamentations, and thence denominated it κατ' ἐξοχὴν, *desertus*.

Afterwards, the Greeks took the name ἱλάρια, from the Romans; as appears from Photius, in his extract of the life of the philosopher Isidore.

Casaubon maintains, that beside this particular signification, the word *hilaria* was also a general name for any joyful or festival day, whether public, or private and domestic. But Salmasius does not allow of this.

Triffan, tom. i. p. 482. distinguishes between *hilaria* and *hilarice*. The former, according to him, were public rejoicings; and the latter, prayers made in consequence thereof; or even of any private feast or rejoicing, as a marriage, &c. The public lasted several days; during which, all mourning and funeral ceremonies were suspended.

HILARODI, ἱλαρῳδοὶ, compounded of ἱλαρὸς, *joyful*, and ᾠδὴ, *song*, in the *ancient Attic* and *Poetry*, a sort of poets among the Greeks, who went about singing little merry diverting poems or songs; though somewhat graver than the Ionic pieces.

The *hilarodi* appeared dressed in white, and were crowned with gold. At first they wore shoes; but afterwards they assumed the crepida, which was only a soal, tied over the foot with straps.

They did not sing alone; but had always a little boy, or girl, to attend them, playing on some instrument.

From the streets they were at length introduced into the tragedy, as the magodi were into comedy.

The *hilarodi* were afterwards called Simodi, from a poet named Simus, who excelled in this kind of poetry.

HILARODIA, a poem, or compoſition in verſe, made or ſung by a kind of rhapſodiſts, called HILARODI.

HILARO-TRAGŒDIA, a dramatic performance, partly tragic or ſerious, and partly comic or merry.

Scaliger holds the *hilaro-tragedia* and *hilarodia* to be one and the ſame thing. Others rather take the *hilaro-tragedia* to have been pretty nearly what we call a *tragi-comedy*. Others, again, will have it to have been a pure tragedy, only terminating with a happy cataſtrophe, which brings the hero out of a wretched into a fortunate ſtate. But the firſt opinion ſeems the moſt probable, and the beſt warranted.

Suidas mentions one Rhinthon, a comic poet of Tarentum, as the inventor of this kind of poem: whence it was alſo called *Rhinthonica fabula*.

HILARY *term*. See TERM.

HILL. See MOUNTAIN.

To find the height of a hill, ſee the latter part of the article LEVELLING.

HILLIA, in *Botany*, a genus of the *hexandria monogynia* claſs: the calyx is ſix-leaved; the corolla is very long, and divided into ſix ſegments; the fruit is a berry, with two cells, containing many ſeeds.

HILLOCK. See MOUNT.

HILUM, a word uſed by botaniſts to expreſs the blackiſh ſpot in beans, commonly called by us the eye of the bean.

HIMANTOPUS, *long-legged plover*, in *Ornithology*, the name of a water-bird, a ſpecies of the CHARADRIUS in the Linnæan ſyſtem, very remarkable for the length and ſlenderneſs of its legs; it is all over white on the breaſt, belly, and throat, and blackiſh on the back and wings: its beak is black, about a hand's breadth long, and very weak and ſlender, fit for nothing but to deſtroy the ſofter ſmall inſects; its tail is of a whitiſh grey; its neck has ſeveral oblong black ſpots drawn downwards, and its wings are very long; its legs and feet are red, and have no hinder toe. Aldrovand. de Avib. lib. xi. cap. 30. Theſe birds are extremely rare in the Britiſh iſlands. See *Tab. II. of Birds*, N° 19.

HIMAS. The proper ſignification of the word *ipsas* is a *thong of leather*; but in medicine it is uſed to ſignify a laxneſs of the uvula, when it becomes long and ſlender, and hangs pendulous. It differs from the cionis, becauſe in this latter diſorder the uvula is not extenuated, but ſeems to acquire a greater thickneſs, as well as length, than what it naturally has.

HIN, a Hebrew meaſure, containing the ſixth part of an epha; or one wine gallon and two pints.

HIND, a female ſtag of the third year. See HUNTING.

HIND-*Berry*, in *Botany*. See RASPBERRY.

HIND-*calf*, a female bart of the firſt year. She fawns in April and May. Her fleſh is ſofter than that of a hart, but not ſo ſavoury, and is dreſt after the ſame manner. If it be roaſted it ought to be larded, dipt in a marinade or pickle, and moiſtened while it is roaſting. See HUNTING.

HIND-*band*, in the *Manage*. See HAND.

HINDENI *homines*, formed from the Saxon *hindene*, a *ſociety or company*, anciently ſignified a ſociety, or claſs of men.

In the time of our Saxon anceſtors, all men were ranked into three claſſes, or *hindenes*; the *leweſt*, the *middle*, and the *higheſt*; and they were valued according to the claſs they were in; that in caſe any injury were done by any one, ſatisfaction might be made according to the value or worth of the man it was done to.

The *leweſt* were thoſe who were worth ten pounds, or two hundred ſhillings; called *viri decentini*, or *twyhyndenes*, and their *wives*, *twyhyndas*.

The *middle* were valued at ſix hundred ſhillings; and were called *ſixhyndemen*, and their wives *ſixhyndas*.

The *higheſt* were valued at twelve hundred ſhillings; and were called *twelvehyndermen*, and their wives the *twelvehyndas*.

HINDOOS. See GENTOOS.

HINE, or HIND, in the *Saxon Language*, ſignifies a ſervant, or one of the family; but it is now taken in a more reſtrictive ſenſe, for a ſervant at huſbandry; and the maſter *hine* is he that overſees the reſt.

HINGES, in *Building*, thoſe neceſſary iron figaments, by means whereof doors, lids, folds of tables, &c. make their motion, whether of opening, ſhutting, or folding. The ſpecies of *hinges* are many, viz. bed, box, butts, cafement, caſling, chell, couch, deſk, dove-tails, eſſes, folding, garnett, weighty, ſide, ſide with riſing joints, ſide with ſquares, ſcrew, ſcuttle, ſhutter, trunk of ſundry ſorts, and hook and eye *hinges*.

HINGWANG, in *Natural Hiſtory*, a name given by the people of the Eaſt Indies to a ſpecies of red arſenic, which they uſe in painting and in medicine. They find it in and about the copper mines. It is calcined ſeveral times, in order to fit it for internal uſe. In painting, it makes a very fine orange-colour; but when mixed with cerus, it makes a lemon-colour; and any other ſhade of yellow. It ſeems to contain ſome portion of ſilver, and ſome cinnabar.

HINNULARIA. a name given by authors to a ſpecies of eagle. See PYGARGUS, and *White-tailed* EAGLE.

HINNULUS, a bind; the young of the deer or goat kind.

The rennet of a young hind or deer, taken within nine days after it is brought forth, is a preſcription given by Scribonius Largus for the epilepſy. James's Med. Dict.

HIP, in the *Manage*. See HAUNCH.

HIP, in the *Materia Medica*, the fruit of the cynoſbatus, ſhrub, wild briar, *hip-tree*, or DOG-ROSE.

Hips are agreeably dulco-acid, and ſtand recommended as cooling teſtringents, in bilious fluxes, ſharpneſs of urine, and hot indiſpoſitions of the ſtomach; but they are but little uſed in the ſhops, except to the conſerve, which is a very pleaſant one, and made of the freſh pulp, by mixing three ounces of it with five of fine ſugar. The pulp ſhould be carefully ſeparated from the rough prickly matter which incloſes the ſeeds; for a ſmall quantity of this retained in the conſerve, is apt to occaſion an uneaſineſs at the ſtomach, pruritus about the anus, and ſometimes vomiting. Lewis.

HIP-*gout*, *ſciatica*. See GOUT and SCIATICA.

HIP-*ſhot*, a diſorder of a horſe, when he has wrung or ſprained his haunches, or *hips*, ſo as to relax the ligaments that are to keep the bone in its due place.

The ſigns are, that the horſe will halt much, and go ſide-long, trailing his leg after him; and the *hip* which is hurt will be lower than the other; the fleſh falling away on the ſide of his buttock.

HIPS, in *Building*, are thoſe pieces of timber, placed at the corners of a roof.

The *hips* are much longer than the rafters, on account of their oblique poſition, and are placed not with a right or ſquare angle, but a very oblique one; and by conſequence are not, at leaſt ought not to be, ſquare at any angle (as rafters are all) but level at every one of them; and, which is yet more, as rafters have but four planes, theſe commonly have five.

They are commonly, by country workmen, called *cornets*: ſome call them *principal rafters*, and others *ſleepers*. Indeed, *hips* and ſleepers are much the ſame; only the ſleepers lie in the valleys, and join at the top with the *hips*; but thoſe ſurfaces or planes, which make the back of the *hip*, are the undерſides of the ſleeper.

The *backs of a hip* are thoſe two ſuperficies, or planes, on the outſide of the *hip*, which lie parallel, both in reſpect of their length and breadth, with the ſuperficies of the adjoining ſide, and end of the roof.

HIP-*mould*, is by ſome uſed for the back of the *hip*. Others underſtand it as a prototype, or pattern, commonly made of a piece of thin wainſcot; by which the back and the ſides of the *hip* are ſet out.

HIP-*roof*, among *Builders*, called alſo *Italian roof*, is a roof which has neither gable-head, nor thread-head, nor jirken-head; which laſt are both gable and *hip* at the ſame end. A *hip-roof* has rafters as long, and with the angles at the foot, &c. at the ends of buildings, as it has at the ſides; and the feet of the rafters on the ends of ſuch buildings as have *hip-roofs*, ſtand on the ſame plane, viz. parallel with the horizon, and at the ſame height from the foundation, with rafters on the ſides of the roof.

HIP-*tyles*. See TYLE.

HIPPAGOGA, in *Antiquity*, a veſſel uſed in tranſporting horſes. It was otherwiſe called *hippago*.

HIPPARCHUS's *period*. See PERIOD.

HIPPELAPHUS, among the *Ancient Zoologiſts*, was only the name of a large race of ſtags, with longer hair on the neck giving it the appearance of a mane.

HIPPEUS, or EQUINUS, in *Phyſiology*, a ſort of comet which ſome writers ſuppoſe to bear a reſemblance in its tail to a horſe. But the ſhape of this kind of comet is not always alike; being ſometimes oval, and ſometimes imitating a rhomboides. Its train alſo is ſometimes ſpread from the front or fore-part, and ſometimes from the hind-part.

Hence this claſs of comets is diſtinguiſhed into *equinus barbatus*, *equinus quadrangularis*, and *equinus oſtentus*. See COMET.

HIPPIATRICE, of ἱππος, *horſe*, and ἰατρεια, *phyſician*, the art of curing the diſeaſes of brutes, and particularly horſes.

This makes what we rather call the *farrier's art*. See FARRIER.

HIPPION, or HIPPIUM, in *Botany*, a name by which John Bauhine, and ſome other authors, have called the larger ſpecies of the autumnal dwarf GENTIAN.

HIPPIUM, in *Antiquity*, that part or trast of the *hippodrome*, which was beaten with the horses feet. See HIPPODROME.

HIPPO, in *Zoology*, the name of a species of COLUBER, the scuta of whose abdomen are one hundred and fixty, and the squamæ of the tail one hundred.

HIPPOBOSCOS, in *Natural History*, the name given by authors to the horse-fly. This is of the bigness of the common fly, and has a broad flat body, which is hard and smooth, and of so firm a structure, that it can scarce be crushed or broken by the fingers. It is remarkable for its flying sideways. See HORSE-*worm*.

This is a genus of the *diptera* class of insects in the Linnæan system.

HIPPOCAMPUS, the *sea-horse*, in *Zoology*, the name of a small sea-animal caught in the Mediterranean, and esteemed useful in medicine among the ancients, but at present not used. This is a species of the SYNGNATHUS in the Linnæan system. See *Tab.* II. *Fish. fig.* 13.

It has its name from the Greek ἱππος, a *horse*, and καμπη, a *caterpillar*, from its resembling a horse in its head, and a caterpillar in the rest of its body. It seldom exceeds the length of three inches, and is about as thick as a finger, or a little more; its snout is long and hollow like a pipe, and is not split, as in other animals, in general; but it has an operculum from below, which opens or shuts up its aperture at the creature's pleasure; its whole snout is perfectly like that of the acus or needle-fish; its eyes are round and prominent, and between the eyes there are two more prominent tubercles. The body, down to the anus, is heptahedral, or seven-sided, and terminated at the angles with a sort of thorny protuberances; from the anus to the tail the shape is only three or four-sided, and ends in a point, and is twilled into a sort of spiral line. In the place where the gills of other fishes are situated, this has two fins in the shape of ears, and above these there are two apertures opening upwards, but no gills are any way discoverable. It has two apertures on the belly, out of one of which the excrements are voided, and by the other the female deposits her eggs; its whole body is composed of a sort of annular cartilages, from distinct parts of which are propagated a sort of prickles; it is while fresh of a dusky green colour, and blackish toward the tail, and is spotted principally on the belly with bluish-white specks; it has a single fin in the middle of its back of an equal height all the way. Into whatever posture you turn the tail, while the creature is yet living, it will retain it when dead. Some of this species have a mane like that of a horse, but most want this character; and naturalists are not yet determined whether it be the character of a distinct species of the animal, or be owing to the different age or sex. It is hairy in many parts of the body, but principally about the head; but the hairs often fall off in drying the creature. Willugh. Hist. Pisc. p. 157.

HIPPOCASTANUM. See *Horse* CHESTNUT.

HIPPOCENTAUR, formed of ἱππος, *horse*, κεντεω, *pungo*, *I spur*, and ταυρος, *bull*, in *Antiquity*, a fabulous monster, supposed to be half horse and half man.

What gave occasion to the fable was, that a people of Theffaly, inhabiting near mount Pelion, became thus denominated, because they were the first that taught the art of mounting on horseback; which occasioned some of their neighbours to imagine that the horse and man made but one animal.

The *hippocentaurs* should seem to have differed from the CENTAURS, in this, that the latter only rode on bullocks, and the former on horses, as the names themselves intimate.

On the medals of Gallienus is represented a centaur drawing a bow, or holding a globe in the right hand, and the helm of a ship in the left; with this inscription, APOLLINI CONS. AUG. *To Apollo the conservator of Augustus*. Triftan considers both the one and the other as a symbol of the protection Gallienus received from Apollo in his wars against the Persians.

HIPPOCEPHALOIDES, the *horse-head stone*.

The word is derived from the Greek ἱππος, a *horse*, and κεφαλη, the *head*; and is a name given by Dr. Plot to a stone found in Oxfordshire, and many other places, and supposed to resemble the head of a horse in figure, though the truth is, it requires a very warm imagination to make out the resemblance.

The stone is composed of the matter of the common coarser quarry-stone, and owes its figure to a shell of the cockle-kind, into which having been received at a time when it was soft and moist, it has taken the exact figure and lineaments of its inner parts. It is about the size of the larger bucardite, from an inch and a half to two inches and a half in length, and indeed very much resembles that stone, having been formed wholly in the same manner, and in a shell of the same genus. Hill's Hist. of Foss. p. 646.

HIPPOCRAS, *Vinum* HIPPOCRATICUM, a kind of medicated WINE.

Menage approves the conjecture of those who derive *hippocras* from *Hippocrates*, as supposing him the inventor hereof; but we may better deduce it from the *manica Hippocratis*, or *Hippocrate's sleeve*, used in the filtration of it.

Hippocras is a drink compofed of wine, with spices and other ingredients infused therein, much used among the French by way of a cordial dram after meals.

There are various kinds of *hippocras*, according to the kind of wine, and the other additional ingredients made use of; as white *hippocras*, red *hippocras*, claret *hippocras*, strawberry *hippocras*, *hippocras* without wine, cyder *hippocras*, &c.

That directed in our late college dispensary, is to be made of cloves, ginger, cinnamon, and nutmegs, beat, infused in canary, with sugar; to the infusion, milk, a lemon, and some slips of rosemary, are to be put, and the whole strained through a flannel. It is recommended as a cordial, and as good in paralytic, and all nervous cases.

HIPPOCRATEA, in *Botany*, a genus of the *triandria monogynia* class. Its characters are these: it has a large spreading compalement of one leaf, cut into five segments; and the flower hath one oval petal, which is entire; it has six slender, short stamina, and an oval germen situated below the petal, which becomes an oblong capsule, winged at the top, including a single seed. We have but one species of this genus, which is a native of Campeachy. Miller.

HIPPOCRATES's *sleeve*, *manica* HIPPOCRATIS, a kind of filtre, or straining-bag, formed by joining the opposite angles of a square piece of flannel, in form of a pyramid, and used to percolate or strain syrups, decoctions, &c. for clarification.

HIPPOCRATIA, in *Antiquity*, feasts celebrated by the Arcadians in honour of the equestrian Neptune, from a notion that this deity conferred horses on men. During the celebration of these, horses were exempt from all labour, and were led in procession through the streets, superbly harnessed, and adorned with garlands of flowers. The Romans celebrated these feasts under the title of CONSUALIA.

HIPPOCRATICA *facies*. See FACIES *Hippocratica*.

HIPPOCRATISM, in *Medicine*, denotes the philosophy of Hippocrates, applied to the science of medicine; or the doctrine of Hippocrates considered with regard to the means of prolonging life, of preventing and counteracting the effects of accidents that tend to abridge it, and of maintaining that state of the animal body, which will preserve it from immature diffolution. Hippocrates, who has been justly venerated for more than twenty centuries, as the institutor, and, in a degree, the inventor of the art of healing, was born in the isle of Coos, one of the Cyclades, about four hundred and fixty years before Christ, in the first year of the eightieth Olympiad, according to Soranus, or thirty years before the Peloponnesian war. However, some authors have made him more and others less ancient. He is said to be descended from Æsculapius, by Heraclides his father, and from Hercules, by Praxithea his mother. Hippocrates first joined reasoning to experience in treating of the medicinal art; and on this account he has been always held in veneration as the father of rational medicine. To him we owe the discovery of that principle of the animal œconomy, which he calls nature, the knowledge of which is so essential to the right conduct of a physician in every branch of his office. Nature is that power, observable in all animals, which directs all the motions both of the solids and fluids for their preservation; to nature, as the governing principle, he ascribes certain faculties, by the mediation of which it selects, retains, and properly prepares what is good and useful to any part of the animal œconomy, and rejects what is superfluous or hurtful. Nature, according to him, is the true physician that heals all diseases, and that preserves health. This should be invariably consulted in the administration of all remedies; its operations should be aided, and all obstacles removed. Without particular attention to nature, and without recovering its active powers, all remedies are not only useless, but commonly injurious. On these principles Hippocrates applied himself principally to examine the progress of nature in the course of different diseases, as appears from his books De Morbis, & De Affectionibus; and to describe their symptoms and their prognostics and diagnostics, in such a manner, that they might be known to others as well as to himself. See 7. Aphorismorum, Lib. Prognost. Prædict. Epem. Coac. Lib. de Judicatione. De Diebb. Judicator.

Hippocrates was no less distinguished as the inventor of that part of medicine, which is called DIETETIC. Vide lib. vi. De Dieta, lib. De Alimento, De Hemidiorum Usu, De Salubri Dieta, De Victu Acutorum. In these works

works he has evinced the great importance of a proper regimen, both for preserving health, and healing diseases. He has also left several treatises on the subject of anatomy. Vide lib. vi. De Corde, De Ossium Natura, De Venis, De Humoribus, De Genitura, De Principiis & Carnibus, De Glandulis, De Natura Humana. It appears also from his six books De Articulis, De Fracturis, De Fistulis, De Vulneribus Capitis, De Chirurgiæ Officina, that he excelled in surgery: with regard to the materia medica, as far as we can judge from his writings, he made use only of a few remedies, and such as were the most simple. Hippocrates applied his extensive acquaintance with physics for determining the effects produced by the NON-NATURALS on the human body. Vide lib. vi. De Aere Locis & Aquis; and he was the first who made use of mathematics in explaining the phenomena of the animal economy: and with this view he recommended the study of them to his son Thessalus. He was no stranger to the doctrine of attraction, and considered the philosophy of Democritus, which he adopted, as of peculiar importance in its reference to the animal economy. The probity of Hippocrates was no less remarkable than his extensive knowledge: an instance of which occurs in his history to this purpose. An infectious disease had infested Persia, and Alexander made the most unlimited offers to Hippocrates to induce him to come and restrain the ravages of this plague; to which he replied, that he could by no means think of giving succour to the enemies of the Greeks. Hippocrates died at a hundred and four years of age, in the three hundred and fifty-sixth year before Christ. He has always occupied in medicine the same kind of distinguished rank as Homer does among the poets, and Cicero among the orators. Galen cites his authority with these words *Magister dixit.* Encyclopedic. See MEDICINE.

The works of Hippocrates are collected in one volume, and published in Greek and Latin by Fœsius. Genevæ. 1657.

HIPPOCRENE, derived from ἵππος, *horse*, and κρήνη, *fountain*, q.d. the fountain of the horse Pegasus, was a spring at the foot of mount HELICON.

HIPPOCREPIS, in *Botany*, the name given by Linnæus to the plant usually called by authors *ferrum equinum*, or the *horse-shoe* VETCH.

HIPPODROME, HIPPODROMUS, composed of ἵππος, *horse*, and δρόμος, *course*, of the verb δράμω, *curro*, *I run*, in *Antiquity*, a list, or course, wherein chariot and horse-races were performed, and horses exercised.

The Olympian *hippodrome* or horse-course was a space of ground of six hundred paces long, surrounded with a wall, near the city Elis, and on the banks of the river Alpheus. It was uneven, and in some degree irregular, on account of the situation; in one part was a hill of a moderate height, and the circuit was adorned with temples, altars, and other embellishments. See STADIUM. There is a very famous *hippodrome* at Constantinople, which was begun by Alexander Severus, and finished by Constantine. This circus, called by the Turks *atmeidan*, is four hundred paces long, and above one hundred paces wide. At the entrance of the *hippodrome* there is a pyramidal obelisk of GRANITE, in one piece, about fifty feet high, terminating in a point, and charged with hieroglyphics. The Greek and Latin inscriptions on its base shew, that it was erected by Theodosius; the machines that were employed to raise it are represented upon it in basso-relievo. We have some vestiges in England of the *hippodromus*, in which the ancient inhabitants of this country performed their races; the most remarkable is that near STONE-HENGE, which is a long tract of ground, about three hundred and fifty feet, or two hundred druid cubits wide, and more than a mile and three quarters, or six thousand druid cubits in length, inclosed quite round with a bank of earth, extending directly east and west. The goal and career are at the east end. The goal is a high bank of earth, raised with a slope inwards, on which the judges are supposed to have sat. The meta are two tumuli, or small barrows, at the west end of the course. These *hippodromes* were called in the language of the country *rhedegva*, the racer *rhedegwr*, and the carriage *rhedy*, from the British word *rhedeg*, *to run*. One of these *hippodromes*, about half a mile to the southward of Leicester, retains evident tracts of the old name *rhedycin*, in the corrupted one of *rotherby*. There is another of these, says Dr. Stukeley, near Dorchester; another on the banks of the river Lowther, near Penrith in Cumberland; and another in the valley, just without the town of Royston.

HIPPODROMUS, in *Chronology*, the Bœotian name for the Athenian month Hecatombæon, or ECATOMBEON.

HIPPOGLOSSUS, a species of the PLEURONECTES in the Linnæan system of *Ichthyology*, the name of the holibut; a large flat fish caught in the British seas and elsewhere. It is the biggest and the most voracious of all the 6th of this kind, and is somewhat of the shape of a turbot, but larger and longer bodied, and consequently less square; its back is of a dusky brownish green, and beneath it is of a pure white; its scales are extremely small, and the whole surface of the fish very smooth, having no crooked prickles on the sides. The eyes are on the right side, and the belly has six small fins, beside the large straight ones. It is caught in the German and British seas, and its flesh is very coarse, excepting the part which adheres to the side fins, which is extremely fat and delicious, but farfeiting. They have been taken in our seas weighing from one to three hundred pounds; but those of a much larger size are found in Newfoundland, Greenland, and Iceland, where they are taken with a hook and line in very deep water. The Greenlanders cut them in large slips, and dry them in the sun.

HIPPOGLOSSUM, *horse-tongue*, in *Botany*, the name of a plant of the *ruscus*, or butcher's broom kind, called by others the Alexandrian bay, or *laurus Alexandrina*. See BUTCHER'S *broom*.

HIPPOLAPATHUM, in *Natural History*, a species of lapathum, called also *monk's* RHUBARB.

HIPPOLITHOS, a name given by some authors to the stones found in the stomachs and intestines of horses: there are often a great number of these in one horse; and they are frequently found in the colon, of a very large size. See BEZOAR.

HIPPOMANE, in *Botany*. See MANCHINEEL.

HIPPOMANES, compounded of ἵππος, *horse*, and μανία, *madness*, a sort of poison, famous among the ancients as an ingredient in amorous philtres, or charms.

Naturalists are not agreed about the nature of the *hippomanes*. Pliny describes it as a blackish carnuncle, found on the head of a new-foaled colt; which the dam bites off and eats, as soon as she is delivered. He adds, that if she be prevented herein by any other's cutting it off before, she will not take to, nor bring up her young. Virgil, and after him Servius and Columella, describe it as a poisonous matter, trickling from the pudendum of a mare, when proud, or longing for the horse. *Æn.* lib. iv. ver. 515.

At the end of Mr. Bayle's Dictionary is a very learned dissertation on the *hippomanes*, and all its virtues, both real and pretended.

HIPPOMYRMEX, the *horse-ant*, the name of a species of ant much larger and nimbler than the common kind. This builds in woods, and makes its nests of sticks and straws, and fragments of various parts of trees. The common ANT builds only with earth.

HIPPONE, in *Mythology*, the goddess of horses and chariots.

HIPPOPHAE, in *Botany*, the name given by Linnæus to a genus of plants, called *rhamnoides* by Tournefort and others. See SEA-*buckthorn*.

HIPPOPHEOS. This was a name given not only to the larger species of the pheos or ibeba, but to a very different plant, a kind of dodder, more vulgarly called epithymum, from its growing upon the pheos, as the dodder of thyme is called epithymum, from its growing upon that plant. It is possible indeed that it might be called originally *hippophleos*, from its riding, as it were, on the pheos. But however this be, there is great reason to suspect that Dioscorides confounds this dodder with the plant itself, and gives its virtues as those of the proper *hippophleos*; which, according to Theophrastus, and all the other writers of credit in antiquity, is only a larger species of the pheos, a prickly shrub, not a plant, growing on its See EPIPHEOS.

HIPPOPHTHALMIC *muscles*, a name given by the ichthyologists to a pair of large muscles found in the head of fish, one placed immediately under the eye; these serve to move the eyes; and, with the two maxillary muscles, placed under the jaws, are the principal muscular part of the head of fish.

HIPPOPODES, or HIPPOPEDES, compounded of ἵππος, *horse*, and πούς, *foot*, in the *Ancient Geography*, an appellation given to a certain people, situated on the banks of the Scythian sea; as being supposed to have horses feet.

The *hippopodes* are mentioned by Dionysius, Geogr. v. 310. Mela, lib. iii. cap. 6. Pliny, lib. iv. cap. 13. and St. Agustine, De Civit. lib. xvi. cap. 8. But the truth is, that they had this appellation given them on account of their swiftness, or lightness of foot.

HIPPOPOTAMUS, in the Linnæan system of *Zoology*, a distinct genus of animals of the order of *bellua*, in the class of *mammalia*, the characters of which are, that it has two pair situated in the grain; its dentes incisores, or cutting teeth, are six above, and four below; others reckon only four in each jaw, and four tusks; the upper ones placed at distances by pairs, the lower ones pro-

minent, with the middle two the largeſt; the dog-teeth are ſingle, and ſeem as if cut off obliquely; the foot are hoofed at their margin. There is only one ſpecies of this genus, which is called the amphibious *hippopotamus*. This is called in Engliſh the river-horſe, and by ſome, though leſs properly, the ſea-horſe. It approaches in figure partly to the buffalo, and partly to the bear. It is larger than the buffalo, and ſecond in ſize only to the elephant, and its legs are very like the bear's. The full-grown male animal is ſeventeen feet long from its head to its tail, and near five feet in the diameter of its body, and its belly is rather flat than ridged; the circumference of its body is uſually nearly equal to its whole length, or about fifteen feet; its height near ſeven feet; the legs near three; the head above three and a half in its girth, and near nine feet: ſo that its head is very large in proportion to its body, and its mouth is capable of opening a foot wide; its eyes are ſmall, its ears alſo ſmall and thin; its teeth are as hard as flint, and will readily give fire with ſteel; it has four tuſks; the hair on the body is thin and whitiſh; its hoofs are black, much like thoſe of the common cloven footed beaſts, but divided into four claws, unconnected with membranes, inſtead of two; its upper jaw is moveable in the manner of the crocodile's, and it is uſually very fat. See Tab. II. *Quadrupeds*, N° 20.

It is found in the Nile and Niger, and many other great rivers; but in none of the rivers which run into the Mediterranean, except the Nile, and only in Upper Egypt, and in the fens and lakes of Æthiopia, through which that river runs. It is a mild and gentle animal, unleſs provoked, and is capable of being tamed. In the night it leaves the rivers to graze, and does great damage to the ſugar-canes, and plantations of rice and millet; it alſo feeds on the roots of trees, and ſmall fiſh. It walks ſlowly, but, when purſued, plunges into the water, and walks at the bottom at full eaſe. When it riſes to the ſurface, with its head out of water, it makes a loud bellowing; and when wounded, will attack canoes and boats with great fury. In the water theſe animals are bold, but timid on the land: they are ſeldom found in the mouths of rivers; they ſleep on ſhoals of ſand in the midſt of the ſtream. There are various ways of taking and deſtroying theſe animals. In ſome places the natives lay boards, full of ſharp irons, in the corn grounds, which ſtrike into their feet. Others ſtrike them in the water with harpoons, and employ ten or twelve canoes in the chace of them. Sometimes a quantity of peas is laid in their way, which they greedily devour; and thus the animals become immoderately thirſty, and drinking large quantities of water, are blown up and deſtroyed. The teeth are uſed by dentiſts for making falſe teeth, being leſs liable to become yellow than ivory. The dried ſkin is extremely hard, and uſed for bucklers.

A herd of females has only a ſingle male; they bring one young at a time, on the land, and ſuckle it in the water. Some have ſaid that the increaſe of the crocodile in Egypt is prevented by the *hippotamus*, to which he is an inveterate enemy; but others affirm, that they have ſeen them ſwimming together, without any diſagreement.

There is no mane on the neck, the hairs being only thicker on that part; the ſkin is thick and ſtrong, and of a duſky colour; the tail is about a foot long, taper, compreſſed, and naked. It is very plainly proved by Bochart, that this is the creature mentioned under the name of the Behemoth, in the book of Job. Ray's Syn. Quad. p. 272. and Pennant.

HIPPOSIS, in the *Writings of the Ancient Phyſicians*, ſignifies a reducing any part of the body into its natural ſituation, by means of compreſſion.

HIPPOSORCHIS, in ſome diſpenſatories, a name given to a powder of the teſticles of horſes.

HIPPOTAURUS, in *Natural Hiſtory*, the name given by authors to a creature generated between a bull and a mare. It ſeems a very unnatural copulation; but Wagner, in his Hiſtory of Switzerland, aſſures us, that the creature produced by it is ſometimes found wild in the mountainous parts of that country.

HIPPURIS, in the Linnæan ſyſtem of *Botany*, a genus of plants of the *monandria digynia* claſs, called by others *limoſperve*. The characters of this genus are, that it has neither calyx nor petal; the ſtigma is ſimple, and the ſeed is ſingle, roundiſh, and naked, or ſurrounded with no ſort of pericarpium.

Pliny has made a great confuſion of plants under this name. The ancients called the *hippuris*, or horſe-tail, *phlegmum*, on account of its having ſo many joints in its ſtalks and branches: this name confounded it with the knot-graſs: and Pliny has made a deſcription from the accounts of different authors, which has the characters and qualities of both, and therefore ſuits neither.

It is eaſy however to trace his errors; where he ſpeaks of the ſtalks being naked, ruſh-like, and brittle, it is plain that he is ſpeaking of the *horſe-tail*; and where he gives it ſmall, oval and pointed leaves, it is equally certain that he means this of the knot-graſs; but he adds in one place, that it has a large ſpreading root, that it grows in woods and ſhady places, and that it bears a round fruit like a coriander-ſeed. Theſe are characters belonging neither to the horſe-tail nor knot-graſs; and might ſeem to beſpeak this *hippuris* a plant different from both; but it rather appears, that Pliny has brought in by an error of his own a third plant, to perplex the caſe, and is here tranſcribing ſome author's account of the Solomon's ſeal, or polygonatum, a name ſounding like the word polygonum, and eaſily miſtaken for the ſame word by ſo haſty a writer as this author appears to have been. He had before erred in his opinion, that the polygonum and horſe-tail were the ſame plant; and here taking the polygonatum to be the ſame plant with the polygonum, he has not ſcrupled to attribute to the horſe-tail whatever he found recorded of the polygonatum.

HIPPURIS, is alſo a name given by Dillenius to the CHARA of Linnæus, a diſtinct genus of plants.

HIPPURUS, in *Ichthyography*, the name of a large ſea-fiſh, the CORYPHENA *hippuris* of Linnæus, with a bifid tail and ſixty dorſal rays, very much reſembling the dorado or gold-fiſh, and by many ſuſpected to be the ſame ſpecies. It is a very remarkable fiſh, having a ſort of creſt riſing immediately behind its head, which is continued in a long fin to the tail; and there is another in ſome meaſure anſwering this, and reaching from the anus to the tail. It is the quickeſt of all fiſh in its growth, which is an obſervation as old as the time of Ariſtotle, but is found true to this day. It is caught upon the coaſts of Spain, but that only at one time of the year, in the month of Auguſt. It is a very delicate and well-taſted fiſh, and is much eſteemed at table. Willughby's Hiſt. Piſc. p. 233. Geſn. de Piſc. p. 502.

HIPPURIS, in the claſs of *zoophytes*, is a ſpecies of ISIS.

HIPPURITES, in *Natural Hiſtory*, a name given by ſome writers to a ſtone which they fancy to repreſent a ſaddle. It is deſcribed to be a ſoft argillaceous ſtone, owing its figure of a ſaddle to certain depreſſions. This is only a luſus naturæ, and is of the nature of the hand-ſtones, and foot-ſtones, with ſeveral others, which fancy has aſſiſted in their reſemblances, but which have been very improperly called by particular names.

HIPPUS, in *Medicine*, a diſorder of the eyes, wherein they continually ſhake and tremble, and thus repreſent objects as if continually fluctuating.

It is thus called from the Greek, ἵππος, *horſe*; becauſe, according to Sllancard, objects appear to ſhift in it, as much as when we are riding.

HIRA, a word uſed by the writers in medicine either for the inteſtinum jejunum, or for all the inteſtines, or in a yet larger ſenſe for all the contents of the abdomen. Caſtel. Lex. in voc.

HIRÆA, in *Botany*, a genus of the *decandria trigynia* claſs; the characters are, that it has a five-leaved calyx, and roundiſh unguiculated petals, and three ſeeds. There is only one ſpecies, found in Carthagena.

HIRARA, in *Zoology*, the name of animal in the Braſils much reſembling the HYÆNA.

HIRCUS, *tragus*, or *goat*, in *Anatomy*, a part of the auricle, or outer EAR; being that eminence next the temples.

HIRCUS, in *Aſtronomy*, a fixed ſtar of the firſt magnitude, the ſame with CAPELLA.

HIRCUS is alſo a denomination given to the rank ſmell exhaling from the arm-pits; and which has its ſource in the axillary glands.

HIRCUS is alſo uſed by ſome writers for a COMET, encompaſſed as it were with a main, ſeemingly rough and hairy.

HIRNGRILL, a name given by ſome authors to the *ſeirinx*.

HIRQUUS, a name given by ſome authors to the great canthus of the eye.

HIRTELLA, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are, that it has five petals, and very long, permanent, ſpiral filaments; the fruit is a ſingle-ſeeded berry, and the ſtyle is lateral. There is only one ſpecies, which is American.

HIRUDELLA *marina*, in *Natural Hiſtory*, the name of a very remarkable little animal of the leech kind. The body of this creature in roundiſh and oblong, and adorned with many longitudinal lines or furrows; it is about an inch in length, and is of a greyiſh colour, and ſomewhat tranſparent; the bowels are ſeen through the ſkin, and appear at firſt ſight like ſtreaks on its ſurface; in the middle of the belly there is a remarkable protuberance, which, when cloſely examined, is found to be a muſcular body in form of a ſpherical bladder; this, when moſt diſtended, has the appearance of a ſpherical air-pump, and has all the properties of that machine, to be em-

ployed for the fervice of the animal, and at its pleafure. It refembles, in its common figure, the cup of an acorn, with the mouth a little contracted. The head of the animal, is of the fame figure with that of the common leech, and ferves to fuck the juices of other animals, in the fame manner as in that infect. That part of the body which reaches from the head to the middle protuberance is of a very irregular form, frequently in motion, and continually changing its figure; but the other part moves more flowly, and lefs frequently, and preferves its fhape unaltered. The protuberance has two motions, expanfion and undulation.

When the creature has a mind to fix itfelf any where, it does it by means of this protuberance, which it applies clofely down to the fubftance, and void of air. Hence the external air fo firmly preffes its fides againft the fubftance, that it is not eafy to remove it. When the creature changes its place, it draws the head round to the protuberance, and loofens it fo as to be able to change its place as it has occafion.

When this creature is kept out of water, it dies in a few hours; and when after being thus kept out a few minutes, it is put into fea-water, it immediately darts out a fine green thread from its mouth; this it ufually makes of the length of its body, or thereabout, though it varies it occafionally; and by means of this it fufpends its body any length that it pleafes in the water. It feems to be calculated for living only in the bodies of fifh, for the fea-water foon kills it; and it is obferved to diminifh its bulk very fenfibly all the time that it is kept in it. Phil. Tranf. N° 416.

HIRUDO, in *Zoology*. See LEECH.

HIRUNDO, in *Ichthyology* and *Ornithology*. See SWALLOW.

HISPANICUM *viride*, *Spanifh green*, a name given by fome to verdigris.

HISPID *leaf*, among *Botanifts*. See LEAF.

HISPID-*ftalk*. See STALK.

HISSING, an appellation given by grammarians to the three confonants, s, x, and z.

HISTIODROMIA, the art of failing, or of conducting veffels on the fea.

The word is compofed of ἱστιον, *fail*, of ἱστος, the *maft of a fhip*, which comes from ἱστημι, *fix*, *I ftand*, and δρομος, *courfe*, of δραμειν, *I run*.

Hiftiodromia is the fame with what we otherwife call *navigation*.

Hiftiodromia turns on four points, any two whereof being given, the other two are eafily found from them, by the loxodromic tables, lines, tangents, fecants, Mercator's chart, &c. Thefe four things are, the difference of latitude, difference of longitude, the courfe, and the diftance run.

HISTORICAL, fomething that relates to HISTORY.

HISTORICAL *column*. See COLUMN, *hiftorical*.

HISTORICAL *mufic*, *mufica hiftorica*, is that branch of mufic which treats of the origin and invention of mufic, of modes, of notes, inftruments, &c. as alfo the lives and writings of celebrated authors on that fubject.

HISTORICAL *ftyle*. See STYLE.

HISTORIOGRAPHER, compofed of ἱστορια, *hiftory*, and γραφω, *I write*, a profeffed hiftorian, or writer of hiftory; or a perfon who applies himfelf peculiarly to it.

The province of the hiftorian is important and extenfive; and he, therefore, ought to be endowed with great and uncommon qualifications. Cicero has given us the whole art of compofing hiftory in a very compendious and comprehenfive manner. No one is ignorant, fays he, that the firft law in writing hiftory is, not to dare to fay any thing that is falfe, and the next, not to be afraid to fpeak the truth; that on the one hand there be no fufpicion of affection, nor of prejudice on the other. Thefe fundamental principles are generally known: but the fuperftructure confifts partly in things, and partly in the ftyle or language. The former require an order of time, and defcription of places. And becaufe in great and memorable events, we are defirous to know firft their caufes, then the actions themfelves, and laftly their confequences; the hiftorian fhould take notice of the fprings or motives that occafioned them; and in mentioning the facts themfelves fhould not only relate what was done or faid, but likewife in what manner; and in treating of their confequences, fhew whether they were the effects of chance, wifdom, or imprudence. Nor fhould he only recite the actions of great and eminent perfons, but likewife defcribe their characters. The ftyle ought to be florid, fmooth, and even, free from that harfhnefs and poignancy which are ufual at the bar. De Orat. lib. ii. cap. 15.

According to this plan, in the obfervance of which few are fuperior to Tacitus, an hiftorian fhould be not only a man of probity, but free from all paffion and bias: he ought to unite the ſteadineſs of a philoſopher with the vivacity of a poet or orator. He fhould alſo poſſeſs a good judgment, to direct him what is proper to be faid, and what to be omitted, and to treat every thing in a manner ſuited to its importance. Induſtry is likewiſe an eſſential quality of an accurate hiſtorian. Thucydides in his Hiſtory of the Peloponneſian War, and Polybius in his Hiſtory of the Roman Affairs, took great pains in procuring neceſſary information. An hiſtorian ſhould be always actuated by a love of truth; to this purpoſe Polybius obſerves, that a good man ought to love his friends and his country, and manifeſt a ſimilar diſpoſition with their's, towards both their friends and enemies. But when he takes upon him the character of a hiſtorian, they muſt all be forgot. In hiſtory, all perſonal conſiderations ſhould be laid aſide, and regard be paid only to their actions. Lib. i. p. 13. See alſo Lucian, De Hiſt. Scrib. p. 366.

Sueronius, Thucydides, and Polybius, are much commended for the integrity and ingenuity of their temper. Cicero obſerves, ubi ſupra, that hiſtory is converſant in great and memorable actions; and, therefore, a hiſtorian ſhould always keep poſterity in view, and relate nothing which may not on ſome account or other be worth the notice of future ages. Thoſe who diſcend to trivial and minute matters, which are below the dignity of hiſtory, ſhould be deemed journaliſts rather than hiſtorians. Whenever a prudent hiſtorian thinks it neceſſary or convenient to take notice of things that are in themſelves leſs conſiderable, he either does it with brevity, or for ſome apparent reaſon, or accounts for it by ſome juſt apology. As it is the province of an hiſtorian to acquaint us with facts, he ſhould give a narration or deſcription not only of the facts or actions themſelves, but likewiſe of ſuch things as are neceſſarily connected with them, viz. the characters of perſons, the circumſtances of time and place, in reference to which chronology and geography have been called the two eyes of hiſtory; the views and deſign of the principal actors, and the iſſue and event of the actions which he deſcribes. The proper diſpoſition of theſe various particulars depends on the ſkill and prudence of the writer. The hiſtorian ſhould alſo introduce pertinent and uſeful reflections in the courſe of his narrations. The beſt hiſtorians, ſuch as Salluſt and Livy, &c. have allowed themſelves this liberty. But the remarks or reflections of the hiſtorian ſhould be brief, and differ in this reſpect from the encomiums or declamations of the orator. Hiſtorians have likewiſe enlivened their narration by introducing, on various occaſions, ſpeeches, which are either oblique or direct; the former recited by the hiſtorian in his own perſon. Of this kind is that of Hannibal in Juſtin, by which he endeavours to perſuade king Antiochus to carry the war of war againſt the Romans into Italy. Lib. xxxi. cap. 5. And in the latter, the perſon himſelf is introduced as addreſſing his audience; and therefore the words, as well as the ſenſe, are to be accommodated to his character. Such is the ſpeech of Eumenes, one of Alexander's captains and ſucceſſors, addreſſed to his ſoldiers, when they had traiterouſly bound him in chains, in order to deliver him up to his enemy Antigonus. Juſtin. lib. xiv. cap. 4.

With regard to direct ſpeeches, there are few ancient hiſtorians who have not adopted them, though ſome of our critics will only admit thoſe which were really ſpoken by the perſons to whom they are aſcribed. The firſt hiſtorian who introduced complete and finiſhed ſpeeches into hiſtory, is ſaid to be Thucydides, thoſe of Herodotus being but ſhort and imperfect. Letters are ſometimes met with in hiſtories, as well as ſpeeches: ſuch are thoſe of Alexander to Darius, in Q. Curtius, lib. iv. cap. 1. and thoſe of Tiberius and Druſus in Tacitus Ann. lib. i. 73. iii. 53. 59. Digreſſions alſo, when they are neither too long nor too frequent, may be ſo managed by the hiſtorian, as to afford the reader both delight and profit. With regard to the order of hiſtory, the hiſtorian ſhould ſo form his introduction, as to give ſome general view of the ſubject, to engage the reader's attention, and to poſſeſs him with a candid opinion of himſelf and of his performance; theſe ſhould be natural, and proportioned to the extent of the work. Such are thoſe of Livy, Herodotus, Thucydides, Tacitus, and others. But order is to be principally regarded in the body of the work: for this purpoſe the *hiſtoriographer* ſhould either attend to the time in a chronological ſeries, which is beſt in biography, after the manner of Plutarch and Cornelius Nepos; in the hiſtory of particular ſtates, after Thucydides, Livy, and Tacitus, and ſometimes alſo in a general hiſtory: though in this latter caſe the order of time cannot always be preſerved, and therefore the actions of each nation, when ſeveral ſtates are independent of each other, muſt neceſſarily be ſeparated, in order to prevent confuſion. This is the method adopted by Herodotus, Dio-

dorus Siculus, and Juſtin. For the ſtyle of the hiſtorian, ſee STYLE.

So numerous and conſiderable are the qualifications neceſſary for an hiſtorian, that this province was formerly aſſigned by the eaſtern nations to a particular order of men; and both among the Greeks and Romans it was generally undertaken by perſons of figure, and ſuch as were eminent for learning, knowledge of the world, and other great abilities: and as it is of ſuch ſingular ſervice to mankind to have the records of paſt ages well and faithfully tranſmitted to poſterity, it is to be wiſhed that perſons of ſimilar character would, in all countries, undertake it. See farther on this ſubject Ward's Oratory, vol. ii. ſect. 42, 43, 44, and 45.

The term is chiefly uſed for a perſon who has a peculiar charge and commiſſion to write the hiſtory of his time. The *hiſtoriographer* to his majeſty is an officer under the lord chamberlain; his ſalary 200l. per ann. There is an office of the ſame kind in Scotland, with the ſame ſalary.

HISTORY, a recital or deſcription of things as they are, or have been, in a continued orderly narration of the principal facts and circumſtances thereof. See ANNALS.

The word is Greek, ἱστορια, *hiſtoria*; and literally denotes a ſearch of curious things, or a deſire of knowing, or even a rehearſal of things we have ſeen; being formed of the verb ἱστωρ, which properly ſignifies to know a thing by having ſeen it: though the idea appropriated to the term *hiſtory* is now much more extenſive, and we apply it to a narration of divers memorable things, even though the relater only takes them from the report of others. The origin of the word is from the verb ἱστημι, *I know*; and hence it is, that among the ancients ſeveral of their great men were called *poſthiſtores*, q. d. perſons of various and general knowledge.

Hiſtory is divided, with regard to its ſubject, into the *hiſtory of nature* and the *hiſtory of actions*.

HISTORY *of nature*, or *Natural* HISTORY, is a deſcription of natural bodies; whether terreſtrial, as animals, vegetables, foſſils, fire, water, air, meteors, &c. or celeſtial, as the ſtars, planets, comets, &c. See *Natural* HISTORY.

Natural hiſtory is much the ſame with what we otherwiſe call PHYSIOLOGY.

HISTORY, with regard to actions, is a continued relation of a ſeries of memorable events in the affairs either of a ſingle perſon, a nation, or ſeveral perſons and nations, and whether included in a great or little ſpace of time; or, it is a narrative of ſuch facts as are fit to be tranſmitted to poſterity for the uſe of mankind and the better conduct of human life. Cicero calls *hiſtory* the miſtreſs of life, (De Orat. lib. ii. cap. 9.) as it teaches us both what we ought to purſue and what we ought to avoid.

Thus Thucydides has written the *Hiſtory* of Greece; Livy, that of Rome; Mezeray and F. Daniel, of France; Tyrrel, Echard, Rapin, &c. the *Hiſtory* of England; Buchanan, of Scotland; Clarendon, the *Hiſtory* of the Rebellion; and Thuanus, biſhop Burnet, &c. the *Hiſtory* of their own Lives and Times.

Euſebius, Baronius, &c. have written the *Hiſtory* of the Church; biſhop Burnet that of the Reformation, &c.

Several authors have written on the Method of reading and ſtudying *Hiſtory*; among the reſt Lucian, Bodin, Voſſius the elder, Wheare, Patrici, Beni, Maſcardi, De Silhon, F. le Moine, F. Rapin, the abbot de St. Real, F. Thomaſſin, Freſnoy, &c.

Hiſtory with reſpect to time, is divided into *ancient* and *modern*, diſtinguiſhed into ſeveral epochs, periods, and intervals.

The three periods of time into which *hiſtory* has been divided are the following: viz. the *firſt*, from the creation to the deluge, which age is reckoned uncertain, becauſe we know no more than the ſhort account given of it in the holy ſcriptures: the *ſecond*, from the deluge to the firſt Olympiad, which, from the many feigned ſtories related in it, is called the fabulous age; the *third*, from the firſt Olympiad to our own times, is called hiſtorical, becauſe the actions done in that period are recorded by writers of true *hiſtory*. See AGE.

The moſt ancient of the Greek hiſtorians now left is Herodotus, who lived, according to Sir Iſaac Newton's Chronology, a hundred and fifty-ſeven years after the building of Rome. And as to the Romans, Livy himſelf confeſſes, that there were ſcarce any certain memoirs of their affairs till the city was taken by the Gauls, which was above a hundred years later than Herodotus; the accounts before this time having been preſerved chiefly by tradition.

Hiſtory, with reſpect to its ſubject, is divided into *univerſal* and *particular*, *ſacred* and *profane*.

F. Meneſtrier gives us the proper characters of the divers kinds of *hiſtory* with great accuracy. He diſtinguiſhes *hiſtory* with regard to both its matter and its form, and gives curious inſtances of each particular.

Hiſtory, with regard to its matter, is either *ſacred*, or *natural*, or *civil*, or *perſonal*, or *ſingular*: to which ſome have added *artificial hiſtory*, giving an account of the origin and progreſs of arts; and *miſcellaneous hiſtory*, which recites many various things as they promiſcuouſly occur in human life.

HISTORY, *ſacred*, is that which lays before us the myſteries and ceremonies of religion, viſions or appearances of the Deity, &c. miracles, and other ſupernatural things, whereof God alone is the author. Such are the book of Geneſis, the Goſpels, Apocalypſe, &c. See MIRACLES, PROPHECY, REVELATION, &c.

To this head we may refer *eccleſiaſtical hiſtory*, which gives an account of the riſe and eſtabliſhment of the ſeveral religions and churches, of the riſe and progreſs of various opinions, ſects, &c. In ancient *ſacred hiſtory* otherwiſe called the *hiſtory* of the Old Teſtament, there are ſeven remarkable periods. The firſt comprehends 1656 years, from the creation of the world to the deluge; ſee *Sacred* CHRONOLOGY. The ſecond period includes 857 years, from the DELUGE to the going forth of the Iſraelites out of Egypt. The third period begins with the exodus of the Iſraelites in 2513, extends to the times of the kings, and includes 396 years. The fourth period begins in the year of the world 2909, or from the beginning of the government by kings, and extends to the end of the Babyloniſh CAPTIVITY, or 3468th year of the world, including 559 years. The fifth period amounts to 372 years, from the year of the world 3468 to the year 3840, or to the times of the MACCABEES. The ſixth period begins with Judas Maccabæus, A. M. 3840, and is continued to the year 3964, or to Herod the Great, comprehending 124 years. The ſeventh or laſt period reaches from Herod the Great to the deſtruction of Jeruſalem, or the 70th year after the birth of Chriſt, containing 106 years.

In more *modern ſacred hiſtory*, more properly called *eccleſiaſtical hiſtory*, which denotes a clear and faithful narration of the tranſactions, revolutions and events, that relate to the external and internal ſtate of the Chriſtian church, Dr. Moſheim has diſtinguiſhed four remarkable periods. The firſt comprehends the ſtate and viciſſitudes of the Chriſtian church, from its commencement to the time of Conſtantine the Great. The ſecond period extends from the reign of Conſtantine to that of Charlemagne, which produced ſuch a remarkable change in the face of Europe. The third period contains the *hiſtory* of the church from the time of Charlemagne to the memorable period when Luther roſe in Germany to oppoſe the tyranny of Rome, and to deliver divine truth from the darkneſs that covered it. The fourth period reaches from the time of Luther to the preſent times. On this plan Dr. Moſheim's Eccleſiaſtical *Hiſtory*, a work deſervedly held in great eſteem, is divided into four books, containing the *hiſtory* of the centuries comprehended by the above periods according to the order of time. See Holberg's Introduction to Univerſal *Hiſtory*, tranſlated by Dr. Sharpe, with notes, &c. p. 55, &c. ed. 1758; and Moſheim's Eccleſiaſtical *Hiſtory*, tranſlated by Dr. Maclaine, with notes, &c. ed. 1758, vol. i. p. 12.

HISTORY, *natural*, is a deſcription of the ſingularities of nature, its irregularities and prodigies, and the alterations it undergoes in the birth, progreſs, end, and uſe of things. Such is Ariſtotle's *Hiſtory* of Animals, Theophraſtus's *Hiſtory* of Plants, and the entire body of Natural *Hiſtory* by Pliny; ſuch alſo are Acoſta's Natural *Hiſtory* of the Indies, Plot's *Hiſtory* of Staffordſhire, &c.

HISTORY, *civil*, is that of people, ſtates, republics, communities, cities, &c. Such are thoſe of Thucydides, Halicarnaſſeus, Livy, Polybius, Mezeray, F. Daniel, Milton, Buchanan, &c.

Civil hiſtory may be again ſubdivided into *particular* and *general*: the former conſiſts of a number of facts relating to the ſame ſtate, ſuitably connected and laid together in a proper ſeries; Such are Thucydides's *Hiſtory* of the Peloponneſian War, comprizing the events of the firſt twenty years of that war; Salluſt's *Hiſtory* of the War between the Romans and king Jugurtha in Africa; and Cæſar's *Hiſtory* of his own Gallic and Civil Wars: the latter, or *general hiſtory*, is made up of ſeveral particular *hiſtories*, whoſe ſeparate tranſactions within the ſame period of time, or part of it, ſhould be ſo diſtinctly related as to cauſe no confuſion; ſuch are thoſe of Diodorus Siculus, of Herodotus, of Juſtin, of Xenophon, and of Polybius, among the ancients; and Thuanus's *Hiſtory*, Lord Lyttelton's *Hiſtory* of Henry II. Dr. Robertſon's *Hiſtory* of Charles V. &c. among the moderns.

Civil hiſtory, in its more unlimited extent, is denominated *univerſal hiſtory*.

HISTORY, *personal*, is that which gives the portrait or life of some single person. Such are the Lives of Plutarch, Cornelius Nepos, Suetonius, &c. and the Lives of the painters, philosophers, saints, &c.

Personal history is the same with that we otherwise call BIOGRAPHY, and may be denominated *literary history*, as it records the lives and productions of learned men, the controversies that subsisted amongst them, and the rise and advancement of sciences.

HISTORY, *singular*, is that which describes a single action, siege, battle, or even a war or expedition, &c. Such was the Conspiracy of Catiline to subvert the Roman State, written by Sallust.

History, with regard to its form, is either *simple*, or *figurative*, or *mixed*.

HISTORY, *simple*, is that delivered without any art or foreign ornament; being only a naked and faithful recital of things, just in the manner and order wherein they passed. Such are the Chronicles of the Eastern Empire, the Fasti, Chronological Tables, Journals, &c.

HISTORY, *figurative*, is that which is farther enriched with ornaments, by the wit, ingenuity, and address of the historian. Such are the political and moral *Histories* of the Greeks, Romans, and most of the moderns.

This latter is a kind of rational *history*, which, without stopping at the shell or outside, the appearances of things, discovers the secret springs and movements of the several events; it enters into the thoughts, the breasts of the persons concerned therein; discovers their intentions and views; and, by the result of enterprizes and undertakings, discovers the prudence or weakness wherewith they were laid, conducted, &c. These are much the most useful and entertaining *histories*. To this class may be particularly referred the *Histories* and Annals of Tacitus, among the ancients; and those of Guicciardin, Thuanus, and bishop Burnet, among the moderns.

HISTORY, *mixed*, is that which, beside the ornaments of figured *history*, calls in the proofs and authorities of simple *history*, furnishing authentic memoirs, or original letters, manifestoes, declarations, &c. to vouch the truth of what is said. Such are *Histories* or Collections of Rushworth, M. Rapin Thoiras's *History* of England, the Genealogical *Histories* of Duchesne, M. De Marca's *History* of Bearne, &c.

HISTORY is also used for a ROMANCE, or a fabulous but probable relation of a series of actions or adventures feigned or invented by the writer.

Such is the *History* of the Civil Wars of Grenada, the *History* of Don Quixote, the Ethiopic *History* of Heliodorus, &c.

HISTORY, in *Painting*, denotes a picture composed of divers figures or persons, representing some transaction or piece of *history*, either real or feigned.

Painters are distinguished into portrait painters, flower and fruit painters, painters of beasts and landscapes, and *history* painters. The first place is universally allowed to *history* painters, as the most difficult, masterly, and sublime province.

HISTRIO, in the *Ancient Drama*, signified an actor or comedian; but more especially a pantomime, who exhibited his part by gestures and dancing.

Livy informs us, that the *histriones* were brought to Rome from Etruria, in the year of the city 391. Dec. i. lib. 7.

HISTRIX. See PORCUPINE.

HITCH, on *Ship-board*, a word denoting a sort of knot or noose, by which one rope is fastened to another, or to some other object, and hence used for catching hold of any thing with a hook or a rope, and to hold it fast. Thus, when the boat is to be hoisted in, they say, *hitch* the tackles into the rings of the boat; and, when about to weigh anchor, *hitch* the fish-hook to the fluke of the anchor.

HITCHEL, the same with HATCHEL.

HITCHING, in *Horsemanship*, is to wriggle or move forwards by degrees, or to knock the legs together in walking.

HIVE. *Bee-hives*, in different places and on different occasions, are of very different materials. In some places the hollow trunk of a tree serves the purpose; in others they are made of four boards nailed together in the shape of a long box, and placed with one end upon the ground, or upon a frame of wood-work erected for that purpose. The most usual form of them, however, is conic and bell-fashioned; and the common materials of which they are made are twisted osier or straw, nicely matted together, and made into a sort of thick cords, bound round with osier-bark. The last is the most common kind, and serves perfectly well for all the purposes of the bees, and of the persons who make their profits of the honey. The lodgment is sufficiently warm and close for the bees, and a thin frame of boards defends it from being injured by the wet. But persons of speculative dispositions have at all times been desirous of seeing what passed in the *hive*, and of observing these industrious insects at their work: for this purpose the ancients contrived a method of placing certain squares or panes of a transparent matter, such as horn, or the lapis specularis, or isinglass, in some parts of the sides of the *hive*, through which they might see all that passed within. This is mentioned by Aristotle, Pliny, and others; but it soon sunk into disuse, and in later ages it has been supposed to be an idle attempt. Mouffet, in particular, ridicules it, and says, that the bees within would immediately spoil the transparence of any material thus employed.

This practice of the ancients seems to have been first revived in our country by Mr. Jeddie, who, in the year 1665, published his invention of boxes for preserving the lives of bees, and obtained a patent from king Charles. These were improved by Joseph Warder, physician at Croydon, who enriched his account of the structure and use of these boxes, with several other curious circumstances concerning bees, in his work entitled The true Amazons, or the Monarchy of Bees. But this method was far from being generally known in the year 1680, since Swammerdam seems to have been altogether unacquainted with it; and to this we are to impute the imperfections of that author's account of bees, because, though a most accurate and faithful writer, he had no opportunities of seeing what has been since discovered with this advantage.

Of late, however, this invention has been commonly practised. A transparent sort of *bee-hive* may easily be made, by leaving certain squares in a wooden hive open, and afterwards fastening clear glass in these vacant spaces: a frame of wood may cover the whole, so that the light is not always let in upon the bees, and the covering may be removed when the observer is to examine their operations. By this means it is found, that the squares of glass, when properly placed, will keep clean and transparent for many years; and when they are sullied, there are easy methods of cleaning them, by taking them out and replacing them when they have been wiped. When the observer places himself behind the *hive*, and has one of these squares of glass before his eye, he sees exactly all that passes within, without incommoding or interrupting the creatures at their work. These glass *hives*, however, are chiefly objects of curiosity, though, in some instances, they have led to discoveries that must gradually contribute to the improvement of the economy of these useful insects.

The principal advantage derived from *hives* of modern construction, is that of obtaining the honey and wax without recurring to the barbarous expedient of destroying the bees. In the common method, a hole is dug near the *hive*, (generally in the month of September,) and a flick, at the end of which is a rag that has been dipped in melted brimstone, is fixed in the hole; and, when the rag is set on fire, the *hive* is immediately put over it, and the earth thrown up round it, so that none of the smoke can escape; and thus the bees are inhumanly and needlessly destroyed. The heaviest and lightest *hives* are treated in this manner; the former, because they yield the greatest profit, with an immediate return; and the latter, because the bees in them would not be able to survive the winter. Those *hives* which weigh from fifteen to twenty pounds are thought to be the fittest for keeping.

The method of preserving the lives of bees has been brought to a considerable degree of perfection by the late Mr. Thorley of Oxfordshire, and Mr. White of Suffolk. Mr. Thorley, who takes the lead in this improvement, prefers colonies to *hives* for the following reasons: 1. The more certain preservation of many thousands of these useful insects. 2. Their greater strength, consisting in their number, and their corresponding security from robbers. 3. Their greater wealth, arising from their united labours. To this purpose he tells us, that he has, in some summers, taken two boxes filled with honey (most of it being pure virgin honey of the best kind) from one colony, and left sufficient store for their maintenance; add to these advantages, the pleasure of viewing them with the greatest safety, at all seasons, even in their busiest time of gathering, and their requiring a much less attendance in swarming time. The bees thus managed are also more effectually secured from wet and cold, from mice, and other injuries.

Mr. Thorley's boxes are made of deal, which, being spongy, sucks up the breath of the bees sooner than a more solid wood would do; and yellow deal, well and roughly seasoned, he says, is the best.

The best form of these boxes is an octagon or eight-square, being nearer to a sphere, allows the bees to work in a round body near the centre of the *hive*; and by due heat is conveyed to all the exterior parts, so that the honey is kept from candying. The dimensions, which he

he recommends, after long trial, are ten inches deep in the inside, the top-board a full inch, and the breadth within twelve or fourteen inches. He has tried boxes containing a buſhel or more, but found them not to anſwer the deſign like thoſe of a leſs ſize. The top of the box ſhould be made of an entire board, or of two boards well glued together, which ſhould be a full inch thick after it has been planed, and projećt on all ſides at leaſt an inch beyond the dimenſions of the box. In the middle of this top there muſt be a hole five inches ſquare, for a communication between the boxes; and this hole ſhould be covered with a ſliding ſhutter of deal or elm, running eaſily in a groove, over the back window. The eight pannels, nine inches deep, and three quarters of an inch thick when planed, are to be let into the top, ſo as to keep them in their proper places; to be ſecured at the corners with plates of braſs, and to be cramped with wires at the bottom, in order to keep them firm. There ſhould be a glaſs window behind, fixed in a frame, with a thin deal cover, two ſmall braſs hinges, and a button to faſten it: this window will ſerve for inſpecting the ſtate and operations of the bees. Two braſs handles, one on each ſide, are neceſſary to lift up the box; theſe ſhould be fixed in with two thin plates of iron, near three inches long, ſo as to turn up and down within the box, and put in three inches below the top-board, which is nailed down cloſe with ſprigs to the other parts of the box. Thoſe who chuſe a frame within, to which the bees may faſten their combs, need only uſe a couple of deal ſticks, of an inch ſquare, placed acroſs in the box, and ſupported by two pins of braſs; one an inch and a half below the top, the other two inches below it; by which means the combs will quickly find a ſtay. There muſt alſo be a paſſage, four or five inches long, and leſs than half an inch deep, for the bees to go in and out at the bottom of the box.

The boxes, thus prepared, ſhould be kept in a houſe or under a ſhed, the diſpoſition and ſtructure of which Mr. Thorley has particularly deſcribed. He alſo recommends to paint the apertures of the boxes, which are the habitations of the ſeveral colonies, with different colours, as red, white, blue, yellow, &c. in form of a half moon or ſquare, that the bees may the better know their own home. For the method of furniſhing theſe colonies with inhabitants, ſee HIVING.

Mr. Thorley, ſon to the above mentioned gentleman, has, by long experience, improved his father's method of managing bees. The *bee-hive* of his conſtruction, preſented to the Society of Arts, &c. is exhibited in *Tab. Agriculture*, &c. *fig.* 3.

The bottom part, marked *a*, is an octangular bee-box, made of deal boards, about an inch in thickneſs, the cover of which is externally ſeventeen inches in diameter, but internally only fifteen and a half, and its height ten inches. In the middle of the cover of this octangular box is a hole, which may be opened or ſhut at pleaſure, by means of a ſlider *d*. in one of the pannels is a pane of glaſs, covered with a wooden door *e*. The entrance *f*, at the bottom of the box, is about three and a half inches broad, and half an inch high. Two ſlips of deal, about half an inch ſquare, croſs each other in the centre of the box, and are faſtened to the pannel by means of ſmall ſcrews: to theſe ſlips the bees faſten their combs. In this octangular box the bees are hived, after ſwarming, in the uſual manner, and there ſuffered to continue till they have built their combs and filled them with honey; which may be known by opening the door, and viewing their works through the glaſs pane, or by the weight of the *hive*.

When the bee-maſter finds his laborious inſects have filled their habitation, he is to place a common *bee-hive* of ſtraw, repreſented at *b*, made either flat at the top, or in the common form, on the octangular box, and drawing out the ſlider, a communication will be opened between the box and the ſtraw *hive*; in conſequence of which the bees will fill this *hive* alſo with the product of their labours.

When the ſtraw *hive* is well filled, the ſlider may be puſhed in, and the *hive* taken away, and another placed in its room, with the ſlider drawn out. This new *hive* will alſo be filled in the ſame manner.

By proceeding in this method, Mr. Thorley aſſured the ſociety, that he had taken three ſucceſſive *hives* filled with honey and wax, from a ſingle *hive*, during the ſame ſummer, and that the food ſtill remaining in the octangular box was ſufficient for the ſupport of the bees during the winter. He adds, that if this method was purſued in every part of the kingdom, inſtead of the cruel method of deſtroying theſe uſeful inſects, he is perſuaded, from long experience, that wax would be collected in ſuch plenty, that candles made with it might be ſold as cheap as thoſe of tallow are ſold at preſent.

Mr. Thorley has alſo added another part to his *bee-hive*, which cannot fail of affording the higheſt entertainment to a curious and inquiſitive mind. This part conſiſts of a glaſs receiver eighteen inches high, eight inches in diameter at the bottom, and in the greateſt part thirteen: this receiver has a hole at the top, about an inch in diameter, through which a ſquare piece of deal is extended nearly to the bottom of the veſſel, having two croſs-bars, to which the bees faſten their combs. Into the other end of this ſquare piece is ſcrewed a piece of braſs, which ſerves for a handle to the receiver or glaſs *hive*. When the bees have filled their ſtraw *hive*, which muſt have a hole in the centre covered with a piece of tin, Mr. Thorley places the glaſs receiver upon the top of the ſtraw *hive*, and draws out the piece of tin. The bees now finding their habitation enlarged, purſue their labours with ſuch alacrity, that they fill this glaſs *hive* likewiſe with their ſtores: and as this receptacle is wholly tranſparent, the curious obſerver may amuſe himſelf with viewing the whole progreſs of their works. It will, however, be neceſſary to cover the glaſs with an empty *hive* of ſtraw, or at leaſt with a cloth, which may be eaſily removed when the bees are inſpected, leſt too much light prevent their working. In this way Mr. Thorley, in a good ſeaſon, has had a glaſs filled in thirty days, containing thirty-eight pounds of fine honey.

When the glaſs is completely filled, ſlide a tin plate between the glaſs and the *hive* or box, ſo as to cover the paſſage, and in half an hour the glaſs may be taken away with ſafety. The few bees that remain will readily go to their companions.

Mr. Thorley has added a glaſs window to his ſtraw *hives*, in order to obſerve the progreſs of the bees; and this contrivance is uſeful, eſpecially if one *hive* is to be removed while the ſeaſon continues favourable for their collecting honey; for when the combs are filled with honey, the cells are ſealed up, and the bees forſake them, and reſide moſtly in the *hives* in which their works are chiefly carried on. Obſerving alſo, that the bees were apt to extend their combs through the paſſage of communication into the upper *hive*, which rendered it neceſſary to diſride the comb when the upper *hive* was taken away, he puts in that paſſage a wire ſcreen or netting, the meſhes of which are large enough for a lonbird bee to paſs eaſily through them; and thus he prevents the junction of the combs from one box to the other, and conſequently obviates the neceſſity of cutting them, and of ſpilling ſome honey, which running down among a crowd of bees, incommoded them much.

Mr. White, in his directions for making the bee-boxes of his invention, tells us, ſpeaking of the conſtruction of a ſingle box, that it may be made of deal, or any other well-ſeaſoned boards, which are not apt to warp or ſplit. The boards ſhould be near an inch thick: the figure of the box ſquare, and its height and breadth nine inches and five eighths every way, meaſuring within. A box of theſe dimenſions will contain near a peck and a half. The front part muſt have a door cut in the middle of the bottom edge, three inches wide, and near half an inch high. In the back part a hole muſt be cut with a rabbit in it, in which is to be fixed, with putty, a pane of the cleareſt and beſt crown-glaſs, about five inches long, and three broad; and let the top of the glaſs be placed as high as the roof within-ſide, that the upper part of the combs may be ſeen: and thus the ſtate and ſtrength of the bees may be judged better of than if the glaſs were fixed in the middle. The glaſs muſt be covered with a thin piece of board, as a ſhutter, which may be made to hang by a ſtring, or turn upon a nail, or ſlide ſideways between two mouldings. The glaſs may be made large, or another pane of glaſs may be fixed on the top and covered with a ſhutter, for the convenience of obſerving the bees at their work. The ſide of the box, which is to be joined to another box of the ſame form and dimenſions, as it will not be expoſed to the external air, may be made of a piece of ſlit-deal, not half an inch thick. This Mr. White calls the ſide of communication, becauſe it is not to be wholly incloſed: a ſpace is to be left or cut at the bottom through the whole breadth of the box, and a little more than an inch in height, and a hole or paſſage is to be made at the top, three inches long and more than half an inch wide. Through theſe the bees are to have a communication from one box to another. In the next place, a looſe board is to be provided, which board is to be half an inch thick, and large enough to cover the ſide of communication; and likewiſe ſeveral little iron ſtaples, an inch and a half long, with the two points or ends bending down more than half an inch; the uſe of this part of the apparatus will appear under the article HIVING. Moreover, let two ſticks be fixed in the box tranſverſely and croſſing each other, in order to be a ſtay to the combs; one about

three inches from the bottom, and the other at the fame diſtance from the top; and when the whole is painted, in order to render it more durable, the box is finiſhed. This box, ſays the inventor, is as plain as poſſible: it is little more than five ſquare pieces of board nailed together; ſo that any poor cottager may make his own boxes, without the help or expence of a carpenter.

The other box muſt be exactly of the ſame form and dimenſions; and the two boxes differ only in this, that the ſide of communication of the one muſt be on the right hand, and of the other on the left. The two boxes with their openings of communication, ready to be joined to each other, are repreſented in *Tab. Agriculture*, &c. *fig.* 4. In *fig.* 5. is exhibited the front of a frame for twelve colonies; *a*, *a*, are two cells of oak, lying flat on the ground, more than four feet long: in theſe cells are fixed four oaken poſts, about the thickneſs of ſuch as are uſed for drying linen. The two poſts *b*, *b*, in the front, are about ſix feet two inches above the cells; the other two, ſtanding backward, five feet eight inches. You are next to nail ſome boards of ſir-deal horizontally from one of the fore-poſts to the other, in order to ſereen the bees from the ſun: let theſe boards be ſeven feet ſeven inches in length, and nailed to the inſide of the poſts, and be well ſeaſoned, that they may not ſhrink or gape in the joints: *c*, *c*, are two ſplints of deal to keep the boards even, and to ſtrengthen them.

Fig. 6. repreſents the back of the frame: *d*, *d*, *d*, *d*, are four ſtrong boards of the ſame length with the frame, on which the boxes are to be placed; let the upper ſide of them be very ſmooth and even, that the boxes may ſtand true upon them, or it may be more adviſeable to place under every pair of boxes a ſmooth thin board, as long as the boxes, and about a quarter of an inch wider. The bees will ſoon faſten the boxes to this board in ſuch a manner, that you may move and weigh the boxes and board together, without breaking the wax or reſin, which, for many reaſons, ought to be avoided.

Theſe floors muſt be ſupported by pieces of wood or bearers *e*, *e*, &c. which are nailed from poſt to poſt at each end: they are likewiſe to be well railed to the frame, to keep them from ſinking with the weight of the boxes. *f* repreſents the roof, which projects backwards about ſeven or eight inches beyond the boxes, to ſhelter them from the rain.

You have now only to cut niches or holes in the frame over againſt every entrance into the boxes, as *b*, *b*, *b*, *fig.* 5. let theſe niches be near four inches long, and under each nail a ſmall piece of wood for the bees to ſight upon. The morning or evening ſun will ſhine upon one or both ends of the frame, let its aſpect be what it will; but you may prevent its over-heating the boxes, by a looſe board ſet up between the poſts, and kept in by two or three pegs.

In order to take away part of the honey, without deſtroying or much diſturbing the bees, Mr. White adviſes to examine the ſtate of the colonies about the latter end of Auguſt through the glaſſes; and he obſerves, that ſuch as have filled a box and a half with their works may ſpare the half box; but the honey-comb ſhould be particularly examined, and about eight or nine pounds left for their winter ſtore. When this is done, open the mouth of the box you intend to take; then, with a thin knife, cut through the reſin with which the bees have joined the boxes to each other, till they are ſeparated; and, after this, thruſt a ſheet of tin gently between the boxes. The communication being thus ſtopped, the bees in the fulleſt box, where moſt probably the queen is, will be a little diſturbed; but thoſe in the other box, where there is no queen, will be in the utmoſt confuſion, running to and fro with a kind of a mournful cry, and iſſuing out at the newly opened door in great diſorder: however, when they have got abroad and diſcovered their companions, they eagerly join them at the mouth of the other box. By this means, in a hour or two, you will have a box of pure honey, without a living bee to moleſt you, or any dead bees to waſte and damage the honey.

Mr. White's boxes are convenient for feeding poor ſtocks in order to preſerve them, and alſo for removing moths and inſects from any colony that is in danger of being injured by them.

Mr. Wildman recommends the following method of taking the wax and honey without deſtroying the bees: remove the *hive*, from which you would take the wax and honey, into a room, into which little light is admitted; invert the *hive* gently, placing it on any ſupport, and cover it with an empty *hive*, keeping the ſide next the window of the empty *hive* raiſed a little, to give the bees ſufficient light to find their way into it: while you hold the empty *hive* ſteadily ſupported on the edge of the full *hive*, between your ſide and your left arm, keep ſtriking with your hand all round the full *hive* from top to bottom, in the manner of beating a drum, ſo that the bees may be frightened by the noiſe, and mount out of the full *hive* into the empty one. As ſoon as all the bees are out of the full *hive*, which will generally be in about five minutes, the other *hive*, in which they are collected, muſt then be placed on the ſtand from which the full *hive* was taken, in order to receive the abſent bees as they return from the fields.

If this be done early in the ſeaſon, the operator ſhould examine the royal cells; for if any of them contain young bees, they, as well as all the combs that have young bees in them, muſt be preſerved in the *hive*. Take out the other combs with a long, broad, and pliable knife, cutting them from the ſides and crown as clear as poſſible, to prevent the future labour of the bees, who muſt lick up all the honey ſpilt, and remove every grain of wax. The ſides of the *hive* ſhould then be ſcraped with a table ſpoon, to clear away what was left by the knife.

Having thus taken the wax and honey, let a table, covered with a clean cloth, be placed near the ſtand, and giving the *hive* in which the bees are a ſudden ſhake, ſtriking at the ſame time with a conſiderable degree of force, the bees will be ſhaken on the cloth. Put their own *hive* upon them immediately, raiſed a little on one ſide, that the bees may the more eaſily enter; and when all are entered, place it on the ſtand as before. If the *hive*, in which the bees are, be turned uppermoſt, and their own *hive* placed over it, the bees will immediately aſcend into it, eſpecially if the lower ſides be ſtruck to alarm them; for the effects of fear, impreſſed on the bees by the continual noiſe, renders them for a conſiderable time ſo mild and tractable, that they will bear any handling, which does not hurt them, without any ſigns of reſentment.

Mr. Thorley objects to the method of driving bees, in order to obtain their honey, becauſe the honey will be ſoul and corrupted, and great numbers of the young brood will thus be utterly deſtroyed, and the ſtocks much reduced and endangered. See on the ſubject of this article, Thorley's Inquiry into the Nature, Order, and Government of Bees, 1774; White's Collateral Bee-Boxes; Wildman, &c. on Bees.

HIVE *droſs*, a name ſometimes given to crude or rough wax. See WAX.

HIVING, the placing a ſwarm of bees in a hive, in order to have the profit of their labours. When the ſwarm of bees has left an old hive, and is placed in form of a cluſter hanging down from the branch of ſome ſhrub or low buſh, the *hiving* is extremely eaſy, and may be done in half an hour, after the time of their being ſtill and calm in the cluſter; or it may be let alone till an hour or two before ſunſet, provided that the ſun do not ſhine too vehemently upon the place where they are, for that would diſquiet them, and force them to riſe; and, in that caſe, they uſually take a long flight before they ſettle again, and are very often loſt: this, however, may at any time be prevented, by placing an artificial ſereen before them, compoſed either of coarſe cloth, or of a few branches of trees well covered with leaves.

It is commonly the branch of ſome ſhrub or tree that they ſettle upon; and we always find that they mean this as their ſettled habitation; for, however ſoon they are hived, the rudiments and beginnings of combs are found on it. It is true, they always leave theſe places, if left to themſelves, in five or ſix days; but this is not till they find them ſo inconvenient that they cannot keep them, either from their being too much ſcorched by the ſun, or expoſed to winds and rain. The quantity of wax and honey left in theſe places, when they have quitted them, abundantly proves, however, that they had meant them for their fixed abode.

When they are placed in a hive, they very ſoon find themſelves much better lodged than in the place they had provided for themſelves; and they uſually ſettle in it, and begin to work the next morning.

It might appear a very difficult talk to get to hive a number of bees into a hive, but it is much leſs than it appears to be. They will often take poſſeſſion of the hive of their own accord, when it is hung over them; but the ſhorteſt way is to hold the hive under the branch where they are, and then ſweep them down into it. This may be done with a branch of a tree, with its leaves on it, or with the hand, armed with a ſtrong glove, and the face covered. But there are country fellows who will go without any ſort of defence, and with their naked hands ſweep them carefully off the bough into the hive, which they hold in the other hand underneath.

It is not to be expected that the whole ſwarm will be thus ſwept peaceably into the hive; many will fly away, and many cluſters will fall beſide the hive to the ground. All this, however, creates no difficulty; for the hive being turned bottom upwards, and ſet on the ground near the tree,

tree, with its edges a little raised above the surface, those bees which fell in clusters to the ground will soon crawl to their companions in the *hive*, and soon after, those which flew off will descend and follow their example.

If it happen, however, that some bees will obstinately keep to the place where they at first fixed themselves, the branch is to be rubbed over with the juice of such plants as these creatures hate the smell of; such are elder, rue, and some others. And if this does not succeed, there must be linen rags burnt under them, the smoke of which will soon drive them off, and make them join their companions, who find themselves more at ease in the *hive*.

As it is necessary to render the places disagreeable to the bees from which they are to be taken into the *hive*, so many people think it very proper to prepare the *hive* for their reception, by scenting it with such things as they love the smell of. To this purpose they rub the inside of it with baum and bean-flowers, and daub a little honey in some parts of it. This, however, does not seem necessary, those *hives* having been found to succeed full as well where it was not done as those where it was. Reaumur's Hist. Inf. vol. x. p. 302.

If it be about noon that the swarm is taken into the *hive*, it must not be removed from the place before evening; and in the mean time it must be sheltered from the too violent heat of the sun by the shade of the trees; or, if that be not sufficient, a sort of screen must be made for it, either of a coarse cloth properly supported, or of branches of trees with their leaves on. In this manner it must remain till sun-set, and then the hive must be gently lifted up, and carried to the place where it is to remain, and the next morning the bees will be seen as busy in their work in it, as the old swarm in their hive. See HIVE.

It sometimes happens that the swarm is not placed so favourably as in the instance before mentioned; they often hang themselves in a long cluster from the young shoots of small branches of high trees; and in this case many different expedients are to be used to hive them, according to the circumstances of their position. The common method is for one man to climb the tree with a long staff in his hand, and another to mount a ladder placed against the tree, and hold the hive under the swarm, while the other sweeps them into it with the staff; and when the bough on which they hang is so far from the body of the tree that this is impracticable by the ladder, the hive is to be fixed to the end of a long pole, and by that means suspended under the swarm while they are swept into it. When all this is impracticable, because of the great height of the branch on which the swarm hangs, a large cloth is to be spread on some of the lower branches, and the whole swarm swept down in a cluster upon it; this is then to be thrown carefully to the ground, and another person is to be ready there to place the hive over the greater part of the cluster, and the rest will usually soon creep into it and join them. If they are slow in doing this, they are to be driven in by burning linen rags about the places where they fly, the disagreeable smell of which will send them towards the hive, where, finding their companions not incommoded with it, they will naturally remain.

Another method of getting a swarm from a branch of a high tree, is to cut off the branch with a saw, as gently and with as little disturbance to the bees as possible. In this case, when the branch is off, a man may carefully descend with it, and the bees will not quit their hold but will be all carried where he pleases with it, and may by that means be very easily put into a hive.

Sometimes the bees, which go out in a swarm, fix upon a hole in a wall, or a hollow in the trunk of a tree, for the assembling themselves. This is a much better choice for them than the branch of a tree, but it is much worse for the person who is to hive them, for they are very difficult to be got out of these places. The common way of the country people is to attack these swarms in the middle of a cold night, and they then enlarge the opening from without, and placing the hive under it scoop the bees out of their hold with a ladle, and put them into the hive.

Mr. Thorley tells us, that the best time to plant colonies of bees is either in March or April with new stocks, or in May or June with swarms. If swarms are used, procure, if possible, two the same day, and put them together in two boxes, or in a hive and a box; at night place them in your house, and with a knife and a little lime and hair, stop close the mouth of the hive or upper box, so that not a bee may be able to go in or out, except at the front door. If boxes are employed, you will, in a week or ten days, see the combs appear in them; but in a hive nothing can be observed till the bees have wrought down into the box. Never plant a colony with a single swarm, as Mr. Thorley says he has sometimes done, but with little success.

When the second box, or the box under the hive, appears full of bees and combs, it is a proper time to raise the colony in the dusk of the evening, which should be done in the following manner: place your empty box with the sliding shutter drawn back, behind the house near the colony that is to be raised, and at nearly the height of the floor, by the help of another empty box upon the ground; then lifting up the colony with as much expedition as possible, set it down upon the empty box, with the aperture of the colony close to the piece of wood nailed upon it, so that no single bee may get out: when this is done, lift the *hive* and two boxes, or the three boxes, into the house again, putting them in their proper place.

Mr. Thorley further adds, that the most effectual method of preserving bees in common hives is incorporation, or uniting two stocks into one, by the help of a peculiar fume or opiate, which will put them entirely in your power for a time, so that you may dispose of and distribute them at pleasure. The queen, in this operation, is immediately to be searched for and detained. Hives or stocks, which have swarmed once or twice, and are consequently reduced in their number, are the fittest to be joined together, as they will be thus greatly strengthened and improved. However, if you have a stock both rich in honey and full of bees, you may take it, by dividing the bees into two parts, and putting them into two other hives instead of one. But be careful to examine, whether the stock to which you design to join the bees of another has honey enough to maintain the bees of both; for which purpose it should be full twenty pounds in weight.

The stupifying fume used in this process is the fungus maximus or pulverulentus, or larger mushroom, commonly known by the name of bunt, puckfist, or frog-cheese: it is as big as a man's head or bigger; when ripe, it is of a brown colour, turns to powder, and is exceeding light. Put one of these pucks into a large paper, pressing it to two thirds or nearly half its bulk, and tying it very close; then place it in an oven some time after the houshold bread is drawn, and let it remain there all night; when it is dry enough to retain fire, it is fit for use in the following manner: cut off a piece of the puck as large as a hen's egg, and fix it in the end of a small stick fit for the purpose, and sharpened at the other end, and place this so that it may hang near the middle of an empty hive; this hive must be set with the mouth upward, in a pail or bucket, near the stock you intend to take: then set fire to the puck, and immediately place the stock of bees over it, tying a cloth round the hives that no smoke may escape. In a little while you will hear the bees fall like drops of hail into the empty hive. You may then beat the top of the hive gently with your hand, to get as many of them out as you can: after this loosening the cloth, lift off the hive to a table, knock it several times against the table, and several more bees will tumble out, and perhaps the queen among them; she is often one of the last that falls: if she is not there, search for her among the main body in the empty hive, spreading them for this purpose upon a table. You must proceed in the same manner with the other hive, with the bees of which these are to be united.

One of the queens being found, you must put the bees of both hives together; mingle them thoroughly, sprinkling them at the same time with a little ale and sugar, and put them among the combs of the latter hive, shaking them down in it. When they are all deposited, cover the hive with a cloth, bound close about it, and let them remain shut up all that night and the next day. Some time after this you will be sensible that they are awakened out of sleep. The second night after their union, in the dusk of the evening, gently remove the cloth from the mouth of the hive (taking care of yourself), and the bees will immediately sally forth with a great noise; but it being too late for them to take wing, they will soon return again: then inserting two pieces of tobacco-pipes to let in air, stop them close as before, and keep them thus confined for three or four days longer, after which the door may be left open.

The best time of the year for uniting them is when the young brood are all out, and before they begin to lodge in the empty cells, which they do in great numbers in cold weather and in winter. The operation should be performed early in the afternoon, that having the greater light, the queen may be more easily found. The few bees that are left in the hive should be suffocated with sulphur.

Mr. Thorley observes, that he never knew such combined stocks conquered by robbers, and that they will either swarm the next summer, or yield a hive full of honey.

Mr.

Mr. White's method *of hiving* a swarm into one or more of his boxes is as follows: take the loose board, mentioned under the article HIVE, and fasten it to one of the boxes, so as to stop the communication; this may be done by three of the staples there mentioned, one on the top of the box near the front, the two others on the back near the top and near the bottom: let one end of the staple be thrust into a gimblet-hole made in the box, so that the other end may go as tight as possible over the loose board, to keep it from slipping when it is handled. Be careful to fasten the shutter so close to the glass, that no light may enter through it; and cover the box as soon as the bees are hived, with a linen cloth thrown loosely over it, or with green boughs, to protect it from the heat of the sun. If the swarm be larger than usual, instead of fastening the loose board to one box, you may join two boxes together with three staples, leaving the communication open from one to the other, and then hive your bees in both. In all other respects, they are to be hived in boxes after the same manner as in common hives. The door of the second box should be carefully stopped up and kept constantly closed, in order that the bees may have no entrance but through the first box. Thorley and White, ubi supra.

HOACHE, in *Natural History*, a name given by the Chinese to a peculiar kind of earth, which they have found lately very useful in the manufacture of their China-ware. It is called *hoache* from the word *hoa*, which signifies *soft* and *glutinous*, and is described to us as being an earth approaching to the nature of chalk, but harder, and feeling like soap to the touch. There is great reason to believe, that this is either the same earth with our SOAPROCK of Cornwall, or something very like it. But we are to learn, in regard to the Chinese way of using it, that it is only one of the ingredients of their fine ware, not the whole matter of which it is made.

The Chinese physicians had long used this earth as a medicine, giving it in disorders of the lungs; but it is only of late times that the workmen in porcelain attempted to use it instead of KAOLIN. It succeeds, however, so well, that the porcelain made of it sells dearer in the Indies than any other kind. The grain of this porcelain is remarkably fine and even, so that it is fitter for receiving the finest pencilling than any other, and it may be made surprisingly light. But there is this disadvantage, that the whole is more brittle than ordinary china, and the just degree of baking is very difficult to hit; without which it is never strong. The Chinese sometimes make the body of their vessels of the common China-ware, and dip them when cold into a thick liquor like cream, in which the *hoache* is dissolved; this gives a new and beautiful coat to the vessel. They give the common varnishing over this, and it succeeds to a very great perfection. The manner in which the Chinese use it for this purpose is this: they first wash it clean with river water, to separate a yellow sort of earth, which lies near it in the mine where they dig it, and is often brought up with it. When it is thus cleaned, they beat it to powder, and mix it in large quantities of water; they stir the mixture well, and then letting the coarser part settle, they pour off the thick liquor, and let it stand till a substance like cream subsides, which they keep moist, and use, as before mentioned, to dip the vessels in, or else they dry it, and use it with the PETUNSE instead of the kaolin in the common manufactures.

It is said that a good porcelain-ware may be made with this earth alone, without any other mixture; but the workmen themselves are unwilling to do this, and always chuse, if they do not work in the common way, to add at least two parts of the petunse to eight of the *hoache*, and with this mixture they make a very good ware, working it in the same manner as they do the petunse and kaolin.

The *hoache*, though ever so proper to supply the place of the kaolin, could not be used in the common works, because it costs three times the price, it being much scarcer, and brought much farther.

There is another very elegant sort of china-ware, which depends entirely on the *hoache* for its beauty: it is all white; but though the surface is perfectly smooth and polished, there are seen flowers and other ornaments on it in a very delicate manner. The method of making this is as follows: they make the vessels of the common matter of the porcelain-ware; they then dissolve, in a sufficient quantity of clear water, as much of the refined *hoache* as will give it the consistence of a syrup. With this they pencil out the figures they intend on the surface of the vessel while yet not quite dry: this penetrates the surface, and the lines and strokes all appear very determinate. They let this dry thoroughly, and then cover the whole vessel with the common varnish of the porcelain.

When it has been baked, the whole appears white, but the figures are very distinctly seen, and appear extremely beautiful. They are of a brighter white than any of the rest, and seem formed of a thin white vapour, running with regularity just under the surface of the vessel. They have a way of doing this with another sort of earth, which they call *chekas*; but this requires more trouble, as it must be reasted and powdered before it is fit for use. The white of this also is not so fine when done as the other. Observ. sur les Coutumes de l'Asie, p. 300, &c. See PORCELAIN.

HOACTLI, in *Ornithology*, the name of an American bird described by Nieremberg, of the size of a common hen: the legs and neck are long; its head is black, and ornamented with a beautiful creft of the same colour; its whole body is of a fine white, but its tail, as well as the upper sides of its wings, are grey; the wings have a greenish cast, and the back has occasionally many black feathers; its feet are not webbed, its legs are of a pale white colour, and it has a circle of white beginning at the eyes and encompassing the head. It is common on the lakes of Mexico, and builds among reeds and sedge. It bites very desperately. Ray's Ornith. p. 300.

HOACTON, in *Ornithology*, the name of a Mexican bird described by Nieremberg, and seeming of the heron or bittern kind. Its neck and belly are white, slightly variegated with brown; the rest of the body is brown variegated with white; its eyes are large, and have a pale iris. Ray's Ornithol. p. 303.

HOACTZIN, in *Ornithology*, a name under which Nieremberg has described a species of American bird which is of the size of a hen, and has a crooked beak: the breast is of a yellowish white; its wings and tail are variegated with large spots of a pale grey and white colour; its neck and back are of a brownish yellow, and it has on its head a creft made of white feathers, which are black on their inside. Its voice is very loud, and it feeds on snakes. It is seen in the autumn about Mexico, and generally frequents high trees near waters. Its bones, feathers, and some other parts, are esteemed by the natives specific in the jaundice and other diseases. Ray's Append. p. 300.

HOANGICOYA, in *Natural History*, an amphibious animal, which in summer is a bird, and in winter a fish. See CROCODILE.

HOAR-*frost*, *grains*. See FROST and EVAPORATION.

HOARSENESS, *raucedo*, in *Medicine*, a diminution of the voice, sometimes attended with a preternatural asperity or roughness thereof.

The part here affected is the ASPERA *arteria*, and particularly its head or the LARYNX.

This distemper differs in degree, being milder when from external causes, and much more obstinate and troublesome when from internal.

Signs of it. The hoarseness of the voice in speaking sufficiently manifests this complaint, but it is usually also attended with a slight cough in the milder kind; and when of the severer sort, is not unfrequently accompanied with catarrhal and scorbutic effects; and not uncommonly, in its worst states, with a complication of venereal taints. The persons most subject to *hoarseness* are young and middle-aged men, and sometimes women, who have for some time been afflicted with obstructions of the menses.

Causes of it. *Hoarseness* is a sort of catarrhous indisposition, arising from a too great acrimony or saltness of the lymph; and the general cause of it is a too copious effusion of thin lymph on the larynx and adjacent parts, or an interception of the lymph destined to lubricate the wind-pipe; and the occasional cause of this is usually an obstruction of the glandular parts, towards the top of that organ, in the simple succedo; but in the complicated kind, in which there is a scorbutic or venereal taint, an erosion of the epiglottis is very often the cause. Besides these, there are many accidental and external causes which will bring on a *hoarseness*; such as the intrusion of any small particles of extraneous matter, if it be only a grain of dust, into the wind-pipe; a vehement cough will also bring it on, as will a frequent loading with too fat foods, and acrid or bilious humours fermenting about these parts, and sometimes worms in the intestines. It is easy to conceive, that the more complicated this disease is, the more difficult will be the cure; and accordingly *hoarseness*, which have scorbutic or venereal taints for their basis are with great difficulty removed.

Method of cure. Lubricating medicines are first to be given, to obtund the acrimony of the humours, and relax the strictures of the glandular parts. To this purpose are properly taken oil of almonds and the pectoral syrups, with barley-water, mucilaginous broths, and decoctions of the pectoral herbs, or infusions of them drank

drank in the manner of TEA. When the *hoarseness* is occasioned by too great acrimony and viscidity of the lymph, a small quantity of horse-radish juice, mixed with honey, may be swallowed every morning with a draught of new-milk whey. When there is a COUGH attending it, these are to be treated in the usual way, and the *hoarseness* will usually go off with them. When the *hoarseness* arises from acrid and bilious humours, the abforbents and nitrous medicines are to be given with gentle diaphoretics; powders compofed of crabs-eyes, nitre, and diaphoretic antimony, are of great ufe in this cafe. The bowels, in all thefe cafes, are to be kept gently relaxed; and where there is a fcorbutic or venereal taint for the bafis, thofe diſeaſes muſt be attacked in the common way, and then the *hoarseness* will be regularly taken off. A relaxation of the wind-pipe is ufually accufed as being the caufe of a *hoarseness*, and that not without fome foundation, fince, where the humours are collected, there will be fuch a relaxation; but when we conſider all the circumſtances of the diſeaſe, and obſerve, that relaxing medicines are the only cure for it, we muſt acknowledge, that though a relaxation of fome part of the aſpera arteria may be in the caſe, yet that the origin of the complaint is from a conſtriction of fome part of it; and it appears, that the longer this complaint remains with people, the greater the conſtriction becomes; ſo that after a courſe of years, the voice is not only hoarſe, but is in a manner ſuppreſſed, ſo that it can ſcarce be heard. Junker's Conſp. Med. p. 505.

Sperma ceti, decoct. papar. & rob. paſſular. are approved remedies herein. Where the diſorder is inveterate, attenuants and expectorants are frequently of ſervice.

In many inſtances, the moſt ſpeedy relief is obtained from continuing the feet in warm water, for the ſpace of half an hour, about bed-time.

HOASE, in *Sea-language*, is a long flexible tube, formed of leather or tarred canvas, but chiefly of the latter, and employed to conduct the freſh water, which is hoiſted aboard a ſhip, into the caſks that are ranged in the hold; and to paſs the water, or other liquors, out of one caſk into the other.

HOBAL, in *Mythology*, an idol of the Ancient Arabs, the worſhip of which at Mecca was deſtroyed by Mahomet.

HOBBISM, or *Philoſophy of Hobbes*, in the *Hiſtory of Literature*, denotes the metaphyſical, moral, religious, and political opinions of Thomas Hobbes, a celebrated Engliſh writer, who was born at Malmeſbury, in Wiltſhire, in the year 1588.

Having diſtinguiſhed himſelf in early life by his genius, application, and improvement, he was taken into the ſervice and protection of the Devonſhire family, which continued with little interruption, as long as he lived, and which gave him an opportunity of purſuing his ſtudies, and of forming connections with perſons of the firſt reputation for learning and ſcience both at home and abroad.

His firſt work was an Engliſh tranſlation of the Hiſtory of Thucydides, which he publiſhed with a view to the ſtate of his country, in order to ſhew the fatal conſequences of inteſtine broils.

Having acquired a thorough acquaintance with the Latin and Greek languages, he applied himſelf to the ſtudy of mathematics; and particularly to the works of Euclid, which he read and admired, principally on account of the clearneſs of his reaſoning, the connection of his arguments, and the wonderful perſpicuity of his method. He alſo devoted his leiſure hours to natural philoſophy, and eſpecially to mechanics and the cauſes of animal motion.

In 1640 he retired to Paris, where he became acquainted with the famous Des Cartes, with whom he afterwards correſponded, and whoſe doctrine concerning innate ideas he ſtrenuouſly oppoſed.

In 1642 he printed a few copies of his book De Cive, a more complete edition of which was printed in Holland in 1647, by the care of Dr. Sorbiere: to this edition two recommendatory letters are prefixed; one written by Gaſſendi and the other by Merſenne, with whom Mr. Hobbes was on terms of intimate friendſhip.

In 1650, two other treatiſes were publiſhed at London; one entitled Human Nature, and another entitled De Corpore Politico, or the Elements of Law. During this time he had been digeſting his religious, political, and moral principles, into a complete ſyſtem, which he entitled Leviathan, and which was printed in Engliſh, at London, in that and the following year. Soon after this publication he returned to England, and joined in communion with a congregation where the ſervice of the church of England was uſed, and continued to return thither.

In 1654 he publiſhed his letter upon Liberty and Neceſſity, which occaſioned a long controverſy between him and Dr. Bramhall, afterward lord primate of Ireland. About this time he likewiſe began a controverſy with Dr. Wallis of Oxford, which laſted as long as he lived, and in which he had the misfortune to have all the mathematicians againſt him: this controverſy *did* him no credit; for though he was once and again refuted, and his miſtakes were clearly pointed out, yet ſuch was the obſtinacy of his temper, he adhered as pertinaciouſly as ever to his old opinions, and rendered that a perſonal quarrel, which ought to have continued a literary diſpute. He was no leſs poſitive and imperious in maintaining his moral, religious, and political ſentiments; and he ſeems to have diſcovered, on a variety of occaſions, a very unbecoming opinion of his own abilities, and a ſupercilious contempt of thoſe of other men.

After the Reſtoration, in 1660, the king ſettled upon him a penſion of a hundred pounds a year, but notwithſtanding this favour, his Leviathan and his treatiſe De Cive were cenſured by parliament in 1666, a circumſtance which much alarmed him: at the ſame time a bill was brought into the houſe of commons to puniſh atheiſm and profaneneſs, which, it is ſaid, induced Mr. Hobbes to write or to enlarge his book concerning Hereſy.

In 1675 he publiſhed his Engliſh edition of the Iliad and Odyſſey; in 1676 his diſpute with Dr. Laney, biſhop of Ely, concerning Liberty and Neceſſity was printed; in 1678 appeared his Decameron Phyſiologicum, or Ten Dialogues of Natural Philoſophy; and about the ſame time a new edition of the Art of Rhetoric, to which he added a Dialogue between a Philoſopher and a Student of the Common Law of England: in the ſame year he alſo publiſhed his Behemoth, or Hiſtory of the Civil Wars from 1640 to 1660.

Mr. Hobbes retained his underſtanding to his laſt ſickneſs; inſomuch that he was not only capable of ſtudying mathematics when above eighty-ſix years old, but alſo of writing very long poems. It has been ſaid, that he was afraid of apparitions and ſpirits; but his friends call this a fable, though they acknowledge that he was afraid of being alone, and aſcribe it to a fear of being aſſaſſinated. Mr. Bayle obſerves, that he meditated much more than he had read, and that he never cared to collect a large library: and Mr. Hobbes ſays of himſelf, that if he had beſtowed as much time on reading as other men of letters, he ſhould have been as ignorant as they. He was a great admirer of Homer, Virgil, Thucydides, and Euclid; but he made no account of large libraries, obſerving that men, for the moſt part, following one another's ſteps like ſheep, have ſeldom the courage to go out of the trodden paths and roads which are preſcribed to them by their guides. Mr. Hobbes died at the houſe of his patron, the earl of Devonſhire, in the year 1679. For a fuller account of his life and writings, the reader may conſult Bayle, or the Biographia Britannica, article *Hobbes*.

Mr. Hobbes's religious and political ſentiments are chiefly contained in his book De Cive and his Leviathan; and it is certain, that there have been few perſons whoſe writings, by the extraordinary abilities of their author and the ſingularity of his notions, for the dogmatical manner in which they are delivered and the agreeableneſs of their ſtyle, that have had a more pernicious influence in ſpreading infidelity and irreligion, though none of them are directly levelled againſt revealed religion.

Mr. Hobbes has been unjuſtly charged with atheiſm; for he expreſsly acknowledges the exiſtence of God, and that we muſt neceſſarily ariſe from the effects which we behold, to the eternal power of all powers, and cauſe of all cauſes; and he blames the abſurdity of thoſe, who call the world, or the ſoul of the world, God: nevertheleſs, he denies that we know any more of him than that he exiſts, and ſeems plainly to make him corporeal; for he affirms, that that which is not body is nothing at all: *Dantur nomina insignificantia, cujus generis eſt ſubſtantia incorporea.* Religion, he ſays, ariſes from the fear of power inviſible, feigned by the mind, or imagined from tales publicly allowed, as ſuperſtition ariſes from thoſe that are not allowed: and he elſewhere reſolves religion into opinions of ghoſts, ignorance of ſecond cauſes, devotion to what men fear, and taking things caſual for prognoſtics. He takes pains in many of his works to prove man to be a neceſſary agent (if theſe contradictory terms can be properly joined), and expreſsly aſſerts the materiality and mortality of the human ſoul; alledging, againſt the well known maxim of Des Cartes, "I think, "therefore, I am," another maxim of his own, "I "think, therefore, matter can think." And he repreſents the doctrine concerning the diſtinction between ſoul and body in man to be an error, contracted by the contagion of the demonology of the Greeks. The belief of a future ſtate, he ſays, is grounded upon other men's

men's saying that they knew it supernaturally, or that they knew those that knew them, that knew others, that knew it supernaturally.

With regard to revealed religion, he treats the pretence to inspiration as a sign of madness: he alledges, that the books of Moses, and the historical writings of the Old Testament, were not written by those whose names they bear; and that they are derived to us from no higher authority than that of Ezra. As to the books of the New Testament, he acknowledges, that they are the true registers of those things which were done and said by the prophets and apostles; but he pretends, that they were not received as of divine authority in the Christian church, till they were established by the council of Laodicea, in the year of Christ 364. Though he sometimes seems to speak with veneration of the sacred writings, and to make the laws of Scripture the laws of God, yet he expressly asserts, that we have no assurance of the certainty of Scripture but the authority of the church, or the authority of the commonwealth; that the precepts of Scripture derive all their obligation from the will of the magistrate; and that the magistrate is the authoritative interpreter of all Scripture doctrines, to whom we are bound to submit. On the same principle he maintains, that the private reason must submit to the public, viz. to God's lieutenant; that a subject may be allowed to deny Christ in words, provided he retains the faith of Christ in his heart, when commanded by his sovereign; and that idolatry, to which a man is compelled by the terror of death, is no idolatry.

Mr. Hobbes's opinions with regard to natural religion and civil government are equally erroneous and extravagant: he asserts, that by the law of nature every man hath a right to all things, and over all persons, and that the natural condition of man is a state of war, a war of all men against all men; that every man acts reasonably, who endeavours, as far as possible, no matter all the persons of others, till he sees no other power great enough to endanger him; that the civil laws are the only rules of good and evil, just and unjust, honest and dishonest, and that antecedently to such laws every action is in its own nature indifferent; that there is nothing good or evil in itself, nor any common laws constituting what is naturally just and unjust; that all things are estimated by what every man judgeth to be fit, where there is no civil government, and by the laws of society, where society is established: that the power of the sovereign is absolute, and that he is not bound by any compact with his subjects; that nothing the sovereign can do to the subject can properly be called injurious or wrong; and that the king's word is sufficient to take any thing from any subject, if there be need, and the king is judge of that need. *Non veritas, sed auctoritas facit legem.* And yet he else where says, *Obligatio civium erga eum qui summam habet potestatem tandem nec diutius permanere intelligitur, quam manet potentia cives protegendi.*

Wood, in his Athenæ Oxon. vol. ii. p. 646. has asserted, that Mr. Hobbes, in advanced life, retracted many of his opinions published in his Leviathan, &c. and composed an apology for himself and his writings; but the authenticity of this apology has been disputed. Leland's View of the Deistical writers, vol. i. letter iii. Mosheim's Eccl. Hist. by Dr. Maclaine, vol. iv. p 234. note *b*, 8vo. ed. 1768.

HOBBY, in *Ornithology*, the English name of a hawk of the long-winged kind, the FALCO *subbuteo* of Linnæus, called, by many authors, by the name *subbuteo*, the name by which others express the ringtail and hen-harrier. The *hobby* has a prominent and crooked beak, covered at the base with a yellow skin; the beak is white near this membrane, elsewhere it is blue; above each eye there is a white line; the crown of the head and back, and covers of the wings, are of a deep bluish black; the hind part of the head is marked with two pale yellow spots, and each cheek with a large black spot pointing downwards; the interior webs of the secondary and quill-feathers are variegated with oval, transverse, reddish spots; the breast is white, marked with oblong spots of black; the thighs and vent-feathers are pale orange; the middle feathers of the tail are entirely of a deep dove-colour; the others are barred on their interior sides with rust-colour, and tipt with a dirty white. The female is much larger than the male. The legs and feet are yellow. It builds with us in high trees, and breeds in England, but migrates in October; it feeds principally upon larks. It was formerly used in that species of FALCONRY called during of larks: the *hobby* was cast off, and the larks were fixed to the ground through fear, and became an easy prey to the net of the fowler. Pennant. See *Tab. II. of Birds*, N° 21. See DOHING and HAWK.

HOBBY is also a name formerly given to strong active horses of a middling size: they are reported to have been originally natives of Ireland, and were much liked and used. Nags answer the same description as to size, qualities, and employments.

HOBGOBLIN, is a name vulgarly applied to fairies or apparitions. Skinner calls the word *robgoblins*, and derives it from *Robin Goodfellow*, Hob being the nick-name of Robin: but Wallis and Junius, with greater probability, derive it from *hopgoblini, emposæ*, because they are supposed to *hop* without moving both their feet. Johnson.

HOBITS, in *Cunnery*. See HOWITS.

HOBLERS, or HOBILERS, HOBELARII, in our *Ancient Customs*, were men who, by their tenure, were obliged to maintain a light horse or hobby, for the certifying any invasion toward the sea-side.

The name was also used for certain Irish knights, who used to serve as light-horsemen upon hobbies.

HOB-NAIL, a nail with a thick strong head, used in shoeing a hobby or little horse. Johnson.

HOB NOB, or HAB NAB, a cant word formed from *hap ne hap*, and denoting an event which happens at random or by mere chance. Johnson.

HOBOO, a name given by the people of Otaheite, and in the neighbouring islands of the South Sea, to their superfine cloth. It is the thinnest and most finished preparation of the AOUTA.

HOBSON'S-*choice*, a vulgar proverbial expression, applied to that kind of choice in which there is no alternative. It is said to be derived from the name of a carrier at Cambridge, who let out hackney horses, and obliged each customer to take, in his turn, that horse which stood next the stable door. Scott.

HOCK. See HAM.

HOCK-*Tuesday money*. See HOKE-*day*.

HOCUB, in *Botany*, a name given by Vaillant to a genus of plants, called by Tournefort and other authors GUNDELIA.

HOCUS POCUS, a cant term applied to a juggle or cheat. Dr. Tillotson derives it from the form of consecrating the sacramental bread in the Romish church, *hoc est corpus*. Junius derives it from the Welch *hocced, a cheat*, and *poke or pocus, a bag*; the jugglers using a bag for conveyance. The etymology, however, is uncertain. Johnson.

HOD, a sort of tray for carrying mortar, in use among bricklayers.

HODEGOS, a term purely Greek (*ὁδηγὸς*, signifying *guide*. The word is chiefly used as the title of a book composed by Anastasius the Sinaite, toward the close of the fifth century; being a method of disputing against the heretics, particulary the Acephali.

Mr. Toland has also published a dissertation under the same title. Its subject is the pillar of fire, &c. which went before the Israelites as a guide in the desert.

HODENSTEIN, in *Natural History*. See ENORCHIS.

HODGE-PODGE. See HOTCH-POT.

HODMAN, a cant term formerly used for a young scholar admitted from Westminster-school to be student in Christ-church in Oxford.

HODOMETRICAL (*of ὁδὸς, way, and μέτρον, I measure,*) *method of finding the longitude at sea* is that of the computation of the measure of the way of a ship between place and place, i. e. of observing the several rhumbs or lines in which the ship sails, and what way she has made, or how many leagues and parts of a league she has run. This method is liable to great errors.

HOE, or HOW, a husbandman's tool, made like a cooper's adz, to cut up weeds in gardens, fields, &c.

This instrument is of great use, and ought to be much more employed than it is, in hacking and clearing the several corners and patches of land, in spare times of the year, which would be no small advantage to it.

Horse-HOE is a large kind of *hoe* drawn by *horses*, and used to stir the intervals in the new HUSBANDRY, and clear the corn from weeds.

The Rev. Mr. Hewitt, of Hadleigh, in Suffolk, presented to the Society for the Encouragement of Arts, &c. in 1766, the model of a new *horse-hoe*, represented in *Tab. Agriculture, fig.* 2. A represents a small round curved iron bar, fixed upon each end of the axle of the wheel, by which the *hoe* is drawn; the wheel B is three feet in diameter; C, C, are two flat iron bars, three feet long, fixed upon the axle of the wheel, and to the sides of the *hoe*, at E, E, by bolts and screws, and moveable both up on the axle and bolts; F is a small round iron bar, fastened at each end into the bars C, C, at I and I; the bolts to these points may be strait, and from I, I, to E, E, let them be curved; H is the *hoe* itself, the breadth of which is to be regulated by the different distances of the rows of plants whose intervals are to be hoed; K, K, are two flat curved iron bars, fixed by bolts, upon which they are moveable, to the bars C, C; each of these passes though a staple, fixed into the sides of the *hoe* at L, L;

in

in both theſe ſmall bars there is a row of holes, and in each ſtaple one hole anſwering to a hole in each of the ſides of the *bar*, which is fixed to any poſition by means of bolts paſſing through theſe holes, and ſome of the holes in the bars K, K, and thus the ground may be hoed as near the ſurface, or as far below it, as is neceſſary; M, M, are two wooden handles, fixed to the two ſides of the *hoe*, and to each other, by the croſs bar O; theſe handles are as long and as high from the ground as thoſe of a common plough.

This machine may eaſily be adapted to hoeing the furrows between the wheat ridges, by ſubſtituting, in the room of the flat hoe, one that is curved, and ſuiting its breadth and curvature to the breadth and curvature of the furrows that are to be hoed.

With this inſtrument the ground may be hoed ſo deep, as to cut aſunder the roots of every weed it meets with below the crown or head; and thus they will either be deſtroyed or prevented from growing again during the ſeaſon. There has been a farther improvement of this inſtrument by annexing a harrow to the *hoe*. See *Hoe* PLOUGH.

HOEING, in the *New Huſbandry*, is the breaking or dividing the ſoil by tillage, while the corn or other plants are growing thereon. It differs from common tillage, which is always performed before the corn or plants are ſown or planted, in the time of performing it; and it is much more beneficial to the crops than any other tillage. This ſort of tillage is performed various ways, and by means of different inſtruments.

Land which, before the tilling, would have yielded little, though the more it is tilled before ſowing the greater crop it yields, yet, if tilled only before the ſowing, will always have ſome weeds, and they will partake of the advantage of the tillage as well as the corn. This is one reaſon for an after-tillage, ſuch as that by *hoeing*. But there is another conſideration that yet more evinces the neceſſity of it; this is, that as ſoon as the ploughman has done the buſineſs, by ploughing and harrowing the land after ſowing, the ſoil, of its own accord, begins to undo it all again, by tending towards its original texture and ſpecific gravity again; the altering of which was the only buſineſs of all the former tillage. The breaking the particles of the earth, and making in it new pores, and new particles or new ſuperficies, is the great buſineſs of the plough and harrow; but as ſoon as their uſe is over, the earth begins to coaleſce again into its own form, the particles unite together, and the artificial pores in a great meaſure cloſe up. The ſeed is nourished in a worſe ground than it was firſt put into, and the more the plant grows up and requires a larger ſupply of food, the worſe the paſture becomes. While nouriſhment is thus denied the growing plants, they are at the ſame time choaked with weeds, which being of a hardier nature than they, will grow with leſs ſupplies, and therefore thrive more vigorouſly, and rob them of a great part of the little food the land before allowed them.

Farmers in all ages have been acquainted, in ſome degree, with the uſe of tillage and dung to crops of uſeful plants; but they have ſo ill managed the time of giving theſe aſſiſtances to nature, that there is no doubt but one third part of the nouriſhment raiſed by dung and tillage, if it were given to plants and corn at many proper ſeaſons, and proportioned to the different times of their exigencies, would be of more benefit to the crop than the whole is, when applied all together at the time of ſowing.

Nature, by what ſhe does to the animal œconomy, ſeems to point out to us ſomething like a remedy for this by *hoeing*; for when the teeth, as the plough, have tilled that ſoil or maſs which is earth altered, and when the ſaliva and the juices of the ſtomach have ſerved to divide and attenuate it, as the ſalts of dung and other manure do land; after all this, the bile and pancreatic juices are ordained to farther attenuate it, at the very time when it is ready to be exhauſted by the numerous mouths of the lacteals ſituate in the inteſtines. This laſt operation of theſe juices ſeems analogous to moiſtening the ſoil by *hoeing*, after the plants are grown and are become fit for uſe.

Tranſplanting is nearly allied in its nature to *hoeing*, but it is much inferiour. The nature of this will not admit of its being a general thing; and even if it would, *hoeing* is better: for, by tranſplanting, the plants can only be kept up to a certain period, after which they will not bear it; but *hoeing* may be uſed to them with advantage, to their utmoſt ſtanding, and makes them vigorous all the while.

The roots of a plant are all neceſſarily broken off in tranſplanting, and it requires ſome time for it to ſtrike a whole ſet of new ones; and if the earth about it is not kept thoroughly moiſtened all this time, the new formed roots will not be able to ſhoot, and the plant will ſtarve in the midſt of plenty. But, on the contrary, in *hoeing*, the ſame advantage of a new paſture for the plant is obtained, by breaking the particles of the earth, and at the ſame time no more of the roots are broken off than can eaſily be ſupplied, and the reſt remaining in their places, the plant continues growing without that ſtop and decay which muſt happen on tranſplanting, and which it recovers only by degrees. It is obſerved, that ſome plants are worſe for tranſplanting: lucerne and ſainfoin are ſaid by ſome to be never ſo good after tranſplanting, as when they are left in their native places, at the ſame diſtances; and ſuccha removed is never ſo good and tender as when it is not. That laſt plant receives ſuch a check from tranſplanting in its infancy, that it has afterwards a diſeaſe like the rickets, which cauſes knots and ſwellings in it that ſpoil it as a delicacy. All the tap-rooted plants ſuffer by tranſplanting, for it is neceſſary in this to cut off the main long root, which afterwards, however good the ſoil may be, never arrives at the length it otherwiſe would have had, and which was neceſſary for the ſucceſs of the plant.

*One great benefit of *hoeing* is, that it keeps plants moiſt in dry weather, the advantage of which to their growth is eaſily ſeen. This good office it performs on a double account. Firſt, as they are better nouriſhed by *hoeing*, they require leſs moiſture, and carry off leſs; for thoſe plants which receive the greateſt increaſe, having moſt terreſtrial nouriſhment, carry off the leaſt water, in proportion to their augment, as is proved by Woodward's experiments. Thus barley or oats being ſown on a piece of ground, well divided by tillage and dung, will come up and grow well without rain, when the ſame grains ſown on another part of the ſame land, not thus dunged or tilled, will ſcarce come up at all without rains, or if they do, will wait wholly for the rains for their growth and increaſe.

The hoe alſo, particularly the horſe-hoe, for the other does not go deep enough, ſaid on this account horſe-*hoeing* is much preferable to *hoeing* with the hand-hoe, or *ſcratch-hoeing*,) procures moiſture for the roots from the dews which fall moiſt in dry weather; and theſe dews ſeem to be the moſt enriching of all moiſture, as it contains in it a fine black earth, which will ſubſide from it in ſtanding, and which ſeems fine enough to be the proper pabulum or food for plants.

A demonſtration that the tilled earth receives an advantage from theſe dews, which the untilled does not, is this: dig a hole in any piece of land, of ſuch a depth as the plough uſually goes to; fill this with powdered earth, and, after a day or two, examine the place, and the bottom part of this earth and the bottom of the hole will be found moiſt, while all the reſt of the ground, at the ſame depth, is dry. Or if a field be tilled in lands, and one land be made fine by frequent deep ploughings, while another is left rough by inſufficient tillage, and the whole field be then ploughed acroſs in the driеſt weather, which has continued long, every fine land will be turned up moiſt, and every rough land as dry as powder from top to bottom.

Although hard ground, when thoroughly ſoaked with rain, will continue wet longer than fine tilled land adjoining to it, yet this water ſerves rather to chill than to nouriſh the plants ſtanding in it, and to keep out the other benefits of the atmoſphere; it leaves the ground much harder alſo than before, when it is finally exhaled out of it; and when, at length, the earth is thus hardened, it can receive no benefit from any thing leſs than a deluge of rain, which ſeldom falls till the ſeaſon of vegetation is over.

As fine hoed ground is not ſo long ſoaked with rain, ſo the dews never ſuffer it to become perfectly dry. This appears from the flouriſhing ſtate of plants in hoed ground, while others near them, but in ground not hoed, are ſtarved for want of nouriſhment. The common opinion is againſt this, but obſervation proves it to be true againſt the common opinion. The vulgar are guided by this, however, and will not hoe their ground in dry weather, for fear of letting in the drought, as they call it; whereas *hoeing* this is the only method of keeping away the drought, and without either this, or watering, they muſt periſh in theſe ſeaſons.

There is alſo another advantage given to plants by *hoeing*, which animals are not capable of. Meat and drink, in a proper degree, are all they require or can diſpenſe with, and unleſs new mouths could be made to them they can uſe no more; but in plants, the *hoeing* at once gives increaſe of nouriſhment in abundant quantities, and increaſe of mouths to receive it; for every time the hoe is ſtruck into the ground, new particles of earth are made by breaking the old ones; the new pores made by theſe, afford a new ſupply of food to the plant, and every ſtroke of the hoe at the ſame time cutting off ſome of the fibrous roots of the plant, great numbers are propagated in

in the places of every one that is cut, and the plant has at once more food, and more mouths to feed with. Tull's Horse-hoeing Husbandry, chap. vi.

It is a certain fact, that breaking the soil and exposing it to the operation of the air are found to fertilize it; but Mr. Tull, in order to account for this fact, adopted a miftaken theory, which fuppofes that fertilization conſiſted principally or ſolely in breaking the earth into fine parts, that they might be the better fitted to enter the nutritious veſſels of the plants. It would be eaſy to ſhew, neverthelefs, that reducing the earth into ſmall parts is only one means of fertilization, and not even conſtant in every circumſtance; that the fitting earth to enter plants by mechanical action is an error, as it never does enter plants at all in a ſolid, undiſſolved ſtate; and that when earth is in the moſt pulverized and incohering ſtate, it is leaſt fertile or capable of ſupporting plants. However, the fact is certain, though for different reaſons, that ſtiff and cohering earth, broken and expoſed to the air, does gain a conſiderable degree of fertility, and is capable of yielding copious crops of ſome kinds of vegetables, which it would not otherwiſe bear. Doſſie's Mem. of Agriculture, vol. i. p. 74. See HUSBANDRY.

HOFFMANISTS, in *Eccleſiaſtical Hiſtory*, denote thoſe who eſpouſed the ſentiments of Daniel Hoffmann, profeſſor of the univerſity of Helmſtadt, who, from the year 1598, maintained, that philoſophy was a mortal enemy to religion; and that what was true in philoſophy was falſe in theology. Theſe abſurd and pernicious tenets occaſioned a warm and extenſive controverſy: at length Hoffman was compelled, by Julius, duke of Brunſwick, to retract his inveCtives againſt philoſophy, and to acknowledge, in the moſt open manner, the harmony and union of ſound philoſophy with true and genuine theology.

HOG, *ſus*, in the *Linnæan Syſtem of Zoology*, a diſtinct genus of animals, of the order of *belluæ* and claſs of *mammalia*: the characters of which are, that the upper fore-teeth are four in number and convergent; thoſe of the lower jaw are ſix and prominent; the canine teeth of the upper jaw are two, and ſhoot; thoſe of the under jaw are ſingle and thruſt out; the ſnout is truncated, prominent, and moveable. Of this genus are the common *hog*, the Guinea *hog* or PORCUS *Guineenſis*, the Mexican muſk *hog* or TAJACU, the *hydrochœris* or CAPYBARA, and the BABYROUSA.

The common *hog*, or *ſus ſcrofa* of Linnæus, is covered with briſtles: in a wild ſtate it is of a dark brinded colour, and under the briſtles there is a ſoft curled hair; the ears are ſhort and a little rounded: in its tame ſtate, the ears are long, ſharp-pointed, and flouching; the colour is generally white, ſometimes mingled with other colours. The *hog*, in its wild ſtate, is found in moſt parts of Europe, except the Britiſh iſles and the countries north of the Baltic; in Aſia, from Syria to the borders of the lake Baikal; in Africa, on the coaſt of Barbary; and in the foreſts of South America.

Tame *hogs* are found univerſally, except in the frigid zone and Kamtſchatka, and ſuch places where the cold is very ſevere. The Chineſe *hog* is only a variety of the common *hog*; its belly hangs almoſt to the ground, its legs are ſhort, its tail reaches to the heels, and the body is generally bare: it is a much cleaner animal than ours. *Hogs* are ſtupid and voracious animals; inſomuch that they will eat their own offspring and devour even infants: but it is obſerved, that the *hog* is not indiſcriminate in the choice of its food; for it has been found to eat ſeventy-two ſpecies of vegetables, and to reject a hundred and ſeventy-one. In America it clears the country of rattle-ſnakes, which it eats with ſafety. *Hogs* cannot bear exceſſive cold, and are very reſtleſs in high winds. There are few animals that are uſeful in a greater variety of ways than *hogs*: they are extremely profitable; their fleſh is agreeable and wholeſome food to thoſe who are much exerciſe; and as it takes ſalt better than any other kind, it is of great importance to a commercial nation. *Hogs* furniſh greaves, and lard, and briſtles. In Minorca, the ſkin and the fat are uſed together to plough the land; and the *hog* has been applied to the ſame uſe in our own iſland, viz. in that part of Murray which lies between the Spey and Elgin. Pennant. See BOAR.

Theſe animals are very profitable to the owner, being kept at ſmall expence, feeding on things that would be otherwiſe thrown away, and producing a very large increaſe. They are apt to dig up the ground and to break fences; but this may be prevented, by putting rings in their noſes, and yokes about their necks. Leiceſterſhire, Northamptonſhire, and Hampſhire, are famous for theſe animals, which ſeems owing to their being clayey countries, and that more beans and peas are ſown there than in other places. The wild kind never grow ſo large as the tame, but they are much better taſted. The keepers of *hogs* ſhould always chuſe ſuch boars for the purpoſe of breeding as are long-bodied, and have deep bellies and ſides, ſhort noſes, thick thighs, ſhort legs, high claws, a thick neck, and a thick chine, well ſet with large briſtles. It is not proper to keep too many breeding ſows; for they will produce ſo many young at a time, and this three times a year, that they will not find food enough. They uſually bring thirteen or fourteen young ones in a litter, ſometimes more, but they can bring up no more than they have teats to ſuckle. Young ſhoots, as they are called, that is, ſwine of three quarters of a year old, are beſt for pork, and thoſe of a year and a half for bacon. The male pigs that are reared ſhould be gelt, and the ſows ſpayed; and for this purpoſe, thoſe which are pigged in the ſpring are the beſt. Moiſt and ſedgy grounds are good for ſwine, for they eat the roots of many of the plants that grow there; and the fruit of the beech, chefnut, and hedge buſhes, fatten them well, and make their fleſh much better taſted than when bred entirely in the ſtye. Mortimer's Huſbandry, p. 253.

Mr. Young obſerves, that *hogs* may be kept in ſummer, with great advantage to the farmer, in clover-fields; and that lucerne is ſuperior to clover for this purpoſe, and that ſainfoin is very good; but that burnet is very bad. In winter they may be well maintained with carrots, parſnips, beets, and potatoes. The dairy ſhould be appropriated to rearing pigs and feeding ſows that have young. It appears, from other experiments of this writer on the fattening quality of ſeveral ſort of food for *hogs*, that pollard alone is a cheaper food than peas alone; that boiled carrots are much the moſt profitable; that buckwheat is more profitable than peas; that ſeveral kinds of food mixed are better than any given alone; that the meal of any one, or various kinds of grain, is better and more profitable than the whole grain mixed or alone; and that peas and barley are much ſweeter food than beans. The keeping of *hogs* in any city or market town is indictable as a public nuiſance.

The dung of *hogs* is one of the richeſt manures we are acquainted with. See DUNG.

The farmers who uſe the dung for their lands, generally take care to ſave it by well paving the ſtyes, and increaſe the quantity by throwing in bean-ſtalks, ſtubble, and many other things of a like kind; and, by good management of this kind, many farmers have procured fifty or ſixty load of excellent manure a year out of a ſmall ſtye. The very beſt way of uſing this dung is to mix it with horſe-dung; and, for this reaſon, it is beſt to have the ſtye near the ſtable, that the two cleanſings may be mixed in one heap, and uſed together.

They have, in many parts of Staffordſhire, a poor, light, ſhallow land, on which they ſow a kind of white pea. The land is neither able to bear this, nor any thing elſe, to their advantage, for reaping. But when the peas are *ripe*, they turn in as many *hogs* as the quantity of peas will fatten, ſuffering them to live at large, and remain there day and night; and, in conſequence of this, the land will produce good crops of hay for ſeveral years afterwards, or, if too poor for that, it will, at the worſt, raiſe graſs enough to make it a good paſture-ground.

*Hedge-*HOG, *erinaceus*, in *Zoology*, a genus of animals of the order of *feræ*, in the claſs of *mammalia*. The characters of this genus are theſe: that the upper fore-teeth are two in number and diſtant, and that the lower are two and leſs diſtant; the canine teeth are two on both ſides, and recumbent. Of this genus there are three ſpecies, viz. the European or common *hedge-hog*, the American *hedge-hog* without ears, and the Malacca *hedge-hog* or porcupine with pendulous ears.

The head and ſnout of the European *hedge-hog* reſemble thoſe of a *hog*, but the noſtrils and extremity of the ſnout have more reſemblance to thoſe of a dog; the noſtrils are narrow, and bordered on each ſide with a looſe flap; the ears are broad and like thoſe of the mouſe kind, and its eyes are ſmall and prominent; its legs reſemble thoſe of the dog, and each foot has five toes, all armed with ſharp claws; of theſe the inner is ſhorter than the reſt; the upper part of the face, the ſides, and rump, are covered with ſtrong courſe hair, reſembling briſtles, of a yellowiſh cinereous colour; the back with ſtrong ſharp ſpines of a whitiſh colour, with a black bar through their middle; the tail is an inch long, and the length from the noſe to the tail is ten inches. See *Tab.* II. *Quadrupeds*, N° 19.

The *hedge-hog* is a nocturnal animal, keeping retired in the day, and in the night ſearching for food. It generally reſides in ſmall thickets, in hedges, or in ditches covered with buſhes; its food is roots, fruits, worms, and inſects; and it is unjuſtly reproached with ſucking cows and hurting their udders, which is impoſſible on account of the ſmallneſs of its mouth.

The *hedge-hog* is a mild and patient animal, and in the proſpect of injury rolls itſelf into the form of a ball, in which ſtate it is ſaid to lie torpid during winter, and is then invulnerable. Pennant.

Hedge-HOG, *ſea*. See ECHINODERMA, CENTRONIA, and *Sea* URCHIN.

HOG'-*fennel*, *in Botany*, the Engliſh name of a genus of plants, called by botaniſts *peucedanum*. See *Hog's* FENNEL.

HOG-*plum*, the name of a diſtinct genus of plants, called by authors *ſpondias*. See PLUM.

HOG-*weed*, the name of a diſtinct genus of plants, of the *monandria monogynia* claſs, called by Linnæus *Boerhaavia*. Its characters are theſe: the flower hath one bell-ſhaped petal, which is pentangular, and entire; it hath in ſome ſpecies one, in others two ſhort ſtamina; the germen is ſituated below the receptacle, and becomes a ſingle oblong ſeed, having no cover. According to Miller there are four ſpecies, natives of warm climates; but Linnæus reckons ſix.

This plant is nearly allied to the valerians.

HOG *ſheer*, among *Hunters*, a wild boar of three years old. See HUNTING.

HOG, on board of a *Ship*, is a ſort of flat ſcrubbing broom, formed by incloſing a number of ſhort ſwigs of birch or ſuch wood, between two pieces of plank faſtened together, and cutting off the ends of the twigs, and ſerving to ſcrape the filth from a ſhip's bottom, under water, particularly in the act of BOOT-*topping*. For this purpoſe they fit to this broom a long ſtaff, with two ropes; one of which is uſed to thruſt the *hog* under the ſhip's bottom, and the other to guide and pull it up again, cloſe to the planks. This buſineſs is commonly performed in the ſhip's boat, which is confined as cloſe as poſſible to the veſſel's ſide during the operation, and ſhifted from one part of the ſide to another, till the whole is completed. Marine Dict.

HOGGET, or HOGREL, is a young boar of the ſecond year.

HOGGENHINE, HOGANHEYNE, or rather AGENHINE, q. d. *own ſervant*. See THIRD *night own hind*.

HOGI, in the *Eaſtern Countries*, as at Cairo, is an under attendant on the moſque, who is the reader under the ſheick.

HOGOE, properly HAUT-GOUT, a meſs in cookery, ſo denominated from its high favour, or reliſh.

HOGSHEAD, a meaſure, or veſſel, of wine or oil; containing the fourth part of a tun, or ſixty-three gallons. Two of theſe *hogſheads* make a pipe or but. See MEASURE. The diſtillers weigh their veſſels when full, and for a *hogſhead* allow four hundred weight, two quarters, and twenty-two pounds, caſk and liquor.

HOIST, in *Sea Language*, denotes the perpendicular height of a flag or enſign, as oppoſed to the *fly*, which ſignifies its breadth from the ſtaff to the outer edge.

HOISTING ſignifies the operation of drawing up any body by the aſſiſtance of one or more tackles. *Hoiſting* is never applied to the act of pulling up any body by the help of a ſingle block, except in the exerciſe of extending the ſails, by drawing them upwards along the maſts or ſtays, to which it is invariably applied. Mar. Dict.

HOITLALLOTL, *in Ornithology*, the name of an American bird, deſcribed by Nieremberg, and called by him *avis longa*. It is very remarkable for the ſwiftneſs of its running, and is of a very long ſhape, having alſo a long tail; its beak is alſo very long, black above, and grey underneath; its tail is green, and has all the ſplendour and beauty of the peacock's; its whole body is of a whitiſh yellow, and near the tail of a blackiſh yellow; but the ſhoulders are black, with white ſpots; it does not fly high, nor very well, but runs ſo faſt as is ſcarce to be conceived. It is but an ill-taſted bird.

HOITZILOTXITL, *in Botany*, a name by which ſome authors have called the tree which affords the balſam of Peru.

HOITZITZIL, in *Ornithology*, the name by which ſome authors have called the guainumbi, or HUMMING-*bird*, the ſmalleſt of all birds.

HOITZITZILIN, in *Ornithology*, the name of a beautiful American bird, deſcribed by Nieremberg. The Indians prodigiouſly eſteem this bird, and uſe its feathers in ornamenting their images. It is not lawful to kill it, only to ſtrip it of its feathers, and then turn it looſe; and this no one may do but the principal perſon of the place. The method of getting their feathers, according to Hernandez, is the inviting them to ſome boiled Indian wheat, and placing lime twigs in their way. They fly in large flocks, and ſit together on trees, making a confuſed hiſſing noiſe. They breed in the holes of trees.

HOKE-DAY, HOCK-DAY, or HOCK-TUESDAY, in *our Ancient Cuſtoms (Dies Morsii, quem quindenam poſcha colunt)* the ſecond Tueſday after Eaſter week; a ſolemn feſtival celebrated for many ages in England, in memory of the great ſlaughter of the Danes in the time of king Ethelred II. in 1002; they having been, in that reign, almoſt all deſtroyed in one day in the different parts of the kingdom, and that principally by women. Mr. Bryant apprehends, that a holiday could not have been inſtituted for the commemoration of ſo cruel an event, which afforded matter for humiliation and ſorrow rather than of feſtivity and mirth. Others have therefore, thought, that *Hoke-day* alluded to the death of Hardicanute, the laſt monarch of the Daniſh race, at a marriage feaſt in Lambeth, on the 8th of June, 1042: by whoſe death, the Engliſh were for ever releaſed from the wanton inſults, and boundleſs exactions of him and his countrymen. See a Memoir on *Hoke-day*, by the Rev. Mr. Denne, in the Archæologia, vol. vii. p. 244. This is ſtill kept up in ſome counties, and the women bear the principal ſway in it, ſtopping all paſſengers with ropes and chains, and exacting ſome ſmall matter from them to make merry with. This day was very remarkable in former times, inſomuch as to be uſed on the ſame footing with Michaelmas, for a general term or time of account. We find leaſes without date referring ſo much rent payable *ad duos anni terminos, ſcil. ad le hoke-day, & ad feſtum ſancti Michaelis*. In the accounts of Magdalen college, Oxford, there is yearly an allowance, *pro mulieribus hockantibus*, of ſome manors of their's in Hampſhire; where the men *hock* the women on Mondays, and the women *hock* them on Tueſdays. The meaning of it is, that, on that day, the women in merriment ſtopped the way with ropes, and pulled paſſengers to them, deſiring ſomething to be laid out for pious uſes.

HOKE-DAY *money*, or HOKE-TUESDAY *money*, a tribute anciently paid the landlord, for giving his tenants and bondmen leave to celebrate *hock-day*, or *hoke-day*, in memory of the expulſion of the domineering Danes.

HOLCE, ὁλκὴ, a word uſed by ſome of the Greek authors, as the name of a dram weight; and by others, as Dioſcorides, &c. to ſignify a weight in general.

HOLCUS, the name by which the antients called the common gramen ſecalinum, or rye-graſs, commonly called by us barley-graſs, or wild baſtard barley; a low graſs, with a large bearded ear, growing under old walls.

HOLCUS, in the Linnæan ſyſtem of *Botany*. See *Indian* MILLET.

HOLD, in the *Manege*. See RETAIN.

HOLD *of a ſhip*, the loweſt part of the ſhip, including all that part of her inſide lying between the floor and the lower deck, through her whole length. See *Tab. Ship. fig.* 2. *lit. G. fig.* 2. *n.* 116.

The *hold* is the ſtore-room in a merchant ſhip, or the place wherein the goods, at leaſt all the heavier and more cumberſome, are ſtowed: the reſt are diſpoſed between the two decks; at leaſt in Dutch ſhips, which have their *holds* very ſhallow, and the ſpace between the decks very high. The *hold* contains the ballaſt, proviſions, and ſtores, of a ſhip of war. The ſeveral ſtore-rooms are ſeparated by bulk-heads, and are denominated according to the ſeveral articles they contain, the ſail-room, the bread-room, the fiſh-room, the ſpirit-room, &c.

To find the burden of a ſhip, the *hold* is to be meaſured.

HOLD, *in Sea Language*, is underſtood to ſignify a particular ſituation with regard to the ſhore, by which ſhe is enabled to keep within a ſufficient diſtance, to facilitate her *courſe*, or anſwer ſome other important object. *Keep a good hold of the land*, implies to keep near, or in ſight of the land.

HOLD, *after*, denotes that part of the *hold* which lies abaft the main-maſt.

HOLD, *fore*, is that part of the *hold* which is ſituated in the fore-part of the ſhip, or before the main hatchway.

HOLD *its own*, at *Sea*. A ſhip is ſaid to *hold* its own, that keeps its courſe right forward.

HOLD, *to rummage the*, at *Sea*, is to remove and clear the goods and things therein.

HOLD, *ready the*, in the *Sea Language*. See READY.

HOLD, *to trim the*. See TRIM.

HOLD, *ſtowing the*, a ſea-phraſe for taking goods into the *hold*. See STOWAGE.

HOLD, in *Muſic*, is a mark, like an arch, with a point in the middle of it, placed over ſome ſingle notes, which has been uſed to ſignify that ſuch note is to be made longer than ordinary; but it now more commonly denotes that the long ends there, and is only uſed when the ſong ends with a repetition of the firſt ſtrain, or part of it.

HOLDE, in our *Old Law-Books*, is uſed for the bailiff of a city or town; and ſometimes for a general.

HOLD-FAST, an iron hook, in ſhape of the letter S, fixed in a wall, to retain and ſupport it.

This term alſo denotes a tool uſed by joiners, &c. which goes through their benches, to hold faſt ſuch work as cannot be finiſhed by being held in the hand.

HOLDING *on*, in *Sea Language*, is the act of pulling back the hand-part of any cable, or other rope, which is heaved round by the capſtan or windlaſs, or drawn in by the purchaſe of a tackle. As there are only a few turns of any rope upon the barrel of the capſtan or windlaſs, when it is employed in heaving, an equal quantity of the rope will neceſſarily come off from the capſtan at the ſame time; and this is accordingly pulled back as ſtrongly as poſſible, to prevent it from forging or jerking round the barrel, by being held too looſely; ſo that *holding on* denotes the act of retaining any quantity of rope, acquired

quired by the effort of a capſtan, windlaſs, or tackle, as theſe are employed in hoiſting as well as in heaving. Mar. Dict.

HOLDING *water* ſignifies the operation of ſtopping a boat in her courſe, by *holding* the oars in the water, and bearing the blade or flat part ſtrongly againſt the current made along-ſide, by her paſſing ſwiftly through the water.

HOLDING *over a term*, &c. in *Law*. By 4 Geo. II. cap. 28. in caſe any tenant for life or years, or other perſon claiming under or by collution with ſuch tenant, ſhall wilfully *hold over* after the determination of the term, and demand made in writing for recovering the poſſeſſion of the premiſes, by him to whom the remainder or reverſion ſhall belong; ſuch perſon ſo *holding over*, ſhall pay for the time he continues at the rate of double the yearly value of the lands ſo detained. See EJECTMENT.

HOLE, in *Anatomy*, denotes ſuch a cavity of a bone as penetrates from one ſide to the other.

HOLE, *Black*, or *Calcutta*, denotes a place of confinment, eighteen feet by eighteen feet, containing three hundred and twenty-four ſquare feet; in which a hundred and forty-ſix perſons were ſhut up by order of the viceroy; ſo that there was a ſquare foot for each perſon of twenty-ſix inches and a half by twelve inches, which was juſt ſufficient to hold them, without preſſing violently upon each other. To this dungeon there was only one ſmall grated window; and the weather being very ſultry, the air within could neither circulate nor be changed. In leſs than an hour after their being incloſed, many of the unhappy people were ſeized with extreme difficulty of breathing, ſeveral were delirious, and the place was filled with incoherent ravings, and exclamations of diſtreſs; the cry of *water! water!* was predominant. This was handed to them by the centinels, but had no effect in allaying their thirſt. In leſs than four hours, many were ſuffocated, or died in violent deliriums. In an hour more, the ſurvivors, except a few at the gate, were to the higheſt degree phrenitic and outrageous. At length thoſe at the grate became ſo inſenſible, that we have no account of what happened, till they were releaſed at ſix o'clock next morning, having been confined from ſeven the preceding evening. Such were the effects of animal effluvia in a cloſe and unventilated place, in the ſpace of eleven hours, that out of a hundred and forty-ſix perſons, no more than twenty-three came out alive, and thoſe in a high putrid fever, of which, however, by freſh air &c. they gradually recovered.

HOLIBUT, or HOLIBUT, in *Ichthyology*, a name given by the people of ſome parts of England to the turbot in general; but in other parts only to the larger iſhes of that ſpecies. See HIPPOGLOSSUS.

HOLLAND, in *Linen Drapery*, a fine, white, even, cloſe kind of linen cloth, chiefly uſed for ſhirts, ſheets, &c.

It is principally wrought in the provinces of Holland, Friſeland, and other parts of the United Provinces; whence the appellation.

The principal mart or ſtaple of this cloth is at Haerlem, whither it is ſent from moſt other parts, as ſoon as wove, there to be whitened in the enſuing ſpring.

That manufactured in Friſeland is the moſt eſteemed, and called *Friſe Holland*. It is the ſtrongeſt and the beſt coloured of any of that fineneſs: it is never calendered, nor thickened, as the reſt; but it is imported juſt as it comes from the whitſter: it is diſtinguiſhed by its being yard quarter and half wide; which is half a quarter more than thoſe commonly called *Friſe Hollands*, which are not right.

HOLLAND, *gulix*, is very white and fine, and is chiefly uſed for ſhirts, being the ſtrongeſt of any for its fineneſs, except true Friſe. It is juſt yard wide.

HOLLAND, *Aleman*, is a very ſtrong cloth, and wears exceeding well. It is about yard quarter and half wide.

HOLLI, the Indian name for what the Spaniards call *ulli*; a reſinous liquor, which flows ſpontaneouſly from the tree *bojnaghaſtli*, or *chilli*. It is often mixed with chocolate in the making, in the proportion of one fourth part; it gives the chocolate in this caſe no very diſagreeable flavour; and becomes a very powerful medicine in dyſenteries. It is uſual, however, before the making it, to mix the cacao and *holli* on an iron plate, and toaſtify them thoroughly together.

HOLLOA, in *Sea Language*, is an exclamation of anſwer to any perſon who calls to another to aſk ſome queſtion, or to give a particular order. It is alſo the firſt anſwer in hailing a ſhip at a diſtance.

HOLLOW, in *Architecture*, a concave moulding, about a quadrant of a circle, by ſome called a CASEMENT, by others an ABACUS.

HOLLOW *root*, in *Botany*. See FUMITORY, and MOSCHATELLINA.

HOLLOW *ſquare*, in *Military Language*, is a body of foot, drawn up with an empty ſpace in the middle, for the colours, drums, and baggage; faring and covered by the pikes every way, to oppoſe the horſe.

HOLLOW *tower*, in *Fortification*, is a rounding made of the remainder of two briſures, to join the curtin to the priſon, where the ſmall ſhot are plaid, that they may not be ſo much expoſed to the view of the enemy.

HOLLOW *toothed horſe*, in the *Manege*. See SHELL-*toothed*.

HOLLOWNESS *of trees*. This is one of the moſt miſchievous diſtempratures to which trees are ſubject. It is generally occaſioned by the LOPPING of them in an improper manner, and leaving the wet to fall in upon them, eſpecially on their heads. When this miſchief is found out in its beginning, the only method is to cut the trunk off to the quick, ſacrificing the whole *hollow* part: if, in this caſe, to be cut off ſloping, that the wet may run off from it. All ſoft woods are liable to this miſchief, after the lopping, particularly the elm; and when it takes hold of any tree, it grows upon it daily, till the whole ſubſtance of the tree is at length eaten away, and only a coat of bark is left. The beſt way of preventing it in the elm is never to cut off the head or top of the trees at all, but only to lop the ſide branches; theſe will yield a very large quantity, and the body of the tree will thrive the better for their being often cut off, and will be good timber at laſt. Theſe tall elms ſometimes grow *hollow* from another cauſe, that is, from the decay of ſome of the large roots; but the ſtarving condition of its branches will ſhew this, though there be no external mark on it. This ſort of *hollowneſs* always begins at the bottom of the tree. Blaſted parts of the trees are to be cut away to the quick, in the ſame manner as the hollow ones, and the wounds will heal in the ſame manner.

HOLLY, *Ilex*, in *Botany*, a genus of the *tetrandria digynia* claſs. Its character are theſe: they have male, female, and hermaphrodite flowers, on diſtinct plants, and often on the ſame tree; the male flowers have a permanent empalement of one leaf, indented in four parts; they have but one petal, cut into four ſegments, and have four awl-ſhaped ſtamina; the female flowers have their empalements and petals the ſame as the male, but have no ſtamina; in the centre is placed a roundiſh germen, which becomes a roundiſh berry with four cells, each containing a ſingle hard ſeed. There are three ſpecies, including many varieties.

The common *holly* grows naturally in woods, and foreſts in many parts of England, where it riſes from twenty to thirty feet high, and ſometimes higher. It is a beautiful tree in the winter, and therefore merits a place in all plantations of evergreen trees and ſhrubs. *Holly* was formerly planted for HEDGES, and is a very proper plant for that purpoſe.

The ſeeds of the *holly* never come up the firſt year, but lie in the ground as the haws do. The berries therefore ſhould be buried in the ground one year, and then taken up and ſowed at Michaelmas upon a bed expoſed only to the morning ſun. In this bed the plants may remain two years, and then ſhould be tranſplanted in the autumn into beds about ſix inches aſunder, where they may ſtand two years longer, and then they will be ſtrong enough to be tranſplanted to the ground in which they are to remain.

The beſt time for tranſplanting the *holly* is in autumn, eſpecially in dry land; but if the ſoil is cold or moiſt, they may be ſafely tranſplanted in the ſpring. Miller.

Holly-hedges are a very beautiful ever-green and ſtrong fence, but liable to periſh in hard winters. It has been ſuppoſed, that the ſeverity of the cold in theſe ſeaſons was the occaſion of this; but a cloſer obſervation has ſhewn, that the miſchief is owing to the field-mice, which in very ſevere ſeaſons, when they can get at nothing elſe, diſbark the roots of theſe ſhrubs. The method of preſerving theſe hedges, in ſuch ſeaſons, is found to be by clearing away the weeds which are a harbour to theſe little animals, and placing traps and boxes in proper places, with a paſte made of butter and ratſbane, daubed over their inſides, and holes made in their ſides no bigger than what the mice or rats, if there be any there, can creep into; and thus the vermin are deſtroyed, and the miſchief which might attend ratſbane being expoſed, are prevented. See FENCE.

The berries of *holly* are hot and dry, of thin parts, and expel wind. They are good againſt the colic; ten or twelve being taken inwardly, bring away by ſtool thick phlegmatic humours.

The BIRDLIME which is made of the bark is no leſs hurtful than that of miſſetoe, if taken inwardly, by gluing up the inteſtines. *Holly* beaten to powder, and drunk, is an experienced medicine againſt all fluxes of the belly, as the dyſentery, and the like. James.

The timber of *holly* is the whiteſt of all hard wood, takes a fine poliſh, and is therefore uſed by the inlayers. See MARQUETRY.

It is alſo uſed for all ſturdy uſes, and therefore preferred to all

all others by the mill-wright, turner, and engraver. It makes the beſt handles and ſtocks for tools, flails, curt-whips, bowls, ſhivers, and pins for blocks; and is excellent for door bars, &c.

HOLLY, *knee*, a name ſometimes given to the *ruſcus*, or BUTCHERS-*broom*.

HOLLY, *ſea*, the name by which ſome call the *eryngium* of botanical writers. See ERYNGO.

HOLLYHOCK, or *Roſe-mallow*, *Alcea*, in *Botany*, a genus of the *monadelphia polyandria* claſs. Its characters are theſe: the flower has a double empalement, of which one is permanent, and cut into ſix parts; the inner is larger, and ſlightly cut into five; the flower is compoſed of five petals, which coaleſce at their baſe, and ſpread open at the top in the form of a roſe; in the centre is placed a round germen, ſupporting a ſhort cylindrical ſtyle, with many ſtamina joined below to the pentagonal column, and ſpread open at the top; the germen afterward becomes a round, depreſſed, articulated capſule, having many cells, in each of which is lodged one compreſſed kidney-ſhaped ſeed. There are two ſpecies.

We have many varieties of this plant cultivated in our gardens, for the beauty of their flowers. They are all propagated from ſeeds, which are to be ſown about the middle of April, upon a bed of light earth, and covered with the ſame earth about half an inch deep. When the plants are come up pretty ſtrong, and have put out ſix or eight leaves, they ſhould be tranſplanted out into nurſery beds at about a foot diſtant from one another. They muſt be watered till they have taken root, and will then require no farther care for ſummer, but being kept clear of weeds. In October following they ſhould be tranſplanted into the places where they are to remain, and ſet in rows of two feet diſtance, and at a foot from each other in the rows where they may flower; and when it is obſerved which roots produce the fineſt flowers, thoſe ſhould, at the next Michaelmas, be tranſplanted into garden beds, where they will live four or five years; after which they grow weak, and ſhould be replaced by new ones. When the ſtalks of the plants begin to decay, they ſhould be cut down cloſe to the ground, otherwiſe they are apt to rot and deſtroy the roots.

HOLM, HULMUS, ſignifies as much as *inſula amnica*, a river-iſland, according to Bede: or a plain, graſſy ground, upon the water-ſide, or in the water, according to Camden.

Where any place is called by the name *holm*, or where this ſyllable is joined with any other in the name of a place, it ſignifies it to be ſurrounded with waters. As the *ſtatholmes*, the *flatholmes*, near Briſtol. If the ſituation of the place be not near the water, it may ſignify a hilly place; for *holm*, in Saxon, alſo ſignifies a *hill*, or *cliff*.

HOLM *oak*. See OAK.

HOLOCAUST, Ὁλοκαύτωσις, formed from ὅλος, *whole* and καίω, *I conſume with fire*, a kind of ſacrifice, wherein the whole offering is burnt or conſumed by fire; as an acknowledgment that God, the creator, preſerver, and lord of all, was worthy of all honour and worſhip, and as a token of men's giving themſelves entirely up to him. It is called alſo, in Scripture, a *burnt-offering*.

Sacrifices of this ſort are often mentioned by the heathens as well as Jews; particularly by Xenophon, Cyropæd. lib. viii. p. 464. ed. Hutchinſ. 1738, who ſpeaks of ſacrificing *holocauſts* of oxen to Jupiter, and of horſes to the Sun; and they appear to have been in uſe long before the inſtitution of the other Jewiſh ſacrifices by the law of Moſes. See Job i. 5. chap. xlii. 8. Gen. xxii. 13. chap. viii. 20. On this account, the Jews, who would not allow the Gentiles to offer on their altar any other ſacrifices peculiarly enjoined by the law of Moſes, admitted them by the Jewiſh prieſts to offer *holocauſts*; becauſe theſe were a ſort of ſacrifices prior to the law, and common to all nations. During their ſubjection to the Romans, it was no uncommon thing for thoſe Gentiles to offer ſacrifices to the God of Iſrael at Jeruſalem. Vide Philo. Opera, p. 801. E. Ed. Colon. Allobr. 1613. Tertullian. Apolog. § 26 p. 26 ed. Rigalt. 1675.

Holocauſts were deemed by the Jews the moſt excellent of all their ſacrifices. It is ſaid, that this kind of ſacrifice was in common uſe among the heathens, till Prometheus introduced the cuſtom of burning only a part, and reſerving the remainder for his own uſe. See SACRIFICE.

HOLOGRAPHUM, compoſed of ὅλος, *all*, and γράφω, *I write*, in the *Civil Law*, ſomething written wholly in the hand-writing of the perſon who ſigns it.

The word is chiefly uſed in ſpeaking of a TESTAMENT, written wholly in the teſtator's own hand.

The Romans did not approve of *holographic* teſtaments; and, though Valentinian authorized them by a novel, they are not uſed where the civil law is in full force.

HOLOMETER, compoſed of ὅλος, *all*, and μέτρον, *I meaſure*, a mathematical inſtrument ſerving univerſally for the taking of all ſorts of meaſures, both on the earth and in the heavens.

The *holometer* is the ſame with what is otherwiſe denominated *pantometer*.

HOLOSCHÆNOS, in the *Materia Medica*, the name of the great bulruſh, or *juncus lævis maximus*, common in rivers.

HOLOSERICA *veſtis*, a garment entirely of ſilk, as the name imports, which was not uſed at Rome till the time of Heliogabalus.

HOLOSTEUM, in *Botany*, a genus of the *triandria trigynia* claſs; the calyx of which is five-leaved; the corolla conſiſts of five petals; and the *fruit* is a ſubcylindric ſingle-celled capſule, opening at the apex.

HOLOSTRUM, in *Ichthyology*, a name by which Bellonius, and ſome others, call the OSTRACION, a *ſiſh* of the river Nile, covered with a hard ſhelly ſkin, and approaching in its body to a pentangular form.

HOLOTHURIA, in *Natural Hiſtory*, a genus of ſea-worms of the order of *molluſca*, in the Linnæan ſyſtem. Theſe are diſtinguiſhed by a pliable, naked, gibbous body, terminated by the anus at one extreme, and furniſhed at the other with many tentaculæ, encompaſſing the mouth. Linnæus enumerates nine ſpecies.

HOLOTONICOS, a word uſed by ſome authors to ſignify an univerſal convulſion or rigor over the whole body.

HOLQUAHUILT, in *Botany*, a name by which ſome authors have called the tree which produces the Jeſuits bark.

HOLSOM. A ſhip *is* ſaid to be *holſom* at ſea, when ſhe will hull, try, and ride well, without rolling or labouring.

HOLT-*waters*. Theſe have been found by experience to be of admirable efficacy in all ſcorbutic and ſcrophulous caſes. An account of ſome very remarkable cures performed by them in theſe caſes, was printed ſeveral years ago; and though known to be fact in the place, was diſbelieved by almoſt every body beſide.

Mr. Lewis, formerly miniſter of the place, confirms their efficacy from his own obſervation; and obſerves, that they are of an attenuating, aſtringent, and drying nature. The firſt of theſe properties they poſſeſs in common with all waters which dilute, attenuate, and ſit the juices for paſſing the proper veſſels; their aſtringency they owe to the alum and iron which they contain; and their drying, abſorbing, and healing qualities, are probably owing to a quantity of ſulphur, and a fine light ochre, which they are impregnated with. Phil. Tranſ. N° 408.

HOLYNESS, or HOLINESS, ſanctity; the quality which conſtitutes or denominates a perſon or thing *holy*; i. e. pure, or exempt from ſin.

HOLYNESS is alſo uſed in reſpect of perſons and things that are ſacred; i. e. ſet apart to the ſervice of God, and the uſes of religion.

In this ſenſe we ſay, *holy* days, *holy* ordinances, the *holy* Bible, *holy* Goſpels, *holy* war, &c. The Roman catholics call the inquiſition the *holy* tribunal; the ſee of Rome, the *holy* ſee, &c.

Holy oil, *holy* water, &c. See UNCTION, WATER, &c.

Paleſtine is particularly called the *holy* land, and Jeruſalem the *holy* city. Princes formerly made a practice of going to ſignalize their religion in the *holy* land; who would have manifeſted the more genuine ſpirit of religion by ſtaying at home. See CROISADE.

In Romiſh countries, one third part of the year is taken up in *holy* days, ſaints days, &c. See FEASTS.

Urban VIII. iſſued out an edict in the year 1643 for diminiſhing the number of *holy* days.

In Scotland they obſerve no ſtated *holy* days, beſides Sundays.

HOLY *fire*. See FIRE.

HOLY *Thurſday* is what we otherwiſe call ASCENSION *day*.

HOLY *week* is the laſt week of Lent, called alſo PASSION-*week*.

HOLY *year* is ſometimes uſed for the year of JUBILEE.

In the Jewiſh tabernacle, and afterwards in the temple, there were two places; the one called the *holy*, *ſanctum*; and the other, which was more retired, the *holy of holies*, *ſanctum ſanctorum*, or the SANCTUARY.

The *holy* was ſeparated from the *holy of holies*, by a veil. In the latter place was the ark of the covenant kept.

HOLYNESS is alſo a title or quality, attributed to the POPE, as that of majeſty is to kings.

Anciently the ſame title, *holyneſs*, was given to all biſhops; as appears in St. Auguſtine, Fortunatus, Nicholas I. Caſſiodore, &c. St. Gregory compliments ſome of his contemporary biſhops with your beatitude, and your *holyneſs*.

The Greek emperors of Conſtantinople were alſo addreſſed under the title of *holyneſs*, on account of their being anointed with *holy* oil at their coronation. Du-Cange adds,

adds, that ſome of the kings of England have had the ſame attribute; and that the Orientals have frequently refuſed it to the pope.

HOLY GHOST, *order of the*, is a military order in France; the principal in point of dignity in that kingdom.

It was inſtituted by king Henry III. in 1569, in memory of three great events happening on the ſame day; viz. his birth, acceſſion to the crown of France, and election to that of Poland: the order is to conſiſt of a hundred knights only; who, to be admitted, are to make proof of their nobility for three deſcents.

The king is the grand-maſter, or ſovereign, and takes the oath as ſuch on his coronation day; whereby he ſolemnly vows to maintain, for ever, the order of the *Holy Ghoſt*; and not to ſuffer it to ſhrink, fail, or diminiſh, ſo long as it is in his power to hinder it; nor ever to attempt to alter or diſpenſe with any of the irrevocable ſtatutes of the order.

The knights are all to wear a gold croſs hung about the neck by a blue ſilk ribband, or collar; and the officers and commanders are alſo to wear a croſs ſewed on the left ſide of their cloaks, robes, and other upper garments. Before they receive the order of *Holy Ghoſt*, that of St. Michael is conferred, as a neceſſary degree; for which reaſon their arms are ſurrounded with a double collar.

HOLY GHOST, *croſs of the*, in *Heraldry*, conſiſts of a circle in the middle of a croſs, and on it the *Holy Ghoſt*, in figure of a dove: the four arms are drawn narrow from the centre, and widening to the ends, where the returning lines divide each of them into two ſharp points; upon each of which is a pearl.

From the intervals of the circle between the arms iſſue four fleurs-de-lis. This is the croſs worn by the knights of the order of the *Holy Ghoſt* in France.

HOLY-ROOD *day*, a feſtival obſerved by the Roman catholics, in memory of the exaltation of our Saviour's croſs. See CROSS and EXALTATION.

HOLY *roſe*. See *Roch* ROSE.

HOLY *thiſtle*. See *Bleſſed* THISTLE.

HOLY-WATER *ſprinkle*, among *Hunters*, ſignifies the TAIL of a fox

HOMAGE, in its general ſenſe, denotes the reverence, reſpect, and ſubmiſſion, which a perſon yields his maſter, lord, prince, or other ſuperior.

The word is formed of the Latin *home*, *man*; becauſe when the tenant takes this oath, he ſays, *Ego devenio home veſter, I become your man*; for the ſame reaſon *homage* is called *manhood*; ſo the *homage* of his tenant, and the *manhood* of his tenant, are the ſame. Coke on Litt. fol. 64.

HOMAGE, HOMAGIUM, HOMINIUM, in *Law*, is an engagement or promiſe of fidelity; which the vaſſal, or tenant, who holds a fee, renders to the lord, when admitted thereto.

In the original grants of lands and tenements, by way of fee, the lord did not only oblige his tenants to certain ſervices, but alſo took a ſubmiſſion, with promiſe and oath, to be true and loyal to him, as their lord and benefactor.

This ſubmiſſion, &c. is called *homage*; the form whereof, as appointed by ſtat. 17 Edward II. is in theſe words: When a free man ſhall do *homage* to his lord, of whom he holdeth in chief, he ſhall hold his hands together, between the hands of his lord, and ſhall ſay thus: "I be-"come your man, from this day forth, for my life, for "member, and for worldly honour; and ſhall owe you "my faith, for the land I hold of you; ſaving the faith "that I owe unto our ſovereign lord the king, and to "mine other lords."

In this manner the lord of the fee, for which *homage* is due, takes *homage* of every tenant, as he comes to the land, or fee. Glanvil, indeed, excepts women; who only perform *homage* by their huſbands; becauſe *homage* is ſuppoſed to have a more immediate relation to ſervice in war: but Fitzherbert denies this exception. Nat. Brev. fol. 157.

It is added, that biſhops do no *homage*, but only fealty; and probably for the ſame reaſon as women. Yet do we read, that the archbiſhop of Canterbury does *homage* on his knees to our kings, at their coronation; and that the biſhop of Man is *homager* to the earl of Derby.

Fulbeck reconciles this; by our law, ſays he, a religious man may do *homage*, but may not ſay to the lord, *Ego devenio home veſter*; becauſe he has already profeſſed himſelf to be only God's man; but he may ſay to him, "I "do unto you *homage*, and to you ſhall be faithful and "loyal."

Homage and FEALTY, or faith, are two diſtinct things, and different duties.

Originally *homage* was performed by the gentlemen, and fealty by the peaſant. Others ſay, that *homage* was that performed to the lord himſelf, and fealty to his ſeneſchal or ſteward, for his lord. It is added, that he who holds lands for term of life, owes *homage*, but not fealty.

Biſhops take the oath of fealty and loyalty to the king, for the temporalities they hold of him; but without *homage*, or vaſſalage.

HOMAGE-*liege*, a more extenſive kind of *homage*, whereby the vaſſal held of the lord, not only for his land, but for his perſon; ſo that the lord might uſe him againſt all mankind, whether within or without the kingdom; excepting againſt the king. See LIEGE.

This kind of *homage* was rendered bare-headed, with the hands joined on the Goſpels, and one knee on the ground, and without ſword, girdle, or ſpurs. By which it was diſtinguiſhed from *frank homage*.

There are alſo other diſtinctions of *homage*; as,

HOMAGE, *plain*, or *homage* of a fee; where no oath of fidelity is taken.

HOMAGE *of devotion*, which is a donation made to the church; and does not import any duty, or ſervice at all.

HOMAGE *of peace*, which a perſon makes to another after a reconciliation, as an aſſurance, that he will no longer diſturb his peace, &c.

HOMAGE, again, is divided into *new*, or that performed upon the grant of the fee; and *anneſtrel*.

HOMAGE, *anneſtrel*, is where a man and his anceſtors, time out of mind, have held their land of the lord, and his anceſtors, by *homage*.

If ſuch lord have received *homage*, he is bound to caquit the tenant againſt all other lords above him, of every manner of ſervice; and if the tenant has done *homage* to his lord, and is impleaded, and vouches the lord to warranty, the lord is bound to warrant him; and if the tenant loſe, he ſhall recover in value againſt the lord ſo much of the lands as he had at the time of the voucher, or any time after.

HOMAGE is alſo uſed for a jury, in a court-baron, becauſe, commonly conſiſting of ſuch as pay *homage* to the lord of the fee. See JURY, COURT-BARON, and MANOR.

HOMAGE is alſo taken, in ſome caſes, for the particular place, or diſtrict, where the ſervices are to be performed.

HOMAGER, a perſon that does, or is bound to do HOMAGE, to another.

HOMAGIO *reſpectuando*, a writ iſſued out to the eſcheator, commanding him to deliver ſeiſin of lands to the heir that is of full age, notwithſtanding his *homage* not being done.

HOMAGIUM *reddere* has been uſed to ſignify, to renounce homage: as where the tenant or vaſſal made a ſolemn declaration of diſavowing his lord, for which there was a form preſcribed by the feudatory laws.

HOME, in *Sea Language*, denotes either the ſituation of ſome object, where it retains its full force of action; or where it is properly lodged for convenience or ſecurity. In the former ſenſe it is applied to the ſails, and ſignifies, that their clues or lower corners are cloſe to the blocks upon the yard-arm, immediately beneath them: hence, to haul *home* the top-ſail-ſheets, is to extend the bottom of the top-ſail to the lower yard, by meane of the ſheets. In the latter ſenſe, it uſually refers to the ſtowage of the hold; as a caſk, &c. is ſaid to be *home*, when it bears againſt and lies cloſe to ſome other objects; or to the anchor, which is ſaid to come *home*, when it looſens from the ground, by the effort of the cable, and approaches the place where the ſhip floated, at the length of her moorings. Mar. Dict.

HOMER, OMER, or CHOMER, a Jewiſh meaſure, containing the tenth part of the EPHA. See CORUS and MEASURE.

HOMESOKEN, or rather HAMSOKEN; ſometimes alſo written HAMSOKA, and HAMSOKNA, the privilege or protection which every man enjoys in his own houſe.

Hamſokne, *hoc eſt quietus eſſe de amerciamentis pro ingreſſu hoſpitis violenter & ſine licentia camero pacem regis, & quod tentatis placita de huiuſmodi tranſgreſſionis in curia veſtra.* W. Thorn. 2036.

Hence, he who invades that freedom, is properly ſaid, *frangere homſecnam*.

This crime ſeems to amount to what we now call BURGLARY; which is a crime of a heinous nature, as being not only a breach of the king's peace, but a breach of that liberty which a man hath in his own houſe, which, as we commonly ſay, ſhould be his caſtle, and therefore ought not to be invaded. Bracton. lib. iii.

HOME-STALL, a manſion-houſe, or ſeat, in the country. Ruſh.

HOMICIDE, of *home*, *man*, and *cædo*, *I kill*, in *Common Law*, the killing of a man.

Homicide is divided into *involuntary* and *caſual*.

HOMICIDE, *caſual* is either *merely caſual*, or *mixed*. *Merely caſual* is when a perſon kills another by pure miſchance, being about his lawful occaſions; as in the caſe of an ax

ſlipping

slipping out of a man's hand, or falling off the helve while he is felling a tree.

It is accounted *mixed*, when there is a negligence, or some other unwarrantable circumstance, attending the action. See MANSLAUGHTER.

HOMICIDE, *voluntary*, is that which is deliberate, and committed with a set purpose, and mind to kill; and is either with a precedent malice or without. The former is murder, which is a felonious killing, with malice prepense, any person in the realm, living under the king's protection. See MURDER.

Judge Blackstone has distinguished *homicide* into three kinds; viz. *justifiable*, *excusable*, and *felonious*.

Justifiable homicide is such as is owing to some unavoidable necessity, without any intention or negligence in the person that kills; and, therefore, without any shadow of blame. Of this kind is the act of a magistrate, or officer, who puts a malefactor to death, in obedience to the law, and in the execution of public justice. *Homicide* is also *justifiable* for the advancement of public justice; as, where an officer, in the execution of his office, either in a civil or criminal case, kills a person that assaults or resists him; where an officer, or any private person, attempts to take a man charged with felony, but is resisted, and in the endeavour to take him, kills him; where officers, in case of a riot or rebellious assembly, endeavouring to disperse the mob, kill them; such officers are justified both by common law, and by the riot act, 1 Geo. I. cap. 5. Where prisoners are killed by the gaoler or officer, in endeavouring to prevent their escape; where trespassers in forests, parks, chases, or warrens, refuse to surrender to the keepers, they may be slain. 21 Edw. I. stat. 2. 3 and 4 W. and M. cap. 10. But in all these cases there must be an apparent necessity, without which this kind of *homicide* is not justifiable. When one champion killed another in battle, such *homicide* was justifiable, and was imputed to the just judgment of God. Moreover, such *homicide* as is committed for preventing any forcible and atrocious crime, is justifiable by the law of nature, and by the law of England. 24 Hen. VIII. cap. 25. Thus if any person attempts a robbery or murder, or endeavours to break open a house in the night-time, or to burn it, and should be killed in the attempt, the slayer shall be acquitted and discharged. This is agreeable to the Jewish law, Exod. xxii. 2. to the laws of Athens, and the Roman law of the Twelve Tables. The English law also justifies *homicide* in defence of CHASTITY.

Excusable homicide is such as the law excuses from the guilt of felony, though it implies some degree of fault and blame. This is either *per infortunium*, by misadventure (see *Casual* HOMICIDE, above), or *se defendendo*, upon a principle of self-preservation in a sudden affray. See CHANCE-*medley*.

With regard to this, it is proper to observe, that the term has been often erroneously applied to any manner of *homicide* by misadventure: whereas by 24 Hen. VIII. cap. 5. and our ancient books of law, it is properly applied to such killing as happens in self-defence, on a sudden rencounter. The true criterion between manslaughter and chance-medley, says judge Blackstone, seems to be this; when both parties are actually combating at the time when the mortal stroke is given, the slayer is then guilty of MANSLAUGHTER; but if the slayer hath not begun to fight, or, having begun, endeavours to decline any farther struggle, and afterwards, being closely pressed by his antagonist, kills him, to avoid his own destruction, this is *homicide* excusable upon self-defence; and, therefore, the law requires, that the person, who kills another in his own defence, should have retreated as far as he conveniently or safely can, to avoid the violence of the assault, before he turns upon his assailant; besides, if the person assaulted does not fall upon the aggressor till the affray is over, or when he is running away, this is revenge and not defence. These two species of *excusable homicide* are similar in their blame and punishment. They formerly incurred a forfeiture, as some say, of all their goods and chattels; according to others, only of part of them, by way of fine or WERE-GILD, which was probably disposed of, as in France, *in pios usus*, or for the benefit of his soul. But the delinquent has now a pardon, and writ of restitution of his goods, as a matter of course and right, only paying for suing out the same; and in most cases the judge will grant a general verdict of acquittal.

Felonious homicide is the act of killing a human creature, without justification or excuse. This is either self-murder (see FELO *de se*); or the killing of another man, which is divided into MANSLAUGHTER and MURDER. Blackst. Com. book iv. chap. 14.

HOMILY, ὁμιλία, formed of ὅμιλος, *assembly*, originally signifies a conference, or conversation; but the word has since been applied to an exhortation, or sermon, delivered to the people.

The Greek *homilia*, says M. Fleury, signifies a familiar discourse, like the Latin *sermo*; and discourses delivered in the church took these denominations, to intimate that they were not harangues, or matters of ostentation and flourish, like those of profane orators, but familiar and useful discourses, as of a master to his disciples, or a father to his children.

All the *homilies* of the Greek and Latin fathers are composed by bishops. We have none of Tertullian, Clemens Alexandrinus, and many other learned persons; because, in the first ages, none but bishops were admitted to preach.

The privilege was not ordinarily allowed to priests, till toward the fifth century. St. Chrysostom was the first presbyter that preached statedly. Origen and St. Augustine also preached, but it was by a peculiar licence, or privilege.

Photius distinguishes *homily* from sermon; in that the *homily* was performed in a more familiar manner; the prelate interrogating and talking to the people, and they, in their turn, answering and interrogating him; so that it was properly a conversation; whereas the sermon was delivered with more form, and in the pulpit, after the manner of the orators.

There are several fine *homilies* of the fathers still extant; and particularly of St. Chrysostom, St. Gregory, &c.

The practice of compiling *homilies*, which were to be committed to memory, and recited by ignorant or indolent priests, commenced towards the close of the eighth century; when Charlemagne ordered Paul Deacon, and Alcuin to form *homilies* or discourses upon the Gospels and Epistles, from the ancient doctors of the church. This gave rise to that famous collection, entitled the Homiliarium of Charlemagne, and which being followed as a model by many productions of the same kind, composed by private persons, from a principle of pious zeal, contributed much (says Mosheim) to nourish the indolence, and to perpetuate the ignorance of a worthless clergy. Eccles. Hist. vol. ii. p. 84. 8vo. ed. 1768.

At the time of the Reformation there were several of these *homilies* composed and printed, and ordered to be read in such churches as were not provided with a sufficiently learned minister, in order to prevent unsound doctrine being taught in remote country places.

HOMILIES, *Clementine*, in *Ecclesiastical History*, are nineteen *homilies* in Greek, published by Cotelerius, with two letters prefixed; one of them writ in the name of Peter, the other in the name of Clement, to James bishop of Jerusalem; in which last letter they are entitled Clement's Epitome of the Preaching and Travels of Peter. According to Le Clerc, these *homilies* were composed by an Ebionite in the second century; but Montfaucon supposes that they were forged long after the age of St. Athanasius. Dr. Lardner apprehends, that the *Clementine Homilies* were the original or first edition of the Recognitions; and that they are the same with the work confuted by Eusebius under the title of Dialogues of Peter and Appion. Credib. of the Gospel Hist. vol. iv. p. 809, &c.

HOMINE *capto in withernam*, a writ for apprehending him that has taken any bondman or woman, and led him or her out of the country; so that he or she cannot be replevied according to law. See WITHERNAM.

HOMINE *illigando ad custiendum pacem fagii pro mercatoribus edicti*, in *Law*, a writ directed to a corporation for the choice of a new person to keep one part of the seal appointed for *statutes merchant*, when a former is dead, according to the statute of Acton Burnel.

HOMINE *replegiando*, a writ for the bailing of a man out of prison, when he is confined without commandment of the king or his judges, or for any cause that is replevisable. But this writ is now seldom used; a writ of HABEAS *corpus* being sued out on the necessary occasions.

HOMINICOLÆ, formed of the Latin *homo*, *hominis*, *man*, and *colo*, *I worship*, in *Antiquity*, a name which the APOLLINARIANS gave to the orthodox, to denote them worshippers of man.

As the orthodox maintained, that Jesus Christ was God-man, the APOLLINARIANS accused them of adoring a man, and therefore called them *hominicolæ*.

HOMMOC, in *Sea Language*, signifies a hillock, or small eminence of land, resembling the figure of a cone, and appearing on the sea-coast of any country.

HOMO, *Man*, in *Zoology*. See MAN.

HOMOCENTRIC, composed of ὅμοιος, *similar*, and κέντρον, *centre*, in *Astronomy*, a term of the same import with CONCENTRIC.

HOMOCHROA, in *Natural History*, the name of a genus of PEBBLES.

The word is derived from the Greek ὅμοιος, *similar*, and χρόα,

χρωμα, *colour*, and expreſſes ſuch pebbles as are not veined, but all of one ſimple and ſimilar colour. Theſe are bodies compoſed of cryſtalline matter, conſiderably debaſed by earth, and this of various kinds in the different ſpecies, but only of one kind in the ſame ſpecies, which is thence always of one colour, and not ſubject to veins. Of this genus there are only five known ſpecies; the white, red, yellow, blueiſh, and greeniſh. All theſe are covered with external coats or cruſts, like thoſe of the common pebbles. Hill's Hiſt. of Foſſ. p. 510.

HOMODROMUS *vectis*, in *Mechanics*, a lever, in which the weight is in the middle between the power and fulcrum, or the power in the middle between the weight and fulcrum. See *Tab. Mechanics, fig.* 2. and 3.

The word *homodromous* is derived from ὁμος, *ſame*, and δρομος, *courſe*, becauſe in this ſpecies of lever the weight and power move in the ſame direction; as in the HETERODROMUS they move in contrary directions.

HOMOEOTELEUTON, ὁμοιοτελευτον, a figure in *Rhetoric*, whereby ſeveral verbs in a ſentence are made ſound alike: as, *ut dedoci, exuli quam ſeſſori malui.* Or, *ut vitia inviderſe, deſiderii ſuaſiſſe, loqueris edoſſe.*

HOMOGENEOUS, or HOMOGENEAL, compoſed of the Greek ὁμος, *like*, and γενος, *kind*, is a term applied to various ſubjects, to denote, that they conſiſt of ſimilar parts, or of parts of the ſame nature and kind: in contradiſtinction to heterogeneous, where the parts are of different natures, &c.

Natural bodies are generally compoſed of *homogeneous* parts, as a diamond, a metal, &c. Artificial bodies, on the contrary, are aſſemblages of heterogeneous parts, or parts of different qualities; as a building, of ſtone, wood, &c.

HOMOGENEAL *light*, is that whoſe rays are all of one and the ſame colour, degreee of refrangibility, and reflexibility. *See* LIGHT.

HOMOGENEAL *animals* and *plants*, are thoſe of the ſame kind and nature.

HOMOGENEAL *ſurds*, are ſuch as have one common radical ſign; as $\sqrt{27}$, and $\sqrt{3}$. See SURD.

HOMOGENEUM *comparationis*, in *Algebra*, the known quantity in an EQUATION; called alſo *abſolute number*.

It is called *homogeneum comparationis, & compariſon*, to diſtinguiſh it from the other terms; which though *homogeneous* as well as this, i. e. always raiſed to the ſame degree of power, are not the quantities to which things are here *compared* or referred.

HOMOGRAMMI, ὁμογραμμοι, among the *Ancients*, an appellation given to the athletæ who drew the ſame letter, and on that account were to engage together; for when any number of athletæ were to enter the liſts, in order to determine with whom every one ſhould contend, they threw into an urn a number of letters equal to that of the athletæ, but ſo that there were always two letters of a ſort, as two *a's*, or two *b's*. After theſe had been ſhaken together, the athletæ drew them out, and thoſe who got the ſame letter were to fight each other.

HOMOIOCATALECTON, ὁμοιοκαταληκτον, in *Rhetoric*, a figure wherein the different parts of a ſentence have the ſame termination.

Homoiocatalexion is uſed as a genus to denote ſimilar terminations and words; and *homoioptoton* and *homoiteleuton* are made its ſpecies.

HOMOIOMERICAL *principles*, of ὁμοιος, *ſimilar*, and μερος, *part*, a peculiar kind of principles, ſuppoſed by Anaxagoras in all mixed bodies; being determinate numbers of ſuch ſimilar principles, as when they came to be parts, e. gr. of an animal body, would there make ſuch maſſes and combinations as their nature required; viz. the ſanguinary particles would then meet together, and make blood, the urinous particles conſtitute urine, the oſſeous ones bones, the carneous fleſh, &c. See PRINCIPLE.

HOMOIOPTOTON, ὁμοιοπτωτον, a figure in *Rhetoric*, whereby the ſeveral parts of a ſentence end with the ſame caſe, or tenſe of a like ſound; e. gr. *mœrentes, flentes, lacherymantes, & miſerantes.* Iſocrates is particularly celebrated for this figure. Some of the beſt orators have induſtriouſly avoided this figure, becauſe it has too much the appearance of art.

HOMOLINON, a word uſed by ſome authors to expreſs crude flax, and by others for a coarſe ſort of flaxen linen, made of the rough threads unwhitened, which was uſed by the ancients for towels to rub people after bathing.

HOMOLOGATION, in the *Civil Law*, the act of confirming or rendering a thing more valid and ſolemn, by publication, repetition, or recognition thereof.

The word comes from the Greek ὁμολογια, *conſent, aſſent*, formed of ὁμος, *ſimilar, like*, and λογος, of λεγειν, *dicere, to ſay*; q. d. *to ſay the ſame thing, to conſent, agree.*

HOMOLOGOUS, in *Geometry*, is applied to the correſpondent ſides of ſimilar figures, which are ſaid to be *homologous*, or in proportion to each other.

The word is compoſed of ὁμος, *ſimilar*, and λογος, *ratio, reaſon*; q. d. quantities *alike* to each other in *ratio*. So, if the ratio of A to B be the ſame as of C to D, here A is *homologous* to C, as B to D; becauſe of the ſimilitude between the antecedents and conſequents. The two antecedents, and the two conſequents, then, in any continued geometrical proportion, *are homologous* terms.

Thus, the baſe of one triangle is *homologous* to the baſe of another ſimilar triangle; ſo, in ſimilar triangles, the ſides oppoſite to equal angles are ſaid to be *homologous*.

Equiangular, or ſimilar triangles, have their *homologous* ſides proportional.

All ſimilar triangles, rectangles, and polygons, are to each other as the ſquares of their *homologous* ſides.

HOMOLOGOUS *things*, in *Logic*, are ſuch as agree in name, but are of different natures. Theſe coincide with what we otherwiſe call *equivocal*, and *homonymous terms*.

HOMONOPAGIA, a word uſed by ſome medicinal authors for the HEADACH.

HOMONYMIA, in *Logic*, an EQUIVOCATION. See HOMONYMOUS, &c.

HOMONYMON, ὁμωνυμον, compoſed of ὁμος, *ſimilis*, and ονομα, *for* νομος, *name*, in *Logic*, a word which has different meanings, or which is uſed to expreſs things of different nature and quality.

Homonyms are the ſame with what are otherwiſe called *polyſema, ſynonyms*, and *equivocals*.

HOMOOUSANS, HOMOUSIANS, HOMOUSIANISTS, HOMOUSIASTS, formed of ὁμοουσιος, or ὁμουσιος, ſignifying *of the ſame ſubſtance*, are names which the Arians anciently gave to the orthodox, becauſe they held that God the Son is *homouſian*, i. e. *conſubſtantial* with the Father.

Hunneric, king of the Vandals, who was an Arian, publiſhed a reſcript, directed to all the *Homouſian* biſhops. See PERSON, &c.

HOMOOUSIOS, ὁμοουσιος, among *Divines*, a being of the ſame ſubſtance or eſſence with another.

The divinity of Chriſt having been denied by the Ebionites and Corinthians in the firſt century, by the Theodotians in the ſecond, by the Artemonians at the beginning of the third, and by the Samoſatenians, or Pauliani, towards the cloſe of the ſame, a council was aſſembled at Antioch, in 269, wherein Paulus Samoſatenus, head of this laſt ſect, and biſhop of Antioch, was condemned and depoſed, and a decree publiſhed, as ſome have ſaid, wherein Chriſt is aſſerted to be God of God, and ὁμοουσιος, i. e. *conſubſtantial* with the Father.

It has been urged by ſeveral ancient writers of the fourth century, viz. Athanaſius, Hilary of Poictiers, and Baſil, that the council of Antioch rejected the word ὁμοουσιος, or *conſubſtantial*, as improper: and if we conſider that Euſebius, who has been called an Arian, ſpeaks of Malchion, who directed and governed at this council, as a man of uncommon ſoundneſs in the faith of Chriſt, we may preſume, that the term was not introduced in this council. The council of Nice, however, aſſembled in 325, expreſsly eſtabliſhed the *Homouſian* doctrine. Many learned writers have taken pains to vindicate the orthodoxy of the council of Antioch, and to ſhew that both theſe councils held the ſame doctrine. See ARIANS.

HOMOPHAGI. See OMOPHAGI.

HOMOPHONOUS, in *Muſic*, is ſaid of two or more chords, ſtrings, or voices, that are of the ſame pitch or tune, or at uniſon.

HOMORIUS, in *Mythology*, is an epithet given to Jupiter by the Greeks, anſwering to *Terminalis* among the Romans. Polyb. Hiſt. lib. ii.

HOMOTONOS, in *Medicine*, an epithet made the characteriſtic of a certain kind of fevers, which continue from the beginning to the end in one equable and uniform tenor, without exacerbation or relaxation.

HOMUNCIONALES, an appellation given by the Arians to the orthodox, who ſaid there were two natures and ſubſtances in Chriſt.

HOMUNCIONISTS, HOMUNCIONITES, formed of *homunculus*, a diminutive of *homo, a man*, q. d. *little man*, a ſect of heretics, the followers of Photinus, and from him alſo called PHOTINIANS.

They had this appellation, becauſe of their denying the two natures in Jeſus Chriſt, and holding that he was only mere man.

HOMUNCIONITES, HOMUNCIONITÆ, were a ſect of ancient heretics, whoſe diſtinguiſhed dogma it was, that the image of God was impreſſed on the body, not on the ſoul or mind of man.

HOND-HABEND. See HAND-HABEND.

HONE, a fine ſort of WHET-*ſtone*, uſed for ſetting razors, penknives, &c. This is the *cos novacula* of Linnæus with ſmall grity particles. See OIL-*ſtone*.

It is of a yellowiſh colour, and is vulgarly, but erroneouſly, ſuppoſed to be ſhelly-wood petrified or changed into ſtone, by lying in a petrifying water for a certain ſeaſon.

Of

Of theſe waters there are ſaid to be ſome in Oxfordſhire, that will thus petrify in a very ſhort time.

HONE, *hed of*, or HONE-*pavement*, is one of the tools uſed in the operation of grinding ſpecula for teleſcopes. This is formed of pieces of the fineſt blue *hone* or whet-ſtone, which are nearly of the ſame breadth and thick-neſs, and which, when wetted, appear moſt even and uniform in their colour and grain. Theſe pieces are to be cut into ſquare bits, and, having ground one ſide of each concave on the convex marble to which they are to be applied, with emery or fine ſand, they are to be cemented upon this thick round piece of marble in a kind of pavement, leaving a ſpace of a ſmall ſtraw's breadth between each, and placing their grain in an al-ternate direction. Mr. Mudge, inſtead of marble, uſes metal made of lead and tin, on which the *hones* are to be ſo diſpenſed, that the ſines between them may run ſtrait from one ſide to the other; and by this diſpoſition, the teeth of a fine ſaw, moved along each of the diviſions, will clear away the cement which riſes between the ſtones. This bed of *hones* ſhould be at leaſt a fourth part larger than the metal which is to be ground upon it. The ſurface of the metal, upon which it is to be cemented, may or may not, at the pleaſure of the workman, be turned of a convexity ſuitable to the gage. As ſoon as the *hones* are cemented down, and the joints cleared by the ſaw, the tool muſt be fixed in the lathe, and turned as exactly true to the gage as poſſible. By this inſtru-ment the ſpherical figure of the ſpeculum is completed, and its ſurface is rendered fit for the poliſher. See *Tab.* II. *Optics, fig.* 30. Smith's Optics, book iii. chap. ii. art. 791. Phil. Tranſ. vol. lxvii. part i. p. 307. See GRINDING.

HONE *wort*, in *Botany*, a ſpecies of *ſium*. See *Baſtard Stone* PARSLEY.

HONESTY, SATYRION-*flower*, or *Moon-wort*, *lunaria*, in *Botany*, a genus of the *tetradynamia ſiliculoſa* claſs. Its characters are theſe: the flower has four petals placed in form of a croſs, which are entire; and it has ſix awl-ſhaped ſtamina, four of which are the length of the em-palement, the other two ſhorter; it has an oblong oval germen, which becomes an erect, plain, compreſſed, el-liptical pod, ſitting upon a ſmall foot-ſtalk, terminated by the ſtyle, having two cells opening with two valves which are parallel, incloſing ſeveral compreſſed kidney-ſhaped ſeeds, which are bordered, ſitting in the middle of the pod. Miller enumerates four ſpecies, and Lin-næus only two.

Theſe plants grow in almoſt any kind of ſoil, require little culture, but love a ſhady ſituation.

This plant is famous in ſome parts of the kingdom for its medicinal virtues, though it has not the fortune to be received in the ſhops. The people in the northern coun-tries dry the whole plant in an oven, and give as much as will lie on a ſhilling for a doſe, twice a day, in hæ-morrhages of all kinds, particularly in the too abundant flowing of the menſes, and with great ſucceſs. The Welch, among whom it is not uncommon, Dr. Need-ham informs us, make an ointment of it, which they uſe externally, and pretend it cures dyſenteries.

HONEY, *mel*, is a ſweet vegetable juice, collected by the BEE from the flowers of different plants, and depoſited in the cells of the combs.

It has been long known, that the bees collect their *honey* as well as their WAX from the flowers of plants; but former writers had no diſtinct knowledge of the ſeveral parts of the flowers which furniſhed theſe induſtrious in-ſects with two ſuch different ſubſtances. It is now known, that the *honey* is procured from thoſe parts of the flowers which were firſt diſcovered by Linnæus, and to which he has given the name of *nectaria*: theſe are certain veſicles or glands ſituated near the baſis of every petal, and continually ſecreting a nectareous or mellonous juice. It is not yet aſcertained from what part of the flower or plant the bees collect the wax: ſome have ſuppoſed that it is furniſhed by the farina contained in the apices of the flowers; but Mr. Polhill, an ingenious friend of the editor, of whoſe extenſive and accurate acquaintance with the œconomy of bees he has availed himſelf in ar-ticles pertaining to this ſubject, aſſures him, that this is not the caſe; and that it is ſtill undiſcovered from whence they procure the wax.

The bee ſeizes upon this part of the flower, and ſucks from it either *honey*, or a juice of that nature, which will become *honey* under her management. She receives this into her body, and carries it home to the hive, where ſhe unloads herſelf, by emptying it into the cells which were before prepared to receive it. The bee does not receive the *honey*, in collecting it from the flowers, into the body by means of her trunk, as many have ſuppoſed; for this trunk ſerves only to collect the ſweet juice, in ſmall drops, from the nectaria of flowers. When the trunk is thus loaded with the juice or *honey*, it depoſits it on the tongue, which is exerted for that purpoſe, and being drawn back into the mouth, conveys it into the œſophagus. The œſophagus of the bee is a long and ſlender canal, paſſing from the mouth into the thorax; towards its termination in that part, it is diſtended into a ſort of bag, which forms the firſt ſtomach of the bee. Maraldi ſuppoſed the receptacle of the *honey* to be a bag, cloſed at the lower end, and only deſtined to re-ceive the *honey*, and diſgorge it again upon occaſion; but Swammerdam, on a more accurate diſſection of this inſect, found it to be a real ſtomach, opening into another or ſecond ventricle. The firſt ſtomach, when empty, is no more than a white filament, which, being hollow, is capable of receiving the *honey*; and, when received, it becomes ſwelled and diſtended in propor-tion to the quantity it contains, and is very narrow at its lower part, where it is joined to the ſecond ſtomach. This is a ſort of white tranſparent bladder, and is uſually much diſtended, and ſo covered with large and broad circular muſcles, that it ſeems to reſemble a tub with many hoops. This ſtomach becomes again very ſlender and narrow at its lower end, where it is joined to the inteſtines. The ſecond ſtomach and the inteſtines of the bee are often found to contain a great quantity of the farina; but the firſt ſtomach contains only *honey*, and is, ſeen, by diſſection, to be furniſhed with all the organs of contraction and diſtenſion, which are neceſſary for throwing out its contents. When the *honey* has un-dergone a kind of concoction in the ſtomach, and is be-come much thicker than in its undigeſted ſtate (though the gentleman already referred to apprehends, that it un-dergoes no kind of change in the ſtomach of the bee), it is diſgorged again through the mouth, and not, as Swam-merdam erroneouſly imagined, through a ſmall orifice in the end of the trunk. The proceſs of this operation may be eaſily diſcovered in glaſs hives, where the cells reach to the glaſs, and have only four ſides of wax, the glaſs ſerving for the other two ſides.

The bee, that comes loaded to her cell, thruſts its head very deep into it, and diſcharges the *honey* from its ſto-mach in a very little time, and ſeemingly with very little trouble, by the mouth. One bee ſucceeds another, till the whole cell is filled. In this work, it has been often obſerved, that what appears to be the laſt quantity of *honey* diſgorged into the cell is always of a different appearance from the reſt: this is of the nature of a cream, and is always much thicker than the reſt of the *honey*, which appears of one colour and conſiſtence; it ſeems to be very uſeful in the œconomy of the work, ſerving at once to keep the *honey* moiſt, and to prevent its running out by any accident. Though this cream or cruſt appears to be the laſt voided quantity, it is not ſo in reality, for it ſeems to have been gathered together from the firſt; and every freſh quantity of *honey* is added under, not upon its ſurface. To this purpoſe it is always obſerved, that the bee, which comes loaded to the cell, does not at once diſcharge its *honey* into it, but, entering into the cell as deep as poſſible, it puts forward the anterior pair of legs, and with them pierces a hole through the cruſt or cream. While this hole is kept open by the feet, the bee diſgorges the *honey* in large drops from the mouth; theſe falling into the hole made by the feet, mix with the maſs below, and the bee, before it flies off, new models the cruſt, and cloſes up the hole; and this is re-gularly done by every bee that contributes to the general ſtore of the cell.

The ſeveral cells of the combs in every hive are diffe-rently filled with *honey*, and for different purpoſes: ſome is laid up for immediate conſumption, on occaſions of bad weather and the like accidents, or for the uſe of thoſe bees that in good weather ſtay at home to work, and are not ſupplied in any other way by thoſe which have been abroad collecting *honey*; and ſome is more carefully preſerved and deſtined for the ſupport of the ſwarm in the winter. Whenever any cell is filled with *honey*, it is always cloſed up, and never opened again, till all the *honey* in the cells which were not full is expended. The manner in which the bees make the lids or covers of the cells is this: they form a circle or ring of wax juſt with-in the verge of the cell; to this they add another ſuch ring, and then another within that; and thus the aper-ture is rendered ſmaller and ſmaller, and by a continuance of the ſame operation is finally cloſed, the lid being compoſed of a vaſt number of concentric circles. This covering is deſigned for preſerving the incloſed *honey* in a ſtate of proper conſiſtence, for a winter ſtore.

Honey has been ſuppoſed by many to be the only food of the bees who collect it; but this is evidently erroneous. The farina of flowers ſerves as food for young bees, whilſt they are in the form of maggots, but it is not ſo certain whether the old bees eat it or not; after which ſome fay it is again thrown out at their mouths in form of wax, and uſed in the ſtructure of their cells; but

others

others abſolutely deny this, becauſe the farina of different flowers varies in colour, whereas the WAX is uniformly white.

Honey and WAX form ſo conſiderable an article in the riches of a kingdom, that M. Reaumur ſtrongly recommended to the court of France the encouragement of thoſe who raiſe ſwarms of bees, by *deducting* ſomething from their taxes in proportion to every hive of bees kept by them above a certain number. And as bees are ſo eaſily raiſed, and kept with ſo little expence and trouble, it is a wonder that they are not more generally propagated in this kingdom. One great means of preſerving and multiplying the bees would be the aboliſhing of that barbarous as well as prejudicial cuſtom, which has hitherto very generally prevailed, of deſtroying the whole hive of bees in order to obtain the *honey*. Reaumur's Hiſt. Inſ. vol. 5. p. 805, &c. See HIVE.

There are many circumſtances neceſſary to the forming of good *honey*, ſuch as a warm and clear air, a good ſtate of health of the bees, and a quantity of aromatic and ſweet flowers in the neighbourhood of their hives. Some naturaliſts ſuppoſe that *honey* is of a different quality, according to the difference of the flowers and plants from which the bees ſuck it. The ancients eſteemed that of lilies and roſes to be the beſt; and Strabo relates, that there is a kind of *honey* in Pontus which is a ſtrong poiſon, being procured by bees which feed upon aconite and hemlock. F. Lamberti, however, aſſures us of the contrary, and aſſirms it to be the beſt *honey* in the world, on account of the great quantity of baum that grows there. He adds, that there is another very white kind of *honey*, hard as ſugar, which does not ſtick to the hands. At preſent, the *honey* of Narbonne, in France, is held to excel all others, on account of the roſemary which abounds there. Bees are uncommonly fond of the lime-tree, the privet, and phillyrea; and in Lithuania, there are large quantities of wild bees, who lodge in hollow trees in woods, and collect their *honey* chiefly from the lime; ſo that when the ſeaſon happens to be unfavourable at the time of the blowing of the lime, it is ſucceeded by a ſcarcity of *honey*. However, it is not to be ſuppoſed, that the bee confines itſelf to one particular flower; nor does it appear, that the *honey* collected from one kind of flower differs eſſentially from that which is the produce of another; the only difference being in the quantity, colour, or ſome ſlight flavour from the flower: Excellent *honey* has been produced where nothing grew but nettles and other weeds.

The *honey* taken out of the hives in the beginning of ſummer is preferable to that gathered in autumn, ſince the firſt is the ſeaſon in which the bees are moſt vigorous, and the plants in their flowering ſtate.

We have two kinds of *honey*, the *white* and *yellow*.

The *white*, *mel album*, called alſo *virgin honey*, is that depoſited in clean new cells, which, when firſt formed, are of a pure white colour; but when the combs are old, eſpecially if bees have been bred in them, they become foul and diſcoloured, and vitiate the *honey* lodged in them. New *honey* is nearly as fluid as water; by age it acquires a greater degree of conſiſtence, and the cold of winter frequently congeals it. The ſecond kind, or *mel flavum*, is ſqueezed from the combs in a preſs, after having firſt ſoftened them with a little water over the fire. There is alſo an intermediate ſort of a yelloviſh white colour, drawn by expreſſion, without fire. That which runs ſpontaneouſly is purer than the expreſſed; a quantity of the wax and other impurities being forced out along with it by the preſſure, eſpecially when the combs are previouſly heated. The beſt ſort of *honey* is of a thick conſiſtence, eaſily and totally ſoluble in cold water, of a whitiſh colour, an agreeable ſmell, and a very pleaſant taſte.

Honey, expoſed to a gentle heat, as that of a water-bath, becomes thin, and throws up to the ſurface its waxy impurities, together with the meal or flour ſometimes fraudulently mingled with it, which may be thus ſeparated by defpumation, ſo as to leave the *honey* pure, and to form the *mel depuratum* or clarified *honey*. On continuing the heat, there riſes a conſiderable quantity of aqueous fluid, impregnated with the fine ſmell of the *honey*; the inſpiſſated reſiduum, like the *honey* at firſt, diſſolves both in water and rectified ſpirit, and promotes the union of oily and reſinous ſubſtances with watery liquors. By treating the inſpiſſated maſs with moiſt clay, as practiſed by the ſugar-baker for purifying ſugar from its unctuous treacly matter, the unctuous parts of *honey* may in like manner be ſeparated, and its pure ſweet matter obtained in the form of a ſolid, ſaline, white concrete.

This juice is an uſeful ſweet for medicinal as well as domeſtic purpoſes: it is more aperient and detergent than the ſimple ſweet prepared from the ſugar-cane; and particularly ſerviceable for promoting expectoration in diſeaſes of the breaſt, and as an ingredient in cooling and detergent gargariſms. For theſe and other ſimilar intentions it is ſometimes mixed with vinegar, and forms the OXYMEL *ſimple* of the ſhops; it is alſo impregnated with the virtues of different vegetables, by boiling it in the ſame manner with their juices or infuſions, till the watery parts of the juice or infuſion have exhaled and left the active matter incorporated with the *honey*. See OXYMEL *compound*.

It is obſerved, that the boiling of *honey*, though it diſſipates great part of its odorous matter, and thus proves in ſome caſes injurious to it, is nevertheleſs in other caſes of advantage. There are particular conſtitutions with which *honey* diſagrees, and in which very ſmall quantities occaſion gripes, purging, and great diſorder; but boiling deprives it of that quality which produces theſe effects. Neumann's Chem. by Lewis, p. 330. Lewis's Mat. Med. p. 376.

Honey contains a quantity of fixed air, and is antiſeptic as well as detergent and diuretic. Sir John Pringle recommends one pound and a quarter to be taken regularly every week in caſes of the gravel, or when the kidneys are loaded with ſand.

Honey is the baſis of ſeveral compoſitions in pharmacy. Of *honey*, with the addition of roſes or violets, mercurialis, &c. is made *mel roſatum*, *mercuriale*, *helleboratum*, &c. There is alſo a *mel ſcillitieum*, or a preparation of ſquills; *mel paſſulatum*, made with raiſins boiled in hot water; and *mel anthoſatum*, made with roſemary-flowers.

Honey is alſo an ingredient in ſeveral drinks, as MUM, METHEGLIN, &c.

The chemiſts alſo draw a water, a ſpirit, an oil, &c. from *honey*.

Mr. Lemery, in his analyſis of *honey*, obſerves, that two pounds of fine *honey* diſtilled in balneo Mariæ, afford ſix ounces of clear water of an inſipid taſte, and of the ſmell of *honey*: this is commonly called the dew of *honey*. A larger quantity of phlegm may be procured by continuing the diſtillation, but it becomes foul. This liquor, though inſipid to the taſte, yet contains a latent acid, for it reddens the turnſole; but it neither ferments with the volatile nor fixed alkalies. The cucurbit being now placed in a ſand-heat, there come over four ounces of a yelloviſh pellucid water, of an acrid taſte, of a ſtrong ſmell of *honey*, and ſomewhat empyreumatic: this liquor reddens the turnſole colour more than the former. The fire being increaſed, there ariſe white clouds, which fill the head of the cucurbit and the receiver, and theſe finally condenſe into a third liquor, which is called the ſpirit of *honey*. This will be about three ounces in quantity, and of a red colour and empyreumatic ſmell, yet with an agreeable flavour, and of an acrid and burning taſte. This is a ſtronger acid than either of the former, and ferments with an alkali.

The fire being again increaſed, more clouds ariſe, and, in fine, there is a fourth liquor produced; this is in quantity about two ounces, of an orange colour, and of an acid taſte, but leſs acid than the third liquor, as it contains more oil, which ſoftens and ſweetens it. Like the former, it ferments with alkalies, and reddens the colour of turnſole. When the diſtillation is thus finiſhed, there will remain in the cucurbit fifteen ounces and a half of a light ſpungy black coal. Mem. Acad. Par. 1706. This is to be then put into a retort for a freſh diſtillation, and a ſtrong fire under this veſſel will raiſe from it ſeven ounces of a reddiſh brown liquor, which ſtains the fingers to an orange colour, of a burnt ſmell, yet with ſomething agreeable in it, and of an acid and very acrid pungent taſte. Beſides this, there come over two drams of a thick black oil, looking like tar; this alſo was of an acrid taſte, which was owing to ſome of the ſalts of the *honey* being blended with it. There is much more oil contained in the *honey*, but it does not come over ſeparate, but blended with the other liquors; and after they have ſtood ſome days, precipitates itſelf from them, and is found ſticking to the ſides and bottom of the veſſel. The matter remaining in the retort is about ſeven ounces of a black coal, of a light ſpungy texture, and of a taſte almoſt inſipid, and only ſeeming to contain a little ſalt. We ſee by this proceſs, that thirty-two ounces of *honey* yield twenty-four ounces and two drams of liquor, that being the difference in weight between the *honey* when firſt put in, and the laſt caput mortuum. Twenty-two ounces and ſix drams are the quantity here preſerved of the ſeveral liquors, the reſt having eſcaped through the junctures of the veſſels, as will always be the caſe in ſuch diſtillations. Id. Ibid.

The caput mortuum of this, and of ſeveral other diſtillations of *honey*, the whole making three pounds and a half, were put into an unglazed earthen pot, and calcined over the fire for ten hours; this readily took fire like common charcoal, and burnt till it loſt ten ounces in weight, but without falling into aſhes. The remaining coal had then a more ſaline taſte than before. Any

acid liquor poured upon this fermented, as with the common alkalies; and when thrown into water to make a lixivium, it bubbled in the manner of quick-lime thrown into water; and, in the common way of making the lixivial salts, this yielded a dram and a half of an acrid alkaline one.

It is remarkable, that the calcined caput mortuum of *honey* contains, like other vegetable ashes, true particles of iron, which adhere to a knife touched with a magnet.

HONEY, *wild*. St. Adaman, abbot of Hii, in his deſcription of the holy places, obſerves, that in the place where St. John Baptiſt lived in the Deſert, there are locuſts which the poor people boil with oil, and a ſort of herbs with large long leaves of a milk colour, and a taſte like that of *honey*; and that this is what in Scripture is called *wild-honey*. See ACRIDOPHAGI.

HONEY-*bird*. See HUMMING-*bird*.

HONEY *buzzard*, the Engliſh name of the *bufeo* APIVORUS.

HONEY *of roſes*. See ROSE.

HONEY-*comb*, a waxen ſtructure, full of cells, framed by the bees to depoſit their *honey*, eggs, &c. in.

The conſtruction of the *honey-comb* ſeems one of the moſt ſurpriſing parts of the works of inſects, and the materials of which it is compoſed, which though evidently collected from flowers of plants, yet do not, that we know of, exiſt in them in that form, have given great cauſe of ſpeculation to the curious. The regular ſtructure of the comb is alſo equally wonderful. When the ſeveral cells in it are examined, it ſhould ſeem that the niceſt rules of geometry had been conſulted for its compoſition, and all the advantages that could be wiſhed or deſired in a thing of that kind are evidently found in it. The bees, in the ſtructure of this receptacle of their *honey*, ſeem to have reſolved a geometrical problem, far from an eaſy one, and indeed clogged with ſo many conditions, that it might have puzzled able profeſſors in that ſcience. This may be expreſſed in theſe words: a quantity of wax being given, to form it into a number of angular and equal cells, of a determinate capacity, but the greateſt that can be made with that quantity of wax, and, at the ſame time, that theſe cells ſhall be ſo diſpoſed as to take up as little room as poſſible in the hive. In order to this laſt condition, it is neceſſary that the cells touch one another, in ſuch a manner, that there be no angular ſpace nor cavity between them. The bees have effected all this by making the cells all hexangular, or tubes of ſix equal ſides: triangular, quadrangular, and ſome other figures for the cells, might have been indeed ſo diſpoſed between one another as to leave no ſpace; but then an equal number of them could not be made with the ſame quantity of wax. The body of the bee being rounded, it will alſo be received into a hexangular cell, without leaving ſuch large ſpaces as it muſt if received into a triangular or ſquare one.

The method of making two ſets of cells in each comb is alſo admirably contrived to ſave the expence of wax, ſince, had they been made ſingle, every comb muſt have had its peculiar baſe, and every ſet of cells their bottom of wax: whereas one bottom now ſerves to two cells, and there is but one plate of wax in the center of a double comb. There is however this farther difficulty attending it, that the ſeveral cells are not ſo many hexagonal tubes with flat and broad baſes, or tubes of an equal breadth all the way; but they are truly pointed at the bottom, being every one of them a hexangular cell with a pyramidal baſe, and forming that kind of figure, as Maraldi and Reaumur firſt diſcovered, which requires the leaſt wax for containing the ſame quantity of *honey*. Each of theſe baſes is compoſed of three equal rhombuſes, and each baſe, in this manner, becomes the baſe of three other cells on the oppoſite ſide of the comb.

This is eaſily demonſtrated to thoſe who underſtand geometry, by means of the ſeveral figures and poſitions of the oppoſite baſes of the cells of the two ſides of the comb; but the moſt familiar explication of it to a common obſerver, is to ſtick three ſmall pins through the baſe of any one cell, each in the centre of the rhomb that makes one ſide of that baſe: if, after this, the comb be turned, the three pins will be found in the centers of three different cells of the oppoſite ſide.

The obtuſe angles of the three equal rhombuſes that form the baſe, are found to be the doubles of an angle (which often comes under conſideration in queſtions relating to *maxima* and *minima*), whoſe tangent is to the radius as the diagonal is to the ſide of the ſquare. By this conſtruction, three of the ſix ſolid angles at the baſe, that correſpond to the angles of the hexagon, are equal to each other, and alſo to the ſolid angle at the apex of the figure, each of which ſolid angles is reſpectively formed from three equal, plane, obtuſe angles; and the other three ſolid angles are alſo equal to each other, but each of them is formed by four equal, plane, acute angles, which are the ſupplements of the former obtuſe angles. Monſ. Maraldi found, by menſuration, that the obtuſe angles of the rhombuſes were nearly 110°, and obſerved, that if they were ſuppoſed equal to each other, each of them muſt be 109° 28'; and Mr. Koenig, by the method of infiniteſimals, found, that this angle, in order to employ the leaſt wax poſſible in a cell of the ſame capacity, ought to be 109° 26'. Mr. Maclaurin has alſo demonſtrated, from the principles of common geometry that the moſt advantageous angle is that which reſults from the ſuppoſed equality of the three plane angles forming the ſolid angle. We ſhall ſubjoin the demonſtration for the ſake of the mathematical reader.

Let GN and NM (*Tab.* II. *Geometry*, *fig.* 49 and 50.) repreſent any two adjoining ſides of the hexagon, or the ſection of the cell perpendicularly to its length. The ſides of the cell are not complete parallelograms as CGNK, BMNK, but trapezia CGNE, BMNE, to which a rhombus CEBo is fitted at OE, that has the oppoſite point *o* in the apex of the figure; ſo that three rhombuſes of this kind, with ſix trapezia, may complete the figure of the cell. Let O be the center of the hexagon, of which CK and KB are adjoining ſides; join CB and KO, interſecting in A; and, becauſe CO B is equal to CKB, and KE equal to O*o*, the ſolid EBCK is equal to the ſolid *o*BCO; whence it follows, that the ſolid content of the cell will be the ſame, wherever the point E is taken in the right line KN, the points C, K, B, G, N, and M, being given. It is, therefore, neceſſary to enquire, where the point E is to be taken in KN, ſo that the area of the rhombus CEBo, together with that of the two trapezia CGNE, ENMB, may form the leaſt ſuperficies. Becauſe Ee is perpendicular to BC in A, the area of the rhombus is AExBC, and that of the trapezia CG+EN×KC; the ſum of theſe is AEx BC + ½KN×KC—KE×KC; and becauſe ½KN×KC is invariable, we are to enquire when AExBC—KEx KC is a minimum?

Suppoſe the point L to be ſo taken upon KN, that KL may be to AL as KC is to BC. From the center A deſcribe in the plane AKE, with the radius AE, an arc ER meeting AL, produced, if neceſſary, in R: let EV be perpendicular to AR in V, and KH be perpendicular to the ſame in H; then the triangles LEV, LKH, LAK, being ſimilar, we have LV : LE :: LH : LK :: LA : LK : BC : BC by the ſuppoſition. Hence, when E is between L and N, we have LH+LV (=VH) : LK+LE (=KE) :: KC : BC; and when E is between K and L, we have LH—LV (=VH) : LK—LE (=KE) : : KC : BC; that is, in both caſes we have KE×KC=VH× BC; and conſequently AExBC—KE×KC=AEx BC—VH×BC=AE—VHxBC=AR—VHxBC= AH+VKxBC: which expreſſion, becauſe AH and BC do not vary, is evidently leaſt when VR vaniſhes, i. e. when E is upon L. Therefore CLB*f* is the rhombus of the moſt advantageous form in reſpect of frugality, when KL is to AL as KC is to BC. But as OK is biſected in A, KC²=OK²=4AK², and AC²=3AK², or BC=2AC=2√3×AK: conſequently KC : BC : : 2AK : 2√3×AK : : 1 : √3; and KL : AL : : (KC : BC :) 1 : √3; or AL : AK : : √3 : √2, and (becauſe AK : AC : : 1 : √3) AL : AC : : 1 : √2; i. e. the angle CLA is that, whoſe tangent is to the radius as √2 to 1, or as 14142135 to 10000000; and therefore it is 54° 44' 8", and conſequently the angle of the rhombus of the beſt form is that of 109° 28' 16".

By this ſolution it is eaſy to eſtimate what ſaving is obtained by means of this conſtruction.

If the baſe were flat, and not of the pyramidal form above deſcribed, then, beſides completing the parallelograms CGNK and BMNK, the ſurface of the baſe had would be 3CBxAK; whilſt they really do form amounts in ſurface to the ſame parallelograms, and 3CBxAH: the ſavings therefore amount to 3CBxAK—AH= 3CBxAH x $\frac{\sqrt{3}-\sqrt{2}}{\sqrt{2}}$, which is almoſt a fourth part of the pains and expence of wax they beſtow above what was neceſſary for completing the parallelogram ſides of the cells.

Mr. Maclaurin has alſo demonſtrated, that the plane angles CLB, CLN, and BLN, which form the ſolid angle at L or the apex at *f*, are equal to each other; from which it is obvious, that the four acute, plain angles, which form the ſolid angle at C or B, are likewiſe mutually equal. It may be alſo added, that if the cells had been of any other form than hexagonal, and the baſes had ſtill been pyramidal, theſe muſt have been terminated by trapezia, and not by rhombuſes: and therefore they would have been leſs regular, becauſe OA and AK would have been unequal. Nor could there have been room for ſuch an advantageous or frugal a conſtruction

as that we have described, because the solid content of the cell would have increased with the right line KE. See Phil. Trans. abr. vol. ix. p. 2, &c.

This construction not only occasions a very great saving of the wax or matter of the comb; but besides this, there is another great advantage, which is, that the angles, resulting from this combination of the bases, greatly strengthen the whole work.

The matter of which the comb is made, costs the bees so much pains and labour in collecting, that it is no wonder they are careful and sparing of it in the work. The sides of the cells are all much thinner than the finest paper, and yet they are so strengthened by their disposition, that they are able to resist all the motions of the bee when within them, as they are very frequently obliged to be. The effect of their thrusting their bodies into the cells, would be the bursting of those cells at the top, were not this well guarded against. But to prevent this, the creatures extend a cord or roll of wax round the verge of every cell, in such a manner, that it is scarce possible they should split in that particular part. This cord or roll is at least three times as thick as the sides of the cell, and is even much thicker and stronger at the angles of the cells than elsewhere; so that the aperture of each cell is not regularly hexagonal, though its inner cavity be perfectly so.

The bases of the cells are not always perfectly trilateral; sometimes, instead of the three rhombs they should be composed of, they consist of four pieces, the bee having begun her work wrong; but then it is admirable to observe how nicely the two smaller pieces are afterwards joined, that the angle they make may be as nearly as possible equal to that of one of the rhombs, so that the base of the cell still remains very nearly trilateral.

It would be a most desirable thing to see the bees at work in their making these elegant and regular fabrics; but it is scarce possible to see any thing of this kind distinctly, even with the advantage of glass hives; for no bee ever works singly on this occasion, but wherever the fabric is erecting, there are numbers together, all trying to assist one another; and their motions are so swift, and so hid by their standing before one another, that very little is to be seen of them. New bees are every moment coming to the place, and old ones going away; and very frequently those which arrive late are dispatched away immediately after they arrive. There are only some very short moments in which the glasses of the hives can give a view of the creatures regularly employed in their work, for the moment that one sees a bee at work in building, that moment we see one either fly off, or some other bee get before her, so as to hinder the view.

These momentary sights, however, are sufficient to make it plain, that the bee uses her teeth in modelling and fashioning the wax. The side of a cell is always received between the two teeth on this occasion, and by means of repeated blows on each side from each tooth, the side is brought to a proper thinness, and the wax is by the same means wrought up to a proper consistence and firmness.

The celerity with which a swarm of bees received into a hive, where they find themselves lodged to their minds, bring their works of the combs to perfection, is amazing. In a week's time, when the weather favours, the half or two thirds of a hive will be filled with combs. There are vast numbers at work all at once, and that they may not incommode one another, they do not work upon the first comb till it is finished; but when the foundation of that is laid, they go to work upon another; so that there are often the beginning of three or four stories made at once; and so many swarms allotted to the carrying on the work of each.

The several combs are all placed parallel one to another, and hang perpendicularly from the top of the hive to the bottom: they begin each comb at the top or upper part of the hive, and carry it down to the floor, from side to side; and there is such a space left between them, that the bees can easily pass between; there are also holes made through the substances of the several combs, by which they pass from the space that lies between one pair of combs and another. They often place a part of the comb in a contrary direction to the rest; so that while the others are placed horizontally, these stand perpendicular: there are also several other directions, in which they are disposed, which are easily accounted for from the nature of the place, and are always found to be the very best that could be used for the occasion.

Though the sides of all the cells are extremely thin, yet the combs are very heavy when full of *honey*. This might endanger their breaking their hold, if only fastened from the top; and for this reason the bees give them several additional supports in whatever places they can, often fastening them in many places one to another, and often fixing them to the sides of the edifice by large and solid lumps of wax.

It has generally been supposed that every bee of a swarm has its particular cell in some comb which was its own, and contained *honey* for its peculiar food; but the use of the glass hives has shewn us that all the cells are used in common. Reaumur, Hist. Inf. vol. ix. p. 282. vol. x. p. 214, &c.

HONEY-*comb*, in *Gunnery*, is a flaw in the metal of a piece of ordnance, when it is ill cast and spongious.

HONEY-*comb-stone*, in *Natural History*, the name given by many authors to a species of fossile coral, which is usually found in large masses, and those full of large hexagonal cells, resembling those of a *honey-comb*. These are but lightly striated, and usually run deep into the stone.

HONEY-*dew* is a sweet tasted *dew*, found early in the morning on the leaves of divers sorts of plants.

Honey-dew is of a very different nature from blastings, being caused by the condensing of a fat moist exhalation, raised in a hot dry summer, from plants and blossoms; as also from the earth; which, by the coolness and serenity of the air in the night, or in the upper clear region of the air, is thickened into a fat gluey matter, and then falls to the earth again; part whereof rests upon oak-leaves, and those of some other trees, whose leaves are smooth, and do not easily admit the moisture into them. Gassendus holds that a viscid juice, transpiring out of the leaves, helps to compose this *honey*; or to convert the dew, falling on them, into a *honey* substance, which before had nothing of it: hence he accounts for the reason why we find it on some trees and not on others.

This *honey-dew*, falling on the ears and stalks of wheat, besmears them with a different colour from the natural; and, being of a clammy substance, so binds up the young, tender, and close ear of the wheat, by the heat of the sun, that it prevents the growth and completing of the perfect grain therein.

Hops, when in flower, are subject to the distemper called the *honey-dew*, which appears in the form of a meal, and is found by the microscope to contain the eggs of small insects, which fly about in swarms near the time when the hop is in flower, and gnaw the leaves and shoots. Several methods have been proposed for preventing the damage arising from this dew; particularly by surrounding the hop-hills with hot dung, or causing wood-ashes to be scattered with the wind over the hops at the time when the mealy dew falls. But the most effectual way of preventing its ill effects is to strip off the leaves, whereby the small insects contained in it perish at once, and before fresh leaves spring forth, their season of breeding is past.

A shower of rain, succeeding presently after the fall thereof, or the wind blowing stiffly, are the only natural remedies against it. See DEW, MILDEW, and *Perspiration of* PLANTS.

HONEY-*flower*, *melianthus*, in *Botany*, a genus of the *didynamia angiospermia* class. Its characters are these: the flower hath four narrow spear-shaped petals, divided into two lips, connected on their sides; and a nectarium of one leaf, situated in the lower segment of the empalement, and fastened with it to the receptacle: it hath four erect stamina, the two under being somewhat shorter than the other; in the centre is situated a four-cornered germen, which afterwards becomes a quadrangular capsule with distended cells divided by partitions in the centre, each containing one almost globular seed. There are two species, natives of the Cape of Good Hope. Miller.

HONEY-*guide*, in *Ornithology*. See CUCULUS *indicator*.

HONEY-*locust*, or *three-thorned acacia*, in *Botany*, *gleditsia*, a genus of the *polygamia dioecia* class. Its characters are these: it hath male and hermaphrodite flowers on the same plant, and female flowers in different plants; the male have a three-leaved empalement and three roundish petals, with a turbinated nectarium; they have six stamina terminated by compressed summits; the hermaphrodite flowers have quadrifid empalements, with four petals and six stamina, and have a germen, style, and pods, like the female, which are situated in different trees; those have a five-leaved empalement and five petals, with two nectariums, and a broad germen longer than the petals; the germen becomes a large flat pod, with several transverse partitions, having a pulp in each division, surrounding one hard roundish seed. There are two species, natives of North America. Miller.

HONEY-*suckle*, in *Botany*, *periclymenum*, Tourn. *Inst.* R. H. 608. tab. 378. Its characters are these: the empalement of the flower is cut into five parts, sitting upon the germen; the flower is of one petal, having an oblong tube, cut at the top into five segments, which turn backward; it has five awl-shaped stamina, almost the length of the petal, and a roundish germen situated below

low the flower, which becomes an umbilicated berry with two cells, each containing one roundish seed. Miller enumerates eight species. Linnæus has joined the periclymenum to the lonicera. See the next article.

The propagation of all the several sorts of *honey-suckles* is by laying down their young shoots in autumn; which, if they are supplied with water, will by the autumn following have taken root so well, as to be fit to remove. They should at this time be transplanted into nursery-beds for a year or two, the better to train them up, either for headed plants or for creepers, to plant against trees, walls, &c.

They may also be propagated by planting cuttings in September; the cuttings should have four joints, three of which should be buried in the ground, and they should be planted in rows, at the distance of about a foot, four inches asunder in the rows, treading the earth close to them. In order to preserve them from the wind and frost, the ground between the rows should be covered with tanner's bark or dung. The plants raised from cuttings are preferable to those propagated by layers, having generally better roots. Their sweetness and long continuance in flower make them of great value in small quarters. Among flowering shrubs they are also very beautiful, when planted against the stems of old trees, where, if they are not too much shaded, they will flourish exceedingly.

The proper season for cutting them, to keep them in a regular form, is about Michaelmas, soon after they have done flowering. This is to be done with a knife, observing always to cut behind a leaf-bud; for how much soever the shoot is left longer, it will always die down to that part. They are most of them very hardy.

The Virginian scarlet *honey-suckle*, called the trumpet *honey-suckle*, is a very beautiful flowering kind, and in great esteem. It is propagated by laying down the young branches, which will easily take root, and may be afterwards treated like the *honey-suckle*. They should be planted in a strong soil, and exposed to the south-east sun; but they must have a wall or pale behind them to support the branches, otherwise they will trail upon the ground. It is a native of Virginia, but will thrive very well with us, bearing all the cold of our winters. These plants begin to flower the latter end of June, and there will be a succession of flowers till the autumn. Miller.

The leaves of the *honey-suckle*, which are the only parts used, are sometimes put into gargarisms for sore throats; though others affirm them not to be proper for that purpose, because of their great heat. Some commend a decoction of them for a cough and asthma, and to open obstructions of the liver and spleen. The oil made by infusion of the flowers, is accounted healing and warming, and good for the cramp and convulsions of the nerves. Miller's Bot. Off.

HONEY-*suckle, upright*, or *dwarf cherry*, *lonicera*, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are: the flower hath a small empalement, cut into five parts, upon which the germen sits; it hath one petal, with an oblong tube, cut into five parts at the brim, and five awl-shaped stamina; under the petal is situated a roundish germen, supporting a slender style; the germen becomes a berry with two cells joined at their base, and polyspermous. Miller enumerates seven species. To this genus Linnæus has joined the *caprifolium periclymenum*, and *xylosteum* of Tournefort, and the *symphoricarpos* of Dillenius.

These plants may be propagated either by seeds or cuttings. The seeds commonly lie in the ground for a year before they vegetate, but require no particular culture. If they are sown in autumn, many of them will grow the following spring. The cuttings should be planted in autumn, in a shady border, and in the following autumn may be removed into a nursery, whence, after two years, they may be transplanted into the ground where they are to remain. They are commonly intermixed with other flowering shrubs for the sake of variety, but there is little beauty in their flowers. They are hardy plants, and will thrive in a cold situation, and love a light moist soil. Miller. See SYRINGA.

HONEY-*suckle, African*, *f.* See HALLERIA.

HONEY-*suckle, American upright*. See AZALEA.

HONEY-*suckle, French*, *hedysarum*, in *Botany*, a genus of the *diadelphia decandria* class. Its characters are these: the flower has a permanent empalement of one leaf, cut into five segments at the top; it is of the butterfly kind, the wings oblong and narrow, the keel compressed and convex at the base; it has nine stamina joined, and one standing separate, which are reflexed; in the center is situated a long narrow germen, which afterward becomes a jointed compressed pod, each joint being roundish, and includes a single kidney-shaped seed. Miller enumerates nineteen species, natives of warm climates; but Linnæus reckons fifty.

The ALHAGI of the Moors is a species of this genus. From this shrub the Persian manna is collected, which is an exudation of the nutritious juice of this plant. This drug is chiefly gathered about Tauris, a town in Persia, where the shrub abounds.

This plant is reckoned deobstruent and vulnerary. James.

HONEY-*suckle, trumpet*. See HONEY-*suckle, supra*.

HONEY-*suckle grass*. See TRIFOLE.

HONEY-*wort, cerinthe*, in *Botany*, a genus of the *pentandria monogynia* class. Its characters are these: the flower has one petal, with a thick short tube, and at the brim is quinquefid, and has five short stamina; in the bosom are situated four germina, two of which afterward become so many seeds, which are hard, smooth, plain on one side, but convex on the other, and are included in the empalement. Miller enumerates five species, but Linnæus only two.

HONI *soit qui mal y pense*, q. d. *evil to him that thinks evil*; the motto of the most noble order of the knights of the Garter. See GARTER and MOTTO.

HONOR. See HONOUR.

HONORABLE. See HONOURABLE.

HONORARY. See HONOURARY.

HONORIACI, in *Antiquity*, a species or order of soldiery under the eastern empire, who introduced the Goths, Vandals, Alani, Sueti, &c. into Spain.

Didymus and Verinianus, two brothers, had, with great vigilance and valour, defended the passages of the Pyrenæans against the Barbarians for some time, at their own expence; but being at length killed, the emperor Constantius appointed the *honoriaci* to defend those passages, who, not contented to lay them open to all the nations of the North then ravaging the Gauls, joined themselves to them.

HONOUR, among the *Ancients*, was worshipped as a divinity, and had a temple erected to it, which had no entry but through the temple of Virtue.

Honour is represented on many medals, under the figure of a man holding a pike, and sometimes an olive-branch, in the right-hand, and a cornucopia in the other.

Beside its literal sense, wherein it denotes a testimony or token of esteem and submission, *honour* is particularly applied in our customs to the more noble kind of seigniories or lordships, whereof other inferior lordships or manors hold or depend.

As a manor consists of several tenements, services, customs, &c. so an *honour* contains divers manors, knights-fees, &c.

It was also formerly called *benefician* or *royal fee*, being always held of the king in capite. Spelman.

Anciently, *honour* signified the same as *baronia*.

HONOUR, *counsellors of*, or *Honourary Counsellors*, are such as have a right to enter or sit in assemblies, courts, &c. to deliberate or give judgment in the same, though they do not regularly and properly belong thereto.

The French call *chevaliers d'*HONNEUR, *knights* or *gentlemen of honour*, the gentlemen-ushers of queens and princesses, who attend them, give them their hand, &c. See USHER.

HONOUR, *maids of*, are young ladies in the queen's household, whose office is to attend the queen when she goes abroad, &c. In England they are six in number, and their salary 300*l.* per annum each.

HONOUR, *pages of*, are officers both of the king's and queen's houlhold, under the master of the horse. Of the former there are four, whose annual salary is 26*l.* each; and of the latter two, with a salary of 15*l.* each.

HONOURS *of the Louvre*, among the *French*, are certain privileges annexed to divers dignities or offices, particularly those of duke, peer, chancellor, &c. as to enter the Louvre in a coach, to have the tabouret or stool in the queen's presence, &c.

HONOURS *of the house* are certain ceremonies observed in receiving visits, making entertainments, &c. performed either by the master himself, or by some person appointed for that purpose; as to go and receive the guests, to conduct them out again, to see they be well seated, and, in short, to perform all the civilities and ceremonials of polite hospitality.

HONOURS *of the city* are the public offices or employments thereof. He who has been constable, overseer of the poor, and churchwarden of his parish; common-councilman, alderman, and lastly mayor; has passed all the *honours* of the city.

HONOURS *of the church* are the rights belonging to the patron, &c. as a seat and sepulchre in the chancel, to be first served with the consecrated bread and wine, &c.

HONOURS are also applied to the principal part of the apparatus of great ceremonies; as coronations, consecrations, christenings, &c. Such are the oil, tapers, &c. In obsequies they anciently represented the *honours*, that is, the shield, crest, sword, gantlets, spurs, banner, horse, &c.

HONOURS, *funeral*, are the ceremonies performed at the interment of great men; as hangings, hearses, funeral harangues, &c.

HONOUR *courts* are held within the *honours* or feignories above mentioned.

HONOUR *point*, in *Heraldry*, is that next above the center of the escutcheon, dividing the upper part into two equal portions. See POINT and ESCUTCHEON.

HONOURABLE *amends*, *amende honourable*. See AMENDE.

HONOURABLE, or HONORABLE *ordinaries*, in *Heraldry*. See ORDINARY.

HONOURARY, or HONORARY, is underſtood of a perſon who bears or poſſeſſes ſome quality or title, only for the name's ſake, without doing any of the functions thereto belonging, or receiving any of the advantages thereof.

Thus we ſay, *honourary* counſellors. See *Counſellors of* HONOUR.

In the college of phyſicians, London, are *honourary* fellows. The royal academy of ſciences at Paris conſiſts of four claſſes of members, viz. *honourary*, penſionary, aſſociates, and adjuncts. See ACADEMY.

HONOURARY *games*. See GAMES.

HONOURARY *ſervices* are thoſe incident to the tenure of grand ſerjeantry, and commonly annexed to *honours*.

HONOURARY *tutor* is a perſon of quality appointed to have an eye over the adminiſtration of the affairs of a minor, while the onerary tutors have the real effective management thereof.

HONOUBARY, HONORARIUM, is alſo uſed ſubſtantively for a lawyer's fee, or a ſalary given to public profeſſors of any art or ſcience.

HONTHONGENETHEF, a thief taken hond-habend, i. e. having the thing ſtolen in hand.

HOOD. See CHAPEROON and CUCULLUS.

HOOD, in *Falconry*, is a piece of leather, wherewith the head of a hawk, falcon, or the like, is covered.

After ſcaling or ſewing up the eyelids of a young hawk, ſhe is to be fitted with a large eaſy *hood*, which is to be taken off and put on very often, watching her two nights, and handling her frequently and gently about the head. When you perceive ſhe has no averſion to the *hood*, unſeal her in the evening by candle-light, continuing to handle, *hood*, and *unhood* her, as before, till at laſt ſhe takes no offence, but will patiently endure handling.

After unſealing, anoint with the finger and ſpittle the place where the ſealing thread was drawn through; then *hood* her, and hold her on your fiſt.

As ſoon as ſhe is well reclaimed, let her ſit upon a perch; but every night keep her on the fiſt three or four hours, ſtroaking, *hooding*, and *unhooding*, &c. And thus you may do in the day-time, when ſhe hath learnt to feed eagerly and without fear.

HOOD, on *Shipboard*, is a copper frame, made to go on the top of the chimney, and to ſhift as the wind does, that the ſmoke may always fly to leeward.

HOOD is alſo a ſort of low wooden porch, placed over the ſtair-caſe or ladder, which leads into the ſteerage or apartments, where the crew generally reſide in a merchant-ſhip. The uſe of the *hood* is to admit air and light, and at the ſame time to prevent the rain from falling into the ſteerage. The wooden porch over the entrance or ſtair-caſe of the maſter's cabin is called *companion*.

HOOF, *ungula*, the horny part which covers the feet of divers animals, as horſes, bullocks, &c.

The *hoof* ſerves much the ſame purpoſes as the nails of ſome animals, and the claws of others.

The *hoof* of a horſe ſurrounds the ſole and the coffin-bone. To be good, it ſhould be of a dark colour, ſomewhat ſhining, high, ſmooth, of a round ſhape, but a little larger below than above; ſhort, that the horſe may tread more on the toe than on the heel; and ſomewhat hollow within, having a narrow ſruſh and broad heels.

The *hoof* ſhould not have circles, which are a ſign of its being brittle, and that the horſe, having been often ſhod, has had his feet ſpoiled by the many pieces broke out of it. A white *hoof* alſo is commonly brittle.

To judge whether the *hoof* be good and ſtanch, lift up the foot, and conſider if it have a ſhoe forged purpoſely for it, and be very much pierced, and the holes made in the unuſual parts, as wanting horn enough to take hold by in thoſe places where the nails are commonly ſtriken. Sometimes they are forced to pierce the ſhoes nigh the heels, becauſe the fore-part is bad; it being unnatural to drive the nails near the heels, except the toe be ſo much ſplit and broke as not to bear nails.

If the *hoof* be not round, but broad, and ſpreading out at the ſides and quarters, the horſe commonly has narrow heels, and, in time, will be flat-footed; which foot is weak, and will not carry a ſhoe, nor travel far, but ſtumble: add, that treading more on his heels than his toes, will cauſe him to go low on his paſterns.

If the *hoof* be long, it will make him tread altogether on his heels. If crooked, viz. broad without and narrow within, ſo that the horſe is ſplay-footed, it will cauſe him to tread too much inward, and cut or interfere. If the ſruſh be broad, the heels will be weak and ſoft. If the heel be narrow and tender, the horſe will in time grow *hoof*-bound.

HOOF, *horn*, is a round bony ſwelling, growing on the top of a horſe's hoof, which is always cauſed by ſome blow or bruiſe. This is ſuit to be ripened and brought to ſuppuration by digeſting it with rotten litter, or hay boiled in ſtale urine, or with a plaiſter of ſtale wine-lees and wheat-flour boiled together. When it is come to a head, let it be lanced with a thin hot iron, and put a tent into it made of turpentine, deer's fat, and wax, boiled together in equal quantities, and lay a plaiſter of the ſame over the tent.

HOOF, *brittle*, the name of an infirmity to which horſes are ſubject. It comes ſometimes naturally, and ſometimes artificially. When it comes naturally, it is generally hereditary, the ſire or dam having had the ſame complaint. When it comes on accidentally, it is ſometimes owing to a diſtemper falling down into the feet; ſometimes to the creature's being much foundered.

The *hoof*, in this diſtemper, is ſo friable and rotten, as it were, that it cracks and flakes off on every ſlight occaſion. The cure is to be attempted in this manner: take wax, turpentine, ſuet, and hog's lard, of each four ounces; ſallad oil, a quarter of a pint by meaſure; and of dog's greaſe, half a pound: let the whole be melted together, and ſtrained through a piece of canvas into a galipot. The *hoof* is to be thoroughly anointed with this every day, morning and evening, eſpecially at the root; and if there are any large cracks, they muſt be filled up at every dreſſing with a mixture of equal parts of cow-dung and hog's lard.

The other infirmities to which *hoofs* are liable, are, the falling of the *hoof*, *hoof*-bound, *hoof*-hard, *hoof*-hurt, looſe *hoof*, falſe quarters, &c.

HOOF, *caſting of the*. A horſe is ſaid to *caſt his hoof*, when the whole coffin of the *hoof* becomes looſened, and falls off from the bone. This may be remedied by care, and proper application; a new *hoof* being procurable, if the coffin bone, &c. be not hurt.

Horſes ſometimes caſt their *hoofs*, by reaſon of ſome prick, ſtub, foundering, ſurbating, or other accident, that cauſes an impoſtumation in the foot; ſo that the *hoof*, and ſometimes the coffin-bone, being ſpongy and eaſily broken, fall off in large pieces. The laſt, when it happens, is a deſperate caſe.

HOOF-*bound*, is a ſhrinking in of a horſe's *hoof* on the top and at the heel, which makes the ſkin ſtare above the *hoof*, and grow over the ſame.

It befalls a horſe divers ways, either by keeping him too dry in the ſtable, by ſtrait ſhoeing, or by ſome unnatural heat after foundering.

HOOF-*hurt*. In labouring beaſts, eſpecially oxen, if the *hoof* be hurt with a coulter or ſhare, it may be cured by a ſalve of pitch and greaſe mixed with powder of brimſtone, diſſolved together, and with a hot iron melted in the cleft of the hoof.

HOOF-*looſened*, is a diſſolution or dividing of the horn or coffin of a horſe's *hoof* from the fleſh, at the ſetting on of the coronet.

If the parting be round about the coronet, it comes by means of foundering; if in part, then by a prick of ſome chanel-nail, quitter-bone, retreat, graveling, cloying, or the like. The ſigns of being looſened by foundering, is its breaking firſt in the fore-part of the coronet, right againſt the toes; becauſe the humour always deſcends towards the toe. If it proceeds from pricking, graveling, or the like, the *hoof* will looſen round about equally, even at firſt. If occaſioned by a quitter-bone, or hurt on the coronet, it will break right above the grieved part, and rarely be ſeen to go any farther.

HOOF-*ſwelled*, is an infirmity that ſometimes befalls young horſes, when they are over-rid or wrought hard, which makes them ſwell in that part, becauſe of the blood falling down and ſettling there; which, if not ſpeedily removed, will uſually beget a wet ſpavin.

For the cure, take the ſtrongeſt aqua fortis, and firſt file or draw away the old *hoof* to a conſiderable degree with a file or drawing iron; then touch what is left of the *hoof* for three or four dreſſings with the aqua fortis; anoint the foot with an ointment made of one pound of hog's greaſe, three quarters of a pound of patch greaſe, five ounces of Veniee turpentine, three ounces of new wax, and three ounces of ſallad oil, melted together over the fire; and thus a new *hoof* will be made to grow on the foot.

HOOK, in *Angling*, &c. See FISHING-*book*.

HOOKS, in *Building*, &c. are of various ſorts; ſome of

iron, and others of brafs, viz. 1. *Armour-hooks*, which are generally of brafs, and are to lay up arms upon, as guns, muſquets, half-pikes, pikes, javelins, &c. 2. *Caſſimont-hooks*. 3. *Chimney-hooks*, which are made both of brafs and iron, and of different faſhions: their uſe is to ſet the tongs and fire-ſhovel againſt. 4. *Cortain-hooks*. 5. *Hooks for doors, grates*, &c. 6. *Double line-hooks*, large and ſmall. 7. *Single line-hooks*, large and ſmall. 8. *Tenter-hooks*, of various ſorts. See TENTER.

HOOKS *of a ſhip*, are all thoſe forked timbers which are placed directly upon the keel, as well in her run as in her rake. See BREAST-*hooks*.

HOOK, *boat*, in a *Ship*. See BOAT.

HOOKS, *con*, thoſe which being made faſt to the end of a rope, with a nooſe like that which brewers uſe to ſling or carry their barrels on), are made uſe of for ſlings.

HOOKS, *foot*, in a *Ship*, the ſame with BUTTOCKS.

HOOK-*land*, or OFF-*land*, land ploughed and ſowed every year. Dict. Ruſt.

HOOKS, *leaf*, in a *Ship*, a tackle with two hooks; one to hitch into a cringle of the main or fore-ſail, in the bolt-rope at the leech of the ſail by the clew; and the other is to hitch into a ſtrap, which is ſpliced to the cheſs-tree. Their uſe is to pull down the ſail, and ſucceur the tackles in a large ſail and ſtiff gale, that all the ſtreſs may not bear upon the tack. It is alſo uſed when the tack is to be ſeized more ſecure, and to take off or put on a bonnet or drabler.

HOOK-*pins*, in *Architecture*, are taper iron pins, only with a *boot*-head, to pin the frame of a roof or floor together.

HOOKS, *ſheet*, in a *Ship*, thoſe *hooks* like fickles fixed in the ends of the yard-arms, that if a ſhip under ſail come to board her, thoſe *hooks* may cut her ſhrowds, and ſo ſpoil her tackling. But as thoſe *ſheet-hooks* are ſubject to break their own yards, and cut the ropes that come from the top-ſails, they are now very ſeldom uſed.

HOOKS, *trail*. See TRAIL-*hooks*.

HOOKS, *draught*. See DRAUGHT-*hooks*.

HOOKER, is the name of a veſſel built like a pink, but rigged and manned like a boy; much uſed by the Dutch.

HOOP-*wheel*. See STERN-*wheel*.

HOOPER, in *Ornithology*, a name by which ſeveral have called the cygnus ferus, or wild SWAN.

HOOPING-*cough*, in *Medicine*. See CHIN-COUGH.

HOOPOE, *Upupa*, in the Linnæan ſyſtem of *Ornithology*, makes a diſtinct genus of birds of the order of *picæ*; the characters of which are, that the beak is bent, convex, ſubcompreſſed, and an ſmall degree obtuſe; the tongue is obtuſe, triangular, and very ſhort: and the feet are ambulatory. Under this genus Linnæus has claſſed three ſpecies; the *upupa epops*, the *promerops*, and *bird of* PARADISE.

The *hoopoe*, or *upupa epops*, is found in many parts of Europe, in Egypt, and even as remote as Ceylon. It frequently viſits our iſlands, but not at ſtated ſeaſons, and never breeds with us. In Sweden it is vulgarly conſidered as a preſage of war, and it was formerly deemed in our country as a fore-runner of ſome calamity. Its general weight is about three ounces; the beak is black, ſlender, ſharp, and a little hooked: its head is adorned with an extremely beautiful and elegant creſt, riſing two fingers high, and compoſed of two ſeries of feathers, reaching from the inſertion of the back to the back part of the head, which it raiſes and depreſſes at pleaſure. The tips of theſe feathers are ornamented with black and white; the reſt is of a chefnut colour; its neck is of a pale reddiſh brown; its breaſt and belly white, variegated with longitudinal ſtreaks, which diſappear in the middle, as the bird grows older; the tail is black, and compoſed of ten feathers, but has a large ſpot in it, in form of a creſcent, the horns pointing towards the extremity of the tail; the legs are ſhort and black. Its wings, when folded, do not reach to the end of the tail, and are ſtreaked acroſs with white; it feeds on beetles, worms, ants, &c. and is ſaid alſo to eat berries, and other vegetables. It breeds in hollow trees, and lays two aſh-coloured eggs. According to Linnæus it takes its name from its note, which has a ſound ſimilar to the word; or it may be derived from the French *huppé, creſted*. Ray and Pennant. See *Tab. Il. Birds*, N° 22.

HOP *Lupulus*, or *Humulus*, in *Botany*, a genus of the *dioecia pentandria* claſs. Its characters are theſe: it has male and female flowers upon different plants; the empalement of the male flower is compoſed of five ſmall concave oblong leaves; it has no petal, but five ſhort, hairy ſtamina; the female flowers have a general, four-pointed, acute perianthium, and a ſeparate oval one of four leaves, including eight flowers; each of theſe have an empalement of one leaf, cloſed at the baſe; theſe have neither petal nor ſtamina, but a ſmall germen, ſituated in the centre, ſupporting two awl-ſhaped ſtyles, which turn to a roundiſh ſeed, covered with a thin ſkin, enclofed in the baſe of the empalement. We have but one ſpecies of this genus, which is diſtinguiſhed into the *male* and *female hop*.

The male *hop* grows wild by the ſide of hedges and upon banks, in many parts of England. The youngſhoots of theſe plants are often gathered by the poor people, and boiled as an eſculent herb; but theſe muſt be taken very young, otherwiſe they are rough and ſtringy. This is eaſily diſtinguiſhed by the flowers, which are ſmall and hang in long looſe bunches from the ſide of the ſtalks, abounding with farina on their ſummits, and have no *hops* ſucceeding to the flowers.

The female *hop* is that ſort which is cultivated for uſe; of this ſort, the people who cultivate them reckon three different varieties: as firſt, the long and ſquare garlick *hop*, the long white *hop*, and the oval *hop*, all which are indifferently cultivated in England.

There being the greateſt plantations of *hops* in Kent of any county in England, it is very probable that their method of planting and ordering them ſhould be the beſt.

Hops were firſt brought into England from the Netherlands in the year 1524. They are firſt mentioned in the Engliſh ſtatute book in the year 1552, viz. in the fifth and ſixth of Edw. VI. cap. 5. and by an act of parliament of the firſt year of king James I. anno 1 IOS. cap. 18. it appears, that *hops* were then produced in abundance in England.

The *hop* being a plant of great importance in the article of brewing, we ſhall conſider what relates to the culture and management of it under the following heads.

HOPS, *the ſoil proper for*. As for the choice of their *hop-grounds*, they eſteem the richeſt and ſtrongeſt grounds as the moſt proper; and if it be rocky within two or three feet of the ſurface, the *hops* will proſper well; but they will by no means thrive on a ſtiff clay, or ſpongy wet land.

The Kentiſh planters account new land beſt *for hops*; they plant their *hop-gardens* with apple trees at a large diſtance, and with cherry trees between; and when the land hath done its beſt for *hops*, which they reckon it will in about ten years, the trees may begin to bear. The cherry trees laſt about thirty years, and by that time the apple trees are large, they cut down the cherry trees.

The Eſſex planters account a moory land the moſt proper *for hops*.

As to the ſituation of a *hop-ground*, one that inclines to the ſouth or weſt is the moſt eligible; but if it be expoſed to the north-eaſt or ſouth-weſt winds, there ſhould be a ſhelter of ſome trees at a diſtance, becauſe the north-eaſt winds are apt to nip the tender ſhoots in the ſpring, and the ſouth-weſt winds frequently break and blow down the poles at the latter end of the ſummer, and very much endanger the *hops*.

In the winter time provide your ſoil and manure for the *hop-ground* againſt the following ſpring.

If the dung be rotten, mix it with two or three parts of common earth, and let it incorporate together till you have occaſion to make uſe of it in making your *hop-hills*; but if it be new dung, then let it be mixed as before, till the ſpring in the next year, for new dung is very injurious to *hops*.

Dung of all ſorts was formerly more commonly made uſe of than it is now, eſpecially when rotted and turned to mould, and they who have no other manure muſt uſe it; which, if they do, cows or hogs-dung, or human ordure mixed with mud may be a proper compoſt, becauſe *hops* delight moſt in a manure that is cool and moiſt.

HOPS, *the planting of*. *Hops* require to be planted in a ſituation ſo open, as that the air may freely paſs round and between them, to dry up and diſſipate the moiſture, whereby they will not be ſo ſubject to FIRE-BLASTS, which often deſtroy the middles of large plantations, while the outſides remain unhurt.

As for the preparation of the ground for planting, it ſhould, in the preceding winter, be ploughed and harrowed even; and then lay upon it in heaps a good quantity of freſh rich earth, or well rotted dung and earth mixed together, ſufficient to put half a buſhel in every hole to plant the *hops* in, unleſs the natural ground be very freſh and good.

The hills where the *hops* are to be planted, ſhould be eight or nine feet aſunder, that the air may freely paſs between them; for in cloſe plantations, they are very ſubject to what the *hop-planters* call the fire-blaſt.

If the ground is intended to be ploughed with horſes between the hills, it will be beſt to plant them in ſquares chequerwiſe; but if the ground is ſo ſmall, that it may be done with the breaſt-plough or ſpade, the holes ſhould be ranged in a quincunx form. Which way ſoever you make uſe of, a ſtake ſhould be ſtuck down at all the places where the hills are to be made.

Perſons ought to be very curious in the choice of the plants,

plants, as to the kind of *hop*; for if the *hop-garden* be planted with a mixture of several sorts of *hops* that ripen at several times, it will cause a great deal of trouble and be a great detriment to the owner.

The two best sorts are the white and the grey bind; the latter is a large square *hop*, more hardy, and is the more plentiful bearer, and ripens later than the former.

There is also another sort of the white bind, which ripens a week or ten days before the common; but this is tenderer and a less plentiful bearer, but it has this advantage, that it comes first to market.

But if three grounds, as three distant parts of one ground, be planted with these three sorts, there will be this convenience, that they may be picked successively as they become ripe. The sets should be five or six inches long, with three or more joints or buds on them.

If there be a sort of *hop* you value, and would increase plants and sets from, the superfluous buds may be laid down when the *hops* are tied, cutting off the tops, and burying them in the hill; or when the *hops* are dressed, all the cuttings may be saved; for almost every part will grow, and become a good set the next spring.

As to the seasons of planting *hops*, the Kentish planters best approve the months of October and March, both which sometimes succeed very well; but the sets are not to be had in October, unless from some ground that is to be destroyed; and likewise there is some danger that the sets may be mired, if the winter prove very wet; therefore the most usual time of procuring them is in March, when the *hops* are cut and dressed.

As to the manner of planting the *sets*, there should be five good sets planted to every hill, one in the middle, and the rest round about sloping, the tops meeting at the centre; they must stand even with the surface of the ground; let them be pressed close with the hand, and covered with fine earth; and a flick should be placed on each side of the hill to secure it.

The ground being thus planted, all that is to be done more during that summer, is to keep the hills clear from weeds, and to dig up the ground about the month of May, and to raise a small hill round about the plants.

In June you must twill the young binds or branches together into a bunch or knot; for if they are tied up to small poles the first year, in order to have a few *hops* from them, it will not countervail the weakening of the plants.

A mixture of compost or dung being prepared for your *hop-ground*, the best time for laying it on, if the weather prove dry, is about Michaelmas, that the wheels of the dung-cart may not injure the *hops*, nor furrow the ground: if this be not done then, you must be obliged to wait till the frost has hardened the ground, so as to bear the dung-cart; and this is also the time to carry on your new poles, to recruit those that are decayed, and to be cast out every year.

If you have good store of dung, the best way will be to spread it in the alleys all over the ground, and to dig it in the winter following. The quantity they will require will be forty loads to an acre, reckoning about thirty bushels to the load.

If you have not dung enough to cover all the ground in one year, you may lay it on one part one year, and on the next in another, or a third; for there is no occasion to dung the ground after this manner oftener than once in three years.

Those who have but a small quantity of dung, usually content themselves with laying on about twenty loads upon an acre every year; this they lay only on the hills, either about November, or in the spring; which last some account the best time, when the *hops* are dressed, to cover them after they are cut; but if it be done at this time, the compost or dung ought to be very well rotted and fine.

HOPS, *the dressing of*. As to the dressing of the *hops*, when the *hop-ground* is dug in January or February, the earth about the hills and very near them, ought to be taken away with a spade, that you may come the more conveniently at the flock to cut it.

About the end of February, if the *hops* were planted the spring before, or if the ground be weak, they ought to be dressed in dry weather; but else, if the ground be strong and in perfection, the middle of March will be a good time; and the latter end of March, if it be apt to produce over-rank binds, or the beginning of April may be soon enough.

Then having with an iron picker cleared away all the earth out of the hills, so as to clear the flock from the principal roots, with a sharp knife you must cut off all the shoots which grew up with the binds the fall year and also all the young suckers, that none be left to run in the alley, and weaken the hill. It will be proper to cut one part of the flock lower than the other, and also to cut that part low that was left highest the preceding year. By pursuing this method, you may expect to have stronger buds, and also keep the hill in good order.

In dressing those *hops* that have been planted the year before, you ought to cut off both the dead tops, and the young suckers, which have sprung up from the sets, and also to cover the flocks with fine earth a finger's length in thickness.

HOPS, *the poling of*. About the middle of April the *hops* are to be poled, when the shoots begin to sprout up; the poles must be set to the hills deep into the ground, with a square iron picker or crow, that they may the better endure the winds; three poles are sufficient for one hill. These should be placed as near the hills as may be, with their bending tops turned outwards from the hill, to prevent the binds from entangling; and a space between two poles ought to be left open to the south, to admit the sun-beams.

The poles ought to be in length sixteen or twenty feet, more or less, according as the ground is in strength; and great care is to be taken not to overpole a young or weak ground, for that will draw the flock too much, and weaken it. If a ground is overpoled, you are not to expect a good crop from it; for the branches, which bear the *hops*, will grow very little, till the binds have overreached the poles, which they cannot do when the poles are too long. Two small poles are sufficient for a ground that is young.

If you wait till the sprouts or young binds are grown to the length of a foot, you will be able to make a better judgement, where to place the largest poles; but if you stay till they are so long as to fall into the alleys, it will be injurious to them, because they will entangle one with another, and will not clasp about the pole readily.

Maple or alpen poles are accounted the best *for hops*, on which they are thought to prolpes best, because of their warmth, or else, because the climbing of the *hop* is promoted by means of the roughness of the bark. But for durability, ashen or willow poles are preferable; but the most durable of all.

If after the *hops* are grown up, you find any of them have been under poled, taller poles may be placed near those that are too short, to receive the binds from them.

HOPS, *the tying of*. As to the tying of *hops*, the buds that do not clasp of themselves to the nearest pole when they are grown to three or four feet high, must be guided to it by the hand, turning them to the sun, whose course they will always follow. They must be bound with withered rushes, but not so close as to hinder them from climbing up the pole.

This you must continue to do till all the poles are furnished with binds, of which two or three are enough for a pole; and all the sprouts and binds that you have no occasion for, are to be plucked up: but if the ground be young, then none of these useless binds should be plucked up, but should be wrapt up together in the middle of the hill.

When the binds are grown beyond the reach of your hands, if they forsake the poles, you should make use of a stand-ladder in tying them up.

Toward the latter end of May, when you have made an end of tying them, the ground must have the summer dressing, this is done by casting up with the spade some fine earth into every hill; and a month after this is done, you must hoe the alleys with a Dutch hoe, and make the hills up to a convenient bigness.

HOPS, *their gathering of*. About the middle of July *hops* begin to blow, and will be ready to gather about Bartholomew tide. A judgement may be made of their ripeness by their strong scent, their hardness, and the brownish colour of their seed.

When by these tokens they appear to be ripe, they must be picked with all the expedition possible; for if at this time a storm of wind should come, it would do them great damage, by breaking the branches, and bruising and discolouring the *hops*; and it is very well known that *hops*, being picked green and bright, will sell for a third part more than those which are discoloured and brown.

The most convenient way of picking them is into a long square frame of wood, called a bin, with a cloth hanging on tenter-hooks within it, to receive the *hops* as they are picked.

The frame is composed of four pieces of wood joined together, supported by four legs, with a prop at each end to bear up another long piece of wood, placed at a convenient height over the middle of the bin; this serves to lay the poles upon, which are to be picked.

This bin is commonly eight feet long, and three feet broad; two poles may be laid on it at a time, and six or eight persons may work at it, three or four on each side. It will be best to begin to pick the *hops* on the east or north side of your ground, if you can do it conveniently;

this will prevent the south-west wind from breaking into the garden.

Having made choice of a plot of the ground containing eleven hills square, place the bin upon the hill which is in the centre, having five hills on each side; and when these hills are picked, remove the bin into another piece of ground of the same extent, and so proceed till the whole *hop-ground* is finished.

When the poles are drawn up to be picked, you must take great care not to cut the binds too near the hills, especially when the *hops* are green, because it will make the sap to flow excessively.

The *hops* must be picked very clean, i. e. free from leaves and stalks; and, as there shall be occasion, two or three times in a day the bin must be emptied into a *hop-bag* made of coarse linen cloth, and carried immediately to the oast or kiln, in order to be dried; for if they should be long in the bin or bag, they will be apt to heat, and be discoloured.

If the weather be hot, there should no more poles be drawn than can be picked in an hour, and they should be gathered in fair weather, if it can be, and when the *hops* are dry; this will save some expence in firing, and preserve the colour better when they are dried.

The crop of *hops* being thus bestowed, you are to take care of the poles against another year, which are best to be laid up in a shed, having first stript off the haulm from them; but if you have not that conveniency, set up three poles in the form of a triangle, or six poles (as you please) wide at bottom; and having set them into the ground, with an iron picker, and bound them together at the top, set the rest of your poles about them; and being thus disposed, none but those on the outside will be subject to the injuries of the weather, for all the inner poles will be kept dry, unless at the top; whereas, if they were on the ground, they would receive more damage in a fortnight than by their standing all the rest of the year.

HOPS, *drying of.* The best method of drying *hops* is with charcoal on an oast or kiln, covered with hair-cloth, of the same form and fashion that is used for drying malt. There is no need to give any particular directions for making these, since every carpenter or bricklayer, in those countries where *hops* grow, or malt is made, knows how to build them.

The kiln ought to be square, and may be of ten, twelve, fourteen, or sixteen feet over at the top, where the *hops* are laid, as your plantation requires, and your room will allow. There ought to be a due proportion between the height and breadth of the kiln, and the brigness of the fire-hole where the fire is kept, viz. if the kiln be twelve feet square on the top, it ought to be nine feet high from the fire, and the fire-hole ought to be six feet and a half square, and so proportionable in other dimensions.

The *hops* must be spread even upon the oast a foot thick or more, if the depth of the curb will allow it; but care is to be overtaken not to overload the oast, if the *hops* be green or wet.

The oast ought to be first warmed with a fire before the *hops* are laid on, and then an even steady fire must be kept under them; it must not be too fierce at first, lest it scorch the *hops*; nor must it be suffered to sink or slacken, but rather be increased, till the *hops* be nearly dried, lest the moisture or sweat, which the fire has raised, fall back or discolour them. When they have lain about nine hours, they must be turned, and in two or three hours more they may be taken off the oast. It may be known when they are well dried, by the brittleness of the stalks, and the easy falling off of the *hop* leaves.

It is found by experience, that the curning of *hops*, though it be after the most easy and best manner, is not only an injury or waste to the *hops*, but also an expence of fuel and time, because they require as much fuel, and as long a time to dry a small quantity, by turning them, as a large one. Now this may be prevented, by having a cover (to be let down and raised at pleasure) to the upper bed whereon the *hops* lie. This cover may also be tinned, by nailing single tin plates over the face of it; so that when the *hops* begin to dry, and are ready to burn, i. e. when the greatest part of their moisture is evaporated, then the cover may be let down within a foot or less of the *hops* (like a reverberatory) which will reflect the heat upon them, so that the top will soon be as dry as the lowermost, and every *hop* be equally dried.

HOPS, *bagging of.* As soon as the *hops* are taken off the kiln, lay them in a room for three weeks or a month to cool, give, and toughen; for if they are bagged immediately, they will powder, but if they lie awhile (and the longer they lie the better, provided they be covered close with blankets to preserve them from the air) they may be bagged with more safety, as not being liable to be broken to powder in treading, and this will make them bear treading the better, and the harder they are trodden the better they will keep.

The common method of bagging is as follows: they have a hole made in an upper floor, either round or square, large enough to receive a *hop-bag*, which consists of four ells and a half of ell wide cloth, and also contains ordinarily two hundred and a half of *hops*, they tie a handful of *hops* in each lower corner of the bag, to serve as handles to it; and they fasten the mouth of the bole, fo placed that the hoop may rest upon the edges of the hole.

Then he that is to tread the *hops* down into the bag, treads the *hops* on every side, another person continually putting them in as he treads them, till the bag is full, which being well filled and trodden, they untrip the fastening of the bag to the hoops, and let it down, and cloath up the mouth of the bag, tying up a handful of *hops* in each corner of the mouth, as was done in the lower part.

Hops being thus packed, if they have been well dried, and laid up in a dry place, will keep good several years; but care must be taken, that they be neither destroyed, nor feeded by the mice making their nests in them. Miller's Gard. Dict.

HOPS, *diseases of.* See FIRE-BLAST, FEN, HONEY-*dew*, &c.

HOPS, *produce of.* The charge of an acre of *hop-ground*, in most parts of England where *hops* are cultivated, is computed thus: three pounds for the husbandry, four pounds for the wear of the poles, five pounds for picking and drying, one pound ten shillings for dung, one pound for rent, though in some places they pay four or five pounds an acre yearly for the rent of the land, and ten shillings for tythe; in all fifteen pounds a year. The *hop-planters* in England reckon, that they have but a moderate return, when the produce of an acre of *hops* does not sell for more than thirty pounds. They frequently have fifty, sixty, eighty, or a hundred pounds; and in a time of general scarcity considerably more: so that upon the whole, if the total charge of an acre of *hops* is computed at fifteen pounds a year, and its average produce at thirty pounds, the clear profit from an acre will be fifteen pounds a year. But the plantation of *hops* has lately so much increased, that the average produce far exceeded the consumption, that *hops* have been with many planters rather a losing than a very profitable article.

HOPS, *use of.* In the spring time, when the bud is yet tender, the tops of the plant being cut off, and boiled, are eat like asparagus, and found very wholesome and effectual to hasten the body; the buds and tendrils are good to purify the blood in the scurvy, and most cutaneous diseases; decoctions of the flowers, and syrups thereof, are of use against pestilential fevers; juleps and apozems are also prepared with *hops*, for hypochondriacal and hysterical affections, and to promote the menses.

A pillow stuffed with *hops*, and laid under the head, is said to procure sleep in fevers, attended with a delirium. But the principal use of *hops* is in the brewery, for the preservation of malt liquors; which by the superaddition of this balsamic, aperient, and diuretic bitter, become less viscid, less apt to turn sour, more detergent, more disposed to pass off by urine, and in general more salubrious. They are said to contain an agreeable odorous principle, which promotes the vinous fermentation. When slightly boiled or infused in warm water, they increase its spirituosity.

HOPS, *laws relating to.* By 9 Anne, cap. 12. an additional duty of 3*d.* a-pound is laid on all *hops* imported, over and above all other duties; and *hops*, landed before entry and payment of duty, or without warrant for landing, shall be forfeited and burnt; the ship also shall be forfeited, and the person concerned in importing or landing shall forfeit 5*l.* a hundred weight. 7 Geo. II. cap. 19. By 9 Anne, cap. 12. there shall be paid a duty of 1*d.* for every pound of *hops* grown in Great Britain, and made fit for use, within six months after they are cured and bagged; and *hop-grounds* are required to be entered on pain of 20*l.* an acre. Places of curing and keeping are also to be entered, on pain of 50*l.* which may be visited by an officer at any time without obstruction, under the penalty of 20*l.* All *hops* shall, within six weeks after gathering, be brought to such places to be cured and bagged, on pain of 5*l.* a pound. The rebagging of foreign *hops* in British bagging for sale or exportation, incurs a forfeiture of 10*l.* a hundred weight; and defrauding the king of his duty by using twice or oftener the same bag, with the officer's mark upon it, is liable to a penalty of 40*l.* The removal of *hops* before they have been bagged and weighed, incurs a penalty of 50*l.* Concealment of *hops* subjects to the forfeiture of 20*l.* and the concealed *hops*; and any person who shall privately convey away any *hops*, with intent to defraud the king

king and owner, shall forfeit 5*l.* a pound; and the duties are required to be paid within six months after curing, bagging, and weighing, on pain of double duty, two-thirds to the king, and one third to the informer. No common brewer, &c. shall use any bitter ingredient instead of *hops*, on pain of 20*l.* *Hops*, which have paid the duty, may be exported to Ireland; but by 6 Geo. cap. 11. there shall be no drawback; and by 7 Geo. II. cap. 19. no foreign *hops* shall be landed in Ireland. Notice of bagging and weighing shall be sent in writing to the officer, on pain of 50*l.* 6 Geo. cap. 21. And by 14 Geo. III. cap. 68. the officer shall, on pain of 5*l.* weigh the bags or pockets, and mark on them the true weight or tare, the planter's name, and place of abode, and the date of the year in which such *hops* were grown; and the altering or forging, or obliterating such mark, incurs a forfeiture of 10*l.*

The owners of *hops* shall keep at their oasts, &c. just weights and scales, and permit the officer to use them, on pain of 20*l.* 6 Geo. cap. 21. And by 10 Geo. III. cap. 44. a penalty of 100*l.* is inflicted for false scales and weights. The owners are allowed to use casks instead of bags, under the same regulations. 6 Geo. cap. 21. If any person shall mix with *hops* any drug to alter the colour or scent, he shall forfeit 5*l.* a hundred weight. If any person shall unlawfully and maliciously cut *hop-bines* growing on poles, in any plantation, he shall be guilty of felony, without benefit of clergy. 6 Geo. II. cap. 37. By a late act, five per cent. is added to the duties on *hops*.

HOP, *wild.* See *Herb* TREFOIL.

HOP-*tree.* See HOLLY.

HOP-*hornbeam*, in *Botany.* See HORNBEAM.

HOPE, in *Ethics*, is the desire of some good, attended with the belief of the possibility, at least, of obtaining it, and enlivened with joy, greater or less, according to the greater or less probability of our possessing the object of our *hope*. Alexander, preparing for his Asian expedition, distributed his hereditary dominions among his friends; allotting to some villages, to others boroughs, to others cities; and being asked what he had reserved for himself, replied, *Hope*.

HOPEA, in *Botany*, a genus of the *polyadelphia polyandria* class. Its characters are, that the calyx is divided into five segments; the corolla has five petals; there are many stamina growing together in five bodies; the style is single and the fruit is a drupe, containing a three-celled nut. There is only one species.

HOPLITES, HOPLITE, formed of ὅπλον, *armour*, in *Antiquity*, were such of the candidates at the Olympic and other sacred games, as ran races in armour.

One of the finest pieces of the famous Parrhasius, was a painting which represented two *hoplites*; the one running and seeming to sweat large drops; the other laying his arms down, as quite spent, and out of breath. Pliny, lib. xxxv. cap. 10. and Valchat. De Coronis, lib. vi. cap. 14.

HOPLITES, in *Natural History*, a name given by some of the writers among the ancients, to a stone of a shining brass-like appearance, looking like the surface of the polished brass-armour, worn in those times. It is easy to conclude, from this account, that the *hoplites* was one of our mundics.

HOPLITODROMOS, formed of ὅπλον, *armour*, and δρόμος, *I run*, in the ancient gymnastic sports, a term applied to such persons as went through those toilsome and robust exercises, in complete armour; by which the exercise became much more violent, and the wearing of armour, in the time of battle, much more easy.

HOPLOCHRISMA, a term used, by the ancient writers in *Medicine*, for the anointing a sword, or other weapon, with which a person had been wounded, in order to the curing of the wound; so early was the idle notion of curing by sympathetic remedies received in the world. Some late authors have also used the word in a very different sense, namely, for the anointing the points of darts or swords with poisonous ingredients, in order to render the least wound given with them fatal; a practice most known, as it is said, among the savage inhabitants of America.

HOPLOMACHI, Ὁπλομάχοι, composed of ὅπλον, *armour*, and μάχομαι, *I fight*, in *Antiquity*, were a species of gladiators, who fought in armour; either completely armed from head to foot, or only with a casque and cuirass.

HOPPER, a vessel wherein seed-corn is carried at the time of *sowing*.

The word is also used for that wooden trough in a mill into which the corn is put to be ground.

HORÆA, Ὥραια, in *Antiquity*, solemn sacrifices, consisting of fruits, &c. offered in spring, summer, autumn, and winter, that heaven might grant mild and temperate weather. These, according to Meursius, were offered to the goddesses, called Ὥραι, i. e. *Hours*, who were three in number, attended upon the Sun, presided over the four seasons of the year, and had divine worship paid them at Athens. Potter, Archæol. Græc. lib. ii. cap. 20. tom. i. p. 439.

HORARY, something relating to *hour*, *hours*. See HOUR.

HORARY *circle of the globe*. See CIRCLE.

HORARY *circles*. See HOUR-*circles* and CIRCLE.

HORARY *circles*, or *lines*, in *Dialling*, are the lines or circles which mark the hours on *sun*-DIALS.

HORARY *motion of the earth*, is the arch it describes in the space of an hour.

This is nearly fifteen degrees; for the earth completes its revolution through 360° in a day, or twenty-four hours, and the twenty-fourth part of 360 is 15; though this is not the exact measure of the *horary* arch, because the earth moves with different velocity, according to its greater or lesser distance from the sun; but it is near enough for ordinary computations. See EQUATION *of time*.

HORCUS *hops*, the name of a stone, mentioned by the writers of the middle ages as useful in soldering silver and other metals. All the description they give of it is, that it was black, and was easily reduced to powder. It was called also catenia.

HORD, HORDA, a Tartarian term, and literally denoting a *multitude*, in *Geography*, is used for a company or tribe of wandering people, which have no settled abode or habitation, but stroll about, dwelling in chariots, or under tents, to be ready to shift as soon as herbage, fruits, and the present province is eaten bare.

HORD is more properly the name which the Tartars, who inhabit beyond the Wolga, in the kingdoms of Astracan and Bulgaria, give to their villages.

A *horde* consists of fifty or sixty tents ranged in a circle, leaving an open place in the middle. The inhabitants of each *horde* usually form a military company or troop: the eldest whereof is commonly the captain, and depends on the general or prince of the whole nation.

HORDEATUM, a liquid medicine, made of barley boiled till it burst.

Sometimes other ingredients are added, as the cold seeds, almonds, and the like.

HORDEOLUM, from *hordeum*, *barley*, as resembling a barley-corn, in *Medicine*, a small tubercle arising on the outer verge of the palpebræ, or eye-lids. See STYE.

HORDEUM, *Barley*, in *Botany*, a genus of the *triandria digynia* class. The characters are, that it hath a partial involucrum of six narrow-pointed leaves, containing three flowers; the petal of the flower opens with two valves; the flower hath three hairy stamina, shorter than the petal; it hath an oval germen, supporting two reflexed styles, which becomes an oblong bellied seed, pointed at both ends, with a longitudinal furrow, surmounted by the petal of the flower, which does not fall off. Miller enumerates four species: viz. 1. The spring barley with many rows of grain, principally cultivated in England, of which the farmers make two sorts, the common and rath-ripe barley, though the latter is only a variety produced from the other, by being long cultivated in warm gravelly lands. The first of barley is easily distinguished by the two orders of beards standing erect; the chaff is also thinner, and it is, therefore, esteemed better for malting. 2. The long-eared barley, the grains of which are regularly ranged in a double row, lying over each other like the scales of fishes; the chaff is very thin, and this barley is much valued for malting. 3. Sprat or battledore barley, with shorter and broader ears, longer beards, and shorter stem. 4. The square or bear barley, or bigg, sown in the northern counties, and generally in Scotland, with its grains disposed in six rows. This species is much hardier than the others, but is not good for malting. For the culture and produce, &c. of barley, see BARLEY.

When barley and malt does not exceed 32*s.* a quarter, there is a duty on importation of 10*s.* by 22 Car. II. cap. 13. but when the price exceeds this rate, the duty is 2*l.* 8*d.* a quarter by 15 Car. II. cap. 7. These duties on importation cease, when barley, bear, or bigg, shall be at or above 24*s.* a quarter, and in lieu of it, the duty shall be only 2*d.* a quarter, by 13 Geo. III. cap. 43. When the price of barley, bear, or bigg, shall be at or above 28*s.* a quarter, exportation is prohibited under a penalty of 20*s.* a bushel, and forfeiture of the vessel, &c. 13 Geo. III. cap. 43. By this statute the former bounties on exportation shall cease; and when barley, bear, or bigg, is under 24*s.* a quarter, there shall be allowed a bounty of 2*s.* 6*d.* for every quarter of barley, &c. or of MALT. By 20 Geo. III. cap. 54. over and above all former duties upon malt, there shall be paid for every bushel of malt made in England, whether for sale or not, the sum of 6*d.*; in Scotland, the sum of 3*d.*; and if brought from Scotland into England 3*d.* more.

HORDICALIA, or HORDICIDIA, in *Antiquity*, a religious feast held among the Romans, wherein they sacrificed cattle big with young.

The word *hordicidia* is formed of *horda*; which Festus explains

explains by *pregnans*, *pregnant*, and *cado*, *I sacrifice*: Ovid, in his Fasti, lib. iv. ver. 631. describes *hordi* or *fordi*, to be *bos pregnans*; of *φορος*, *gravidus*.

This feast fell on the fifteenth of April; on which day they sacrificed thirty cows, big with calf, to the goddess Tellus, or Terra, Earth: part of them were sacrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to ashes at Pale, by the pontifices; afterwards, by the chief of the Vestal virgins.

Alexander ab Alexandro, Genial. Dier. writes *hordalia dies*, and from him, some of the moderns call the feast *hordalia*; but Varro writes it *horolonia*, and Festus, *horolidia*.

HOREHOUND, *Marrubium*, in *Botany*, a genus of the *didynamia gymnospermia* class. Its characters are these: the empalement of the flower is funnel-shaped, of one leaf, and equal at the brim, which spreads open; the flower is of the lip kind, with a cylindrical tube, divided into two lips; it has four stamina, which are under the lip, two of which are somewhat longer than the other; it has a four-pointed germen, which afterward turns to four oblong seeds, sitting in the empalement. There are fifteen species. Miller.

The leaves of the common white *horehound* or *prasium*, with hooked bristly indentures to the empalement, are said to be attenuant and resolvent; they are famous for the relief they give in moist asthmas, and in all diseases of the breast and lungs, in which a thick and viscous matter is the cause. They are also capable of doing great good in menstrual suppressions, cachexies, and other chronical disorders, proceeding from a viscidity of the fluids, and obstructions of the viscera. A dram of the dry leaves in powder, or two or three ounces of the expressed juice, or an infusion of half a handful, or a handful of the fresh leaves, are commonly directed for a dose. There used to be a compound syrup of it, called *syrupus de Prasio*, which is now out of use. See ASTHMA.

HOREHOUND, *base*, *Stachys*, in *Botany*, a genus of the *didynamia gymnospermia* class. Its characters are these: the flower has a tubulous, permanent empalement, cut into five acute parts at the top; and it has one lip-shaped petal, with a short tube, having oblong chaps; the upper lip is erect, hooked, and a little indented at the point, being cut into three parts; it has four awl-shaped stamina, two of which are longer, and inclined to the upper lip; the other two are shorter, terminated by single summits; and it has a four-pointed germen, supporting a slender style of the length of the stamina, crowned by a bifid acute stigma; the germen turns to four oblong, angular seeds, which ripen in the empalement. Miller reckons eight species, and Linnæus fifteen; adding to this genus some species of the *galeopsis*; one of these is common by the sides of ditches, and is ordered in the dispensatories as a good vulnerary herb.

HOREHOUND, *bastard*. See IRON-*wort*.

HOREHOUND, *black*, or *stinking*, *Ballota*, in *Botany*, a genus of the *didynamia gymnospermia* class of plants: the flower is monopetalous and cluven, the upper lip being concave and crenated, and the lower obtuse, and divided into three segments; the empalement of the flower is funnel-shaped, terminated by five horizontal points, and marked with ten furrows. This is a common weed, growing on the sides of banks in most parts of England, so is seldom allowed a place in gardens. There are two sorts of it, one with white, the other with purple flowers. Miller.

Linnæus enumerates five species of this genus.

Mr. Ray recommends a strong decoction of this plant in hysterical and hypochondriacal cases. Make a tea of equal parts of white *horehound*, *stinking horehound*, and betony leaves; three or four cups of it drunk every day, will prevent the gout, or mitigate its attacks.

HOREHOUND, *water*, *Lycopus*, in *Botany*, the name of a genus of plants of the *diandria monogynia* class; the characters of which are these: the flower consists of one leaf, and is of the labiated kind; but, in some degree, resembles the bell-fashioned flowers; for the upper lip is scarce at all to be distinguished from the lower, so that the flower appears at first sight a tubular one, divided simply into four segments; the pistil arises from the cup, and is fixed in the manner of a nail to the lower part of the flower; it is surrounded by four embryos, which afterwards become as many seeds of a roundish form, and are contained in an open capsule, which was before the cup of the flower.

The species of *lycopus* enumerated by Mr. Tournefort are four, and by Linnæus two.

This plant grows in great plenty at the sides of ditches.

HORIZON, or HORISON, in *Astronomy*, a great circle of the sphere, dividing the world into two parts, or hemispheres; the one upper, and visible; the other lower, and hid.

The word is *ορος*, which literally signifies *bounding* or *terminating the sight*; being formed of *ορος*, *terminus*, *confinis*, *I bound*, *I limit*; whence it is also called *finitor*, *confinis*.

The *horizon* is either *rational* or *sensible*.

HORIZON, *rational*, *true*, or *astronomical*, which is also simply and absolutely the *horizon*, is a great circle, whose plane passes through the centre of the earth, and whose poles are the zenith and nadir. It divides the sphere into two equal parts, or hemispheres.

Such is the circle HR (*Tab. Astronomy, fig.* 53.) whose poles are the zenith and nadir; whence it follows, that the several points of the *horizon* are a quadrant distant from the ZENITH and NADIR.

The meridian and vertical circles cut the rational *horizon* at right angles, and into equal parts.

HORIZON, *sensible*, *visible*, or *apparent*, is a lesser circle of the sphere, as *hr*, which divides the visible part of the sphere from the invisible, and whose plane touches the spherical surface of the earth.

Its poles, too, are the zenith and nadir; and, consequently, the *sensible horizon* is parallel to the *rational*; and it is cut at right angles, and into two equal parts, by the verticals.

The *sensible horizon* is divided into *eastern* and *western*.

HORIZON, *the eastern*, or *ortive*, is that part of the *horizon* wherein the heavenly bodies rise.

HORIZON, *the western*, or *occidual*, is that wherein the stars set.

HORIZON, in *Geography*, is a circle passing over the earth, and dividing the visible part of the earth and heavens from that which is invisible.

The altitude, or elevation, of any point of the sphere, is an arch of a vertical circle, intercepted between it and the sensible *horizon*.

This is peculiarly denominated *sensible* or *apparent horizon*, to distinguish it from the *rational*, or *true*, which passes through the centre of the earth; as already observed.

The two *horizons*, though distant from one another by the semidiameter of the earth, will appear to coincide, when continued to the *sphere* of the fixed stars; because the earth compared with this sphere is but a point.

By *sensible horizon* is also frequently meant a circle, which determines the segment of the surface of the earth, over which the eye can reach; called also the *physical horizon*. In this sense we say, a *spacious horizon*; a *narrow*, *scanty horizon*.

It is evident, that the higher the eye is, the farther is the visible *horizon* extended. Thus, (*Tab. Geography, fig.* 1.) represent a part of the spherical surface of the earth; if the eye be at A, draw *Ab* and *Ar* tangents to the globe of the earth; and let one of these lines *Ab*, the point A continuing immoveable, be carried round, and in its revolution always touch the surface of the earth; the point *b* will describe the visible *horizon*, part of which is represented by the curve *bsr*. But if the eye be placed higher, as at B, the tangents BH and BR will reach farther, and the visible *horizon* will be larger, viz. HOR. The visible *horizon* is most accurately observed upon the sea, and *it*, therefore, sometimes called the *horizon of the sea*. In observing this *horizon*, the visual rays, Ab and Ar, will, on account of the spherical surface of the sea, always point a little below the true sensible *horizon* SS, and consequently below the rational *horizon* TF, which is parallel to it.

To find the DEPRESSION of the *horizon* of the sea below the true *horizon*, which varies with the height of the eye, and in a small degree with the variation of the refractive power of the atmosphere, see DEPRESSION.

The semidiameter of the earth and the height of the eye being given, the extent of the visible *horizon* is thus found. Let ADE (*Tab. Geography, fig.* 2.) be an arch of a great circle upon the earth, C the centre of the earth, B the eye of the observer, BD the height of the eye, BA and BE lines drawn from the eye, touching the surface of the earth at A and E, and terminating the visible *horizon*: in order to find AD, draw CA, and in the triangle BAC, right-angled at A, we have CB to CA as the whole sine or radius is to the sine of the angle ABC, whose complement is the angle C, measured by the arc AD. E. g. Let DB, the height of the eye, be five feet, DC, or CA, the semidiameter of the earth, be 20946655 feet, and CB will be 20946660 feet: then will the logarithm of CB be to that of CA, or 7.3201769 to 7.3201768 as 10.0000000 to 9.9999999, the sine of ABC = 89° 58′; therefore the angle C is = 2′ or 12185 feet = 2.308 *miles*, or two miles 542 yards, nearly. *BA*, or the right-lined distance of the farthest point of sight from the eye, may easily be found, as the angles and other sides are known: thus, radius or sine of the angle A is to CB as the line of C is to BA: or, since BA

$= \overline{CB^2 - CA^2}$ | $= \overline{CB + CA \times CB - CA}$ |, if the logarithm of the sum of the two given sides be added to that of their difference, the half of these two logarithms will be equal to the logarithm of BA, nearly; i. e. $7.6222684 + 0.8980700 \over 2 = 4.1603884$, the logarithm of 14474 feet = BA, nearly. See DISTANCE.

The depression of the *horizon* of the sea at a given height of the eye, may be thus found by calculation: For if the eye be at B, the sensible *horizon* is FG, the depression is the angle FBA, which being the complement of ABC, is equal to ACD. See DEPRESSION.

The distance on a perfect globe, if the visual rays came to the eye in a strait line, would be as it has been now stated; but by means of the REFRACTION of the atmosphere, distant objects on the *horizon* appear higher than they really are and may be seen at a greater distance, especially on the sea. Thus, without refraction, the most distant part of the sea visible to the eye at B, would be A; but refraction elevates the parts of the sea, which are farther from the eye than A, so that the tangent or visual ray shall fall upon a more distant point, as H, and consequently the extent of the visible *horizon* is enlarged by refraction: for it is DH, instead of DA; and refraction makes the angle of depression less than it would be, viz. HBF, instead of ABF.

Father Laval, professor of hydrography at Marseilles, found, that the *horizon* of his observatory toward the sea was never more than 25 minutes, nor less than 17½; that is, the arch of the circumference of the earth, intercepted between the observatory and the *horizon*, fluctuated between those two quantities; whence M. Cassini deduces, that the extent of the *horizon* is seven French leagues, of three miles each; and that the observatory is 175 feet high.

The height of the *horizon*, at the same place, and the same elevation above it, is very subject to vary, by means of differences in the atmosphere, which occasion others in the refractions.

When the sea was still, or the north-west or south-west wind blew, and the air hazy about the *horizon*, F. Laval always found his *horizon* depressed, or lower; i. e. the refraction which should raise it in that case was less than ordinary. And yet, on the common principles, the air being now much charged with vapours, the very contrary was rather to be expected. This makes M. Cassini suspect that there is some other refractive matter in the atmosphere, beside the air itself.

The same author observes, that at a height ten times greater than that of F. Laval's observatory, he found the arch terminated by the *horizon* toward the sea, 42′, without any sensible variation; whence he concludes, that the variations are the greater, as the height is the less; which may seem contrary to what he had asserted in another place, viz. that the variations in the apparent altitudes of bodies are greater, as those objects are more remote, because they are seen through the larger quantity of air, which is liable to be varied. But the contradiction may be solved.

HORIZON *of the globe*. See GLOBE.

HORIZONTAL, something that relates to the *horizon*, or that is taken in the *horizon*, or on a level with the *horizon*.

We say, a *horizontal* plane, *horizontal* line, *horizontal* distance, &c.

HORIZONTAL *dial*, is that drawn on a plane parallel to the horizon; having its gnomon, or style, elevated according to the altitude of the pole of the place it is designed for.

Horizontal dials are of all others the most simple and easy. The manner of describing them, see under the article DIAL.

HORIZONTAL *distance*. See DISTANCE.

HORIZONTAL *line*, in *Perspective*, is a right line drawn through the principal point, parallel to the horizon; or it is the intersection of the *horizontal* and perspective planes.

Such is the line PL (*Tab. Perspective, fig.* 12.) passing through the principal point F.

HORIZONTAL *line*, or base of a hill, in *Surveying*, a line drawn on the *horizontal* plane of the hill, or that on which it stands.

HORIZONTAL *moon*. See *Apparent* MAGNITUDE.

HORIZONTAL *parallax*. See PARALLAX.

HORIZONTAL *plane*, is that which is parallel to the horizon of the place, or not inclined to it.

The business of LEVELLING is, to find whether two points be in the *horizontal* plane; or how much the deviation is.

HORIZONTAL *plane*, in *Perspective*. See PLANE.

HORIZONTAL *projection*. See PROJECTION and MAP.

HORIZONTAL *range*, or *level range*, of a piece of ordnance, is the line it describes, when directed parallel to the horizon, or *horizontal* line.

Dr. Halley gives two very ready theorems: the one, to find the greatest *horizontal* range at 45 degrees elevation, in any shot made upon any inclined plane, with any elevation of the piece whatsoever; and the other, to find elevations proper to strike a given object with any force, greater than what is sufficient to reach it with the middle elevation.

1. A shot being made on an inclined plane; having the *horizontal* distance of the object it strikes, with the elevation of the piece, and the angle at the gun between the object and the perpendicular; to find the greatest *horizontal* range of that piece laden with the same charge; that is, half the latus rectum of all the parabolæ made with the same impetus. Take half the distance of the object from the nadir, and the difference of the given elevation from that half; subtract the versed sine of that difference from the versed sine of the distance of the object from the zenith; the difference of those versed sines will be to the sine of the distance of the object from the zenith, as the *horizontal* distance of the object struck, to the greatest range at 45 degrees.

2. Having the greatest *horizontal* range of a gun, the *horizontal* distance and angle of inclination of an object to the perpendicular; to find the two elevations necessary to strike that object. Halve the distance of the object from the nadir; this half is equal to the half sum of the two elevations sought; then say, as the greatest *horizontal* range is to the *horizontal* distance of the object, so is the sine of the angle of inclination, or distance of the object from the perpendicular, to a fourth proportional: which fourth being subtracted from the versed sines of the distance of the object from the zenith, leaves the versed sine of half the difference of the elevations sought; which elevations are therefore had, by adding and subtracting that half of the difference to and from the aforesaid sum. See PROJECTILE and GUNNERY.

HORIZONTAL *refraction*. See REFRACTION.

HORIZONTAL *rests*. See FIRELOCK *rests*.

HORIZONTAL *shelters*, among *Gardeners*, are defences, disposed parallel to the horizon, for tender plants, blossoms, and fruits, in the spring, to defend them against blasts, and pinching nights.

The usual shelters that have obtained, are hafs mats, and other warm coverings, which are rolled up in the day-time, and let down in the night. It was the reverend Mr. Lawrence who first propoſed *horizontal shelters*, chiefly on this principle; the moſt of our froſts and blaſts fall perpendicularly, i. e. the condenſed vapours, falling from the upper region, do at night form themſelves, toward the ſurface of the earth, into drops of dew, ſubject to be frozen by the coldneſs of the air.

Horizontal ſhelters are to be made by laying rows of tiles, at certain diſtances one above another, in the ſtructure of the wall, ſo as to project or hang over the plane of the wall, to carry off the dew, wet, &c. It is an inconvenience, objected to this method, that it is difficult to lead a tree rightly among the tiles, or to keep its figure duly filled up.

But the principal objection againſt theſe tiles is this, that they prevent vegetables from receiving the advantage of dews, rains, &c. in conſequence of which they become weak and languid, and at laſt entirely decay. The only ſort of *horizontal ſhelters*, which Mr. Miller has ever obſerved to be uſeful for fruit-trees, are made with two leaves of fir-deal, joined over each other, and pointed. This kind of ſhelter being fixed upon the top of the wall with pullies, to draw up and down at pleaſure, forms a ſort of pent-houſe; which being let down in great rains or cold nights, whilſt the trees are in flower, or the fruit is ſetting, proves ſerviceable; but it muſt be removed ſoon after the fruit is ſet, ſo that the trees may enjoy all the advantages of rain, dew, &c. in the ſummer, which are abſolutely neceſſary for producing healthy trees, or good fruit.

HORIZONTAL *ſpeculum*. One of the great inconveniencies mariners have to ſtruggle with, is the frequent want of a horizon; for though the atmoſphere may, at the height of ten or twelve degrees and upward, be clear enough to give a view of the ſun and other objects, yet all below that height is often ſo hazy, as to hinder a diſtinct ſight of the horizon, and conſequently to prevent obſervations from having the requiſite correctneſs. This inconvenience is removed by a *horizontal ſpeculum*, invented by Mr. Sexton, who was loſt in the Victory man of war, in which ſhip he was ſent out to make trial of his machine.

The principle on which this machine was conſtructed, was derived from the conſideration of a top while ſpinning: for this author obſerving that the top had a conſi-

derable

derable degree of steadiness in, and force to acquire, an upright motion, whether the body which sustained it was in motion or at rest: he therefore concluded, that if a circular machine, whose upper face was a flat polished speculum, was to have a swift circular motion communicated to it, that speculum, by acquiring a *horizontal* situation, would shew all objects which it reflected, as much below the horizon, as they really are above it. Consequently, if the image of the sun, as seen reflected from the speculum, were made to coincide with the sun's image seen in a Hadley's quadrant, the angle given by the quadrant would in all cases be double the real altitude. Mr. Serson also found, that to confine the speculum to one place, it was necessary to let the point spin in a cup; for the *horizontality* of the speculum would not be altered, whatever position might be given to the cup; provided it touched only at the point on which it spun. This curious and useful instrument, as it is now improved by Mr. Smeaton, consists in a well polished metal speculum, of about three inches and a half in diameter, inclosed within a circular rim of brass; so fitted that the centre of gravity of the whole shall fall near the point whereon it spins. This is the end of a steel axis running through the centre of the speculum, above which it finishes in a square, for the convenience of fitting a roller on it, by which it is set in motion by means of a piece of tape wound round the roller. The cup in which it spins, is made of agate, flint, or other hard substance; and a pyramidal cover may be made to the whole, composed of glass panes: by this means an observation may be made with it as well covered as open, and it will thereby be prevented from tarnishing by the moist air and spray of the sea.

If the box be placed steadily, and as level as may be, after the tape is untwisted, the speculum will be fit for observation in less than two minutes, and will generally continue so for twelve or fifteen. When it is to be used for a meridian observation, it may be convenient to know what time to set it up: and this may be had near enough by taking the sun's bearing from the meridian with an azimuth compass, allowing for the variation; and if it has about five degrees to run before it culminates, it is then time to spin the speculum. The observer is to place himself as near the box as he conveniently can, and look down on the sun's image in the speculum, and bring the sun's image seen in the quadrant to agree with it, so that their centres coincide; the quadrant will then give the double altitude, without any allowance for the height of the ship, or the sun's semidiameter.

When the sun is about 45° high, the observer must look through that sight of the quadrant, which is used for a back observation; but he must look down on the *horizontal* image, or that in the speculum, as it was the back horizon; and then making the solar images to agree, the quadrant according as it is numbered, will give the double altitude, or double zenith distance.

These speculums are as useful by night as by day; for as the images of the smallest stars may be seen in the speculum, consequently any object that can be seen reflected from the glasses of the quadrant, may be observed by the speculum; and these are all the stars of the first magnitude, the planets Venus, Mars, Jupiter, Saturn, and the Moon. So that by having the declinations of these bodies in an ephemeris, they may be used in observations as well as the sun.

As the great distresses to which ships are sometimes driven in several parts of the world, for want of a horizon to observe by, are by this ingenious contrivance quite removed, it is hoped the use of this instrument may become general. See HADLEY'S QUADRANT.

HORMEZION, or HORMESION, in *Natural History*, the name of a gem described by Pliny, and seeming to have been a species of HYACINTH. He says it was very bright, and of a yellowish red or flame colour, with a whitish cast at the edges.

HORMINODES, in *Natural History*, the name of a gem described by Pliny, and others of the ancient writers. The stone itself, they tell us, was either black or white, but had in it a green speck, surrounded by a circle of a bright yellow. It seems to have been no other than one of the oculus beli's of our jewellers.

HORMINUM, in *Botany*. See CLARY.

HORMINUM, *Pyrenean Clary*, in the Linnæan system of *Botany*, a genus of the *didynamia gymnospermia* class: the calyx is bell-shaped, with four equal segments, and a fifth, which is larger, and emarginated; the upper lip of the corolla is concave. There are two species.

HORN, *Cornu*, a hard, callous substance, growing on the head of divers animals, and serving them as weapons of offence and defence.

It is laid down as a rule, by some naturalists, that no animals have *horns* but those that are cloven-footed.

The *horns* are usually a double part; insomuch that there is but one exception, which is in the rhinoceros.

The *horns* of many animals, particularly of the deer-kind, are cast every year, and new ones grow up in their places. With us the deer drop them in March, and the new *horns* are full grown by the July following. Vossius very justly ranks this among the most wonderful phenomena of nature: he says, that we have nothing analogous to the growth of such hard and solid bodies of so great a bulk, in so short a time.

The growth and casting of the *horns* of deer is a very singular circumstance in the animal world. The stag puts out its first *horns* in the second year of its age, and after this they cast them every year in March. The lusty and well-fed ones cast their *horns* first; the sickly or weak ones sometimes keep the old ones till the end of April. These *horns* are fastened to the bones of the skull, not to the skin of the head only, as some people would have it thought, who are for making the casting of them the less wonderful. About ten days after the *horns* are cast, the new or young *horns* begin to appear; they are soft and hairy at first, but they grow hard in about three months, and the stag then rubs off their hairy skin.

Many idle opinions have been formed of the cause of the falling of these parts of the animal; and worms in the head, and many other things, have been supposed instrumental to it, which have no share in it. The true reason seems, that these are a sort of vegetables growing on the animal, as our nails and hair have by many been said also to be; and there appears a great analogy between them and the sprouting of the leaves and branches in trees and plants. Trees commonly cast their ripe fruit in summer, and drop their leaves in autumn, because the sap, or nourishing juice, flows into them no longer; and in the same manner, at certain stated periods, the blood and juices cease to flow into these parts of the animal, and they drop off. The cavernous part, at the root of the *horns*, probably grows hard, and the pores through which the vessels pass, grow up at this time; and then, as no juices can be carried through them to the *horn*, it is not at all wonderful that it decays, and falls off, for want of nourishment.

It is probable that this stoppage of the pores, and denying of the passage of any juices, happen in the *horns* as soon as they are arrived at their full growth in July; but they are so firmly fixed to the head, that it takes a long time for them to loosen and fall; whereas in the leaves of plants the pedicles are so tender, that they wither and fall immediately on the juices ceasing to flow into them. This analogy between the operations of nature, in the casting the *horns* of deer, and the falling off of ripe fruit and leaves from vegetables, derives great force from observation of the orange and other trees. If the stalk, from which a ripe orange has fallen, be compared with that part of the forehead of a deer from which a *horn* is just fallen, there will be seen such a similarity between the one and the other, that it will appear very obvious, that nature has operated by the same laws in both. Phil. Trans. N° 227. p. 494.

The number of branches in the *horns* is proportioned to the AGE of the animal, the young ones always having but few, the old ones most. Six or seven branches are the common number, and in Tuscany they have sometimes eight or nine. But in Saxony, where these creatures are very long lived, they are sometimes seen with fourteen or fifteen branches, and sometimes more. The young *horns*, while yet soft, are full of blood-vessels; and if cut off, especially near the head, they are found to bleed very violently, and the creature will sometimes even bleed to death at the wound. This blood was found by Redi to coagulate also like the other blood of the stag, let out of the other parts of the body; though this is contrary to the accounts of Aristotle and Galen. Blood-vessels are sent in large numbers into all *horns*, while young, to furnish them with nourishment for their increase and growth; but when they are arrived at their full growth, these vessels dry up, there being no farther occasion for them; and hence it is that no ill symptoms attend the falling off of these parts, when full grown. If a stag be castrated while he is so young as not to have *horns*, he will never have any at all; and if castrated afterwards, while his *horns* are on, he will never cast them, but always retain the same pair which he had at the time of the operation. The *horns* of a deer are by huntsmen called his HEAD.

In the history of the French Academy of Sciences, we have an account of a bullock's *horn*, dug out of the ground in plowing, which had thet forth fibrous roots, and appeared to have grown, or vegetated, after the manner of a plant.

Horns make a considerable article in the arts and manufactures. Bullocks *horns*, softened by the fire, serve to make

make lanthorns, combs, knives, ink-horns, tobacco-boxes, &c.

HORN, *staining of.* See BONES, DYING, IVORY, TORTOISE-*shell*, and WOOD.

HORN is sometimes also used for the hoof of a *horse*, &c.

HORN, *Ammon's.* See CORNU *Ammonis.*

HORN-*blend*, is a black or green indurated bole or clay, consisting of scaly particles, which are distinguishable from those of mica, by being less shining, thicker, and rectangular. It is generally found among iron ores, and sometimes intermixed with mica, forming a compact stone.

HORN, *harts, cornu cervi.* The scrapings or raspings of the *horn* of this animal are medicinal, and used in decoctions, ptisans, &c.

Hartshorn-jelly is nutritive and strengthening, and is sometimes given in diarrhœas; but a decoction of burnt *hartshorn* in water is more frequently used for this purpose, and is called *hartshorn drink.*

The coal of *hartshorn*, by being calcined with a long continued and strong fire, is changed into a very white earth, called *hartshorn* calcined to whiteness. This earth is employed in medicine as an absorbent, and administered in dysenteries and labour-pains, which are supposed to be caused by acrid and ill-digested matters. This earth levigated is the basis of Sydenham's white decoction, which is commonly prescribed in these diseases.

The salt of *hartshorn* is a great sudorific, and given in fevers with success; and *hartshorn* also yields, by distillation, a very penetrative volatile *spirit.*

HORN, in the *Manage.* To give a stroke with the *horn*, is to bleed a horse in the roof of the mouth, with the *horn* of a flag or rochet, the tip or end of which is so sharp and pointed, as to produce the same effect as a lancet. They strike with the *horn* in the middle of the fourth notch or ridge of the upper jaw.

HORN-*tipped.* A horse is said to be so, when the tops of the two haunch-bones appear too high.

HORN is also a sort of musical instrument, of the wind kind: chiefly used in hunting, to animate and bring together the dogs, and the hunters.

The *horn* may have all the extent of the trumpet.

The term for sounding anciently was, wind a *horn*; all *horns* being in those times compassed: but since strait *horns* are come in fashion, they say, blow a *horn*; and sometimes, plainly sound a *horn.*

There are various lessons on a *horn*: as the recheat, double recheat, royal recheat, running or farewel recheat, &c. See RECHEAT.

The French *horn* is no other than a wreathed or contorted trumpet. It labours under the same defects as the trumpet itself; but these have of late been so palliated, as to require no particular selection of keys for this instrument. In the beginning of the year 1773, a foreigner, named Spandau, played in a concert at the Opera-house a concerto, part whereof was in the key of C, with the minor-third; in the performance of which all the intervals seemed to be as perfect as in any wind-instrument. This improvement was effected by putting his right-hand into the bottom or bell of the instrument, and stopping the sounds by the application of his fingers to different parts of the tube.

The Hebrews made use of *horns*, formed of rams *horns*, to proclaim the jubilee; whence the name JUBILEE.

HORNS *of the uterus*, two processes arising from the sides of the fund. See UTERUS.

HORN, in *Architecture*, is sometimes used for VOLUTE.

HORN *of plenty.* See CORNUCOPIA.

HORN *with horn, or* HORN *under horn (cornutum cum cornuto)*, is when there is common *par cause de cocuage*, intercommoning of horned beasts. See COMMON and INTERCOMMONING.

HORNS, in *Botany.* See *Snail* TREFOIL.

HORNS *and bridging.* See LUCERNE.

HORNS *of insects.* See FEELERS.

HORNS, *fossil.* See MOOSE-*deer*, and ELK.

HORN-*bill*, in *Ornithology.* See BUCEROS.

HORN-*owl*, a name given by fowlers to the great *horn*-OWL.

A sportsman who has got one of these birds, has a constant lure to draw together almost what numbers of others he pleases. The method of taking other birds by it, is thus: the sportsman fixes upon some single tree which stands in the middle of an open field, and cutting the boughs of this into a regularity, he spreads nets all about it, and then places his owl within them, with a string fastened to its leg, by means of which the bird may be put in motion by the sportsman as he stands at a distance under covert. There are to be two perches placed near one another, so that the owl can easily go from the one to the other. It is the nature of this bird to fly only by night, and therefore whenever it is seen by day-light, all the other birds quarrel with it, and abuse it; even the hawks will make at it wherever it comes in their way. The sportsman depends upon this; and as soon as he sees any bird approach, or as soon as the owl, who sees further than he can, gives him the signal that some bird is in sight, he pulls the string, on which the owl, being disturbed, flies from one perch to the other. This draws the strange bird to her; and flying violently at her, it is entangled in the net placed with that intent, and the sportsman muft immediately run up and take it out, and replace the net for the next.

HORN-*fish*, an English name for the fish which we alſo call the gar fish. It is by some accounted a species of the acus or tobacco-pipe fish; but the only reaſon for this opinion ſeems to have been, that it is as long and ſlender as that fish. It is properly a ſpecies of pike or ſlox. See ACUS and ESOX.

HORN-*fish*, in *Ichthyology.* See CORNUTUS *piſcis.*

HORN-*owl*, in *Ornithology.* See OWL.

HORN-*work*, in *Fortification*, a ſort of out-work, advancing toward the field, to cover and defend a curtin, baſtion, or other place, ſuſpected to be weaker than the reſt: as alſo to poſſeſs a height, &c. See *Tab.* II. *Fortification, fig.* 21. No. 2. *lit. f.*

It conſiſts of a front and two branches; the front is made into two demi-baſtions, and a curtin; its ſides, or flanks, are uſually parallel; though ſometimes they approach or contract towards the place, forming what they call a QUEUE *d'aronde*, or *ſwallow's tail.*

When the flanks are too long, they ſometimes make epaulements to flank them. The parts of the *horn-work* next the country are to be defended by a parapet.

For the conſtruction of *horn-works*, produce the capital of the ravelin beyond the ſaliant angle A (*Tab.* VIII. *Fortification, fig.* 42.) to the diſtance AB, of about eighty toiſes; draw DBE at right angles to AB, in which take BD, BE, each equal to fifty-five toiſes; and on the outward ſide DE, trace the front of a polygon in the ſame manner as that of the body of the place, making the perpendicular BF eighteen toiſes, and the faces thirty. The branches D*a*, E*b*, of the *horn-work*, when produced, terminate on the faces of the baſtions, within five toiſes of the ſhoulders. The ditch of the *horn-work* is twelve toiſes, and its counterſcarp parallel to the branches, and in the front terminates at the ſhoulders. The capital of the ravelin before the front of the *horn-work* is thirty five toiſes, and the faces terminate on the ſhoulders, or rather two or three toiſes beyond them; and the ditch before the ravelin is eight toiſes. There are ſometimes made retrenchments within the *horn-works*, ſuch as S, S*a* which are conſtructed by erecting perpendiculars to the faces of the ravelins, within twenty-five toiſes of their extremities. This retrenchment, like all others, has a parapet turfed only with a beam of eight feet before it, and likewiſe, a ditch from three to five toiſes broad. When a *horn-work* is made before the baſtion, the diſtance of the front from the ſaliant angle of the baſtion is a hundred toiſes; and the branches terminate on the faces of the adjacent ravelins within five toiſes from their extremities; the reſt of the conſtruction is as before.

Two *horn-works* joined together make a CROWN-WORK, which is conſtructed by deſcribing from the ſaliant angle A (*fig.* 43.) of the ravelin, as a centre, an arc of a circle, with a radius of about 120 toiſes, cutting the capital of the ravelin produced at C; from the point C let off the chords CB, CF, each equal to a hundred and ten toiſes, and on each of theſe conſtruct the front of a polygon of the ſame dimenſions, as in the *horn-work*, that is, the perpendicular ſhould be eighteen toiſes, the faces thirty, and the branches terminate on the faces of the baſtions, within twenty-five toiſes of the ſhoulders. The ditch is twelve toiſes; the capital of the ravelin thirty-five, and its ditch eight. When the crown-work is made before the baſtions, the arc is deſcribed from the ſaliant angle of the baſtion with a radius of a hundred and twenty toiſes, and the branches terminate on the faces of the adjacent ravelins, within twenty five toiſes of their extremities, &c. as before. Muller's Elem. of Fortif. p. 59, &c.

HORNAGIUM, HORNAGE, in our ancient *Law Books*, ſeems to import the ſame with *hornegeld.*

HORNBEAM, *Carpinus*, in *Botany*, a genus of the *monœcia polyandria* claſs. Its characters are theſe: it has male and female flowers, growing ſeparate on the ſame plant: the male flowers are diſpoſed in a cylindrical rope or catkin, and have ten ſmall ſtamina: the female flowers are diſpoſed in the ſame form, and have one petal ſhaped like a cup, cut into ſix parts, with two ſhort germina; the catkin afterwards grows large, and at the baſe of each ſcale is lodged an oval angular *nut.* There are four ſpecies. Miller.

Linnæus enumerates only two ſpecies.

The *hornbeam* is very common in many parts of England, but

but is rarely ſuffered to grow as a timber-tree, being generally reduced to pollards by the country people; yet where the young trees have been properly treated, they have grown to a large ſize.

Theſe trees will thrive on cold and barren hills, and may therefore be cultivated in ſuch places with great advantage. When they are deſigned for timber, they ſhould be raiſed from ſeeds in the ſame ſoil and ſituation where they are deſigned to grow. The ſeeds ſhould be ſown in the autumn, ſoon after they are ripe. As the plants grow up, they ſhould be kept free from weeds, and in two years time they will be fit to tranſplant; and as the trees advance in their growth, they ſhould be carefully thinned.

The timber of this tree is very tough and flexible, and might be converted to many uſeful purpoſes, if ſuffered to grow to a proper ſize; but as it has been generally treated otherwiſe, ſo the principal uſes it has been applied to have been for turnery ware, for which it is an excellent wood, and alſo for making mill-cogs, heads of beetles, &c. It is alſo excellent fuel. Miller's Gard. Dict.

HORNBEAM *pollengers*, a denomination given by ſome to trees of this ſpecies, which have been lopped, and are of about twenty years growth. See TREE.

HORNED *poppy*. See POPPY.

HORNET, *Crabro*, in *Zoology*, a ſpecies of the WASP, with a black thorax, and double black ſpots on the ſegments of the abdomen. This inſect is very bold and venomous; and wholly reſembles the waſp, only it is twice as large, and that the head is of a longer and ſleuderer ſhape, and the eyes formed ſomewhat like a half moon. They build under ground, and in winter hide themſelves in hollow trees. They feed on fleſh, and when very hungry, will ſeize upon a ſmall bird. Mouffett relates, that they have been ſeen ſingly to purſue and kill a ſparrow, and afterwards feed on its fleſh. See WASP.

HORNET-*fly*, in *Natural Hiſtory*, a very large two-winged fly, which has the ſhape and colours of the *hornet*, and is, at firſt ſight, ſcarce to be diſtinguiſhed from it. The principal colour of the body of this fly is yellow; but it has two long and large black lines placed tranſverſely on it, and has a black corcelet, and a yellow head.

Theſe lay, at a proper ſeaſon, a great number of oblong white eggs, which hatch into large and long worms, whoſe chief food is the worms and nymphs of the humble bees. The worm of this fly is continually found in the neſts of theſe bees, where it never meddles either with the wax or honey, but preys only on the young offſpring of the creature.

HORNGELD ſignifies a tax, within the foreſt, to be paid for the feeding of *horned* beaſts. See GELD.

Quietum eſſe omni collectione in foreſta de beſtiis cornutis, &c. Et ſint quieti de omnibus geldis, & Danegeldis, & wodegeldis, & ſengeldis, & horngeldis, &c.

To be free of *horngeld*, is a privilege granted by the king to ſuch as he thinks good.

HORNPIPE, a common inſtrument of muſic in Wales, conſiſting of a wooden pipe, with holes at ſtated diſtances, and a horn at each end: the one to collect the wind blown into it by the mouth, and the other to carry off the ſounds as modulated by the performer. See the deſcription and form of this inſtrument, by the honourable Daines Barrington, in Archæol. vol. iii. p. 33.

HORNPIPE is alſo the name of an Engliſh air, probably derived from the above inſtrument. The meaſure of this air is triple time, with ſix crotchets in a bar; four of which are to be beat with the hand down, and two up.

HORNSTEIN, in *Natural Hiſtory*, is a name given in Germany to the ſiliceous ſtone, called in England cherts, or CHERT.

HORODICTIC *quadrant*. See QUADRANT.

HOROGRAPHY, compounded of ὥρα, *hour*, and γράφω, *I write*, the art of making or conſtructing dials; called alſo *horologiography*, *gnomonica*, *ſciatherica*, *photoſciatherica*, &c. See DIALLING.

HOROLOGIOGRAPHY, the art of making or conſtructing dials. See DIALLING.

HOROLOGIUM, Ὡρολόγιον, compoſed of ὥρα, *hora*, *time*, *hour*, and λόγος, *ſpeech*, *diſcourſe*, a common name, among ancient writers, for any inſtrument or machine for meaſuring the hours. See CHRONOMETER.

Such are our clocks, watches, ſun-dials, &c. See CLOCK, WATCH, DIAL, and CLEPSYDRA.

Modern inventions, and gradual improvements, have given birth to ſome new terms that come properly under this head, and annexed new meanings to others totally different to what they had originally. All chronometers that announced the hour by ſtriking on a bell, were called CLOCKS: thus, we read of pocket-clocks, though nothing could ſeem more abſurd than to ſuppoſe that a clock, according to the modern idea, ſhould be carried in the pocket. In like manner, all clocks that did not ſtrike the hour were called WATCHES, or time pieces; and the different parts of a ſtriking clock were diſtinguiſhed by the watch-part, and the clock-part; the former, meaning that part which meaſures the time, and the latter, the part which proclaims the hours. In the report of ſir Iſaac Newton to the houſe of commons, anno 1713, relative to the longitude act, he ſtates the difficulties of aſcertaining the longitude by means of a WATCH; yet it is obvious, from ſeveral circumſtances, that his remarks were directly to be underſtood of a time-piece, regulated by a pendulum; for his objections are founded on the known properties of the pendulum, ſome of which differ eſſentially from the properties of the balance and ſpring. It is alſo to be remembered, that all the attempts of Huygens for finding the longitude were by means of pendulum clocks, that did not ſtrike the hour, and, conſequently, according to the language of the times, were called watches. At this time ſuch machines for meaſuring time as are fixed in their place, are called CLOCKS; if they ſtrike the hour, if they do not ſtrike the hour, they are called time-pieces; and when conſtructed with more care, for a more accurate meaſure of time, they are called regulators. Some artiſts of late have affected to call ſuch watches as were conſtructed for aſtronomical and nautical obſervations, by the name of *time-pieces*, probably to intimate that they poſſeſs the advantages of thoſe conſtructed with a pendulum.

Mr. John Harriſon firſt gave the name of TIME-KEEPER to his watch, for the performance of which he received from parliament the ſum of twenty thouſand pounds. See LONGITUDE.

For the account of the principles of this machine, ſee TIME-KEEPER. And for the chief improvements that have been made for the more accurate meaſure of time, ſee PALLETS, PENDULUM, SCAPEMENT, and THERMOMETER.

HOROLOGIUM, HOROLOGION, is alſo a name the Greeks give to their liturgy, or breviary; becauſe it contains the daily hours, or the ſeveral offices to be rehearſed each day.

The Greeks call it ἀρολόγιον, which anſwers to what in Latin and Engliſh we call *diurnum*, or *diurnal*.

The ἀρολόγιον is the breviary of the Greeks.

HOROMETRY, the art of meaſuring and dividing the hours, and keeping an account of time.

HOROPTER, in *Optics*, is a right line, drawn through the point where the two optic axes meet, parallel to that which joins the centres of the two eyes, or the two pupils.

Such is the line A B (*Tab.* II. *Optics*, *fig.* 31.) drawn through the point of concourſe C, of the optic axes of the eyes D and E, parallel to H I, which joins the centres of the eyes H and I.

It is called *horopter*; as being found, by experience, to be the limit of diſtinct viſion.

The *horopter* has ſeveral properties in optics, which are deſcribed at large in Aguilonius, Opt. lib. ii. Diſſ. 10.

HOROPTER, *plane of the*. See PLANE *of the horopter*.

HOROSCOPE, in *Aſtrology*, the degree or point of the heavens riſing above the eaſtern point of the horizon, at any time given when a prediction is to be made of a future event: as, the fortune of a perſon then born, the ſucceſs of a deſign then laid, the weather, &c.

The word is compoſed of ὥρα, *hora*, *hour*, and the verb σκοπέω, *ſpecto*, *conſidero*, *I conſider*. The Latins call it *cardo orientalis*; ſometimes *aſcendens*. See ASCENDANT.

They were formerly ſo infatuated with *horoſcopes*, that Albertus Magnus, Cardan, and others, are ſaid to have had the temerity to draw that of Jeſus Chriſt.

HOROSCOPE is alſo uſed for a ſcheme, or figure, of the twelve houſes; i. e. the twelve ſigns of the zodiac, wherein is marked the diſpoſition of the heavens for any given time.

Thus we ſay, to draw a *horoſcope*, conſtruct a *horoſcope*, &c. we call it, more peculiarly, *calculating* a nativity, when the life and fortune of a perſon are the ſubject of the prediction; for they draw *horoſcopes* of cities, great enterprizes, &c. See HOUSE.

HOROSCOPE, *lunar*, is the point which the moon iſſues out of, when the ſun is in the aſcending point of the eaſt.

This is alſo called the *part of fortune*.

HOROSCOPE is alſo a mathematical inſtrument, in manner of a planiſphere; but now diſuſed.

It was invented by J. Paduanus, who compoſed a ſpecial treatiſe thereon.

HORREA, in *Roman Antiquity*, were public magazines of corn and ſalt meat, out of which the ſoldiers were furniſhed on their march in the military roads of the empire.

Horrea was alſo the name which they gave to their GRANARIES.

HORROR, HORROUR, ſtrictly ſignifies ſuch an exceſs of fear as makes a perſon tremble. It is a compound of admiration and fear, not without an occaſional mixture of pleaſure, from which, when predominant, it is denominated a pleaſing *horror*. In *Phyſics*, it denotes ſuch a ſhuddering, or quivering, as precedes an ague-fit; and is often joined with rigores, and lumbagines. See AGUE, FEVER, &c.

Through ignorance of this acceptation, ſome have underſtood fear to be accounted by authors among the antecedent ſymptoms of thoſe diſtempers.

HORROR *of a vacuum* was an imaginary principle among the ancient philoſophers, to which they aſcribed the aſcent of water in pumps, and other ſimilar phenomena, which are now known to be occaſioned by the weight of the AIR.

HORSE *de ſon fee*, q. d. *out of his fee*, is an exception to avoid an action brought for rent, or other ſervice, iſſuing out of certain lands, by him that pretends to be the lord. For if the defendant can prove the land to be without the compaſs of his fee, the action fails.

HORSE, *equus*, in *Zoology*. In the LINNÆAN ſyſtem this makes a diſtinct genus of animals, of the order of *belluæ*, the characters of which are: that the fore-teeth are ſix in each jaw, the upper erect and parallel, the lower more prominent; the canine, or dog-teeth, are ſingle, placed at a diſtance from the others, and are but little longer than they; and the hoof conſiſts of one piece. According to theſe characters, the author includes in this genus the *equus caballus* with a hairy tail, or *horſe*, the *aſs*, the wild *aſs*, the MULE, and the ZEBRA, or, as he calls it, the ſtriped *horſe*.

The *horſe* makes the ſubject of a very extenſive art, called HORSEMANSHIP, conſiſting of divers ſubordinate arts or branches.

From the ſame head alſo ariſe the profeſſions of chivalry, knighthood, &c.

Authors are divided as to the time when men firſt began to mount *horſes*. The ſcholiaſt of Euripides, and Euſtathius on the ſecond book of the Iliad, ſpeak as if the ancients had been unacquainted with the uſe of ſaddle-*horſes*, and had only uſed them to draw chariots, &c. They add, that courſes on *horſe*-back were not introduced at the Olympic games before the fifteenth Olympiad. But this can ſcarce be; becauſe the Centaurs, to whom the invention is attributed, lived long before that time. Beſides Homer, though he mentions only chariots in his account of the ſiege of Troy, ſpeaks of riding ſo familiarly in ſome parts of his Iliad and Odyſſey, that it muſt have been practiſed among the Greeks before he compoſed either of theſe poems. In the fifteenth book of the Iliad he repreſents the ſtrength and activity of Ajax, when he fought in defence of the Grecian ſhips that were attacked by the Trojans, and leaped from one ſhip to another, by the readineſs and addreſs with which a ſkilful horſeman would vault from the back of one *horſe* to that of another; and his ability to defend many ſhips at once by that of the accompliſhed rider, who is capable of managing and controuling ſeveral *horſes* at the ſame time. This compariſon proves not only that riding was commonly known at the time when Homer wrote, but that it muſt have been ſtudied and cultivated with great care and attention. In the fifth book of the Odyſſey, the poet compares Ulyſſes, ſhipwrecked and ſitting aſtride a plank which was ſhooting on the waves, to a man beſtriding a *horſe*, and keeping his ſeat in ſpite of the motions which the animal could make. Herodotus, in Thalia, ſpeaks of hunting on *horſe*-back, as an exerciſe practiſed in the time of Darius: in Melpomene, likewiſe, he ſays, the Amazons hunted on *horſe*-back, with their huſbands, the Sauromatæ. Xenophon ſays, that Cyrus hunted on *horſe*-back, when he had a mind to exerciſe himſelf and his *horſes*.

It appears, likewiſe, from Pauſanias, that there were *horſe*-courſes even in the time of Hercules, the inſtitutor of the Olympic games.

It alſo appears, from the moſt ancient hiſtory extant, viz. the hiſtory of the Bible, that the *horſe* was made ſubſervient to the will of man in the earlieſt times, and therefore the uſe of this animal is probably almoſt coeval with mankind. See Gen. ch. xlvii. 17. Job xxxix. 18, 19. Gen. l. 9. Exodus xiv. 9.

From the two laſt cited paſſages, in which chariots and horſemen are named together, it appears probable, that the uſe of chariots and the art of riding were introduced about the ſame time, the latter being a little prior to the former; and Egypt ſeems to have been the country to which mankind are indebted for the equeſtrian art, though the preciſe period of time, in which it was at firſt practiſed, cannot be eaſily aſcertained. From hence it was conveyed to the Æthiopians, Arabs, Indians, Perſians, Parthians, Armenians, Scythians, &c. The colonies which came from Phœnicia in Egypt, brought this art with them, and eſtabliſhed it in Greece, and with the art, tranſplanted thither the *horſe*, which was not originally a native of Greece. The Theſſalian *horſes* were the moſt famous of ancient Greece, and valued and admired not only by the inhabitants of that country, but by the moſt judicious and experienced of other nations. From Greece the art of horſemanſhip was tranſmitted to the Romans, who cultivated it with ſuch diligence and zeal, that they were ſoon able to excel their maſters.

It was the cuſtom among the ancients to impreſs ſome mark on their *horſes*: the moſt common were, a Σ, *ſigma*; a K, *koppa*; and bullock's head. Hence thoſe marked with Σ's were called Σαμφοικοι; thoſe with a K, Κατταναιοι; and thoſe with a bull's head, Βουκεφαλοι, *Bucephali*. It is, however, more probable, that the famous *horſe* Bucephalus owed his appellation to the reſemblance which his head bore to that of a bull, and not to the impreſſion of one which was burnt into his fleſh, and was a mark in no wiſe peculiar to him, but common to all *horſes*, ſo that he could not have been particularly diſtinguiſhed by it. And Aulus Gellius, lib. v. cap. 2. expreſsly tells us, that this was the fact; and that the head exactly reſembled, in ſhape and figure, the head of a bull. This mark was ſtamped on the *horſe*'s buttocks and his harneſs, as appears from the ſcholiaſt on Ariſtophanes' Clouds, Heſychius, &c.

In modern times, Arabia is moſt diſtinguiſhed for the excellence of its *horſes*, and the addreſs of its inhabitants in riding them.

The Arabians breed their *horſes* for ſale, and there is a conſiderable revenue ariſing from thoſe that are ſent out of the country, the tax being about 10*l.* ſterling for each *horſe*. The people are ſcrupulouſly exact in preſerving the pedigree of their *horſes* for ſeveral ages; ſo that they know their parentage, alliances, and genealogy, diſtinguiſhing each breed by different appellations, and dividing the whole kind into three claſſes. The firſt claſs is called *noble*, being the moſt pure and ancient, without any mixture, on the ſide of the ſires or dams. The ſecond claſs is compoſed of *horſes*, whoſe race, though ancient, has been mixed with plebeian blood, either on the male or female ſide, which, nevertheleſs, is deemed noble, but miſcalled. The laſt claſs comprehends the common *horſes*, which are ſold at a low price; but the two former ſorts are extremely dear, the loweſt-priced mares of the firſt claſs being worth five hundred French crowns, and ſome fetching even four, five, or ſix thouſand livres.

When a ſtallion covers a mare among the Arabs, both being of equal quality, witneſſes are called to be preſent on the occaſion, who ſign a certificate in the preſence of a magiſtrate, in which the names of the horſe and mare are mentioned, with their pedigrees. When the mare drops her foal, witneſſes are called again, and another certificate is drawn up and ſigned; and thoſe vouchers are given with the animal, like the deeds of an eſtate when it is ſold.

The Arabian *horſes* are generally of a middling ſize, neat and clean in their ſhape and limbs, and of a thin and ſlender figure. Their keepers curry and feed them morning and evening, and only let them drink two or three times in the day. About March, when the graſs is ſtrong and plentiful, they fall them, and devote this ſeaſon like a ſe to procreation; obſerving the cuſtom, which we have probably ſerved from them, of throwing cold water upon the mare as ſoon as the ſtallion deſcends from her back. When the ſpring is paſt, the *horſes* are taken from the paſtures, and kept for the reſt of the year without graſs or hay, ſolely upon barley, with a certain portion of ſtraw. When the colts are about eighteen months old, they ſhear the hair of their tails, in order to make it grow thicker and ſtronger. They begin to ride their colts at the age of two years, or two and a half at moſt.

The beſt breeds of this country are ſaid to be ſprung from the old *horſes* of the Deſert, of which, many ages ago, a ſtud was compoſed, which increaſed the breed, and furniſhed Europe, Aſia, and Africa, with theſe noble animals. The beſt *horſes* are, therefore, immediately or remotely deſcended from Barbs, deſcended from Arabians, whoſe climate is peculiarly favourable to the breed of *horſes*.

The Arabian breed is propagated in Barbary, among the Moors, and even among the Negroes, on the banks of Gambia and Senegal, where they are fed with Indian corn, bruiſed and mixed with milk. Egypt, Turkey, and Perſia, are ſupplied with *horſes* from Arabia. The Barbary *horſes* are to be found in moſt countries of Europe.

The foreheads of theſe *horſes* are generally long, ſlender, and

and ill furnished with mane, but rising disliostly and boldly out of their withers; their heads lean and small, and resembling that of a sheep; the ears handsome and well placed; the shoulders light, sloping backwards, and flat; their withers fine, and standing high; loins, short and strait; flanks and ribs round and full, without having too large a barrel; their haunches strong and elastic; the croupe often somewhat too long; the tail placed high; thighs well turned and rounded; legs clean, well made, and thin of hair; the sinews detached from the hoof, but the pastern generally too long and bending; the foot good and sound. These *horses* are of all colours; but the most common sort is grey; they are generally cold and slow in their paces, and require to be roared and animated by the rider, when they will discover a great fund of vigour, wind, and speed. They are very light and nimble, formed for running, and are more valued in their offspring than for their own merit, being thought, when transported into foreign countries, to get colts which excel their sires in goodness; on which account they are valuableasin stock.

The Algerines are said not to use to castrate their *horses*, but only squeeze their testicles when they are about three months old, and thus render them incapable of propagation.

It is thought that the *horses* of the kingdom of Morocco are the best, and next to them a breed called the mountain Barbs, which are fore-footed, of a gentle disposition, and very attentive and docile. Their walk is free and bold, and their gallop very rapid.

In Turkey, Arabia, and Persia, they expose the dung of their *horses* to the sun, and when it is capable of being finely powdered, they spread it under them instead of litter, which gives their coat a beautiful gloss and lustre. The Persian *horses* are reckoned next in value to those of the Arabians. The Spanish *horses* are much commended: some make them second to the Arabians, and place them before the Barb. Holland furnishes a race of *horses*, which are principally serviceable in the coach: the best come from Friesland. France abounds in *horses* of all kinds, but by no means excels. The best of those fit for the saddle come from Limosin; and next to those, Normandy claims precedence, for its handsome, generous, and useful breed. The French *horses* are apt to have their shoulders too loose and open, as those of the Barbs are too confined and narrow.

The finer and better sort of the more modern Englisli horses are descended from Arabians and Barbs, and frequently resemble their sires in looks and appearance, but differ from them considerably in size and mould, being more furnished, stout, and lusty. In general, they are strong, nimble, of good courage, capable of enduring much fatigue, and both in perseverance and speed surpass all *horses* in the world. However, it is objected to Englisli *horses*, that they want grace or expression in their figure and carriage: that they are obliterate and fallen; that they have stiff shoulders, and want suppleness in their limbs, which render them unfit for the manege. England has at all times, even in its rudest state, been possessed of a breed of *horses* sufficient to answer every necessary purpose. But it is probable, that those now used in the service of war, as well as for draught, are an offspring of the German or Flemish breed, meliorated by our soil, and a judicious culture; as our race *horses* derive their origin from Arabia. The venerable Bede says, that the English began to use saddle-*horses* about the year 631, when prelates and others rode on *kerfe-back*, who till that time were accustomed to walk. In the reign of Athelstan the English became so fealous of their *horses*, which were also held in high esteem by foreigners, that a law was made by that monarch to prohibit the exportation of them, unless they were designed for presents; and in the reign of this prince many foreign *horses* were introduced into this kingdom. The variety of breeds in this island was further augmented by William the Conqueror, and particularly by Roger de Montgomery, earl of Shrewsbury, in his time, who introduced the Spanish Italliens into his estate in Powis Land, from which that part of Wales was for many years celebrated for a swift and generous race of *horses*. See on this subject Berenger's History and Art of Horsemanship, vol. i. passim; and Pennant's British Zoology, vol. i. p. 1, &c.

The importation and breed of *horses* were much promoted by Edward II. and Edward III. Polydore Virgil informs us, that in the reign of Henry VII. the English were wont to keep large herds of *horses* in their pastures and common fields; and by 11 Hen. VII. cap. 13. it was prohibited to convey *horses* out of the realm without the king's licence, on pain of forfeiture. In the reign of the succeeding prince, a particular regard was paid to the raising of a breed of good and strong *horses*; and accordingly several laws were made, enjoining those who had parks, inclosures, &c. to keep at least two brood mares, of a certain size, &c. and prohibiting stoned *horse* from being put into forests or commons where mares were kept, within certain counties, which were above the age of two years, but not fifteen hands high, on pain of forfeiture; and scabbed *horses* from being kept in such places, on pain of 10*l*. 27 Hen. VIII. cap. 6. 32 Hen. VIII. cap. 13.

By 1 Ed. VI. cap. 12, & 2 & 3 Ed. VI. cap. 31. *horse*-stealers are excluded from the benefit of clergy. By these prudent and judicious measures, the Englisli breed of *horses* was not only improved in strength and size, but also greatly increased in number. Till the ufe of COACHES was introduced in the reign of queen Elizabeth, saddle-*horses* and carts were the only methods of conveyance for all sorts of people; and the queen rode behind her master of the *horse*, when she went in state to St. Paul's. By the 2 and 3 Ph. & M. cap. 7. and 31 Eliz. cap. 12. it is enacted, in order to prevent *horses* from being stolen or sold in private places, that owners of fairs and markets shall appoint toll-takers or book-keepers, who are to enter the names of buyers and sellers of *horses*, &c. And to alter the property, the *horse* must be rid or stand in the open fair one hour; and all the parties to the contract must be present with the *horse*. Sellers of *horses* are to procure vouchers of the sale; and the names of the buyer, seller, and voucher, price of the *horse*, the colour, and one special mark at least, are to be entered in the toll-taker's book, and a note of the same delivered to the buyer; and if any person shall sell a *horse*, without being known to the book-keeper, or bringing a voucher; or if any one shall vouch, without knowing the seller, or the book-keeper shall make an entry, without knowing either; in each of these cases the sale is void, and a forfeiture is incurred of 5*l*. The owner may seize and take his *horse* again, or have an action of detinue, &c. A stolen *horse*, though sold according to the direction of the act, may be redeemed and taken by the owner within six months, repaying the buyer what he shall swear he gave for the same. Any person killing a *horse* in the night-time is guilty of felony, and liable to transportation for seven years; and maiming a *horse* incurs the penalty of treble damages. 22 & 23 Car. II. cap. 7.

Horses in hackney-coaches are to be fourteen hands high. 6 Anne, cap. 23. If hired *horses* are abused by immoderate riding, &c. there lies an action of trespass on the case.

British *horses*, mares, and geldings, pay on exportation a duty of 5*s*. each.

The parts of a *horse*'s body furnish a great variety of terms, by no means to be overlooked. The skin and coat are called the *hair*; the long hair on the neck, the *mane*; the fore-top, the *toping* or *tuft*; the hair behind, on the feet, the *fet-lock* or *fetter-lock*; that growing over the top of the hoof, the *coronet*, or *crones*; that on the eye-lids, the *brills*. The ridge whereon the mane grows, is called the *creft* or *crift*; the fore-part, from the neck to the fore-legs, the *briftet* or *thoft*; the mark frequently running down his face, the *roche*; and that in the forehead, the *ftar*. The top of the shoulder-blades, at the setting of the neck, is called the *withers*; the place where the saddle is set, the *back*; and a bruise or hurt thereon, a *navel-gall*; the middle of the back, from the mane to the hips, the *reins*; the extremity of the reins above the hips, the *croupe*; the tail, the *dock* or *rump*; the hollow or sinking of the back-bone, the *fway*; the hind part of the belly, next the genital, the *flank*; that nearer the thighs, the *groin*; the loose skin wherein the yard is, the *sheath*; and the fore parts of the shoulders, next the breast, the *fillets*. The uppermost part of the hind-leg, next the buttock, is called the *ftifle* or *ftiffe-joint*; the after-joint, or bending of the hind-leg, the *chambrel* or *elbow*; the inner, the *ham* or *hough*; the joint at the fetlock, the *pastern ancle* or *fetlock-joint*; the foot, above the hoof of the ancle-joint, the *cornet*. The part from the withers to the top joint of the thigh, is called the *ftoulder*; the middle joint of the fore-leg, the *knee*; the right-leg before, the *fartber leg*; and the left, the *master*. The hoof is called the *horn*; the hollow of the hoof, the *coffin*; the tender part of the hoof, next the heel, the *fruſh*; the ball of the foot, the *frog*; the part to be pared or cut off the hoof, when overgrown, the *reft*; the fore part of the hoof, the *toes*; the hind part, where there is a rising in the middle of the sole, the *heels*; and the insides meeting on the heel, the *quarters*. Of moft of thefe a farther account will be found under the refpective articles.

The maiters of this art lay it down, that a *horfe*, to be good and well-made, muft have three parts like thofe of a woman; viz. the breaft, which is to be broad, the hips round, and the mane long; three of a lion, viz.

conte-

countenance, intrepidity, and fire; three of a bullock, viz. the eye, noſtril, and joint; three of a ſheep, viz. the noſe, gentleneſs, and patience; three of a mule, ſtrength, conſtancy, and foot; three of a deer, head, leg, and hair, ſhort; three of a wolf, throat, neck, and hearing; three of a fox, ear, tail, and trot; three of a ſerpent, memory, ſight, and turning: three of a hare or cat, cunning, walking, and ſuppleneſs.

Horſes are diſtinguiſhed into divers kinds, and are differently denominated, with regard to their ſtrain or country. As the Neapolitan, known by his hawk noſe; the Spaniſh *genet*, by his ſmall limbs; the Turk, by his fine head and deep hoof; the Dutch, by the roughneſs of his legs; the Engliſh by a ſtrong knitting together, &c. the Flandrin, &c.

Horſes are alſo diſtinguiſhed, with regard to the uſes or offices they are reſerved for; as the *coach-horſe*, *war-horſe*, *hunting-horſe*, *running-horſe*, *pack-horſe*, &c.

Horſes are alſo diſtinguiſhed with regard to their colours; as a *bay*, which admits of divers ſhades or caſts; viz. a black-bay, brown-bay, dapple-bay; all which have conſtantly black manes and tails. *Dun* and *mouſe-dun*, having frequently a black liſt along the back, which denominates them *flea-backed*. *Flea-bitten*, which is white ſpotted with red. *Grey*, dapple-grey, ſilver-grey, ſad or powdered grey, black-grey, branded-grey, ſandy-grey, and iron-grey. *Griſſel* or *roan*, a light fleſh-colour interlaced with white. *Peach-colour* or *bloſſom colour*. *Pyebald*, which conſiſts of two colours, one of them white. *Roan*, a bay, black, or ſorrel, intermixed with white hairs. *Rubican*, black or ſorrel, with a few white hairs ſcattered about his body. *Sorrel*, common ſorrel, red or cow-coloured ſorrel; bright, or light-coloured ſorrel, burnt ſorrel; all chiefly diſtinguiſhed by the colour of their mane. *Starling-colour*, reſembling a brownith or blackiſh grey, only more freckled, or intermixed with white. *Tyger-colour*, much the ſame with the branded grey, only the ſpots ſmaller. *Wolf-colour*, *deer-colour*, *black*, *white*, &c.

Theſe colours are generally conſidered as ſymbolical of the nature, qualities, &c. of the beaſts; and accordingly their value is much influenced hereby. The dapple-grey is prized for beauty; the brown-bay for ſervice; the black, with ſilver hair, for courage; the roan for countenance; the ſorrel, black without white, and iron-grey, are reputed hot and fiery; the bright-grey, flea-bitten, and black with white ſpots, are ſanguine; the white, *dun*, and pye-bald, phlegmatic and heavy; the mouſe-dun, red-bay, and blue-grey, are dull; the peach-colour rarely prove obedient to the ſpur; the ſorrel ſeldom fail of being good, eſpecially if their legs, tails, and manes, be black; and the ſame may be ſaid of the flea-bitten, at leaſt theſe ſo marked in the fore parts, or over the whole body; for, when only behind, it is an ill ſign.

Indeed, it is hard to lay down any univerſal rules in this caſe. The white, which promiſe the leaſt, often prove good, when black about the eyes and noſtrils; and there are excellent iron-greys, though that is not reputed a good colour.

The common marks of a dull, ſtupid *horſe*, are white ſpots round the eye, and on the tip of the noſe, upon any general colour whatever. Though the vulgar take theſe ſpots for ſigns of ſtupidity, yet it is certain they are marks of the goodneſs of a *horſe*; and ſuch *horſes* as have them, are very ſenſible and quick upon the ſpur. The French call theſe ſpots *marques de louhre*.

Our dealers in *horſes* uſe the term mettled *horſe* to expreſs a creature of that ſpecies which has a great deal of vigour and heart, as they call it. Otherwiſe there is a great difference between a *mettled horſe*, a *horſe* of vigour, and a fiery *horſe*; but as this is not ſufficiently attended to by gentlemen in their purchaſes of this animal, ſome general rules for the diſtinguiſhing real vigour in a *horſe*, may be acceptable in a work of this general kind.

When a *horſe* is ſtanding ſtill, the rider who has a mind to try whether he has vigour in him, ſhould keep him faſt with the bridle-hand, and apply the ſpurs to the hair of his ſides; this is called by horſemen pinching. If the *horſe* is impatient under this, gathering himſelf up, and endeavouring to go forwards, and champs upon the bit, without thruſting out his noſe, it is a ſign of vigour and right mettle in him. Some caution is to be uſed, however, in judging by this, to diſtinguiſh between a *horſe* that has vigour really in him, and one that has only a fine ſkin, and is rather ticklith than mettled. This is the caſe with a great many *horſes*, and is found by their being very ſenſible of the touch of the ſpur, and ſhewing the appearance of a great deal of mettle and vigour when touched, but immediately loſing the apprehenſion of it. Theſe are of a dull diſpoſition, but only have a tender ſkin.

The *mettled horſe* is to be highly valued, but the fiery one is good for nothing; a *horſe* that is truly vigorous ſhould be calm and cool; he ſhould in general move on patiently, and only ſhew his mettle when it is required of him. The ſureſt method is to chooſe ſuch *horſes* as are extremely apprehenſive of ſtrokes, and are afraid at the leaſt appearance of their coming. Theſe, at the only cloſing of the legs and thighs, ſeem to be ſeized with fear, and alarmed, but without fretting or fierceneſs. A *horſe* that walks deliberately and ſecurely, and that, without requiring the whip too often, will go on briſkly and without fretting, will go from the walk to the gallop, and as eaſily from the gallop to the walk again, and continually champs upon the bit, and trots with gaibneſs, upon the ſhoulders eaſily, and ſnorting a little through his noſtrils: this is generally a creature of true mettle and vigour, though it does not riſe to ſuch a fierceneſs as is troubleſome or dangerous. If to theſe good qualities a *horſe* be well upon his haunches, and have a light and eaſy ſtop, his head well placed and firm, and the feeling of his bit equal and juſt, the gentleman who loves riding will ſeldom need to complain of the price. All the good qualities of a *horſe* ſhould, however, never recommend him, unleſs he has a good mouth, and a ſenſible obedience to the ſpur.

HORSES, *for the age, height, teeth*, &c. *of*, ſee AGE, HEIGHT, &c.

HORSE, *airing of a*. See AIRING.

HORSES, *backing of*. The firſt backing of a *horſe* is a thing of great conſequence, as his value afterwards very much depends on it. After a colt has been exerciſed ſome time, morning and evening, and becomes ſomewhat obedient, he is to be taken to ſome ploughed lands, the lighter the better; he muſt be made to trot over theſe in the hand, by that means to tire him and abate his wantonneſs. When this is done, care muſt be taken that all the tackling be good and firm, and every thing in its due and proper place; then a perſon is to hold his head, and another to mount him; but this muſt not be done ſuddenly, or at a jerk, but very gradually and ſlowly, by ſeveral half riſings and heavings. If he bears this patiently, the perſon is to ſeat himſelf firmly on his back; but if he be troubleſome, and not tamed enough, the perſon is to forbear the attempt to mount, and he is to be trotted hard in the hand over the ſame ploughed lands again, till he is willing to receive the rider quietly on his back. When this is done, the perſon who is on his back muſt cheriſh him, and the man who has his head muſt lead him a few paces forward; then he is to be cheriſhed again. The feet are to be fitted well in the ſtirrups, and the toes turned out; afterwards the rider is to ſhrink and move himſelf in the ſaddle, and the perſon who holds his head, is to withdraw his hand a little farther from the mouth. As the rider moves his toes forward, the holder muſt move him forward with the rein, till he is made to apprehend the rider's motion of body and foot, which muſt always go together, and with ſpirit, and will go forward without the other's aſſiſtance, and then upon the reſtraint of the rider's hands.

When this is accompliſhed, let him be cheriſhed, and have graſs and bread to eat; and then let the rider mount and alight ſeveral times, cheriſhing him between each time; and thus he is to be managed till he will go on, or ſtand ſtill at pleaſure. This being done, the long rein may be laid aſide, and the hand about the neck, which are always uſed on this occaſion, and nothing will be neceſſary but the trenches and caveſon, with the martingal. A groom muſt lead the way before; or another *horſe* going only ſtraight forwards, and making him ſtand ſtill when deſired. In this manner, by ſometimes following, and ſometimes going before another *horſe* on the trot, the creature will by degrees be brought to know that it is his buſineſs to be quiet and governable. See FOAL.

HORSES, *breeding of*. In order to have a good and beautiful race of *horſes*, it is neceſſary to chooſe for a ſtallion a fine barb, free from hereditary infirmities; ſuch as weak eyes, bad feet, ſpavins, purfineſs, or the like. Diſorders that ariſe from accidents are of no conſequence: nor is the *horſe* to be at all the leſs valued for them as a ſtallion. Three months before this *horſe* is to cover a mare, he ſhould be fed with ſound oats, peaſe, or beans, or with coarſe bread, and a little hay, but a good quantity of wheat ſtraw; he ſhould be led out twice a day to water all this time, and after every watering walked about an hour, but not over-heated. If he be not prepared and put in heart in this manner, the colts will be weakly, and the *horſe* himſelf will be ſpoiled, growing purſy and broken-winded.

If he is put to too many mares, he will not laſt long; his main and tail will begin to fall off through weakneſs, and it will be difficult to get up his fleſh again by the next year. The number of mares ſhould be proportioned to his

lits ſtrength, and twelve, fifteen, or at the moſt twenty, are as many as a *horſe* will well ſerve for in a ſeaſon. Mares go with foal eleven months, and as many days over as they are years old. This being certainly known, it is eaſy to contrive ſo that all the foals may be brought forth at a time when there is plenty of graſs. About the end of May the mares are to be put into an incloſure capable of feeding them as long as the ſtallion is to be with them, or that they are in ſeaſon. In this incloſure all the mares are to be put together, as well thoſe which are barren as others. The ſtallion's hind-ſhoes are to be taken off, but the fore-ſhoes ſhould be left on to preſerve his feet; then lead him forth, and let him cover a mare twice in hand, to render him more tame and gentle. After this take off the bridle, and turn him looſe among the reſt, where he will become familiar with them, and not one of them will be horſed but when they are in ſeaſon. There ſhould be a little lodge built up in ſome part of the incloſure, and peaſe, beans, oats, bread, and other good food, put into the manger in it, that the *horſe* may retire into it in the ſcorching heats, and eat what he likes beſt. He muſt be thus entertained during the whole time he is with the mares, which is to be about ſix or ſeven weeks.

Mares that are very fat and groſs do not hold well; but thoſe which are moderately fat conceive with the greateſt ſucceſs and eaſe. To bring a mare in ſeaſon, it is a common thing to give her a quart of hemp-ſeed, or twice that quantity, night and morning, for eight days before the is brought to the *horſe*. If the refuſe it alone, it may be mixed with beans or oats, and will go down; and if the ſtallion eat of it alſo, it will make him the better.

The ſtallion ſhould not cover before he is ſix years old, nor after he is fifteen. A mare ſhould never be covered before ſhe is three years old; they ſhould be always found and healthful, and of a good breed; ſuch as theſe will bring forth better and finer foals than any others. The colts produced from theſe, are not to be uſed for ſtallions; for they will degenerate, and the race will ſoon become exactly our own country breed. If a barb is not to be had, a Spaniſh *horſe* is to be choſen. See MARE.

HORSES, *diſeaſes of*. See BOTTS, CONSUMPTION, COUGH, FEVER, GRIPES, HORSE-*worm*, &c.

The *horſe* is likewiſe in ſome caſes ſubject to the ſtone.

HORSES, *eyes of*. See EYES *of horſes*.

HORSES, *fattening of*. The being able to do this ſpeedily is one of the greateſt arts our dealers have, and indeed one of the greateſt niceties in the whole management of theſe animals. Many methods have been preſcribed; but the following ſeems moſt to be depended on: take elecampane, cumming-ſeed, tamariſk, and aniſeed, of each two ounces; common grounſel, one handful; boil all theſe very well, with two handfuls of garlic, ſcraped and cleaned, in a gallon of good ale; ſtrain the liquor well off, and give the *horſe* a quart of it every morning made hot; keep him warm after it. After he has taken this for four or five mornings, he muſt be turned out to graſs, or kept in the houſe, as the ſeaſon will permit. But whenever provender is given him, a quantity of powder is to be prepared of equal parts of cummin-ſeeds and elecampane, and give him half an ounce of it every time, ſprinkling it in by degrees as he eats, that he may not naufeate the whole.

If this method does not ſucceed in a ſhort time, then take two ſpoonfuls of diapente; brew it in a pint of ſweet wine, and give it the horſe for three mornings. This will take off any inward ſickneſs, and make the other things take effect. After this feed him with good provender three times a day; that is, after his watering in the morning, after his watering in the evening, and at nine o'clock at night. If he does not eat the provender well and freely, it muſt be changed for ſome other kind.

If all this does not ſucceed, let the horſe be blooded; and then take half a buſhel of coarſe barley meal, put it into a pail-full of water, and ſtir the whole together very well; then let it ſettle by ſtanding. Pour off the clear liquor into another veſſel, and let him drink it for his common drink, and eat the remainder, which falls to the bottom of the pail. If he refuſe to eat this alone, there may be ſome bran mixed among it. This ſhould be given him three times a day, morning, noon, and night. If he does not rightly take to the meal with the bran, ſome oats muſt be mixed with it, and this will readily bring him to feed on it. But which ever way is uſed, they muſt be by degrees diminiſhed in quantity, till at length he is brought to eat the meal alone; for that is the thing that muſt fatten him up. Care muſt be taken that the barley is ground freſh every day as it is uſed, for it quickly grows ſour; and when this has once been the caſe with one parcel, no art will ever bring the *horſe* to touch any of it afterwards. Scarce any *horſe* but will be well fattened by keeping him to this diet for about twenty days.

Barley ground in this manner cools and purges the creature; but the greateſt efficacy, as to the fattening him, lies in the water, which by this management takes up all the rich part of the barley into itſelf. When the *horſe* grows luſty on this diet, it muſt be taken from him by degrees, giving him at firſt oats once, and barley-meal twice a day; and then oats twice, and the barley-meal once, till he is perfectly weaned from it. In the mean time he muſt have good hay, and he muſt not be rid; only it will be proper to walk him gently about an hour or two in the heat of the day. If it be found that the *horſe* wants a good ſmart purging during the time of his continuing in the barley-diet, the beſt time to give it him is after the firſt eight days, and the following is a very proper ſort of phyſic: take of the ſineſt aloes one ounce, agaric in powder, half an ounce; and powder of Florentine orrice, one ounce: let all theſe be mixed together, and put into a quart of milk, warm from the cow. This will work very briſkly; and after it is over, the uſual diet is to be continued. If horſes of value were to be kept to this diet once a year, it would make them leſs hot and dry, and not ſubject to many diſeaſes which they are troubled with at preſent, and would be particularly uſeful after campaigns and long journeys. If the horſe loſes his appetite by this diet, it will be proper to tie a chewing-ball to his bit, renewing it ſo often, till at length he begins to feed heartily on the barley; for theſe balls at once reſtore appetite, and are themſelves of a fattening nature. See CHEWING-*balls*.

HORSE *on a journey, management of a*. The common method of travelling in England being on horſeback, it may be proper to give ſome general rules for keeping the creature ſound, and doing the buſineſs agreeably, without many of the accidents which uſually attend it.

Care muſt be taken that the ſhoes be not too ſtreight, and do not pinch the horſe's feet any way; but be well ſhaped, and fet eaſy. It is proper to have them put on freſh a few days before the journey, that they may laſt well, and that they may be ſettled to the feet before the ſetting out. The bridle is next to be examined; that the bit of it be proper, and not too heavy; for if it be, it will incline him to carry low when he grows tired, and reſt upon the rider's hand: this is what they call the uſing a fifth leg. It is a very diſagreeable thing, but may often be avoided, only by taking a proper care of the bit. The mouth of the bit ſhould reſt upon his bars, about a finger's breadth from his tuſhes, ſo as not to make his lips uneaſy. The curb ſhould reſt in the hollow of his head, a little above the chin; and if it gall him, the place muſt be defended with a piece of buff or other ſort of leather.

The next thing to be regarded, is the ſaddle; and proper care muſt be taken as to this, that it do not reſt either upon the withers, reins, or back-bone; and that one part of it do not preſs upon the back, any more than another. Some riders gall a *horſe*'s ſides below the ſaddle with their ſtirrup-leathers. This is moſt likely to happen to a lean *horſe*; and to prevent it the leather ſtrap ſhould be fixed between the points of the fore and hinder bows of the ſaddle, and the ſtirrup-leathers ſhould be made to paſs over theſe leathers.

It is always beſt to begin a long journey by ſhort ſtages; and this is the more neceſſary, if the *horſe* has not been exerciſed for ſome time before. If it be a *horſe* that is rid, he ſhould be ſuffered to ſtale as often as he likes, and even invited to it; but, if a mare, ſhe is to be leſs indulged in it as leſs neceſſary, and often diminiſhing her ſtrength. It is always adviſable to ride very ſoftly for a quarter of an hour, or half an hour before coming in to the inn at night, that he may not be over-hot when put into the ſtable; but if the haſte of the journey will not admit of this, the *horſe* ſhould be walked in ſome perſon's hands, to cool him gently before he is put up.

If the weather is cold, a cloth ſhould be laid over him while he is walked; and when taken in, his whole body ſhould be rubbed and dried with ſtraw. Some have a cuſtom of ordering their *horſes* legs to be rubbed well down, on their firſt coming in; but this is very prejudicial while the *horſe* is hot, and ſhould always be let alone till he is perfectly cooled.

As ſoon as the *horſe* is cooled, and ceaſes to beat in the flanks, the bridle is to be taken off, the bit waſhed, and hay given him, that he may eat at pleaſure. The duſt in very dry weather will ſometimes clog up the tongue of the *horſe* in ſuch a manner, that he cannot eat without great difficulty; in this caſe ſome bran and water ſhould be firſt given him to waſh his mouth, or the ſervant ſhould do it with a wetted ſponge.

Theſe are the proper methods, when the *horſe* has been rode moderately; but when he has been hurried at a great rate, the ſaddle is to be taken off as ſoon as he is put up, and the ſweat rubbed off with a ſweat-knife; and then the whole body and legs are to be rubbed carefully down, and the head is to be wiped with a cloth, as alſo the

back under the saddle, and the thighs; then the saddle should be clapped on again, and the *horse* gently led up and down, till cool and dry. The feet are also to be examined, to see if a thoe be wanting, or if any of them pitch upon the sole; and the dirt, gravel, or other foulness, is to be picked out from between the shoe and the foot. The openings of the feet may be stopped with cow-dung, and the hoofs, if brittle, should be anointed with some fatty substance just at the setting on; and in dry weather they should be greased, not only at night, but noon. Many horses, as soon as unbridled, will lay themselves down, instead of eating.

Many are apt on this to suppose the *horse* sick; but it is generally owing only to the heat and pain they find in their feet, which renders them unable to stand upon them. In this case, if their eyes are examined, they will be found brisk and good; and the hay being offered them as they lie, they will eat it greedily. This shews there is no inward disorder, and the heat and tenderness of the feet, if examined, will shew that they are the part in pain. The principal thing to be done in this case, is taking care that the shoes do not rest upon the soles. This is not easily known, but by taking off the shoes, which in cases of extremity should always be done; it will then be found where the sole is touched by the shoe, being in that part more smooth and shining than elsewhere. In this case the feet are to be pared in those parts, and then the shoes are to be fixed on again, anointing the hoofs, and stopping the soles with hot black pitch or tar.

These are the means by which travelling will be rendered easy and commodious both to the rider and the *horse*; but there is some care also to be taken of the creature, after he comes off from a long journey. The first thing to be done is, to draw the two heel-nails of the fore-feet, and if the shoe be large, then four should be drawn: two or three days after the *horse* should be blooded, and for ten or twelve days after this he should be fed with wet bran, without any oats; but he is to be kept well littered. All the reason of drawing the heel-nails is, that the feet are apt to swell after journeys; and if this is not done, the shoes press upon them in that part, and become very uneasy to them. It is advisable to stop them also with cow-dung for some time; but they are in the way one who pare them down after taking off the shoes, for the humours being all in motion after this, they are apt to fall into the feet.

If there appear any danger of the creature's legs swelling after the journey, it may be easily prevented by this means: take a quantity of the dung of an ox or cow fresh made; mix it with so much vinegar as will reduce it to a soft paste, and add to it a handful of salt; with this rub all the legs thoroughly up to the knees, and let it dry on; give the water in a pail that evening, that the legs may not be wetted, and the next morning the *horse* is to be led to water, and the whole remaining matter washed off. The jockies have a very cunning trick to recover the hoofs of a *horse* injured by a long journey: they make a hole in the shoe, and fill it with moistened cow-dung; they keep this in it a month, and the continual moisture occasioned by it makes the hoof grow very quick, and soon recover the proper dimensions; but it lays after dries and shrinks so, that the foot is streightened, and the whole hoof becomes brittle.

Cow-dung applied to a *horse's* foot always moistens the sole; but it dries up the hoof, if continued any length of time so it. The best method of recovering a *horse's* hoofs is to make a hole in the stable floor, filled with blue clay a little wetted; in this the *horse* should keep his fore-feet a month; this will have more effect than a small portion of cow-dung in the foot; and the effect will be of so different a nature, that the hoof will be rendered more tough than before, instead of being made brittle by it.

Most *horses* that are fatigued, or overworked by long journies, have their flanks altered by it, without being purfy; especially *horses* naturally vigorous, which have been worked too violently. The best remedy in this case, is to give the *horse* half a pound of honey in the morning, mixed among a feed of scalded bran; if he eats the half pound readily, give him a pound the next morning; continue this till the honey ceases to purge the creature; after this, powder of liquorice may be added to the scalded bran, and this continued some time, and two or three glysters at convenient distances of time will be found very serviceable. If the *horse* be very lean, it will be proper to give him some wet bran over and above his proportion of oats; and grass is also very proper, if the creature be not inclined to be purfy. This caution, however, is to be had at all times, that excessive feeding may be bad, by subjecting the *horse* to the farcy. When the *horse* begins to drink heartily, it is a sign that he will soon recover. Though this sometimes fails, it is a good general rule.

When a *horse* comes tired into a stable, fresh litter has the virtue always to occasion him immediately to stale. This is known to be a very great advantage to a *horse* in a tired state; and when the litter is old and dirty, it never has any such effect upon him. If the owners knew how refreshing it is to a *horse* to discharge his urine on his return from labour, they would be more careful in giving him all means and occasions of it than they are. This staling after fatigue prevents those obstructions in the neck of the bladder or urinary passages, which *horses* are too subject to; the bladder being often inflamed by the long retention of the heated urine in it, and the creature perishing by it. Some of our farmers act wrong in this case of the litter, but through carelessness or accident, but by principle; they order the old litter to be left a long time in the stables, that it may be impregnated with more and more of the urine, &c. of the animal, and be made richer for the fields. It is not to be doubted but the *manure* is greatly improved by this; but the damage done to the *horse* by it is greatly over-proportioned to this benefit. The heat which the dung acquires, by thus lying together, spoils the feet of the creature, and makes it unfit for any service, and occasions many distempers, which are ignorantly continued and increased by the continual addition of heat in the fermenting dung, till at length the *horse* perishes.

Those who have any concern with *horses* know, that it is sometimes very difficult to make them lie down in the stable. The following simple method is proposed for this purpose by a noted dealer. When you have a mind to make him lie down, take a piece of strong packthread, or laycord, and tie it as tight round the *horse's* tail as possible, without breaking the skin, and as near as you can to the rump-bone: this will give him a pain in the back, and he will be glad to change his posture, to get ease; and when he finds he cannot in any other way procure it, he will lie down, which he will find the most easy posture, and he will of course take a lilting to it.

Horses, *watering of*. Whilst a person is on a journey, the *horse* should always be suffered to drink of the first good water he comes to after seven o'clock in the morning in summer, and after nine or ten in the winter. Moderately pure water is to be preferred, that being best of all which is neither too clear nor penetrating, nor muddy and flinking.

Though it is the custom in England to run and gallop *horses* after drinking, which we call *watering-scurfes*, and which we suppose brings them into wind, yet Solleysel, and many other of the best judges of *horses*, tell us, that it is one of the worst and most pernicious practices that we can be guilty of; no good can accrue from it, and many *horses* are rendered purfy by it.

While a *horse* is drinking, the rider should draw up his head five or six times, making him move a little between every draught. The rider need not be afraid of giving him water, with proper moderation, even in almost any circumstances: if he be warm and sweating much, yet if he is not quite out of breath, and there are four or five miles to ride, he will be better after drinking a little, than if he had drank none at all; only observing, that if the *horse* were very warm at his going into the water, his pace must not be less than a moderate trot when he comes out, that he may not be chilled.

In the time of a journey the *horse* ought to be suffered to drink in this manner of the waters that come in the way, as often as may be; for if the rider happens to bait when he is hot and sweaty, he must not be suffered to drink for a long time, as it would endanger his life; and if he has not been watered in this manner on the road, his excessive thirst will often prevent his eating, and he will not be able to touch any sort of food for an hour or two, which is usually more time than the rider can stay; and yet without eating at baiting times, he will not have strength to go on. The giving him water on the road will, on the contrary, keep him ready for food whenever it is offered him, and the rider need stay no longer than his own refreshment requires, the *horse* eating immediately, and being readily qualified to go on again.

If there be any shallow water in the way, a little before the coming to the inn where the *horse* is to rest all night, it is always proper to ride him in, and not only give him a little drink, but ride him about several times, not quite up to the belly; this will clean his legs, and prevent humours from falling down into them. If the *horse* be very warm, and there has been no convenience of watering him upon the road, the oats that are given him should be first steeped a while in ale; this will induce him to eat, though he could not have touched any that were wholly dry.

Many are of opinion, that *horses* are sometimes spoiled by

by giving them oats before their water; but Mr. Sollyfel affirms, that though it be not the cuſtom to give oats till afterwards, yet it never does any harm to feed the *horſe* with them both before and after drinking; and that it is often proper and neceſſary, eſpecially when the *horſe* has been hard rid, and is warm.

HORSE, *Draught*, in *Farming*, a ſort of courſe-made *horſe* deſtined for the ſervice of the cart or plough. In the choice of theſe *horſes* for what is called the flow *draught*, they are to be choſen of an ordinary height, for otherwiſe when put into the cart one *draws* unequally with the other. The *draught-horſe* ſhould be large-bodied and ſtrong-loined, and of ſuch a diſpoſition, rather to be too dull than too briſk, and rather to require the whip than to draw more than is neceſſal. Mares are the fitteſt for this uſe for the farmer, as they will be kept cheap, and not only do the work, but be kept breeding, and give a yearly increaſe of a foal. They ſhould have a good head, neck, breaſt, and ſhoulders; for the reſt of the ſhape, it is not of much conſequence. Only, for breeding, the mare ſhould have a large belly; for the more room a foal has in the dam, the better proportioned it will be. *Draught-horſes* ſhould be always kept to that employ. Some put them to the ſaddle on occaſion, but it does them great harm, alters their pace, and ſpoils them for labour. The *draught-horſe* ought to have a large broad head, becauſe horſes of this ſhaped head are leſs ſubject than others to diſeaſes of the eyes. The ears ſhould be ſmall, ſtraight and upright; the noſtrils large and open, that he may breathe with the more freedom. A horſe with a full and bold eye always promiſes well. On the other hand, a ſunk eye and an elevated brow are bad ſigns. The horſe is eſteemed fitteſt for this purpoſe alſo, that has a large and round buttock, which neither ſinks down nor cuts. He muſt have a firm and ſtrong tail, and the dock muſt be thick and well furniſhed with hair, and placed neither very high nor very low. The legs ſhould be rather flat and broad than round: the roundneſs of the leg being a fault in a horſe deſtined to labour, that will ſoon ruin him. As to the hinder legs, the thighs ſhould be fleſhy and long, and the whole muſcle which ſhews itſelf on the outſide of the thigh ſhould be large and very thick. No country can bring a parallel to the ſize and ſtrength of our *horſes* deſtined for the draught. In London there are inſtances of ſingle *horſes* that are able to draw on a plain, for a ſmall ſpace, the weight of three tons, and which can with eaſe, and for con-inuance, draw half that weight. The pack *horſes* of Yorkſhire uſually carry a burden of four hundred and twenty pounds, over the higheſt hills of the North, as well as the moſt level roads: but the moſt remarkable proof of the ſtrength of our Britiſh *horſes* is derived from that of our mill *horſes*; ſome of which will at one load, carry thirteen meaſures, which at a moderate computation of ſeventy pounds each, will amount to nine hundred and ten pounds. Nothing is ſo eſſential to the health of theſe ſerviceable creatures as cleanlineſs; if they are fed ever ſo well, and not kept clean, they will be ſubject to numerous diſeaſes.

The ſervant who has the care of them ought to be up very early, and to clean the racks and mangers from all filth. The currying of them ought to be carefully performed every morning, but not in the ſtable, for the duſt to fall upon the other horſes, as it is too often done. After the horſes are duſted, they ſhould daily twiſt a whiſp of ſtraw hard up, and wetting it in water, rub the legs, ſhoulders and body with it. Many of the diſeaſes of *draught-horſes*, which are not owing to naſtineſs, are owing to bad water; ſuch as are too raw, too muddy, or too cold, being all improper. If there be any running ſtream in the neighbourhood, they ſhould always be led to that to water, every day in ſummer, but in winter, well-water is warmiſh, and is better for them. If there be a neceſſity of giving them well-water in ſummer, it muſt be drawn up ſome hours before the time, and expoſed to the ſun-beams in tubs or troughs; marſh-water or that of lowland ditches is worſt of all. When the labouring horſe has drank his water, he ſhould have his oats given him, and theſe ſhould be carefully ſifted, and the manger duſted firſt. It is a common practice as ſoon as a horſe is come in from his work, to rub down his legs with a hard whiſp of hay, but the beſt judges of horſes abſolutely condemn this, and obſerve, that this rubbing of the legs after hard labour, brings down humours into them, and makes them ſtiff.

The rubbing itſelf is wholeſome, but the doing it when the creature is hot is the miſchief; while a horſe is in a ſweat it is a great relief and refreſhment to him to have his body rubbed down, but when he is cold is the proper time to rub his legs. The racks are to be well ſupplied with hay, and the horſes ſhould be left to reſt and eat, about two hours, and then led to water; after this their oats ſhould be given them; and they ſhould then go to work again.

In the evening when the labour of the day is over, the firſt thing to be done, is to examine the feet, and ſee if any thing is amiſs about the ſhoes, and what earth or gravel is lodged in the foot, between the ſhoe and the ſole, is to be picked out and ſome freſh cow-dung put in its place, which will cool and refreſh the part.

A very material thing for the preſervation of all ſorts of cattle, but of none ſo much as *draught-horſes*, is freſh and clean litter.

HORSE, *Hunting*. See HUNTER.

HORSE, *Race*. See RACING.

HORSE, *Stone*. See STALLION.

HORSE, *War*. The proper rules for chooſing a horſe for ſervice in WAR, are theſe: he ſhould be tall in ſtature, with a comely head, and out-ſwelling forehead. His eye ſhould be bright and ſparkling, and the white part of it covered by the eye brow. The ears ſhould be ſmall, thin, ſhort, and pricking; or, if long, they ſhould be moveable with eaſe, and well carried. The neck ſhould be deep, and the breaſt large and ſwelling. The ribs bending, the chine broad and ſtraight, and the buttocks round and full. The tail ſhould be high and broad, neither too thick, nor too thin; the thigh twelling, the leg broad and flat, and the paſtern ſhort. When ſuch a horſe is choſen, he muſt be kept high during the time of his teaching, that he may be full of vigour. His food muſt be ſweet hay, and good clean oats, or two parts of oats, and one part of beans or peaſe, well dried and hardened. The quantity ſhould be half a peck in the morning, and the ſame quantity at noon, and in the evening. Upon his riding days he is to be dreſſed between five and ſix in the morning, and watered at ſeven or eight. In the evening he is to be dreſſed at four, and watered about five, and he muſt always have provender given him after watering; he muſt be littered about eight, and then muſt have food given him for all night.

The night before he is ridden, all his hay is to be taken away about nine o'clock, and he muſt have a handful or two of oats about four in the morning: when he has eaten theſe, he is to be turned upon the ſnaffle, and rubbed very well with dry-cloths; then ſaddled, and made fit for his exerciſe. When he has performed this, he is to be brought ſweating into the ſtable, and rubbed down with dry whiſps. When this has been done, the ſaddle is to be taken off, and he is to be rubbed down with dry cloths; the houſing cloth is then to be laid on, and the ſaddle being again laid on, he is to be walked gently about till thoroughly cool. After this, he muſt ſtand without meat two or three hours, then he muſt be fed; and in the afternoon he is to be rubbed and dreſſed as before, and watered in the uſual manner.

HORSE, *River*, in *Zoology*. See HIPPOPOTAMUS.

HORSE, *Sea*. See HIPPOCAMPUS.

HORSE is alſo uſed, in the *Military Language*, to expreſs the CAVALRY; or the body of ſoldiers who ſerve on horſeback.

The *horſe* includes *horſe* guards, *horſe* grenadiers, and troopers. Dragoons are alſo frequently comprehended under this name, though they fight on foot: of theſe there are now eighteen regiments; beſides three regiments of dragoon-guards, raiſed in 1685. See GRANADIER, and DRAGOONS.

Horſe guards, by the Spaniards called *guardas a caballo*; by the French, *gardes de corps*; by the Engliſh uſually, *life-guards*; are the guards of the king's perſon and body.

Of theſe there are now two troops, raiſed in 1660: each troop has a colonel, two lieutenant-colonels, one cornet and major, one guidon and major, four exempts and captains, four brigadiers and lieutenants, one adjutant, four ſub-brigadiers and cornets, and ſixty private men. To which have been ſince added, by eſtabliſhment, viz. in 1693 and 1702, two troops of *horſe*-GRENADIER-*guards*, each of which conſiſts of a colonel, lieutenant-colonel, one guidon or major, three exempts and captains, three lieutenants, one adjutant, three cornets, and ſixty private men: and the royal regiment of *horſe guards*, raiſed in 1661. There are beſides only four regiments of *horſe*, which are quartered in Ireland.

The duty is, by parties from the guard, to attend the king's perſon when he goes out near home; an honour which has been lately appropriated to the *light-horſe*. On ſtate-days he is attended by detachments out of the *horſe* and grenadier guards.

One of three captains of the *horſe* guards attends on the king when he walks on foot, immediately next his perſon; carrying in his hand an ebony ſtaff, or truncheon, with a gold head.

HORSE, *Maſter of the*. See MASTER *of the horſe*.

HORSE, *Light*, are regiments of cavalry, mounted on light swift horſes, whoſe men are ſmall and lightly accoutred. They were firſt raiſed in 1757.

The denomination aroſe hence, that anciently they were lightly armed, in compariſon of the royal guards, which were armed at all points.

HORSE, *Hungarian*. See HUSSARS.

HORSE is alſo a term uſed in various arts and manufactories, for ſomething that helps to ſuſtain their work from the ground, for the more commodious working at it.

The *horſe* uſed by tanners and ſkinners, alſo called the *leg*, is a piece of wood cut hollow and roundiſh, four or five feet long, and placed aſlope; upon which they pare their ſkins to get off the dirt, hair, fleſh, &c.

HORSE is alſo uſed, in *Carpentry*, for a piece of wood jointed acroſs two other perpendicular ones, to ſuſtain the boards, planks, &c. which make bridges over ſmall rivers; and on divers other occaſions.

HORSE, *Little*. See EQUULEUS.

HORSE, in *Sea-language*, is the name of a rope reaching from the middle of a yard to its extremity, or what is called the yard-arm, and depending about two or three feet under the yard, for the ſailors to tread upon, whilſt they are looſing, reefing, or furling the ſails, rigging out the ſtudding-ſail-booms, &c. In order, therefore, to keep the *horſe* more parallel to the yard, it is uſually ſuſpended to it, at proper diſtances, by certain ropes called *ſtirrups*, which hang about two feet under the yard, having an eye in their lower ends through which the *horſe* paſſes.

HORSE is alſo a thick rope, extended in a perpendicular direction near the fore or after-ſide of a maſt, for the purpoſe of hoiſting or extending ſome ſail upon it. When it is fixed before a maſt, it is calculated for the uſe of a ſail called the ſquare-ſail, whoſe yard being attached to the *horſe*, by means of a traveller or bull's eye, which ſlides up and down occaſionally, is retained in a ſteady poſition: either when the ſail is ſet, or whilſt it is hoiſting or lowering. When the *horſe* is placed abaft or behind a maſt, it is intended for the try-ſail of a ſnow, and is accordingly very rarely fixed in this poſition, except in thoſe ſloops of war which occaſionally aſſume the form of ſnows; in order to deceive the enemy. Falconer's Mar. Dict.

HORSE is alſo a cant name introduced into the management of lotteries, for the chance or benefit of a ticket, or number for one or more days, upon condition, *if* it be drawn a prize within the time covenanted for, of returning to the ſeller an undrawn ticket.

To determine the value of a *horſe*. Multiply the amount of the prizes in the lottery by the time the *horſe* is hired for; and from the product ſubtract the amount of the number of prizes by the value of an undrawn ticket into the time of the *horſe*: the remainder being divided by the number of tickets into the whole time of drawing, the quotient is the value of the *horſe*. See LOTTERY.

HORSE *Bean*. See BEAN.

HORSE-*bread*. Bread of a proper kind is often given to *horſes* to hearten and ſtrengthen them when they have gone through great fatigues, or are to prepare for ſuch. Common houſhold-bread will anſwer the purpoſe, but the more common way is to prepare a kind of bread on purpoſe. There are two different receipts for making this ſort of bread, each of which has its admirers. The firſt method is this: take wheat-meal, oat-meal, and beans ground fine, of each half a peck; aniſeed, two ounces; gentian and fenugreek-ſeed, of each an ounce; liquorice, two ounces; let all theſe be made into a fine powder, and ſifted together, that they may be perfectly mixed: then add the whites of twenty new-laid eggs, and as much fine-ale as will knead the whole into dough. This is to be made into loaves, and well baked, but not burnt; and the *horſe* is to have a good quantity of it every morning for five or ſix days, without any other proviſion.

The other method is much nicer, but perhaps does not any way better anſwer the intended purpoſe of hearteningup the creature. It is this: take wheat-meal, rye-meal, bean-meal, and oat-meal, of each half a peck; aniſeed and liquorice, of each an ounce; white ſugar-candy, four ounces: beat all theſe to powder, and ſift them together; then add the whites and yolks of twenty new-laid eggs, and as much white-wine as will make the whole into a dough. Let this be made into great loaves, and well baked; it muſt not be given the *horſe* too new, but when it has ſtood about three days, it may begin to be uſed; the outſide is always to be chipped off when any of it is given. Theſe are the two ſorts of bread uſually given to prepare *horſes* for long journies. But there are three other receipts for making bread for race-*horſes*, which are as much eſteemed, and are given by our expert jockies for the ſecond, third, and fourth fortnight's feed. The firſt kind is made in this manner: take three pecks of clean beans, and one peck of fine wheat; let theſe be ground together, and kneaded into dough, with a large quantity of freſh barm or yeaſt, but with as little water as may be: when this has heaved and worked up a little, let it be kneaded again, and then made into large loaves and carefully baked; when three days old, it may be given to the *horſe*, but not ſooner.

The ſecond ſort is to be made as the other, only with equal quantities of beans and wheat, and the cruſt of this is to be cut quite away before it is eat. This is to be given to the *horſe* at his uſual meals, either alone, or mixed with oats and ſplit beans.

The third ſort of bread is ſtronger than either of the others, and is to be made thus: take three pecks of wheat, and one of beans; let them be ground together, and made into very fine flour; knead this up into dough with a good quantity of yeaſt diſſolved in as much ſtrong ale as is neceſſary; add the whites of twenty eggs, and make the whole into large loaves. Theſe muſt be thoroughly baked, and when they have ſtood three days, the cruſt muſt be cut off, and the crumb only given, either alone, or mixed with oats or ſplit beans. This is to be the food for the laſt fortnight.

HORSE, *Cheſtnut*. See *Horſe* CHESTNUT.

HORSE, *Courſe*. See HIPPODROME.

HORSE-*dung*, in *Gardening*, is of great uſe in making hot beds, for the raiſing all ſorts of early crops; as ſalladings, cucumbers, melons, aſparagus, &c. for which purpoſes no other kinds of dung will do ſo well. *Horſe-dung* ferments the ſtrongeſt; and if mixed with litter and ſea-coal aſhes in a due proportion, will continue its heat much longer, than any other ſort of dung whatſoever: and afterward when rotted, becomes an excellent manure for moſt ſorts of land; more eſpecially for ſuch as are of a cold nature. For ſtiff clayey land, *horſe-dung* mixed with ſea-coal aſhes, and the cleanſing of London ſtreets, will cauſe the parts to ſeparate much ſooner than any other compoſt: ſo that where it can be obtained in plenty, it is always to be recommended for ſuch lands. See DUNG.

HORSE-*hairs*, *animated*, a term uſed to expreſs a ſort of long and ſlender water-worms, of a blackiſh colour, and ſo much reſembling a *horſe-hair*, that it is generally, by the vulgar, ſuppoſed to be the hair fallen from a *horſe's* mane into the water as he drinks, and there animated by ſome ſtrange power. Dr. Liſter has at large conſuted this abſurd opinion, in the Philoſophical Tranſactions. See AMPHISBÆNA *aquatica*.

HORSE-*hair-worms*. See AMPHISBÆNA.

HORSE-*head*, in *Botany*. See STAR *wort*.

HORSE-*hoeing*, *Huſbandry*. See HOEING and HUSBANDRY.

HORSE-*mackrel*. See MACKREL.

HORSE-*man*, the name given to a particular ſpecies of pigeon, called by Moore the *columba ſubalterna minor*. It very much reſembles in ſhape the CARRIER-*pigeon*, but it is ſmaller, and ſhorter necked; the protuberant fleſh on the beak, and round the eye, is alſo leſs in quantity; it is more barrel-headed alſo, and the eye is ſomewhat pinched. It is matter of diſpute whether this be an original ſpecies of pigeon, or a baſtard between the carrier and tumbler pigeons.

There are of this ſpecies of all ſorts of feathers, but the blue and blue-pieds are the moſt valued. Theſe are one of the ſort of pigeons made uſe of in England for carrying letters, and flying for wagers; for the true original carriers are now very ſcarce, and not riſked on every trifling occaſion.

HORSEMANSHIP, the art of breaking, diſciplining, and managing horſes.

Horſemanſhip, in its latitude, includes what relates to the knowledge of the make, colour, age, temper and qualities, of *horſes*; their reſpective countries and climates, with the manner of breeding, propagating, &c. the diſcovery of the uſes or ſervices they are fitted for; whether the wars, the race, the ſaddle, or labour; and forwarding and accommodating them for this purpoſe.

In this general ſenſe, it alſo includes the knowledge of the defects and diſeaſes of *horſes*, and the remedies proper for the ſame, with the ſeveral operations requiſite thereto, as *docking*, *gelding*, *ſhoeing*, &c. and theſe are in the farrier's province.

But the word is in a more peculiar manner underſtood of the art of riding, or of directing a horſe to ſtrategies not only in the ordinary motions, but alſo ſuch as are neceſſary in the managing, or making him work upon volts and ſo on. See MANEGE.

HORSE-*mint*. See MINT.

HORSE-*muſcle*. See MUSCLE.

HORSE-*radiſh*. See *Horſe* RADISH.

HORSE-SHOE, a cover or defence for the ſole of a horſe's foot. See SHOE.

Of theſe there are ſeveral ſorts; as, the

SHOE, *Plunch*, or *Pancelat*, which is ſaid to make a good foot, and a bad leg; becauſe it makes the foot to grow beyond the meaſure of the leg. It is choſen for a weak heel, and will laſt longer than any other *ſhoe*; being borrowed from the meal, which has weak heels, and trailers, to keep the feet from ſtones and gravel.

SHOES *with Calkins*, which, though intended to ſecure the horſe from ſliding, yet are reputed by many to do him more harm than good, in that he cannot tread evenly upon the ground; whereby, many times, he wrenches his foot, or ſtrains ſome limb, eſpecially upon ſtony ways, where ſtones will not ſuffer the calkins to enter. *Double calkins* are leſs hurtful, as he treads even with them than on the ſingle calkins; but then they muſt not be over-long, or ſharp-pointed, but rather ſhort and flat.

SHOES *with Rings*: theſe were firſt invented to make the horſe lift his feet up high; though ſuch *ſhoes* are more painful, than helpful, beſides the unhandſomeneſs of the tight. The fault of not lifting the feet high enough is moſt incident to horſes that have not ſound hoofs; for tender feet fear to touch the ground hard: but what is intended for remedy proves a prejudice to the horſe, by adding high calkins, or rings to his *ſhoes*; as by that means his heels are made weaker than before.

SHOES *with ſwelling Welts or Borders* round about them, are uſed in Germany, &c. which being higher than the heads of the nails, ſave them from wearing. Theſe are the beſt ſort of laſting *ſhoes*, if made of well tempered ſtuff, as they wear equally in all parts; and the horſe treads evenly upon them. Others, who uſe to paſs mountains and places where ſmiths are not ſo eaſily met with, carry *ſhoes* about them, with vices, whereby they faſten them to the horſe's hoofs without the help of the hammer or nail: yet is this more for ſhew than ſervice; for though ſuch *ſhoe* may ſave a horſe's feet from ſtones, yet it ſo pinches his hoof, that he goes with pain; and perhaps injures it more than the ſtones do. On ſuch emergent occaſions, therefore, it were better to make uſe of the

SHOE, *Joint*, which is made of two pieces, with a flat rivet nail joining them together in the toe, ſo that it might be taken both wide and narrow, to ſerve any foot.

SHOE, *Panton* or *Pantable*, which opens at the heels, and helps hoof-binding. To which may be added, *half-pantin ſhoe*.

SHOE, *Patten*, is uſed for a horſe that is burnt in the hip, ſtiffie, or ſhoulder; as it cauſes him to bear upon that leg the grief is on, and conſequently makes him uſe it better.

HORSE-SHOE, in *Fortification*, is a work ſometimes of a round, ſometimes of an oval figure, incloſed with a parapet, raiſed in the ditch of a marſhy place, or in low grounds; ſometimes alſo to cover a gate; or to ſerve as a lodgment for ſoldiers, to prevent ſurprizes, or relieve an over-tedious defence.

HORSE-SHOE HEAD, a diſeaſe in infants, wherein the ſutures of the ſkull are too open, or too great a vacuity is left between them; ſo that the aperture ſhall not be totally cloſed up, or the cranium in that part not be ſo hard as the reſt for ſome years after.

This openneſs is found to be increaſed upon the child's catching cold. When the diſeaſe continues long, it is reputed a ſign of weakneſs, and ſhort life. In this caſe, it is uſual to rub the head now-and-then with warm rum, or brandy, mixed with the white of an egg, and palm-oil.

Sometimes the diſorder ariſes from a collection of waters in the head, called an HYDROCEPHALUS.

HORSE-*ſhoe Vetch*. See VETCH.

HORSE *Meaſure* is a rod of box, to ſlide out of a cane, with a ſquare at the end, being divided into hands and inches, to meaſure the height of horſes.

HORSE-*tail*, *equiſetum*, in *Botany*, the name of a genus of ferns of the *cryptogamia* claſs, the characters of which are theſe: the flower is of the apetalous kind, being compoſed of a number of ſtamina, each furniſhed with a mushroom-like head, and all diſpoſed in a ſort of ſpiked form. Theſe flowers are barren, and the ſeeds of the ſame ſpecies grow on plants of a very different figure, which have no flowers, and only produce black rough ſeeds. To this it is to be added, that the plant conſiſts of ſeveral joints, one received into another, in the manner of larger and ſmaller tubes. There are ſeveral ſpecies of *horſe-tail*, which are found in England, on the ſides of ditches or in ſhady woods; but they are never cultivated in gardens.

The common great marſh *horſe-tail* is uſed in medicine as an aſtringent and vulnerary. Schroder recommends it in all kinds of hæmorrhages, and exulcerations of the kidneys and bladder.

HORSE-*tail*, *ſpondyle*, *Ephedra*, in *Botany*, a genus of the *dioecia monadelphia* claſs: the characters are, that it has male and female flowers in different plants; the male flowers are collected in katkins, which are ſcaly, each ſcale covering a ſingle flower: theſe have no petals, but ſeven ſtamina, which are joined in form of a column, and terminated by roundiſh ſummits; the female flowers have an oval perianthium, compoſed of five ſeries of leaves; theſe have no petals, but have two oval germina, ſitting upon the perianthium, ſupporting ſhort ſtyles, crowned by ſingle ſtigmata: the germina afterwards turn to oval berries, each of which has two ſeeds. This is a low ſhrubby plant, which grows naturally upon the rocks by the ſea, in the ſouth of France, in Spain, and in Italy; and is preſerved in ſeveral gardens for the ſake of variety, but has little beauty. Miller.

HORSE, *Tongue*. See BUTCHER'S *Broom*.

HORSE *Worm*, in *Natural Hiſtory*, a ſpecies of fly-worm called alſo BOTT, produced of eggs depoſited by a two-winged fly, of the ſhape and ſize of the humble-bee, in the inteſtines of *horſes*.

The worms of the human bowels have not been longer known to the world than thoſe of the horſe; and the farriers in all ages, who have undertaken the care of theſe valuable animals, have had their remedies for the long worms bred in their inteſtines, and alſo for the ſhort ones. The ſhort ones are the creatures here to be deſcribed. But though the world has ſo long been acquainted with their exiſtence, it never knew their origin till Mr. Valliſnieri diſcovered of late that they were produced from one of the humble-bee ſize.

Theſe flies always live in the open fields, and are never found about towns and houſes, and this is the reaſon that theſe *horſes* which are kept up in the ſtable in the ſummer and autumn, are never found to be ſubject to theſe worms.

In the latter end of ſummer, and toward autumn, theſe flies are found continually buzzing about the backs of *horſes* in the open fields, and their whole buſineſs there is to depoſit their eggs, where nature has inſtructed them to do it.

Horſes at this ſeaſon are ſenſible of the buſineſs of this little annoyer, and have been ſeen from the moſt quiet ſtate to jump, run about, and kick, only at the ſound of the wings of one of theſe flies, which has been at that time ſearching for an opportunity to depoſit its eggs in them.

A fly has been ſeen, when it has not ſucceeded in its attempt in this manner, to fly with leſs noiſe toward a ſingle *horſe* in another part of the field, ſlily to creep under his tail, to uſe ſome gentle titillation in order to make the creature open his fundament, and, when a little open, has ventured to crawl in, and without doubt then only found herſelf in a proper place for the depoſiting her eggs for a few moments. After this the *horſe* has jumped, kicked, and capered as if mad, and continued ſo for a quarter of an hour: hence we may infer one reaſon againſt depriving *horſes* of the ſafeguard of their tails, in compliance with an abſurd faſhion.

The worms hatched from theſe eggs, or perhaps living worms there depoſited, if the fly be of the viviparous kind, ſoon find their way farther up the inteſtines, and often penetrate even into the ſtomach.

After a ſufficient time for theſe worms to acquire their deſtined growth, they naturally quit their old place of abode; in order to this they all get toward the lower part of the inteſtines, and are either voided by the creature with its dung, or of themſelves crawl out.

There is nothing ſingular in the figure of theſe worms: they are larger than thoſe of the common fleſh-fly, and ſmaller than thoſe of the ox-fly; they are ſomewhat of a conic figure, their head being pointed, and their poſterior part much larger; they are of different colours, ſome greeniſh, and others yellowiſh, and ſome brown; they are provided with each two cruſtaceous hooks, by which they lay hold and pull themſelves along by that means, and prevent their being forced out of their habitation by the faeces of the *horſes*. It is ſuppoſed that clyſters of oil are a remedy for this diſorder in *horſes*; but it probably is of no effect, ſince the oiling over the whole body of the worm, nay, the introducing drops of oil into the cavity where the great ſtigmata are, has not been found to kill the animal.

When theſe worms are only in ſmall numbers in a *horſe*, they are of no harm to the animal; but there are ſeaſons in which they increaſe to ſuch vaſt numbers, that they are a very fatal malady; and, in ſome years, when *horſes* have died of a ſort of epidemic malady, after they have been opened, prodigious numbers of theſe worms have been found living in their ſtomachs, each having eat itſelf a ſort of cell in the membrane of the ſtomach, and all

being lodged there as close together as the seeds in a pomegranate.

We are not to wonder at all how such immense numbers of worms come into one *horse*, since one female is able to deposit more than seven hundred, as Mr. Vallisnieri has observed.

When these worms are fallen from the intestines of the *horse*, they crawl about till they find some place of safety, where they make a shell of their skin, and pass all their changes, and from whence they finally come out in form of the parent fly. See Reaumur, Hist. Inf. vol. iv. p. 540, seq. See also Vallisnieri.

HORSHAM *stone* is a kind of thin broad slate, of a greyish colour; formerly much used, especially in Sussex, to heal or cover churches and chancels, great houses, &c. but on account of its weight very unfit for the purpose.

It is called *Horsham stone*, because chiefly brought from the town of Horsham in Sussex.

HORTA, in *Mythology*, a goddess among the Romans, who presided over youth, and excited them to virtue by her exhortations. Her temple is never shut, to admonish youth, to liable to be seduced, *cereo in virum flecti*, that they should be always disposed with particular vigilance over themselves to the practice of virtue.

HORTAGILERS, in the grand seignior's court, are upholsterers, or tapestry-hangers.

There is no city better or more orderly regulated than the grand seignior's camp; and to have a notion of the magnificence of that prince, he must be seen in that equipage; as he is much better lodged and accommodated there, than at Constantinople, or any other city of his dominions.

He has always two tents or pavilions, and two sets of furniture entire; that, while he is in one, they may pitch or spread the other.

In order to this, he has constantly four hundred *hortagilers*, or upholsterers, in his retinue, who go a day's journey before him to fix on a proper place. They first prepare the sultan's tent, and then those of the officers of the Porte; and the beglerbegs, according to their rank.

HORTATOR, in the *Roman Navigation*, an officer whose business it was to give the word of command to the rowers, and to direct them when to stop, and when to ply their oars.

The Greeks gave the name of KELEUSTES to this officer.

HORTICULTURE, compounded of *hortus*, *garden*, and *colo*, *I till*, *dress*, &c. the art of gardening. See GARDENING.

HORTULANUS, in *Ornithology*, the name of a species of the EMBERIZA, in the Linnæan system, though some writers have made this a distinct genus.

HORTUS, a name used by some authors for the female genital parts of animals.

HORTUS *siccus*, a dry garden, a name given to a collection of specimens of plants, carefully dried and preserved.

The value of such a collection is very evident, since a thousand minutiæ may be preserved in the well-dried specimens of plants, which the most accurate engraver would overlook. We shall therefore give two methods of drying and preserving a *hortus siccus*; the first by sir Robert Southwell in Phil. Trans. N° 237; and the other by Dr. Hill, in his Review of the Works of the Royal Society; with his objections to sir Robert's method.

According to the former gentleman, the plants are to be laid flat between papers, and then put between two smooth plates of iron, screwed together at the corners; and in this condition committed to a baker's oven for two hours. When taken out, they are to be rubbed over with a mixture of equal parts of aqua fortis and brandy; and after this to be fastened down on paper with a solution of the quantity of a walnut of gum tragacanth dissolved in a pint of water. See HERBAL.

To this the doctor objects, that the heat of an oven is much too uncertain to be employed in so nice an operation; and that the space of time ordered for continuing the plants in it, is of no information, unless the degree of heat, and even the different nature of the plant, as to its succulency, and the firmness or tenderness of its fibres, be attended to; there being scarcely any two plants alike in these particulars: consequently the degree and duration of heat sufficient for one plant, would destroy another. Beside which, the acid used, destroys the colour of many plants, and never recovers that of others lost in the drying; and frequently after the plant is fixed down, rots both the paper it is fixed to, and that which fallsover it. Dr. Hill's method is as follows. Take a specimen of a plant in flower, and with it, one of its bottom leaves, if it have any; bruise the stalk if too rigid, or slit it if too thick: spread out the leaves and flowers on paper, cover it with more paper, and lay a weight over all. At the end of eighteen hours take out the plants, now perfectly flattened, and lay them on a bed of dry common sand; sift more dry sand over them to the depth of two inches, and thus let them lie about three weeks: the less succulent dry much sooner, but they take no harm afterward. If the floor of a garret be covered in spring with sand two inches deep, leaving space for walking to the several parts, it will receive the collection of a whole summer; the covering of sand being sifted over every parcel as laid in, they need no farther care. From the time of laying them till they are taken up to be stuck on paper. The cement used by the doctor is thus prepared: early in the spring, put two ounces of camphor into three quarts of water in a large bottle, shake it from time to time, and when the first collected plants are ready for the fastening down, put into a pint of the water, poured off into an earthen vessel that will bear the fire, two ounces of common glue, such as is used by the carpenters, and the same quantity of ichthyocolla beat to shreds; let them stand six and thirty hours, then gently boil the whole a few moments, and strain it off through a coarse cloth: this is to be warmed over a gentle heat when it is to be used, and the back of the plants smeared over with a painter's brush: after this lay them on paper, and gently press them for a few minutes, then expose them to the air a little, and finally lay them under a small weight between quires of paper, to be perfectly dried.

It is scarcely to be conceived how strongly the water becomes impregnated with the camphor by this simple process: a part of it indeed flies off in the making of the cement and the using of it; but enough remains with the plants to prevent the breeding of insects in it. He farther observes, that plants may be dried very well without sand, by only putting them frequently into fresh quires of paper, or a few, by only pressing them between the leaves of a book: but the sand method preserves the colour best, and is done with least trouble.

Another method much better than that of the oven, is the flattening and drying the plant by passing a common smoothing iron for linen over the papers between which it is laid: but for nice things the most perfect of all methods is that by a common sand heat, such as is used for chemical purposes. The cold sand is to be spread smooth upon this occasion, the plant laid on it carefully flatted, and a thick bed of sand sifted over: the fire is then to be made, and the whole process carefully watched, until by a very gentle heat the plant be carefully dried. The colour of the tenderest herb, may by this manner be preserved; and flowers that can no way else be preserved, may be managed perfectly well thus.

HOSANNA, in the *Hebrew Ceremonies*, a prayer which they rehearsed on the several days of the feast of tabernacles.

It was thus called, because there was frequent repetition therein of the word הוֹשִׁיעָה נָּא, *serva nunc*, or *serva precor*, i. e. save us now; or, save us, we pray.

There are divers of these *hosannas*. The Jews call them *hoshanoth*; i. e. the *hosannas*. Some are rehearsed on the first day, others on the second, &c. which they call *hosanna* of the first day, *hosanna* of the second day, &c.

HOSANNA *Rabbo*, or *Grand* HOSANNA, is a name they give to their feast of tabernacles, which lasts eight days; because during the course thereof, they are frequently calling for the assistance of God, the forgiveness of their sins, and his blessing on the new year; and to that purpose they make great use of the *hoshanoth*, or prayers above mentioned.

The Jews, also, apply the term *hosanna rabba*, in a more peculiar manner, to the seventh day of the feast of tabernacles; because they apply themselves more immediately on that day to invoke the divine blessing, &c.

HOSE, from the Saxon *hose*, a stocking. See STOCKING.

HOSE in HOSE, among *Botanists*, signifies one long husk of a flower within another; as in the polyanthus. See PRIMROSE.

HOSE-HUSK, in *Botany*, a long round husk; as in pinks, july-flowers, &c.

HOSEA, in *Scripture History*, a canonical book of the Old Testament, so called from the prophet of that name, its author; the first of the lesser prophets. He lived in the kingdom of Samaria, and delivered his prophecies under the reign of Jeroboam II. and his successors, kings of Israel: and under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal design is to publish the gross idolatry of the people of Judah and Israel, to denounce the divine vengeance against them, and to foretel the captivity in Assyria.

HOSPITA, in *Mythology*, a surname of Venus, under which appellation she was worshipped, and had a temple at Memphis in Egypt.

HOSPITAL, popularly SPITAL, a place or building erected, endowed, or supported by charitable contributions, for the reception and relief of the poor, aged, infirm, sick, and otherwise helpless.

The

The word is formed of the Latin *hospes*, *host* or *stranger*. In the first ages of the church, the bishop had immediate charge of all the poor, both sound and diseased; as also of widows, orphans, strangers, &c. When the churches came to have fixed revenues allotted them, it was decreed, that, at least, one fourth part thereof should go to the relief of the poor; and to provide for them the more commodiously, divers houses of charity were built, which are since denominated *hospitals*.

They were governed wholly by the priests and deacons, under the inspection of the bishop.

In course of time, separate revenues were assigned for the *hospitals*; and particular persons, out of motives of piety and charity, gave lands and money for erecting of *hospitals*.

When the church-discipline began to relax, the priests, who, till then, had been the administrators of *hospitals*, converted them into a sort of benefices, which they held at pleasure, without giving an account thereof to any body, reserving the greatest part of the income to their own use; so that the intentions of the founders were frustrated. To remove this abuse, the council of Vienne expressly prohibited the giving any *hospital* to secular priests in the way of a benefice; and directed the administration thereof to be given to sufficient and responsible laymen, who should take an oath, like that of tutors, for the faithful discharge thereof; and be accountable to the ordinaries. This decree was executed, and confirmed by the council of Trent.

In England, *hospitals*, founded for the mere relief of the indigent and necessitous, are peculiarly called *almshouses*; the name *hospital* being reserved to those destined for the sick, aged, young, &c.

Any person seised of an estate in fee simple, may by deed inrolled in chancery, erect and found an *hospital* for the sustenance and relief of the poor, to continue for ever: and place such heads &c. therein as he shall think fit: and such *hospital* shall be incorporated, and subject to such visitors &c. as the founder shall nominate. Also such corporations shall have power to take and purchase lands not exceeding two hundred pounds per annum, so as the same be not holden of the king, &c. and to make lease for twenty-one years, reserving the accustomed yearly rent: but no *hospital* is to be erected, unless upon the foundation it be endowed with lands or hereditaments of the clear yearly value of ten pounds per annum. Stat. 39 Eliz. cap. 5.

This act was made perpetual by the 21 Jac. cap. 1. It is understood in consequence of this statute, that if the lands given to an *hospital* be afterwards improved, they shall be enjoyed by the *hospital*, though they should be above the yearly value of two hundred pounds. And goods and chattels, real or personal, may be taken of what value forever. But by 9 Geo. II. cap. 36. no lands nor money shall be conveyed or settled in trust, for the benefit of any charitable foundations, unless the appointment of lands, money, or personal estate, stocks in the public funds excepted, be made by deed indented, sealed and delivered in the presence of two witnesses, at least twelve calendar months before the death of the donor, and be inrolled in chancery within six calendar months next after the execution thereof; and unless such stock in the public funds be transferred in the public books usually kept for the transfer of stocks, at least six calendar months before the death of the donor, and take effect immediately and without the power of revocation. By 43 Eliz. cap. 4. the lord chancellor may issue commissions to take account of misapplication of lands and goods, given to *hospitals*, which have no special visitors or governors. By 31 Eliz. cap. 6. the place of any person, taking reward for nominating to an *hospital*, shall be void. By the aforesaid stat. of the 39 Eliz. cap. 5. it is provided, that all leases of estates for a term exceeding the number of twenty-one years, in possession, and on which the accustomable yearly rent or more, by the greater part of twenty-one years next before the taking of such lease shall not be reserved and yearly payable, shall be void. By 43 Eliz. cap. 2. all lands within the parish are to be assessed to the poor's rate, and it has been determined by courts of law, particularly by Holt, in 1 Anne, that *hospital* lands are chargeable to the poor as well as others. 2 Salk. 527. In the case of St. Luke's *hospital*, by 1 Geo. III. it was determined in general, that no *hospital* is chargeable to the parish rates, with respect to the scite thereof, except those parts of it which are inhabited by the officers, whose apartments are to be rated as single tenements, of which the said officers are the occupiers. By the annual acts for the land tax, it is provided, that the same shall not extend to charge any *hospital*, for or in respect to the scite of such *hospital*, or any of the buildings within the walls or limits thereof; or to charge any of the houses or lands, which on or before Mar. 25. 1693, did belong to Christ's *hospital*, St. Bartholomew, Bridewell, St. Thomas, and Bethlehem *hospital*; or to charge any other *hospitals* or alms-houses, for or in respect of any rents or revenues, which on or before March 25, 1693, were payable to the said *hospitals* or alms-houses, for the immediate relief of the poor. But all such lands &c. belonging to any *hospital* or alms-house, or settled to any charitable or pious use, as were assessed in the fourth year of W. and M. shall be liable to be charged.

The principal English *hospitals* are the following:

HOSPITAL, *Aske's* or *Haberdashers*, is an *hospital* situated at Hoxton and erected in 1692, by the company of Haberdashers, in pursuance of the will of Robert Aske, esq. who left for building and endowing it 20,000*l*. This *hospital* is established for the maintenance of twenty poor haberdashers, and the support and education of twenty boys. Each of the pensioners in this *hospital* has convenient apartments, is provided with proper diet and firing, three pounds yearly in money, and a gown every second year. There are also established salaries, &c. for chaplain, clerk, butler, porter, and other domestics.

HOSPITAL, *St. Bartholomew's*, is situated on the south-east side of Smithfield, and incorporated by the name of the *hospital* of the mayor, commonalty and citizens of London, governors for the poor, called Little St. Bartholomew's, near West-Smithfield. This *hospital* formerly belonged to the priory of St. Bartholomew, in Smithfield, founded by one Rahere, about the year 1102.

At the dissolution of the monasteries, Henry VIII. left five hundred marks a year to it, on condition that the city should add five hundred marks per annum for the relief of sick and poor people; but it was more largely endowed, for the use of sick and lame persons only, by Edward VI. by the munificence of the city and private benefactors. This *hospital*, having escaped the dreadful fire in 1666, was repaired and beautified by the governors in the year 1691. But the buildings became by length of time so ruinous and dangerous, that a subscription was entered into in 1729, for defraying the expence of rebuilding it, on a plan comprehending four detached piles of building to be joined by stone gate-ways, about a court or area. Four piles have been erected and finished; one of these piles contains a large hall for the resort of the governors at general courts, a compting-house for the committees, and other necessary offices; the other three piles contain wards for the reception of the patients, &c.

It is governed by a president, treasurer, &c. It is furnished with three physicians, and three master surgeons, besides as many assistant surgeons, an apothecary, and vicar. The officers of this *hospital*, are a cook, steward, renter, matron, and porter. This *hospital*, since its enlargement, is capable of accomodating four hundred and twenty patients. It extends relief also to a great number of out-patients. By the report of 1780, it appears that this *hospital* administered relief to 10846 patients, in the course of the preceding year.

HOSPITAL, *Bethlehem*, or *Bedlam*, was originally a priory, founded by Simon Fitzmary, sheriff of London, in the year 1246; but in the year 1246, king Henry VIII. gave this *hospital* to the city, who employed it for the accommodation of lunatics. The present stately fabric was erected by the city of London in the year 1675, at a charge of about seventeen thousand pounds. It is in length five hundred and forty feet, and forty feet broad, and contains a great number of cells, or rooms for the accommodation of the unfortunate, who are maintained without any expence to their friends; except an allowance for bedding. At each end of this stately edifice are erected, by the charitable contributions of the citizens, two wings, or spacious buildings for the reception of poor incurable lunatics. Before this magnificent structure there is a pleasant garden, inclosed by a stately wall about seven hundred feet in length. This *hospital*, being united to that of Bridewell, has the same president, governors, whose number is about two hundred, treasurer, clerk, auditor, physician, surgeon, and apothecary; but each *hospital* has a steward, and inferior officers peculiar to itself. The number of patients in this *hospital* under cure in 1780 was 252.

HOSPITAL, *Bridewell*. See BRIDEWELL.

The domestics peculiar to this house are, a steward, chaplain, reader, porter and his servant, matron and beadles, one of whom is chapel-clerk.

HOSPITAL, *Charter-house*. See CHARTER-HOUSE.

This is also called king James's *hospital*, because he established it by letters patent, in the year 1611, confirmed by parliament in 1628; and *Sutton's hospital*, from the name of its founder.

HOSPITAL *Christ's*, popularly called the *blue-coat hospital*, was anciently a monastery of grey friars, founded by Rahere, the first prior thereof, in the time of Henry I. It was dissolved by Henry VIII. and granted by him to the city in 1547; and the grant to the citizens was confirmed

firmed in 1552, by charter of Edward VI. who converted it into an *hospital* for poor children; who are supplied with all neceſſaries and conveniencies, clothed, dieted, and taught.

Since its firſt endowment it has received abundance of new donations. Beſides the numerous benefactions of private perſons, the city allows this houſe the benefit of superintending and licenſing the carts of London; and a duty of about ½ upon every cloth brought to Blackwell-hall, where clerks are kept to receive it. The citizens by king Edward's charter are incorporated governors of his ſeveral foundations in the city and liberties of London, by the name of the mayor, commonalty and citizens of the city of London, governors of the poſſeſſions, revenues, and goods of the *hoſpitals* of Edw. VI. &c. A great part of it was burnt down by the great fire; but is again rebuilt by the care of the governors; though not without incurring a great debt, and anticipating the revenues of the *hoſpital*.

Formerly, a thouſand poor children, moſt of them orphans, were maintained on this foundation; eight or nine ſcore yearly put out apprentices, and the girls to ſervice; but the number, through the deficiency of the funds, grew afterwards much leſs.

Beſides the children that are maintained within the walls of this *hoſpital*, there is a conſiderable number of the leaſt and youngeſt provided for in the country, viz. at Hertford, in Hertfordſhire, where there are a ſchool-houſe, a maſter's houſe, and ſeveral houſes for nurſes employed in taking care of the children. The number of children under the care and charge of this *hoſpital* in 1780 was 1200.

Here were two mathematical ſchools; the firſt founded by king Charles II. but they are now united. Youths are there taught ſeveral parts of practical mathematics, particularly navigation, to fit them for apprentices to maſters of ſhips: there is alſo a grammar-ſchool (whence the moſt improved boys are yearly ſent to the univerſity), a writing-ſchool, and a ſchool for the girls, where they learn to read, to ſew and to mark. The maſters of theſe ſchools are four; viz. a grammar maſter, who is aſſiſted by an under maſter, a mathematical maſter, and a writing maſter, who have 100 l. per annum each, for their ſalaries, beſides houſes. There are alſo two ſchool-miſtreſſes. The grammar maſter hath an addition of 20 l. yearly for catechiſing the boys, and his uſher is allowed 30 l. a year. There are likewiſe a drawing-maſter, and a muſic-maſter.

The officers of this *hoſpital* are a preſident, treaſurer, phyſician, chief-clerk, under clerk and receiver, ſurgeon, apothecary, wardrobe-keeper, and aſſiſtant clerk, ſteward, matron &c. The number of governors ſuperintending this *hoſpital* is very conſiderable; generally above three hundred.

HOSPITAL, *Emanuel*, is ſituated at Tothill-fields, in Weſtminſter, and was founded by Lady Dacres, in 1601, for twenty aged ſingle men and women, each of whom have an allowance of 20 l. per annum, with the liberty of bringing up a poor child. The city of London has this charity in truſt, with 200 l. a year for its ſupport, iſſuing from a leaſe of 109 years, at the expiration of which, the whole manor of Bramſhurton in the county of York, amounting to above 600 l. per annum, is deviſed for the augmentation of this foundation. In 1735 the court of lord-mayor and aldermen erected a ſchool-houſe and dormitory, adjoining to this *hoſpital*, for the reception of twenty poor boys and girls who are ſupplied with all the neceſſaries of life; the boys are taught to read, write and account, and the girls to read, write and do plain-work.

HOSPITAL, *Foundling*, was eſtabliſhed, at the ſolicitation of Thomas Coram, eſq. by royal charter, in the 13th year of George the II. and incorporated by the name of *the governor and guardians of the hoſpital for the maintenance and education of expoſed and deſerted young children*: and the powers granted by charter were enlarged and confirmed by a ſtatute of the ſame year. This charity is under the management of a preſident, the king being patron; five vice-preſidents, treaſurer, and governors. The ſubordinate officers are a chaplain, morning preacher, ſecretary, ſolicitor, ſteward, matron, ſchool-maſter, and treaſurer's clerk. This *hoſpital* has two phyſicians, a ſurgeon and apothecary. In 1742 the noble building in Lambs-conduit fields for the uſe of this *hoſpital* was begun to be erected; one wing was finiſhed in 1745; the chapel was begun in 1747; and in 1749 orders were given for building the other wing of the *hoſpital*. The children admitted to this *hoſpital* are nurſed, educated and employed under proper regulations, and provided with all neceſſaries, till they attain the age appointed by parliament for their diſcharge viz. twenty-four for males, and twenty-one for females, unleſs they be previouſly married with the conſent of the committee; at ſuch time, the general committee, at their diſcretion, may give them cloaths, money, or neceſſaries, not exceeding the value of ten pounds. In the mean while, the corporation of the *hoſpital* may employ the children educated and maintained here in any ſort of labour, or manufacture, or in the ſea ſervice; and bind ſuch children apprentices, or place them out as ſervants, or mariners, to any huſbandman, maſter or captain of a ſhip, or other perſon, until the aforeſaid reſpective ages. The corporation of this *hoſpital* is allowed to purchaſe lands or tenements to the yearly value of 4000 l.

HOSPITAL, *French*, in the pariſh of St. Luke, was erected in the year 1717; and the governors of it, by letters patent of Geo. I anno 1718, were conſtituted a body politic and corporate, by the appellation of *The governor and directors of the* HOSPITAL, for the *poor French Proteſtants and their deſcendants, reſiding in Great Britain*. To this foundation belong a governor, ſub-governor, treaſurer, ſecretary, ſteward, and chaplain, phyſician, ſurgeon, and matron.

HOSPITAL, *St. George's*, near Hyde-park Corner, was inſtituted in 1733 for the relief of the poor, ſick, and lame, who are ſupplied with advice, medicine, diet, waſhing, lodging, and ſome of them alſo with cloaths. This *hoſpital* is under the direction of a general board of the governors, who meet regularly five times a year. The qualification of a governor is 5 l. as an annual ſubſcription, or 50 l. as a ſingle benefaction. The king is preſident, there are three vice-preſidents, two treaſurers, four phyſicians, four ſurgeons and one aſſiſtant ſurgeon, ſix viſiting apothecaries: the domeſtic officers are a chaplain, apothecary, ſecretary, matron, and meſſenger. Beſides the patients that are admitted into the houſe, relief is afforded to a conſiderable number of out-patients. Recommendations to this charity are received every Wedneſday morning.

HOSPITAL, *Greenwich*, is a retreat for ſeamen, who, by age, wounds, or other accidents, are diſabled from ſervice; and for the widows and children of ſuch as are ſlain in the ſervice.

This, in point of magnificence and ſpaciouſneſs, greatly excels even Cheſſea *hoſpital*. King William and Queen Mary had the benevolent deſign of eſtabliſhing this *hoſpital* much at heart; and they accordingly made a grant of the royal palace at Greenwich, a part of which, on the weſt ſide, had been begun to be rebuilt for a royal palace by king Charles the ſecond, and alſo a large adjoining ſpace of ground, for this purpoſe. King William, after Queen Mary's death, on the 25th of October, 1695, appointed by patent a number of commiſſioners for directing the building and endowing of this intended *hoſpital*, and granted a large ſum out of his civil liſt for that end, and his royal ſucceſſors were alſo conſiderable benefactors to it. At length annual ſums were granted by parliament for finiſhing this truly magnificent ornament and glory of Great Britain: and it was fully completed in the reign of George the IId. By an act of the 5th and 8th of king William, cap. 21. the privilege of admiſſion into this *hoſpital* was granted to regiſtered ſeamen, when maimed or ſuperannuated, and to the widows and children of thoſe, who were killed in the ſervice. This act for regiſtering ſeamen was enforced by 8 and 9 W. III. cap. 22. but repealed by 9 Anne. Every ſeaman is required to allow out of his wages ſix pence a month, for the better ſupport of the ſaid *hoſpital*; for which duty receivers are appointed &c. The money is paid into a receivers office, on Tower-hill, which is under the management of three commiſſioners and their clerks. 8 and 9 W. 3. cap. 23. 10 Anne. 2 Geo. II. cap. 7. By the laſt act a ſeaman abſenting himſelf from his ſhip without leave, ſhall forfeit for every day's abſence two day's pay to Greenwich *hoſpital* to be deducted out of his wages: and a ſeaman, not entering into the king's ſervice, who ſhall leave his ſhip before he hath a diſcharge in writing, ſhall forfeit one month's pay, in like manner.

By 8 Geo. II. cap. 29. the net rents and profits of the eſtates forfeited by the attainder of James late earl of Derwentwater, and of Charles Radcliffe, were applied in the firſt place to the completing of the building of Greenwich *hoſpital*; and it is hereby enacted, that all ſeamen in the merchants ſervice who ſhall happen to be maimed in fighting, not only againſt pirates, but alſo any enemy of his majeſty, &c. ſhall be admitted into and provided for in the ſaid *hoſpital*, as well as ſeamen maimed or diſabled in the king's actual ſervice; and in the next place, the whole net rents of thoſe forfeited eſtates ſhall be for ever applicable for the ſupport of the royal *hoſpitals*, for the better maintenance of the ſeamen therein, worn out and become decrepit in the ſervice of their country. This law was further explained and amended by 11 Geo. II. cap. 30.

Proviſion

Provision is made for securing the payment of the fix pence per month from privateers by 18 Geo. II. cap. 21 and for securing prize money belonging to the *hospital* by 20 Geo. II. cap. 24. The governors are empowered to grant out-pensions to decrepit seamen, by 3 Geo III. cap. 16. and persons personating or falsely assuming the name and character of out-pensioners, shall be guilty of felony without benefit of clergy; and those who receive half yearly pensions shall, together with the printed bill delivered to them by the commissioners, produce a certificate under the hand of the minister and churchwardens, where they reside, testifying that they are the persons named in such bill.

To this *hospital* there belong 2169 pensioners, 140 boys, and 138 nurses. The pensioners are clothed in blue and are allowed stockings, shoes, linen, and a shilling a week for other necessaries. The victualling is according to the allowance of Chelsea *hospital*, viz. four men to a *mess*, each mess to contain four pounds of flesh, a gallon of beer, &c.

The governors of this *hospital* are the great officers of state, and persons in high posts under the king; and it is under the more particular inspection and government of twenty-four commissioners, a governor with an annual salary of 1000l. and clerk, a lieutenant governor, whose salary is 400l. a year; four captains, allowed 230l. a year each; and seven lieutenants, with 115l. a year each; a treasurer whose salary is 200l. with two clerks; secretary, with 160l. a year and clerk, auditor whose annual salary is 100l. and clerk, surveyor with 200l. salary, clerk of works at five shillings a day, a physician at ten shillings a day, a surgeon with an annual salary of 150l. a servant and two assistants, dispenser with 50l. a year and his assistant, two chaplains with a salary of 130l. each, steward with a salary of 160l. and three clerks; clerk of cheque with 100l. salary and three clerks; brewer, three matrons, organist, messenger, two chief cooks and four mates, scullery man and two mates, butler and two mates, porter and barber.

HOSPITAL, *Guy's*, situated in the parish of St. Thomas, Southwark, was founded, in his life-time, by Thomas Guy, esq. a very wealthy citizen and bookseller of London. For this purpose he took a lease of a piece of ground belonging to St. Thomas's *hospital*, for the term of 999 years, at a ground-rent of 30l. per annum; the foundation of the intended *hospital* was laid in 1722, and the fabric was roofed before the death of the founder, which happened in the year 1724. The charge of erecting and furnishing this *hospital* amounted to the sum of 18793l. and the sum left to endow it to 200,000l. and upwards. The governors of this *hospital* were incorporated by act of parliament, made in the eleventh year of Geo. I. Anno 1725, under the title of *The President and Governors of the* HOSPITAL founded at the sole cost and charges of Thomas Guy, esq. and under this title they are impowered to purchase, either in perpetuity or for a term of years, any estate not exceeding 13,000l. per annum. The number of governors appointed to be chosen from those of St. Thomas's *hospital* by the founder is fifty; and it is enacted, that if the number does not exceed 40, the vacancies shall be supplied by the lord chancellor, lord keeper, or commissioners of the great seal, lords chief justices of the king's bench and common pleas, and lord chief baron of the exchequer, so as to make up the number of fifty. It is also enacted, that the management of the *hospital* be referred to a president, treasurer, and twenty-one governors; forming a committee appointed by a general court, seven of whom are annually changed; this committee is empowered to chuse, and at pleasure to remove, all officers and servants employed in the *hospital*, except the physicians, surgeons, clerk, and chaplain, who are elected by the general court, to appoint their salaries, to admit objects of charity, and in general to transact the affairs of the *hospital* subject to the inspection and control of a general court; and this general court has power to make any by-laws for the better government of the corporation. This *hospital* so liberally endowed by its founder, was established for the reception and relief of upwards of 400 sick and diseased poor objects; besides twenty incurable lunatics, who are provided for in a separate building. Since the decease of Mr. Guy, the governors have taken a lease of an additional spot of ground, for which with the former, they annually pay to St. Thomas's *hospital* the sum of 100l. on this ground they have erected two handsome wings; in the centre of one wing there is a spacious hall and rooms for public business, and opposite to it in the other a neat and elegant chapel; in which there is a finely executed statue of the founder by Mr. Bacon. The corner house in one wing is for the residence of the treasurer, and the other houses are for the chaplain, steward, and apothecary. The *hospital* is under the medical inspection of three physicians and three surgeons, who are allowed 40l. a year each, an apothecary, who has 90l. a year for himself and assistant, and a house. The officers are a clerk, chaplain, steward, accomptant, matron, butler and assistant; surgery man, porter, beadle, keeper of the lunatic men, and keeper of the lunatic women. It contains at this time, 13 wards and 411 beds; and the number of patients admitted into this *hospital*, at an average for the last ten years, has been 2744 yearly; of whom 2014 have been discharged, and 230 have died; under the prudent conduct of the treasurer and governors, it does great honour to the liberality of its founder. The day of admission to this *hospital* is Wednesday. We shall add under this article, that Mr. Guy has bequeathed to the president and governors of *Christ's* HOSPITAL, a perpetual annuity of 400l. for taking into the said *hospital* four children yearly, at the nomination of the governors of his *hospital*: preference being always given to his own relations, who have never failed to offer themselves. To his poor need relations he gave annuities during life to the amount of 870l. and among his younger relations and executors the sum of 83180l. together with the sum of 1000l. for discharging poor prisoners, within the city of London, and counties of Middlesex and Surry, who could be released for the sum of five pounds.

He likewise erected an alms-house, with a library, at Tamworth, where his mother resided, and which he represented in several parliaments, for the use of fourteen poor men and women; to whom he allowed certain pensions during life, and at his death, for their future support and putting out children apprentices, &c. he bequeathed a perpetual annual sum of 123l. Mr. Guy also built and finished, at his own expence, in the year 1707, three wards on the north side of the outer court of *St. Thomas's* HOSPITAL; and gave to the same 100l. per annum, for eleven years immediately preceding the foundation of his *hospital*. Some time before his death, he removed the frontispiece of the said *hospital* of St. Thomas, which stood over the gate-way in the borough, and erected the same in the place where it now stands, fronting the street; and having enlarged the gateway, rebuilt the two large houses on the sides thereof, and erected the stately iron-gate between them, at an expence of between 3 and 5000l. To many of his relations he gave stated allowances of 10 or 20l. per annum, and to others, money for advancing them in the world.

HOSPITAL, *of Jerusalem*. See HOSPITALER.

HOSPITAL, *Jews*, called *Bethholem*, or house for the relief of the sick, was founded by subscription in 1748. This charity, which administers medicines and advice gratis, is maintained by a certain sum, allowed by the synagogue, and private contributions, amounting to about 500l. a year. They have likewise a ward assigned for poor lying-in women.

HOSPITAL, *Lock*, near Hyde-park corner, was instituted in the year 1746, for the relief of foul patients. Every gentleman subscribing five pounds a year and upwards shall be a governor of this *hospital*, and whoever gives a benefaction of fifty pounds at one time becomes a governor for life. This *hospital* is under the direction of a president, seven vice-presidents, two treasurers, and a committee of the governors. It is attended by a physician, two surgeons, and two visiting apothecaries. The officers are a chaplain, house-surgeon, secretary, collector, and matron.

HOSPITAL, *London*, in Mile-end road, was instituted in 1740, and incorporated in 1758. This *hospital* is supported in a very large and convenient building, furnished with about 212 beds, by voluntary contributions for the relief of all sick and diseased persons. The charity is under the government and direction of a president, three vice-presidents, a treasurer, and of such persons, who, by giving a benefaction of thirty guineas or more at one time become governors for life; or who subscribe five guineas or more per annum. A house-committee of twelve governors is appointed at every general quarterly court, one of whom is chosen chairman; four of these governors take the first month, four the next, and the other four the last month of the quarter; and they meet every week at the *hospital* to transact the necessary business.

There is also a committee of accounts and a physical committee, each of which consists of twelve governors. The management of the house is inspected by two governors, appointed visitors by the house-committee. Three physicians and three surgeons attend this *hospital*: the officers are a chaplain, apothecary, secretary and receiver, steward and two matrons. Every governor is entitled to send one in-patient at a time, and out-patients without limitation. Subscribers, that are not governors, may send as many out-patients, as they please: the day of admission is Tuesday. Since the institution of this *hospital*, upwards of 372,063 distressed objects have been relieved by it.

HOSPITAL, *St. Luke's for lunatics*, in Upper Moor-fields, was instituted in 1751. Persons paying the entire sum

of twenty guineas or upwards, or paying five guineas at least, and figning an agreement to pay five guineas yearly for the four next fucceeding years, are admitted governors of this *hofpital*; nine of whom conftitute a general court, to be held twice every year. At one of thefe courts one prefident, four vice-prefidents, a treafurer, a general committee, phyfician, furgeon, apothecary, and fecretary, fhall be elected for the enfuing year. The general committee is impowered to manage all the neceffary bufinefs of the *hofpital*, and to appoint fub-committees. Patients are admitted into the *hofpital* according to the order of time in which their petitions, previoufly figned by a governor, have been delivered to the fecretary, and without any expence, except that the parifh poor fhall provide their bedding, which they may take away at their difcharge. But no perfon can be admitted into this *hofpital* who is not poor and mad; or who hath been a lunatic more than twelve calendar months; or who hath been difcharged uncured from any other *hofpital* for the reception of lunatics, or who is troubled with epileptic or convulfive fits; or who is deemed incurable; or who is infected with the venereal difeafe; nor any woman with child. Befides a petition, the governors require two printed certificates; one teftifying the above particulars, figned by the minifter and churchwardens, or overfeers of the poor of the parifh or place where the propofed patient refides; and the other to the fame purpofe, figned by fome phyfician, furgeon, or apothecary, who hath vifited fuch patient; which fignatures muft be attefted upon oath.

On the admiffion of every patient, two refponfible houfe-keepers enter into a bond to the treafurer, in the penalty of 100l. to take away fuch patient within feven days after notice for that purpofe from the committee or fecretary. It is alfo provided, that the general committee may receive immediately into this *hofpital* any patient who fhall have been difcharged cured, in cafe fuch patient relapfe within two months; and that fuch patients who have been difcharged uncured, not exceeding thirty, fhall be admitted by rotation; on condition of the payment of five fhillings per week for each, till the charity fhall be enabled to bear that expence.

It appears from the printed ftate of this *hofpital*, that the balance of the *hofpital* came in the hands on the firft day of January, 1773, was 8915*l.* 4*s.* 11*d.* and that from the opening of the *hofpital* on the 25th of July 1751, to the 30th of July 1760, 2812 patients have been received into the houfe, of whom 1280 have been difcharged cured; and that 105 perfons difcharged uncured have been again received into the houfe at five fhillings a week.

HOSPITAL, *Lying in*. There are feveral *hofpitals* of this kind in the cities or fuburbs of London and Weftminfter. The Middlefex *hofpital* for ſick and lame, and lying-in married women, in Mary-le-bone Fields, was inſtituted in 1745: it is under the direction of a preſident, five vice-prefidents, two treaſurers, and a committee of the governors; the qualification for a governor is an annual ſubſcription of three guineas, and of a governor for life thirty guineas at one payment. The lying-in ward in this *hofpital* has no communication with thoſe of the ſick and lame. The patients are viſited by four phyſicians, two men-midwives, and four ſurgeons. The domeſtic officers are a houſe-ſurgeon, chaplain, ſecretary, collector, apothecary, and two matrons or midwives. The day for admiſſion of patients is Tueſday.

The *Britiſh lying-in hoſpital* for married women in Brownlow-ſtreet, Long-acre, was inſtituted in 1749. This *hoſpital* is governed by a preſident, four vice-preſidents, a treaſurer and a committee of fifteen governors, who meet every Friday to receive the women recommended and to direct the ordinary affairs of the houſe. The qualification of an annual governor is a ſubſcription of three guineas or upwards per annum, and of a perpetual governor a ſingle payment of thirty guineas. This *hoſpital* is occaſionally viſited by two phyſicians, and two ſurgeons; and it is provided with an apothecary, chaplain, ſecretary, matron, and midwife, ſix nurſes and ſixty-two beds. Four female pupils, being widows or married women, not leſs than twenty-five years of age, and of approved character, are permitted to attend this *hoſpital*, for inſtruction in midwifery, and have a right to ſtay in the *hoſpital* ſix months. They are to board in the *hoſpital*, and dine at the ſteward and matron's table; and on leaving the *hoſpital* to receive certificates of their qualification. The expences of inſtruction and board are ſettled by a general court.

Theatre of London Lying-in hoſpital for married women, in Jewin-ſtreet, was inſtituted in 1770. The government of this *hoſpital* is veſted in a preſident, four vice-preſidents, and twelve others, choſen annually from among the governors and ſtanding committees. The ſubſcription of twenty guineas conſtitutes a governor for life; thoſe who ſubſcribe five guineas, or three guineas per annum, are governors ſo long as they continue their ſubſcription, and may recommend one pregnant woman at a time. A general court is held four times a-year, which appoints a houſe-committee conſiſting of thirteen governors, who meet every Tueſday to receive and diſcharge women, &c. This *hoſpital* is viſited by a phyſician in ordinary, men-midwives and two ſurgeons. It is alſo provided with an apothecary, chaplain, ſecretary, matron or midwife, and a ſufficient number of nurſes and ſervants.

The Weſtminſter new lying-in hoſpital, on the Surry ſide of Weſtminſter bridge, was inſtituted by ſubſcription in the year 1765. It is governed by a preſident, ſix vice-preſidents, and a committee of governors. It is attended by two men-midwives, a conſulting phyſician, two ſuperintendant apothecaries, and a ſurgeon. The officers are a ſecretary, receiver, and matron or midwife.

HOSPITAL, *Magdalen*, in St. George's Fields, was inſtituted in the year 1758 for the relief and reformation of proſtitutes. The queen is patroneſs of this charity; it is under the direction of a preſident, ſix vice-preſidents, treaſurer, and committee of thirty governors. It is attended by a phyſician, two ſurgeons and two apothecaries. The domeſtic officers are a chaplain, ſteward, ſecretary, matron and aſſiſtant, and meſſenger and aſſiſtant. Twenty guineas conſtitute a governor for life, and an annual ſubſcription of five guineas is a qualification for a governeſs for one year; which ſubſcription when it amounts to twenty-five guineas, qualifies a governor for life. In twenty one years, viz. from Aug. 10, 1758, to Dec. 25, 1779, there have been admitted into this *hoſpital* 1029, of which number 1209 have been reconciled to, and received by their friends, or placed in ſervice in reſpectable families, and to trades.

HOSPITAL, *Mifericordia*, in Goodman's Fields, was eſtabliſhed by ſubſcription, in a 1744, for the cure and relief of indigent perſons afflicted with the venereal diſeaſe. It is under the direction of a preſident, four vice-preſidents, treaſurer, and governors. It is attended by a phyſician, and two ſurgeons; the officers are a chaplain, ſecretary, clerk, apothecary, and matron.

HOSPITAL, *St. Peter's*, at *Newington-Butts*, was erected by the company of Fiſhmongers, by virtue of letters patent of king James I. in 1618, for the reception of divers of their poor members, who had penſions bequeathed them by the wills of ſome of their company.

HOSPITAL, *Royal*, for diſabled ſoldiers, commonly called *Chelſea-College*.

It was founded by king Charles II. carried on by king James II. and finiſhed by king William and queen Mary.

The building is very ſpacious and magnificent: its figure is a H; the middle or front part whereof conſiſts of a chapel and hall; the other two lines, being four ſtories high, are divided into wards or galleries, two in each ſtory; containing each twenty-ſix diſtinct apartments for the poor ſoldiers. At each of the four corners of the main building, there is a pavilion, in one whereof is the governor's lodging, and the council-chamber; the other being lodgings for ſeveral of the officers of the houſe. Beſide the main building, there are four wings or out-buildings; one for the infirmary, another for ſeveral officers of the houſe, another for old maimed officers of horſe and foot; and the fourth for the baker, bakehouſe, &c. The number of ordinary penſioners is 476; beſides the officers and ſervants in the houſe: the out or extraordinary penſioners are alſo very numerous; and theſe, upon occaſion, do duty in the ſeveral garriſons, from whence draughts are made for the army, &c.

The penſioners are all provided with cloaths, diet, waſhing, lodging, firing; and have one day's pay in every week for ſpending money.

The qualifications required to be admitted of this body, are, that the candidate bring a certificate from his ſuperior officer, that he has been maimed or diſabled in the ſervice of the crown; or that he has ſerved the crown twenty years, which muſt be made appear by muſter-rolls.

To defray the charges of this *hoſpital*, there is a conſiderable ſum paid yearly out of the poundage of the army; beſide one day's pay of each officer, and each common ſoldier, every year, which in time of war, amounts to a very conſiderable ſum.

For the adminiſtration of this *hoſpital* there are commiſſioners, a governor whoſe ſalary is 360*l.* per annum, a lieutenant governor with 46*l.* a major with 30*l.* an adjutant with 10*l.* two chaplains with 100*l.* a year each, a phyſician and ſurgeon, whoſe ſalaries are 200*l.* each, beſides ſurgeon's mates and apothecaries; a treaſurer, who is the pay-maſter-general of the land-forces for the time being; and his deputy and clerk, ſecretary and regiſter and clerks, agent and pay-maſter to the out-penſioners and his clerks, comptroller, ſteward, &c. &c.

HOSPITAL, *Scots*, or *Corporation*, was formed for the re-

lief of the aged and neceſſitous poor of Scotland, within the cities of London and Weſtminſter, and incorporated by charter in 1665, which was confirmed by letters patent of Charles II. in 1666, by the appellation of *The Scots Hoſpital of King Charles II.* to be governed by eight Scotſmen, who were allowed to elect thirty-three aſſiſtants, and to purchaſe in mortmain 400l. per annum, above the annual ſum mentioned in the firſt charter. This corporation had, for many years, a hall in Black-Friars, but the buſineſs of it is now conducted in the houſe lately belonging to the Royal Society, in Crane-Court: the officers are a treaſurer, regiſter, two ſtewards, and a beadle; and the ſum annually diſtributed by the ſociety is about 600l.

HOSPITAL, *Small-Pox*, or HOSPITAL for reſieving poor people afflicted with the ſmall-pox and for inoculation, was inſtituted by voluntary ſubſcription in the year 1746. This *hoſpital* conſiſts of two houſes, at a due diſtance from each other, in airy ſituations. The houſe for preparing patients for inoculation is at Pancras, and that for receiving them when the diſeaſe appears, and for accommodating patients who have it in the natural way, is in Cold-bath Fields. The king is the patron of this *hoſpital*, and it is under the ſubordinate government of a preſident, four vice-preſidents, a treaſurer and a committee of thirteen governors, choſen at general courts, which are held half-yearly. Thirty guineas conſtitute a governor for life, and five guineas per annum a governor during ſuch ſubſcription. Every governor is entitled to have one patient in the houſe for inoculation, and one in the houſe for the natural way, at the ſame time. Patients in the natural way are received every day, wherever there are vacancies; and thoſe for inoculation are alſo received every day, provided they come before nine in the morning. The *hoſpital* is under the medical care of a phyſician and eight houſe lies its apothecary and matron and proper nurſes. From the annual ſtate of this *hoſpital*, it appears, that there have been received into the houſe for the natural way, from September 26, 1746, to the 24th of March 1780, 14833 patients; and there have been inoculated to the ſame period 2870.

HOSPITAL, *Saint's*. See CHRISTENDOM.

HOSPITAL, *St. Thomas's*, in Southwark, is eſtabliſhed for the ſame purpoſes as that of St. Bartholomew.

It was originally founded an *hoſpital*, by Richard prior of Bermondſey, in 1213, and ſurrendered to king Henry VIII. in 1538; in the year 1551, the mayor and citizens of London, having purchaſed of king Edward VI. the manor of Southwark, including this *hoſpital*, repaired and enlarged it, and admitted into it 260 poor, ſick, and helpleſs objects; wherefore the king in 1553 incorporated it together with thoſe of Chriſt and Bride-well. This ancient ſtructure, much damaged by time and by fire, was rebuilt by voluntary ſubſcription in the year 1693; and by additional buildings greatly enlarged; in conſequence of which it conſiſted of three beautiful ſquares; to which the governors, in 1732, added a magnificent new building, conſiſting of ſeveral wards, a brew-houſe, and other neceſſary offices at their own expence. It now conſiſts of four quadrangular courts; in the firſt are wards for women; in the ſecond two chapels, the leſſer for the private uſe of the *hoſpital*, and the larger, parochial; in the ſame court and adjoining to it, are the houſes of the treaſurer, and other officers; in the third court are ſeveral wards for men; the fourth hath alſo wards, hot and cold baths, a ſurgery, theatre, apothecary's ſhop, &c. The number of patients relieved by this *hoſpital* in the year 1780 was 3624; and 3607 in-patients, and 4603 out-patients were diſcharged cured. The annual diſburſements of this *hoſpital* are about 8000l. the governors of this *hoſpital* are the lord mayor and court of aldermen, and the number of others, who on receiving a governor's fine, give a benefaction of 50l. or upwards, is unlimited; but it is commonly between four and five hundred. They chooſe their officers and ſervants, who are a preſident, treaſurer, hoſpitaller or chaplain, beſides the miniſter of the pariſh, who is paid by the *hoſpital*, three phyſicians, three ſurgeons, apothecary, clerk, receiver, steward, matron, butler and brewer, baker, cook, aſſiſtant and ſervant, an aſſiſtant clerk in the compting houſe, two porters, four beadles, nineteen aſſiſters, nineteen nurſes, nineteen watch-women, a chapel clerk and ſexton, and nine watchmen. The houſe contains at this time eighteen wards and 485 beds.

Beſides the *hoſpitals* already enumerated, there are royal *hoſpitals* for ſick as that at Haſlar, near Portſmouth, for ſick and hurt ſeamen and marines, and the royal *hoſpital* at Chelſea, and many others, ſupported by the benefactions of private and voluntary contributors, which provide relief for almoſt every ſpecies of diſeaſe or injury.

HOSPITALS, *Camp*, are either general or regimental.

The general *hoſpitals* are of two kinds, viz. the flying *hoſpital*, attending the camp at ſome convenient diſtance, and the ſtationary *hoſpital*, which is fixed to one place. In the choice of both, it will be better to have them in towns than villages, as the former will afford larger wards, beſides more of other conveniencies: theſe wards ſhould be as airy as poſſible.

As to the diſpoſition of *hoſpitals*, in regard to preſerving the purity of the air, the beſt rule is to admit but few patients into each ward. It will alſo be found a good expedient, when the cottages are low, to remove ſome part of them, and to open the gable-ends. The doors and windows muſt likewiſe be opened, and ventilations uſed to purify the air of every ward. In winter-*hoſpitals*, the wards are to be warmed with chimneys, and never by ſtoves: for, though the latter may warm a large ward better, and at a leſs expence, yet by ſcarce making any draught of air, they will be apt to occaſion a putrid quality; whereas a fire, kept up in a chimney, acts like a conſtant ventilator.

The general *hoſpital* ſhould receive only ſuch ſick as the regimental ones cannot conveniently contain, together with thoſe who cannot be moved with the army. Without this diſpoſition of the ſick, the general *hoſpital*, in bad ſeaſons, would have a greater number than could be well attended; and what is equally, if not more pernicious, it would be too much crowded, by which means the contagion would ſpread, and the mortality be rendered more general.

Regimental *hoſpitals* are of the greateſt importance, and therefore ſhould be ſupplied with blankets and medicines from the public ſtores, with an allowance alſo for nurſes and other neceſſaries. Nor are they to be maintained in the field only, but alſo in winter-quarters, as there will always be a great many more ſick than can be taken care of in the general *hoſpitals*.

Barns, ſtables, granaries, and other out-houſes, but above all, churches, make the beſt *hoſpitals* from the beginning of June to October: for as the greateſt danger ariſes from foul air, which cannot be counteracted by diet or medicine, we may lay it down as a rule, that the more airy and large the *hoſpitals* are, the leſs danger there is of the ſick's ſpreading. Pringle, Obſerv. on the Diſeaſes of the Army, p. 200, ſeq.

HOSPITAL-*fever*, a name given to the moſt pernicious *putrid fever*, as being frequent in *hoſpitals*. See FEVER.

Dr. Pringle has given us an elaborate account of the riſe, ſymptoms, and cure of this terrible diſeaſe, in his Obſervations on the Diſeaſes of the Army. It may be owing to a great many concurring cauſes, but the principal are foul and putrid air, occaſioned by filth and impurity of any kind. Hence it is no wonder that it prevails in marſhy countries after hot ſeaſons, and in populous cities eſpecially if low, and ill aired, unprovided with common ſewers, or where the ſtreets are narrow and foul, the houſes dirty, water ſcarce, and where jails or hoſpitals are crouded, and not ventilated and kept clean; when in ſickly times the burials are within the town, and the bodies not laid deep; when ſlaughter-houſes are alſo within the walls; or when dead animals or offals are left to rot in the kennels, or on dunghills; when drains are not provided, or every other way the body of the air or corrupted water, in the neighbourhood; when freſh meats make the greateſt part of the diet, without a proper mixture of bread, greens, wine, or other fermented liquors; from the uſe of cold and muſty grain, or what has been damaged by a wet ſeaſon; or, laſtly, when the fibres are relaxed by a moderate warm bathing.

When the diſeaſe comes on ſlowly, the ſymptoms are ſmall intermiſſions of fears and cold, trembling of the hands, interrupted ſleep, &c. But when it advances faſt, the above ſymptoms are all in a higher degree; and beſides theſe, the patient is afflicted with great laſſitude, a naufea, pains in the back, a conſtant pain and confuſion in the head, a dejection of ſpirits, and an uncommon tremor of the hands. If the ſick be warm, and have had no preceding flux, the body is generally coſtive; but when they be cold, as they often do in field-hoſpitals, the pores of the ſkin being ſhut, a diarrhœa is a common ſymptom: in the worſt caſes, a flux appears in the laſt ſtage: when the ſtools are involuntary, colliquative, ichorous, or bloody, and of a cadaverous ſmell, which are the effect of a mortification of the bowels, and the ſigns of approaching death: ſome are never delirious, but all are under a great ſtupor and confuſion. The petechiæ are the frequent, but not inſeparable attendants of the fever: they are ſometimes of a brighter or paler red, at other times of a livid colour, but are never raiſed above the ſkin. For the moſt part, theſe ſpots are ſo little conſpicuous, that unleſs looked for attentively, they may eſcape notice. They are thickeſt on the breaſt and back, leſs on the legs and arms, and the Dr. never remembers to have ſeen any upon the face. This fever, though of the continued kind, has often exacerbations at night, with remiſſions, and partial ſweats next day; and, after a long continuance, is apt to change into a hectic, a remitting, or intermitting form.

Prog-

Progreſſus in it. To have a little delirium, the ſtrength little impaired, turbid urine in the decline of the diſeaſe, and at the ſame time a gentle ſweat or moiſture diffuſed over the body, are reckoned good ſigns; and it ſeems peculiar to malignant fevers, that deafneſs is rather a good ſign.

Method of cure. Theſe vary according to the ſtate of the diſeaſe, which may be diſtinguiſhed into three periods; the firſt containing as long as the perſon is able to go about; the ſecond beginning with his confinement; and the third when the pulſe ſinks and a ſtupor comes on.

In the firſt, as well as in the other periods, the cure is principally to be aimed at by removing the patient out of the foul air. When this cannot be done, the ward or room ſhould be purified by making a ſucceſſion of air by means of fires, or letting it in by doors and windows, or diffuſing the fumes of vinegar.

The next thing to be done, is to promote a diaphoreſis, which, in this period, ſhould only be attempted by mild diaphoretics, as the ſpiritus Mindereri.

When the fever is confirmed, contrayerva powders, with nitre, camphor, the common piſan acidulated, and ſuch medicines as are good in inflammatory caſes, ought to be given.

Cathereſis is to be preſented by emollient clyſters. But opiates are dangerous, both in this and the third ſtage, in which the pulſe ſinks, and ſtupor is greater, a delirium impends, and petechiæ often appear. When this is obſerved to be the caſe, the nitre and diaphoretic medicines are to make room for a decoction of ſnake-root, to which a ſmall quantity of ſtrong water may be added. It may alſo be given in ſubſtance from two to four ſcruples a day, with ſenſible good effects. Towards the decline of the fever, an equal quantity of Peruvian bark may be joined with the root. Wine is alſo an excellent cordial at this period, and may be given either made into whey, or added to the panada, which was the only food allowed to the ſick. It may be taken from half a pint to a quart a day, according to the ſtrength of the patient. Perhaps there is no rule of more importance, than to give ſtrict charge to the attendants of the ſick, never to let the patient, when low, remain above two or three hours without taking ſomething cordial and nouriſhing. But however neceſſary wine, volatiles, and other cordials are, in this low ſtate of the fever, it ought to be remembered, that they muſt never be given with an intention to force a ſweat, but only as antiſeptics, and to ſupport the *vis vitæ*. If there be danger of a phrenitis coming on, it will be proper to call in the aſſiſtance of epiſpaſtics. Sinapiſms too may be uſed when the pulſe is greatly ſunk. If a diarrhœa comes on in the decline of the fever, it is to be moderated by adding a few drops of the tinctura thebaica to the full quantity of the alexipharmic decoction; or by giving a ſpoonful or two of an aſtringent mixture. In proportion, however, to the putrid nature of the ſtools, aſtringents are to be uſed with the more caution. When the fever is over, there are few but complain of a vertigo, and want of reſt; a continuation of the deafneſs, and other nervous ſymptoms, are frequently the conſequences of great lowneſs; in which caſe, the ſpiritus Mindereri are to be given at night, with analeptics and medicines of the ſtrengthening kind. Vide Pringle's Obſerv. on Diſeaſes of the Army, p. 243. 278.

HOSPITAL *Ship*. See SHIP.

HOSPITALER, one that entertains and provides for poor people, travellers, &c.

The appellation is chiefly given to certain communities of religious; as, the *Hoſpitalers* of Elſefort in Eſſex, inſtituted to take care of lepers; *Hoſpitalers* of St. John Baptiſt, of Coventry; *Hoſpitalers* of St. Julian; *Hoſpitalers* of St. Leonard at York, &c.

The religious *Hoſpitalers* generally follow the rule of St. Auguſtine. Moſt of them pretend, that St. Martha was their firſt foundreſs, and chooſe her for their patron, becauſe ſhe entertained Jeſus Chriſt at her houſe. Some of them go back to the patriarch Abraham for their founder.

There are alſo *Hoſpitalers* among the military orders; ſuch as the knights of St. Lazarus, and St. John of Jeruſalem.

HOSPITALERS, HOSPITALARII, more particularly denote an order of religious knights, who built an hoſpital at Jeruſalem, wherein pilgrims were received. To theſe pope Clement V. transferred the effects and revenues of the Templers; whom, by a council held at Vienne, he ſuppreſſed, for their many and great miſdemeanours.

Theſe *Hoſpitalers* were otherwiſe called *Knights of St. John of Jeruſalem*; and are the ſame with thoſe whom we now call *Knights of* MALTA.

HOSPITALIS, in *Mythology*, is a name which the ancient Romans gave to Jupiter, calling him Jupiter Hoſpes, becauſe they conſidered him as the guardian of hoſpitality.

HOSPITIUM, *Inn*, a term peculiarly uſed, in our law-books, for an INN *of court*.

HOSPITIUM is alſo uſed for a little convent, which the religious built for the reception of ſtrangers and travellers, of the ſame order, who had occaſion to ſtay with them ſome time.

Moſt of theſe *hoſpitia*, or inns, in time became fixed convents.

HOSPITIUM was likewiſe formerly uſed for PROCURATION, or viſitation money.

HOSPODAR, the title borne by the princes of Wallachia and Moldavia.

The *hoſpodars* of Walachia and Moldavia receive the inveſtiture of thoſe principalities from the grand ſeignior, by a veſt, and a ſtandard which he gives them.

They are ſometimes depoſed by him; though in other reſpects they have ſovereign power within their ſtates.

HOST, HOSPES, which ſome will have thus called, *quaſi hoſtium*, or *oſtium petens*; for *oſtium* was anciently written with an aſpirate; a term of mutual relation, applied both to a perſon who lodges and entertains another, and to the perſon thus lodged, &c.

Thus the innkeeper ſays, he has a good *hoſt*, in ſpeaking of the traveller who lodges with him; and the traveller again ſays, he has a kind *hoſt*, in ſpeaking of his landlord. It muſt be obſerved, then, that it was the cuſtom among the ancients, when any ſtranger aſked for lodging, for the maſter of the houſe, and the ſtranger, each of them to ſet a foot on each ſide of the threſhold, and ſwear they would neither of them do any harm to the other. It was this ceremony that raiſed ſo much horror againſt thoſe who violated the law or right of hoſpitality on either ſide; inaſmuch as they were looked on as perjured. Inſtead of *hoſpes*, the antient Latins called it *hoſtis*, as Cicero himſelf informs us; though, in courſe of time, *hoſtis* came to ſignify an *enemy*; ſo much was the notion of hoſpitality altered.

HOST is alſo uſed by way of abbreviation for HOSTIA, a victim, or ſacrifice, offered to the Deity.

In this ſenſe *hoſt* is more immediately underſtood, of the perſon of the Word incarnate, who was offered up a *hoſt*, or *hoſtia*, to the Father on the croſs, for the ſins of mankind.

HOST, or HOSTY, is chiefly uſed in the Romiſh church for the body of Jeſus Chriſt, contained under the ſpecies of bread and wine, which is offered up every day, a new *hoſt*, or ſacrifice in the maſs.

Pope Gregory IX. firſt decreed a bell to be rung, as the ſignal for the people to betake themſelves to the adoration of the *hoſt*.

The veſſel wherein the *hoſts* are kept, is called the *ciborv*; being a large kind of covered chalice.

HOSTAGE, formed of *hoſt*, and that of *hoſpes*, a perſon left as ſurety for the performance of the articles of a treaty.

When two enemies are upon the point of concluding a treaty, or capitulation, it is frequent for them to give *hoſtages* on each ſide, as ſurecies for the execution of what is contained therein.

A *hoſtage* is either a principal, or an acceſſary, according to the ſtate of the caſe. He is only an acceſſary, when, for inſtances, a prince promiſes fidelity to another, and gives up his ſon, or ſome other great lord, to aſſure his engagement, without any farther ſtipulation. For here, if the prince fail of his word, the *hoſtage* is no ways accountable for it.

But the *hoſtage* becomes a principal, when it is expreſly ſtipulated, that he ſhall be anſwerable for the event: for inſtance, if a city engage to ſurrender, in caſe it be not relieved in ſo many days, and to ſecure the engagement, give *hoſtages*, theſe *hoſtages* are what a ſurety is to a creditor for the debt of his principal. So that, if the relief do not come, and yet the citizens refuſe to ſurrender, the *hoſtages* ſtand in their place, become principals, and are liable to be puniſhed for the prevarication of thoſe they are become ſureties for.

A *hoſtage* given for another perſon becomes free when that perſon dies.

HOSTEL, or HOTEL, a French term, anciently ſignifying a houſe, or dwelling-place.

It is now more commonly uſed for the palaces or houſes of the king, princes, and great lords.

In this ſenſe they ſay, the *hotel de Conde*, *Hotel de Conti*, *hotel de Lorrey*, &c.

The grand prevot *de l'hotel* is the firſt judge of the officers of the king's houſhold. His juriſdiction is much like that of lord-ſteward of the houſhold of the king of England.

The *hotel de ville* is what we call a town-houſe, or ſtone-hall.

HOTEL-DIEU, is a common name for the firſt hoſpital for the reception of ſick perſons, in moſt of the cities of France.

The HOTEL *de Mars*, is a hoſpital near Paris; of the ſame nature with Chelſea hoſpital.

HOSTIA. HOST, in *Antiquity*, a victim offered in ſacrifice to a deity.

The word is formed from *hostis*, *enemy*; it being the cuſtom to offer up a ſacrifice before they joined battle, to render the gods propitious; or, after the battle was over, to give them thanks. Some chooſe to derive the word from *hoſtio*, q. d. *facio*, *I ſtrike*. Iſidore on this word remarks, that the name *hoſtia* was given to thoſe ſacrifices which they offered before they marched to attack an enemy; *hoſtem quem*, ſays he, *ad hoſtem peregerent*, in contradiſtinction from *victima*, which were properly thoſe offered after the victory. Ovid ſeems to diſtinguiſh otherwiſe, when he ſays,

Victima quæ cecidit dextra victrice, vocatur;
Hoſtibus a domitis hoſtia nomen habet.

As if the *hoſtia* might be ſlain by any prieſt, but the victim only by the hands of the victor. Pronton makes another diſtinction: according to him, *victima* was a grand oblation, and *hoſtia* a ſmaller and leſs conſiderable one.

HOSILLINA, in *Mythology*, a goddeſs adored among the Romans, and invoked particularly for the fertility of the earth.

HOSTILITY, the action of an enemy. During a truce, all *hoſtilities* are to ceaſe on both ſides: ſuch a city ſtands neuter, and commits no *hoſtilities* on either ſide.

The word is Latin, *hoſtilitas*, formed of the primitive *hoſtis*, which ſignifies *enemy*; and which anciently ſignified ſtranger, *hoſpes*.

HOSTILLERS, in our *Old Writers*, is uſed for inn-keepers; and in ſome old books the word *hoſtler* is taken in the ſame ſenſe. 31 Ed. III. cap. 2.

The word is French, *hoſtelliers*, of the ſame import.

HOSTIS, in *Antiquity*. See BISHOP.

HOT-*bath*. See BATH, and THERMÆ.

HOT-*bed*, in *Gardening*, a bed of earth ſheltered from the cold air, and heated by means of a ſufficient quantity of freſh horſe-dung, or tanner's bark, &c. laid underneath it. Its uſe is to forward the growth of plants before the natural ſeaſon, or to force vegetation, where the climate is not ſufficiently warm for the particular occaſion.

By means of *hot-beds*, skilfully managed, we can ſo nearly imitate the temperature of other climates, that ſeeds of plants brought from any country between the tropics, may be made to flouriſh even under the poles.

Hot-beds are of general uſe in the northern parts of Europe, without which we could not enjoy ſo many of the products of the warmer climes as we now do, nor have our tables furniſhed with the various products of the ſummer ſo early in the ſpring.

The common *hot-bed*, uſed in kitchen-gardens, are made with horſe-dung, in the following manner: a large quantity of new dung from the ſtable, with the litter among it, ſhould be mixed with ſome ſea-coal aſhes; and when it has ſtood a week, it ſhould be turned over, and the parts ſhould be well mixed together: in this ſtate it may continue five or ſix days longer, and it will then have acquired a conſiderable heat. This dung is then to be placed in a ſhallow trench, made in a ſheltered part of the garden, and dug about a foot or a foot and a half deep, if the ground be dry; but if it be wet, not above ſix inches: the dung muſt then be laid exactly ſmooth and even; and the lower part of the heap, which is commonly free from litter, ſhould be ſcattered over the ſurface of the bed; or the heat may be prevented from riſing, and the mould from burning, by ſpreading a layer of neat's dung over the ſurface of the horſe-dung. If the bed be intended for the planting out of MELONS or CUCUMBERS, there muſt be made, at proper diſtances, where the middle of the light of the glaſs they are to be covered with will come, holes of ten inches over, and ſix deep, which muſt be filled up with freſh earth, thruſting a ſtick in the middle, to ſhew the place where the hole is. The whole bed is then to be covered about four inches thick, with the earth taken out of the trench. When this is done, the beds are to be covered with frames of wood, fitted with ſaſhes of glaſs, and after about two days the earth will be of a proper degree of warmth to receive the plants to be ſet in it.

In the making theſe beds, great care muſt be taken to lay the dung cloſe and even; and if it be full of long litter it ſhould be trod down, otherwiſe it will heat too violently, and the warmth be ſoon diſſipated. For the firſt week or ten days the glaſſes muſt be but ſlightly covered in the night, and in the day-time carefully raiſed to let out the ſteam, which is ſubject to riſe very copiouſly while the dung is freſh. Afterwards the covering muſt be increaſed; and if the bed cools too faſt, new dung muſt be laid about its ſides, which will give it a great warmth throughout; and by that time this is diſſipated, the ſun's rays will have power enough to ſupply the place of artificial heat. Only, at this time, if the nights happen to be cold, as is indeed often the caſe, it will be neceſſary to lay ſome mowings of graſs about the ſides of the bed.

This is the *firſt* of *hot-bed* moſt in uſe in kitchen-gardens; but thoſe made with tanners bark are much more proper for the tender exotic plants and fruits, which require a ſteady and equal degree of warmth to be kept up for ſeveral months. In order to the making of theſe, a trench muſt be dug in the earth, about three feet deep, if the ſoil be dry; but if it be wet, it muſt be only dug one foot, and the bed raiſed two feet above ground. The length muſt be proportioned to the number of frames it is intended to be covered with; but it ſhould never be leſs than eleven or twelve feet, nor its breadth leſs than ſix, in order to admit a body of bark ſufficient to keep up the heat. This trench is to be bricked up to the height above mentioned, and in the ſame ſhould be filled with freſh tanners bark, that is, ſuch as the tanners have lately drawn out of their vats, after having tanned leather with it. This ſhould be laid in a round heap for a week or ten days before it is put into the trench, that the moiſture may run off; if it is then to be put into the trench, and gently beat down with a dung-fork; it muſt then be covered with a wooden frame and glaſſes, and in about ten days or a fortnight it will begin to heat, and is then fit to have the pots of plants and ſeeds plunged into it.

A bed of this kind will continue in a good temper of warmth for two or three months; and when the heat declines, if it be ſtirred up thoroughly from the bottom with a fork, and a load or two of freſh bark added to it, will recover its heat, and keep it for two or three months longer.

The frames that cover theſe beds ſhould be proportioned to the plants they are to contain; if for the PINE-*apple*, the back ſhould be three feet high, and the lower part fifteen inches, in order to drain off the wet. If the bed be intended for taller plants, the frame muſt be higher in proportion; but if deſigned only for ſowing of ſeeds, it need not be more than fourteen inches high at the back and about ſeven inches deep at the front. Miller.

In Holland they make uſe of *hot-beds* made of ſand; which are not ſo apt to raiſe unwholeſome damps, as thoſe of horſe-dung.

Bradley, with very good reaſon, propoſes a thermometer to be uſed to regulate the heat of *hot-beds*. For plants that are either to be brought up in a colder ſeaſon or colder climate than what they naturally require, you are to take the height at which the thermometer ſtands in their proper ſeaſon, or clime, as a ſtandard; and by applying a thermometer to the *hot-bed*, judge whether the heat is to be increaſed, or remitted. Thus, a *hot-bed* for cucumbers muſt be kept, to raiſe the ſpirit in the glaſs to the ſame height as the natural temperature of the weather will raiſe it to, about the latter end of May and June, when cucumbers will grow abroad, without any artificial heat or ſhelter.

HOT-*houſe*. See STOVE, and HYPOCAUSTUM.

HOT-*houſe*, in the *Salt Works*, the place where they dry the ſalt after it is taken out of the boiling-pan. In the Cheſhire ſalt-works, this is ſituated between the furnace and the funnels of the chimney which convey up the ſmoak. Along the floor of this room there run two funnels, nearly in a horizontal direction. From the furnace, after this courſe along the floor, they riſe perpendicularly. In theſe the flame and ſmoak running along, heat the room by the way.

HOT-*houſe*, or HOVILESS, a ſort of factitious, or compound fire, made of a third part of any coal, pit, ſea, or charcoal, mixed with two thirds of loam.

Theſe ingredients are to be made up into balls, moiſtened with a little urine, round, or in any other form, at pleaſure, and expoſed to the air till thoroughly dry; then may they be built in the moſt orderly fire imaginable, affording a glowing, regular, and conſtant heat, for ſeven or eight hours, without ſtirring. This mixture is alſo uſed in ſome parts to ſlacken the impetuous devouring of the fire, and keep coals from conſuming too faſt.

HOTAMBŒA, in *Zoology*, the name of a ſpecies of ſerpent found in the Eaſt Indies, of a greyiſh-yellow colour, and very rank ſmell.

HOTCH-POTCH, or HODGE-PODGE, from the French *hache in pache*, or, according to Camden, *hotches en pot*, i. e. *boiled in a pot*, primarily denotes a Flemiſh medley diſh, made of fleſh cut in pieces, and ſodden with herbs, roots, &c.

HOTCH-POT, in *Law*, ſignifies a mixture or blending of lands, given in marriage, with other lands in fee accruing by deſcent. Thus, a man ſeiſed of thirty acres of land in fee, hath two daughters, and gives with one of them ten acres in frank-marriage, and dies ſeiſed of the other twenty. If now, the that is thus married will have any part of the twenty acres, ſhe muſt put her lands given in frank-marriage in *hotch-pot*, that is, ſhe muſt refuſe to take the ſole profits of the ten acres, but ſuffer them to be mingled with the other twenty, ſo that an

equal diviſion may be made of the whole thirty between her and her ſiſter. Thus, for her ten acres ſhe will be entitled to fifteen. Coke on Litt.

HOTTONIA, in *Botany*. See *Water* VIOLET.

HOTTENTOT *cherry*, in *Botany*. See CHERRY.

HOTTS, or HUTTS, pounces, and round balls of leather ſtuffed or tied on the ſharp ends of fighting-cocks ſpurs, to keep them from hurting one another in SPARRING, or breathing themſelves.

HOVEL, a covering or ſhelter for cattle, made of hurdles or the like, or any other mean building.

HOVELLING, in *Architecture*, is a method of working up the ſides of a chimney, and covering the top with tiles or bricks, ſet up in a pyramidical form, ſo that the ſmoke may eſcape below the *current*, when the wind makes over the CHIMNEY, or againſt any one ſide of it. This is uſed to prevent the inconvenience ariſing from adjoining buildings higher than the chimney, or from its being in the eddy of any very lofty building, or in the vicinity of high trees: the covered ſide muſt in this caſe be kept towards the building which occaſions the inconvenience.

HOVEN is the name of a diſeaſe incident to horned cattle, on eating too greedily of green clover. This diſeaſe conſiſts of a ſwelling of the paunch, which, without ſpeedy relief, proves fatal. The ſureſt and ſpeedieſt method of relief is that of making an inciſion into the paunch of the beaſt, by which means the wind, that cauſed the ſwelling, will eſcape through the orifice, and the animal recover. This operation is performed with a penknife, the blade of which ſhould be puſhed in, till wind be perceived to iſſue out: the blade may be five inches long, ſharp at the point, but enlarged and rounded off at the edges towards the ſhank, and penetrated quite to the hilt. The wounds thus made ſhould not be ſown up, as they will ſoon heal, provided that the knife does not penetrate too near the hip-bone: it is therefore proper to feel for the ſhort ribs before the puncture is made, and to paſs the knife as near the centre as poſſible between theſe ribs and the hip-bone. It is alſo adviſeable, as ſoon as the beaſt is relieved of his wind, to throw up a proper clyſter, as hot as he can bear it.

HOUGH and HOUGHING, in *Gardening*. See HOE and HOEING.

HOUGH, *Ham*, in the *Manage*, the joint of the hind-leg of a beaſt, which connects the thigh to the leg. See HAM.

To HOUGH, *or cut the hough's*, is to ham-ſtring, or to diſable by cutting the ſinews of the ham.

HOUGH, *bony*, is a hard, round ſwellings or tumor, growing upon the tip or elbow of the *hough*.

It generally proceeds from ſome ſtroke or bruiſe; and if neglected till the ſubſtance of the ſwelling becomes hard, like glue, it proves difficult to cure.

HOUND, *canis venaticus*, a hunting dog. See CANIS and DOG.

Hounds may be diſtinguiſhed, with regard to the manner of their hunting, into ſuch as find out and purſue the game by ſight, and the quickneſs and ſwiftneſs of their motion; of which kind are the *gaze-hound*, *agaſæus*; and *grey-hound*, *canis graius*; the *terrier*, &c. and thoſe which find and purſue the game by the goodneſs of their ſmell.

The ſpecies of ſcenting-dogs may be divided farther; into *hounds*, ſimply ſo called, and *blood-hounds*; each whereof admits of ſome diverſities.

1. As to *hounds*, ſimply thus called, thoſe which are all of one colour, as white, black, &c. are moſt valued; then thoſe ſpotted with red; the white with black ears, and a black ſpot at the ſetting on of the tail, are generally eſteemed the beſt for compoſing a kennel, and are of the beſt ſcent and condition; thoſe ſpotted with dun are leſs prized, as uſually wanting courage and boldneſs. The black-tanned, or the all liver-coloured, or all white, the true talbots, are beſt for the ſtring or line; and the grizzled, whether mixed or unmixed, if their hairs are ſhagged, are uſually the beſt runners. There ſhould always be a couple of theſe in the pack. *Follow-hounds* are of good ſcent, and hardy, not fearing the water; they keep the chace well, without change; but are not ſo ſwift as the white; they love the hart above any other chace, having little ſtomach for the hare, &c. whence they are not ſo fit for private gentlemen; beſide that, they are apt to run at tame beaſts.

The *ſlow-hounds* are of a more general uſe, being fit for all chaces. Their ſagacity and fidelity in knowing and ſticking to their maſter's voice and horn, and to none elſe, are much admired; they alſo underſtand each other, and know which are babblers, which ſtars, &c. They are of different ſizes and qualities in the ſeveral countries, &c. Mountainous and woodland parts breed a tall heavy ſort, called *ſlow-hounds*; moderate folds, where the champaign and covert ſtate pretty equally, produce a middle-ſized *hound* of a nimbler make.

The marks of a good and fair *hound* are to be of a middle proportion, rather long than round, the noſtrils wide, back bowed, fillets great, haunches large, ham ſtrait, tail big near the reins, and the reſt ſlender towards the end, the leg big, the ſole dry, and claws large.

For the terms uſed in reſpect of *hound*, their noiſes, &c. ſee HUNTING.

Nothing is more eſſential to the having a good pack of *hounds*, than a proper care of the whelps, and of the parents from which they are to be bred.

The bitches, in particular, ſhould be carefully choſen, and ſhould be ſuch as are the ſtrongeſt and beſt proportioned; they muſt alſo have large ribs and flanks.

The beſt ſeaſon for the coupling of hounds is in January, February or March; for then they will litter in a good time of the year, that is, in ſpring; ſo that they will be fit to enter in due courſe without loſs of time, or of the ſeaſon; for if bitches litter in winter, it is very difficult to bring up the whelps, the cold killing them if there is not great care taken of them.

The dogs that line the bitches muſt not be above five years old; for if they are older than this, the young ones will be dull and heavy. Care ſhould be taken to have a proper dog ready the firſt time of the biteh's going proud; for it is aſſumed by many, who ſay they have experience for it, that whatever kind of dog lines a bitch the firſt time, there will be one puppy at leaſt in all her ſucceeding litters that will have ſome reſemblance of him.

The firſt litter of puppies that a bitch brings, are never eſteemed ſo good as the ſecond or third. When a bitch has been lined, and grows big with whelps, ſhe is not to be ſuffered to hunt among the pack, nor to take any other violent exerciſe; for that would endanger her caſting her whelps; ſhe ſhould be kept up, and fed well, and a good place ſhould be provided for her to litter in. As ſoon as ſhe has littered, thoſe which are intended to be kept ſhould be ſelected out, and the reſt immediately drowned. There is great difficulty in chooſing the beſt at this early time; but the general opinion gives it for thoſe which are the lighteſt, that they will be the ſwifteſt and beſt as they grow up.

Others take all the whelps away; and having determined what number they will keep, they make the choice on thoſe which the bitch carries back firſt to the place where ſhe littered. But all this ſeems very uncertain. Others ſelect that which was puppied laſt.

The whelps muſt have good freſh ſtraw to lie in, and it muſt be often changed. They are to be kept in a place where neither the rain nor ſun-ſhine can be troubleſome to them; and once a week it will be proper to anoint them all over with a little nut-oil, with ſome ſaffron infuſed in it. This will prevent the flies from annoying them ſo much as they otherwiſe would, and will kill worms of all kinds. When they are fifteen days old, it is the cuſtom to worm them, and a week after one joint of their ſtern ſhould be twiſted off. As ſoon as they can ſee, they ſhould have milk given them to lap; and at two months old they muſt be weaned, keeping them wholly from the bitch; they muſt at this time be well kept, but not too high fed; and it is proper to put ſome cumin ſeed into their food, to keep the wind out of their bellies.

Many let the whelps of their hounds ſuck three months, and then ſend them away to villages to be bred up till they are ten months old, cautioning thoſe people who have the care of them, not to let them eat carrion, nor frequent warrens.

Rye-bread is a very common food for young *hounds*, and is particularly recommended by many, but wrongly; for it ſoon paſſes through them, and gives them very little nouriſhment. When they are fed conſtantly with this, in the time of their growing up, they always become narrow-backed; and this is a great fault in this ſort of dog; a bread back being one of the principal recommendations in a *hound*. Wheat-bread is greatly preferable on all accounts for the food of the young *hounds*, giving him ſtrength and firmneſs.

At ten months old they are to be taken home, and put into the company of the others, to live with them and after a few weeks keeping company with the pack, they are to be coupled, and to go out to hunt.

For the method of entering young *hounds*, ſee ENTERING.

It ought to be noted, that whatever young *hounds* are entered at, and rewarded with, they will ever after be moſt; ſo that if they be intended, e. g. for the hare, they muſt not be entered at the hare.

2. The *grey*-HOUND, or *leporarius*, or *gallicus*, or *gallicus graius*, might deſerve the firſt place, on account of his ſwiftneſs, ſtrength, and ſagacity, in purſuing his game;

such being the nature of this dog, that he is speedy and quick of foot to follow, fierce and ſtrong to overcome, yet ſilent, coming upon his prey unawares.

Dr. Caius derives the name of the *grey-gound*, or *greyhound*, from its being the firſt in rank among dogs; and that it was formerly ſo eſteemed, appears from the foreſt-laws of king Canute, who enacted, that no one under the degree of a gentleman ſhould preſume to keep a *grey-hound*. The varieties of this ſpecies are the *Italian grey-hound*, which is ſmall and ſmooth, and the *Oriental*, which is tall and ſlender, with very pendulous ears, and very long hairs on the tail, hanging down a great length. There was formerly a variety, called the Highland *grey-hound*, which is now become very ſcarce, of a very great ſize, ſtrong, deep cheſted, and covered with long and ſtrong hair.

The make and proportions required in a good *grey-hound* are, that he have a long body, ſtrong, and pretty large, a neat ſharp head, ſparkling eyes, a long mouth, and ſharp teeth, little ears, with thin griſtles in them, a ſtrait, broad, and ſtrong breaſt, his fore-legs ſtrait and ſhort, his hind-legs long and ſtrait, broad ſhoulders, round ribs, fleſhy buttocks, but not fat, and a long tail, ſtrong and full of ſinews.

Of this kind, thoſe are always fitteſt to be choſen among the whelps that weigh lighteſt; for they will be ſooner at the game, and ſo hang upon it, hindering its ſwiftneſs, till the heavier and ſtrong *hounds* come in to offer their aſſiſtance; whence, beſides what has been already ſaid, it is requiſite for a *grey-hound* to have large ſides, and a broad midriff, that he may take his breath in and out the more eaſily; his belly ſhould alſo be ſmall, which otherwiſe would obſtruct the ſwiftneſs of his courſe; and his hairs thin and ſoft.

The huntſman is to lead theſe *hounds* on his left hand, if he be on foot; and on the right, if on horſeback. The beſt time to try and train them to the game, is at twelve months old, though ſome begin ſooner, with the males at ten, and the females at eight months old, which laſt are ſaid to be generally more ſwift than the dogs; they ſhould be kept in a flip, while abroad, till they ſee their courſe; neither ſhould you ſlacken a young dog till the game has been a conſiderable time on foot, as he is apt, by over eagerneſs at the prey, to ſtrain his limbs.

The *grey-hound* is the beſt uſed in open countries where there is little cover; in theſe places there will ſometimes be a courſe after a hare of two miles or more, and both the dogs and the game in ſight all the while. It is generally ſuppoſed, that the *grey-hound* bitch will beat the dog in running; but this ſeems to be an error, for the dog is both larger made, and conſiderably ſtronger than the bitch of the ſame kind. In the breeding of theſe dogs the bitch is principally to be regarded; for it is found by experience, that the beſt dog, with a bad bitch, will not get ſo good puppies as an indifferent dog with a good bitch. The dog and bitch ſhould be as nearly as can be of the ſame age; and for the breeding of perfect and fine dogs, they ſhould not be more than four years old; an old bitch may be uſed with a young dog, but the puppies of a young bitch and an old dog will never be good for any thing.

The general food of a *grey-hound* ought to be chippings or raſpings of bread, with ſoft bones and griſtles; and theſe chippings ought always to be ſoaked in beef or mutton-broth; and when it is nearly cool, ſome milk ſhould be added: this given the dog morning and evening will keep him in good heart and ſpirits; he muſt never have any hard bones given him, becauſe they harden his mouth, and hurt his teeth. If the dog grows ſick and weakly upon this diet, then take ſheep's heads with the wool on, waſh them clean, and boil them in a ſufficient quantity of water, to make a very rich and ſtrong broth, and add a large quantity of oat-meal to it. When the meat is very tender, and the broth rich, it is good and fit for the dog; and giving him ſometimes the one, and ſometimes the other, will very ſoon recover him.

If one of theſe dogs is to run for a wager, or on any particular occaſion, he may be dieted with the following bread: take half a peck of good wheat, and the ſame quantity of the fineſt and drieſt oat-meal; grind theſe together, and let the meal be ſifted very fine; then add as much liquorice and aniſeeds, in powder, as will not give it too diſagreeable a flavour; and knead the whole into dough with the whites of eggs. This ſhould be baked in ſmall loaves conſiderably hard; and when the dog is to be fed with it, it is to be ſoaked in beef or other broth. He is to be led out to walk half an hour after ſun-riſe every morning, and half an hour before ſun-ſet every evening, and at his coming in fed with this ſoaked bread. The proper exerciſe for a *grey-hound* is the courſing him three times a week, and *rewarding* him with blood, which will animate him in the higheſt degree, and encourage him to proſecute his game. But the hare alſo ſhould ever have fair play; the ſhould have the law, as it is called, that is, have leave to run twelve ſcore yards before the dog is ſlipped at her, that he may have ſome difficulty in the courſe, and not pick up the game too eaſily. If he kill the hare he muſt never be ſuffered to tear her, but the muſt be taken from him, his mouth cleaned of the wool, and the liver and lights given him by way of encouragement. Then he is to be led home, and his feet are to be waſhed with butter and beer, and about an hour after he is to be fed.

When the dog is to be taken out to courſe, he ſhould have nothing in the morning but a toaſt and butter, and then he is to be kennelled till taken out to the field. The kennelling theſe dogs is of great uſe, always giving them ſpirit and nimbleneſs when they are let looſe; and the beſt way of managing a fine *grey-hound* is never to let him ſtir out of the kennel, except at the times of feeding, walking, or courſing.

3. The GAZEHOUND, or *hagle*, is a dog more beholden to the ſharpneſs of his ſight than his noſe or ſmelling; by virtue of which he makes excellent ſport with the deer and hare. He is alſo noted as requiſite in chooſing of one that is not lank or lean, but full, fat, and round, which, if it happen to return, and be mingled again with the troſſoe of the herd, he will ſoon ſpy out, and leave the reſt untouched, never ceaſing, after he has ſeparated it from its company, and till he has wearied it to death. Theſe dogs were much uſed in the North of England, and on champaign ground, rather than buſhy and woody places, and by horſemen, more than foormen. If at any time he happen to take a wrong way, upon the uſual ſign made by his maſter, he immediately returns, takes the right and ready courſe, beginning his chace afreſh, with a clear voice, and ſwift foot, following the game with as much courage as at firſt.

This ſpecies which was the *agaſæus* of Dr. Caius, ſays Mr. Pennant, is now loſt, or at leaſt unknown to us; and it is very different from the *agaſæus* of Oppian, which is our BEAGLE.

4. The *blood*-HOUND, or *canis ſagax* of Linnæus, differs nothing in quality from the *Scottiſh flat-hound*, derived from the Saxon *flat*, the impreſſion which a deer leaves of its foot in the mire, and *hund*, a *dog*, ſaving that it is longer-ſhaped, and not always of the ſame colour, but ſometimes red, ſtanded, black, white-ſpotted, &c. though moſt commonly either brown or red.

Their nature is, that being ſet on by the voice and words of their leader, to caſt about for the finding of the preſent game, and having found it, they will never ceaſe purſuing it with full cry, till it be tired, without changing for any other.

They ſeldom bark, except in their chace, and are very obedient and attentive to the voice of their leader. Thoſe that are really good, when they have found the hare, make ſhew thereof to the huntſman by running more ſpeedily, and with geſture of head, eyes, ears, and tail, winding to the ſcent or hare's muſe, never giving over proſecution, and running with a gallant noiſe.

They have good and hard feet, and ſtately ſtomachs, and are very properly denominated *ſanguinary* or *blood-hounds*, on account of their extraordinary ſcent; for if their game be only wounded, ſo that it eſcape the huntſman's hands, or if it be killed, and never ſo cleanly carried away, theſe dogs, by their exquiſite ſmell, will diſcover it, and not be wanting, either by nimbleneſs or greedineſs, to come at it, provided there be any ſtains of blood. Nay, though by all the cunning and foreſight imaginable, a beaſt be conveyed away without ſpot or blood, yet through the rougheſt and moſt croſs and ways and meers, this dog will find out the deer-ſtealer, and, even in the thickeſt throngs, will, by his ſmell, ſeparate and pick him out.

The *blood-hound* was in great requeſt on the confines of England and Scotland, where the borderers were continually preying on the herds and flocks of their neighbours. The true *blood-hound*, ſays Mr. Pennant, was large, ſtrong, muſculous, broad breaſted, of a ſtern countenance, of a deep tan-colour, and generally marked with a black ſpot above each eye.

5. The *terrier* or *tarrier*, only hunts the fox or badger; being thus called, becauſe, after the manner of a *ferret* in ſearching for coneys, he leaps into the ground, and affrights or attacks the beaſts, either tearing them in pieces, or haling them out by force; or, at leaſt, driving them out of their harbours to be taken in a net, or otherwiſe.

The huntſmen have commonly a couple of *tarriers*, that they may put in a freſh one, as occaſion ſerves, to relieve the other.

The time of entering the *terrier* is when he is near a twelvemonth old: if it be not done within that time, he will

will hardly be brought to take the earth. This entering and feshing of them may be performed several ways. First, when the foxes and badgers have young cubs, take an old *terrier*, set him into the ground, and when he begins to bay, hold the young one at the hole or mouth of the earth, that he may listen and hear the old one's bay. The old fox or badger being taken, so that nothing remains within but the cubs, couple up the old ones, and put in the young in their steads, encouraging them by crying, *to him, to him*. If they take any cub within, let them do with it what they list; not forgetting to give the old *terriers* their reward, which is blood and livers, fried with cheese, and some of their greafe; shewing them also heads and skins to encourage them.

HOUND-*fish*, in *Ichthyology*, an English name given to two different fish of the squalus kind, the one called the smooth, and the other the prickly *hound*. See GALEUS *levis*, and GALEUS *spinax*.

We find in Willoughby, and almoft all the other writers on fishes, the name of another fpecies of *hound-fish* beside these, called the ftarry *hound*, or *galeus aflerias*, and MUSTELUS *aflerias*, or *flellaris*; but this has been found by Artedi to be no other than a variety of the firft fpecies, or fmooth *hound-fish*.

There is alfo another fish of the fqualus kind, fometimes called by this name, with the addition of the epithet rough. This is the *morgay*, or rough *hound-fish*. It is the *pofe gatto* of the Italians, the *catulus minor* of authors, and the *muftelus ftellaris tertius*, or the third fpecies of ftarry *hound-fish* of Bellonius. Artedi diftinguifhes it from the others, and from all the other fquali, by the name of the fqualus with a variegated back, and with the belly-fins concreted together. See SQUALUS and CATULUS.

HOUND'S *tongue*, *cynoglofſum*, in *Botany*, a genus of the *pentandria monogynia* claſs. Its characters are these: it has a funnel-fhaped flower of one leaf, with a long tube, and has five fhort ftamina in the chops of the petal; at the bottom of the tube are fituated four germina; and the empalement afterwards becomes four capfules, including four oval feeds. There are eight fpecies. Miller.

The common *hound's tongue* is eafily known by the whitifh colour, and foftneſs of its leaves, the beautiful purple of its flowers, and its difagreeable fmell. It is an excellent remedy in catarrhs, and will alone often cure a gonorrhœa fimplex. The root is the part in which its virtues principally refide. Externally it is ufed as a vulnerary, and it is faid to cure even in fcrophulous cafes. See CYNOGLOSSI *radix*.

HOUNDS, in a *Ship*, are thofe parts of a maft-head, which gradually project on the right and left fide, beyond the cylindrical or conical furface, which is preferved from the partners upwards. The *hounds*, whofe upper parts are alfo called cheeks, are ufed as fhoulders to fupport the frame of the top, together with the top-maft and rigging of the lower maft.

HOUR, Eng. *Hora*, in *Chronology*, an aliquot part of a natural *day*, ufually a 24th, fometimes a 12th.

The origin of the word *hora*, or ὥρα, comes, according to fome authors, from a furname of the *fun*, the father of *hours*, whom the Egyptians call *Horus*. Others derive it from the Greek ὁρίζειν, *to terminate, diſtinguiſh*, &c. Others from the word ὄρος, *mine*; pretending that Trifmegiftus was the firft that fettled the diviſion of *hours*; which he did from obfervation of an animal conſecrated to Serapis, named the *cynocephalus*, which makes water twelve times a day, and as often in the night, at equal intervals.

An *hour* with us is a meaſure or quantity of time, equal to a twenty-fourth part of the natural day, or nycthemeron; or it is the duration of the twenty-fourth part of the earth's diurnal rotation. Fifteen degrees of the equator anſwer to an *hour*; though not preciſely, but near enough for common uſe.

The *hour* is divided into fixty minutes, the minute into fixty ſeconds, &c.

The diviſion of the day into *hours* is very ancient; as is fhown by Kircher, Oedip. Ægypt. tom. ii. part ii. claſs vii. cap. 8. though the paſſages he quotes from Scripture do not prove it. The moft ancient *hour* is that of the twelfth part of the day. Herodotus, lib. ii. obſerves, that the Greeks learnt from the Egyptians, among other things, the method of dividing the day into twelve parts.

The aſtronomers of Cathaya, &c. biſhop Beveridge obſerves, ſtill retain this diviſion. They call the *hour chog*; and to each *chog* they give a peculiar name, taken from ſome animal: the firſt is called *with*, *mauſe*; the ſecond *chin*, *bullock*; the third *tom*, *leopard*; the fourth *mun*, *hare*; the fifth *chin*, the *crocodile*, &c.

The diviſion of the day into twenty-four *hours* was not known to the Romans before the Punic war. Till that time they only regulated their days by the riſing and ſetting of the ſun.

They divided the twelve *hours* of their day into four; viz. *prima*, which commenced at ſix o'clock, *third* at nine, *ſixth* at twelve, and *none* at three. They alſo divided the night into four watches, each containing three *hours*.

There are divers kinds of *hours*, uſed by chronologers, aſtronomers, dialiſts, &c. Sometimes,

Hours are divided into *equal* and *unequal*.

HOURS, *equal*, are the twenty-fourth parts of a day and night preciſely; that is, the time wherein the fifteen degrees of the equator mount above the horizon.

Theſe are alſo called *equinoctial hours*, becauſe meaſured on the equinoctial; and *after-noted*, becauſe uſed by aſtronomers.

They are alſo differently denominated, according to the manner of accounting them in different countries.

HOURS, *aſtronomical*, are equal *hours*, reckoned from noon, or mid-day, in a continued ſeries of twenty-four.

HOURS, *Babyloniſh*, are equal *hours*, reckoned from ſunriſe in a continued ſeries of twenty-four.

HOURS, *European*, are equal *hours*, reckoned from midnight; twelve from thence till noon, and from noon till midnight twelve more.

HOURS, *Jewiſh*, *or planetary*, or *ancient*, are twelfth parts of the artificial day and night.

Hence, as it is only in the time of the equinoxes that the artificial day is equal to the night, it is then only that the *hours* of the day are equal to thoſe of the night; at other times they will be always either increaſing or decreaſing.

They are called *ancient* or *Jewiſh hours*, becauſe uſed by the ancients, and ſtill among the Jews. They are called *planetary hours*, becauſe the aſtrologers pretend, that a new planet comes to predominate every *hour*; and that the day takes its denomination from that which predominates the firſt *hour* thereof: as Monday from the moon, &c.

HOURS, *Italian*, are equal *hours*, reckoned from ſun-ſet, in a continued ſeries of twenty-four.

HOURS, *unequal*, *or temporary*, are twelfth parts of the artificial day and night. The obliquity of the ſphere renders theſe more or leſs unequal at different times; ſo that they only agree with the equal *hours* at the times of the equinoxes.

To find the *hour* of the day, when the latitude of the place, the ſun's declination, and his altitude, are given. Thus, ſuppoſe the latitude is 51° 32', the ſun's declination 18° north, and his altitude 40°, to find the *hour* of the day.

The geometrical ſolution of this problem is performed by projecting ſtereographically on the plane of the meridian the oblique-angled ſpherical triangle, which is made by the complement of the latitude, the complement of the ſun's altitude, and the ſun's diſtance from the elevated pole. Thus, with the chord of 60° (*Tab. III. Aſtronomy, fig.* 80.) draw the primitive circle Z O N H; quarter it; alſo draw the axis P C P through the poles, and the equinoctial Æ C Q; likewiſe the parallel of declination D ⊙ *d* equal 18°; then draw parallel to the horizon H O, the almacanter or parallel of the ſun's altitude A = 40°, to cut the parallel of the ſun's declination in ⊙ the place of the ſun at that time. Then through ⊙ draw two great circles, one through Z and N the poles of the horizon, and the other through P and P the poles of the equinoctial, as Z ⊙ N, and P ⊙ P; which form the oblique-angled ſpherical triangle P Z ⊙, and the angle Z P ⊙, meaſured on the line of half tangents, gives the hour of the day from twelve, viz. 47° 20' equal to 3 hours 9 minutes nearly, or to 51 minutes after eight in the morning, or 51 minutes before four in the afternoon. But by ſpherical trigonometry, having three ſides given, that is Z P 38° 28' the complement of the latitude, Z ⊙ 50° 00' the complement of the ſun's altitude, and P ⊙ 72° 00' the ſun's diſtance from the elevated pole (which is the declination added to 90°, when the latitude and declination are of a contrary name; but if of one name, it is the complement of the declination); and the angle Z P ⊙, the *hour* of the day, is found by caſe 11 of ſpherical trigonometry, as follows:

Firſt add the complement of the latitude, [illegible] of the ſun's altitude, and the ſun's diſtance from the elevated pole, into one ſum. Secondly, [illegible] that ſum ſubtract the complement of the [illegible], leaving the half ſum, and the remainder [illegible]. Then the ſine arithmetical of the ſines of the [illegible] of the latitude, and the ſun's diſtance from the [illegible] of the ſaid half ſum and remainder [illegible] the ſine of half this ſum, doubled, and [illegible] from 180 degrees, gives the hour from noon.

	Z ⊙ Co. alt. 32° 00′	half sum sides	70° 14′ 8″—9.957060
	sum is	180° 42′	remainder 30° 14′ 8″—9.702018
	Half is,	70° 14′	sum of the 4—19.951582
	Co. alt.	57° 60′	fine half sum)—9.951582
	Remainder	32° 14′	60° 00″
			60° 00′

Which doubled gives 128° 40′

This subtracted from 180° 00′ leaves 47° 20′ equal to 3 hours 9′ nearly, the same as before.

By the same operation you may find the sun's azimuth PZ⊙, if instead of the complement of the sun's altitude you subtract the sun's distance from the pole, noting the half sum and remainder as before. And the rule will stand thus: to the complement arithmetical of the fines of the complement of the latitude, and complement of the sun's altitude, add the fines of the aforesaid half sum and remainder; then the fine of half the total of these four, doubled, and taken from 180 degrees, gives the sun's azimuth from the north, in north latitude; and from the south, in south latitude.

If the *hour* of the night is required, the height of fome ſtar muſt be taken. And it is found by adding to, or ſubtracting the right aſcenſion of that ſtar from that of the ſun.

To find the *hour* of the day or night by the globe, ſee GLOBE.

HOURS, HORÆ, in the *Ancient Mythology*, were certain goddeſſes, the daughters of Jupiter and Themis; at firſt only three in number, Eunomia, Dice, and Irene; to which were afterwards added two more, Carpo, and Thallote.

Homer makes them the door-keepers of heaven. Ovid aſſots them the employment of harneſſing the horſes of the ſun:

Jungere equos Titan velocibus imperat Horis.

And ſpeaks of them as ſtanding, at equal diſtances, about the throne of Sol:

——*et, poſitæ ſpatiis æqualibus,* Horæ.

The poets repreſent them as dreſſed in fine coloured or embroidered robes, and gliding on with a quick and eaſy motion. Ovid. Faſt. v. ver. 218. Met. ii. ver. 119. Stat. Theb. iii. ver. 410.

HOURS, *Horæ*, in the *Romiſh Church*, are certain prayers performed at ſtated times of the day; as *matins, veſpers, lauds*, &c.

The leſſer *hours*, are *prime, tierce, ſixth*, and *none*. They are called *hours*, or *canonical hours*, as being to be rehearſed at certain *hours* preſcribed by the canons of that church, in commemoration of the myſteries accompliſhed at theſe *hours*. Theſe *hours* were anciently alſo called *courſe, curſus*. F. Mabillon has a diſſertation on them, entitled, De Curſu Gallicano.

The firſt conſtitution enjoining the obſervation of the canonical *hours*, is of the ninth century, being found in a capitular of Heito, biſhop of Baſil, directed to his curates, importing, that the prieſts ſhall never be abſent at the canonical *hours*, either by day or night.

HOURS, *prayers of forty*, are public prayers continued for the ſpace of three days ſucceſſively, and without intermiſſion, before the holy ſacrament, to obtain the aſſiſtance of heaven on ſome important occaſion.

In theſe days, care is taken, that the holy ſacrament be expoſed forty *hours*, viz. thirteen or fourteen *hours* each day.

HOUR-*circles*, or HORARY *circles*, in *Aſtronomy*, &c. are great circles, meeting in the poles of the world, and croſſing the equinoctial at right angles; the ſame as *meridians*.

They are ſuppoſed to be drawn through every fifteenth degree of the equinoctial and equator, and on both globes are ſupplied by the meridian *hour-circle* and index. See GLOBE.

The planes of the *hour circles* are perpendicular to the plane of the equinoctial, which they divide into twenty-four equal parts.

HOUR-*glaſs*, a popular kind of chronometer or clepſydra, ſerving to meaſure the ſhis of time, by the deſcent or running of ſand out of one glaſs veſſel into another.

The beſt *hour-glaſſes* are thoſe, which inſtead of ſand have egg-ſhells well dreſſed in the oven, then beaten fine and ſifted.

Hour-glaſſes are much uſed at ſea, for reckoning, &c.

There is alſo a ſort of *hour-glaſſes*, which depend on the flux of water, or ſome other liquid, more properly called *clepſydræ*. See CLEPSYDRA.

HOUR-*lines*, on a *Dial*, are lines which ariſe from the interſections of the plane of the dial, with the ſeveral planes of the *hour circles* of the ſphere, and therefore muſt be all right lines.

HOUR-*ſcale*, a divided line on the edge of Collins's quadrant, being only of tangents of forty-five degrees each, ſet together in the middle. Its uſe, together with the lines of latitude, is to draw the *hour lines* of dials that have centres, by means of an equilateral triangle, drawn on the dial-plane. See DIALLING-*lines*, and SCALE.

HOURIS, in *Moſaick Hiſtory*, is a name given by the MAHOMETANS to thoſe females that are deſigned for the faithful in paradiſe. Theſe are not the ſame with whom they have lived on earth, but formed for this purpoſe, with ſingular beauty and undecaying charms.

HOUSAGE, a fee which a carrier, or other perſon, pays for laying up goods in a houſe.
